COVER STORY

Plus/4 on the spot

32

Has Commodore come up with a new block-buster? With the bundling of applications software in a low-cost 64K micro it should give buyers pause for thought.

OUTPUT

Commodore gremlins

12

A garden full of butterflies and poisonous mushrooms is the location Tony Crowther chose for this imaginative game, written exclusively for PCN.

Spritely Amstrad

16

We finally round off the series on creating sprites on the Amstrad with a large listing for you to hack in.

Spectrum's added columns

18

The humble Spectrum can print up to 64 characters per line with the machine code program by Stuart Nicholls.

Directory Enquiries

22

The Commodore 64's disk directory is unravelled with two utilities, one of which can be incorporated into other programs.

Oric war game

26

Tank Assault is an arcade style maze game with plenty of action.

Acorn memories

29

Monitor your micro's memory — both random access and read only.

PERIPHERALS

Raven remembers

38

Expand the BBC's memory by 20K and add a few commands as well with the Raven-20 expansion board.

Cheetah choice

42

Cheetah's version of a Spectrum keyboard looks upmarket, but does it live up to its image?

SOFTWARE

Commodore tunes in

54

Your Commodore can make beautiful music with the aid of Musicalc — if you can figure out how it works.

Macintosh on file

57

Picture this — a database that uses pictures instead of labels — and you have Fivision, Apple's new package for the Mac.

Gameplay

47

A wide variety of adventure and arcade magic for the Commodore 64, Spectrum and BBC B.

Spectrum gets a facelift

Sinclair has dropped the veil of secrecy surrounding its home micro plans and will launch the Spectrum Plus this week.

The machine works like a Spectrum, looks like a QL and is likely to cost about £50 more than the current model. It is a 48K system said to be completely compatible with existing Spectrum software and with the Interfaces 1 and 2.

Maybe with the MSX machines in mind, Sinclair is equipping the Spectrum Plus with a 'professional' keyboard. It hasn't had to look too far to find one — the Spectrum Plus's case is in effect a cut-down QL shorn of the Microdrives.

Sinclair has gone overboard on the number of new keys wired in, possibly to make sure the Spectrum Plus outclasses any of the existing third party add-on keyboards.

The keys are full-travel, using a membrane beneath similar to that used by the QL. There is a full space-bar, with cursor

keys either side of it, QL-fashion, and punctuation, E Mode, Edit, Delete, Graphics, Break and True and Inverse Video keys have also been added.

The machine also has twin Symbol and Caps Shift keys. Sinclair wouldn't comment on internal modifications, but unless the company has done something clever the ULA may have had to be changed. Manufacturers of add-on keyboards have repeatedly run into crashing problems when they've tried to wire too many keys in.

Only two weeks ago Sinclair was denying point blank that it had any plans for a new version of the Spectrum (issue 82). Either the company has done very well to keep it a secret or it has knocked the Spectrum Plus together over a weekend to take advantage of the late MSX.

As a further sweetener the Plus will include a number of free software packages.

Prices reach new low on Eighth Day

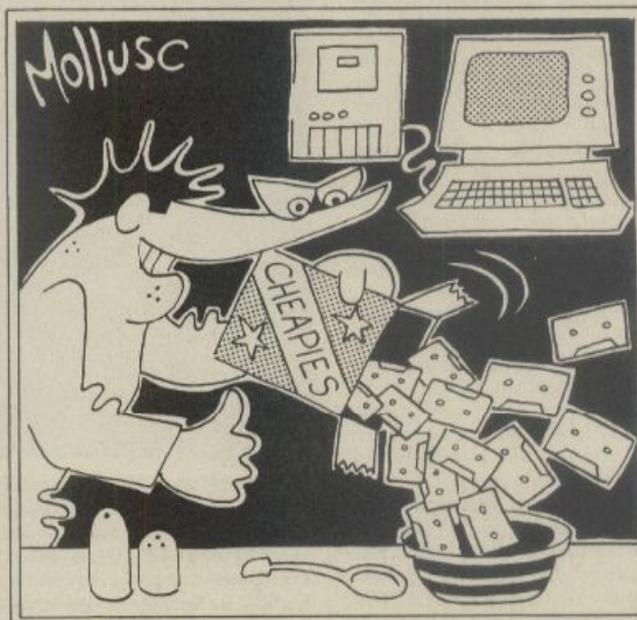

Nervous software suppliers around the country will be reaching for the panic button as the price of games plummets again.

