MEGA - SOUND

Now you can achieve amazing sound capabilities that your standard ZX Spectrum has been lacking.

Your games will become more playable as the Spectrum sound is amplified through your T.V., providing you with a whole new sound dimension. The Spectrum "beep" will also be amplified through the T.V. ensuring confidence when pressing keys during programming.

In order to prevent damage to your Mega-Sound or computer, please ensure that your computer is switched off before plugging or unplugging the unit. Then simply plug into the user port at the rear of the computer - it will take its power from the existing power supply. The phono lead protruding from the unit, should be plugged into the Mic socket on the computer.

Turn up the volume control of the T.V. If you notice too much background noise, then simply adjust the sound through the hole at the front of the unit, until the desired level is obtained. A tool is provided for this purpose.

The T.V. volume control is now all that stands between you and absolutely marvellous results!

All Sinclair and Cheetah peripherals can be used via the through connector at the rear of the Mega-Sound unit.