The first six products from a company called Eighth Day will cost a penny-pinching £1.75. They are Quill-designed adventures called collectively Games Without Frontiers; this just happens to be the translation of Jeux Sans Frontières but there's no joke intended.

'We hope we've produced £7 games for £1.75,' said Mike White, one of the two directors of Eighth Day. We'll pass judge-

ment on how successful they've been in a forthcoming issue, but the games are available now via mail order from Eighth Day at 18 Flaxhill, Moreton, Wirral.

When Mastertronic made the £1.99 breakthrough earlier this year some established software suppliers scoffed. They said confidently that there weren't enough micros in the country to make possible the kind of turnover that Mastertronic would need. But the company has gone from strength to strength and has forced its competitors to look again at the prices they've been charging.

New support gives flagging Ace a boost

The Jupiter Ace, that rare and endangered species, is still alive and kicking with a number of new add-ons and software coming out for it.

A new company called MegaTechnic Computing has produced three packages for the 16K Forth veteran. Jupiter Jumpman and Paint 'n' Run are arcade style games. Ex-Forth 84 is a utility program that has new Forth words.

A spokeswoman for the company said: 'Initially we're testing the response to these packages, before we go into a big launch. But we think there'll be some demand.'

The software costs £5.50 and is available by mail order from MegaTechnic, 8 East Langham Road, Raunds, Wellingborough, Northants NN9 6LG.

In terms of support, Ace users can still count on Boldfield (0487-840740) which rescued the machine from deep waters earlier this year (issue 73). The company says that demand is still going strong for its £29.90 micro — and Boldfield has even crossed the Channel into France to buy up Aces and reconfigure them for English buyers.

Paul Downham of Boldfield said: 'We've got a full commitment to the Jupiter Ace and have produced a number of new products for users.'

On the list is a sound box with three-sound channel generator at £39, a 'professional' keyboard at £39, a joystick interface at £19.55, a video monitor connector at £12.65 and an adaptor kit at £5.98.

Buy now, pay later micros at Woolworth

If it's shortage of cash that's stopping you buying a new micro, Woolworth is out to lure you with an interest-free credit scheme.

The Woolies chain has been trying to live down the dime store tag for years, but it's still somehow appropriate that the inventor of Mix 'n' Match sweets should lead the way with Spectrums on the never-never.

Woolies' computer deals apply to a range of home micros including the Electron, Amstrad, Spectrum, BBC, Vic 20, Commodore 64 and Atari 600XL. In addition there are the Atari 2600 and Colecovision games machines.

If you buy a 48K Spectrum, for instance, you'll get £58 worth of software in the £129.95 package. Initially, you'd have to put down a deposit of £13.95, then 11 monthly payments of

£9.66 and a final payment of £9.74 to bring you to the total credit price.

The offer is available from most Woolworth stores throughout the country and will last indefinitely. Other big retail stores such as WH Smith and Boots have no plans to follow in Woolies footsteps.

MSX software prices hit the roof

Confirming fears that MSX software will be overpriced, Micro Peripherals has announced that the games cartridges it is importing from Japan will cost £18.95.

'Well, they are 64K cartridges. That's as much memory as there is in an MSX micro,' said a company spokesman.

All this memory is swallowed up by some of the games which include a version of the arcade hit Track and Field. Actually, this game comes on two cartridges so it will cost you £37.90 if you want to enjoy it in the seclusion of your living room.

Other titles include Athletic Land ('fun and games in the park'), Time Pilot, Hyper Sports, Super Cobra, Monkey Academy, Antarctic Adventure, Comic Bakery and Circus Charlie.

Micro Peripherals reckons that all this action can be very taxing on your average joystick so it is also selling a 'HyperShot' special controller for the athletic games.

Money-laden MSX users can contact the company on Basingstoke 0256-473232.

Competition winners get Commodore 64s

At last the results of PCN's Commodore 64 competition, which closed a few weeks ago. The response was overwhelming but after much digging in the hat, we've pulled out five winners.

They are: Mrs NA Junik, of Peebles; HC Li, of London SW7; Andrew Carson, of Harborne, Birmingham; AG Pereira, of London E3; and JD Gorse, of BFPO 35. Commodore 64s will be on their way shortly.

Most entrants had most of the right answers but all-correct entries were a bit on the thin side. Here's what we were looking for: 1 The Kernal operating system; 2 Vic chip; 3 SID chip; 4 Institute of Electrical and Electronics Engineers; 5 5K; 6 Personal Electronic Transactor.

Acorn dampens conversion hopes

It's official. Elite will not be available for micros other than the BBC and Electron for the foreseeable future.

So says David Johnson Davies, Acornsoft's managing director. Replying to PCN's request, nay demand, that this addictive mega-game should be converted to run on other machines (see last week's rave review), DJD stated: 'We don't have any definite plans.'

'It would take time to convert and no work is being done in that connection. But we haven't ruled the possibility out.'

'By the end of last week we had sold 13,000 copies,' DJD said. That means within a couple of weeks it will become Acornsoft's best selling title ever.

This cuts no ice with the staff at PCN who are still queuing up to take turns at playing the game.

● Acornsoft will shortly be announcing the first monthly winner of its Elite competition. PCN can exclusively reveal that the as yet un-named winner has managed a score of 106,764.9 credits and achieved a 'dangerous' rating.

Software Projects wraps up pirates

Beauty is most definitely in the eye of the beholder as far as Software Projects is concerned and it's preparing a poke in the eye for any unlawful beholders.

The attractive packaging of all Software Projects games that may seem to the user as a little extra decoration should present a big headache to any would be pirates.

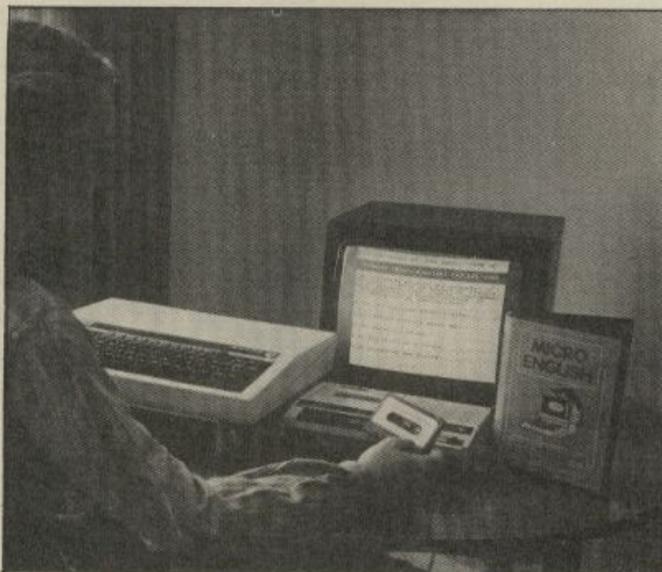

The new light blue cassette, which is probably more in keeping with the nature of the contents than the dowdy grey and black that we are used to for software, is non-standard — and must be specially ordered. In short, anybody who wishes to purchase similar blanks must buy at least 250,000. A transparent leader section on each tape has the name Software Projects printed on it.

The real deterrent, though, should be the simple security tape that binds the cellophane wrapper together, similar to those found on cigarette packets. Each tape has the company's name and logo and costs very little to produce. The sole manufacturer ensures that no one besides the original client can order duplicates.

Software Projects already holds copyright on its name and the names of all its games. It hopes to further disadvantage the pirates by introducing holograms on to the packaging. It would be impossible to make realistic copies of these without the original artwork.

Software pirates have shown themselves to be both resourceful and enterprising but these new features may require a little too much enterprise. As managing director Allan Maton says: 'If they are prepared to put all that effort into pirating why don't they make their own software.'

So keep your eyes open for features like these — if you buy a Software Projects tape that doesn't have them, the company isn't going to bale you out if anything goes wrong.

OUT OF SCHOOL — No need to go to school for 'O' Levels any more. Now you can thrill to the subtleties of comprehension, marvel at the oddities of spelling, and grapple with irregular plurals in your own home. Ludinski Computer-Assisted Learning (0784-58771) has released Micro English, which it claims is a full 'O' Level course that covers all your favourites on a pair of disks or several tapes. For the BBC, it also features a speech synthesiser to warble through the course with you. It costs £24.50 but might prove to be priceless.

MONITOR

Chip Shop serves up MSX Basicode

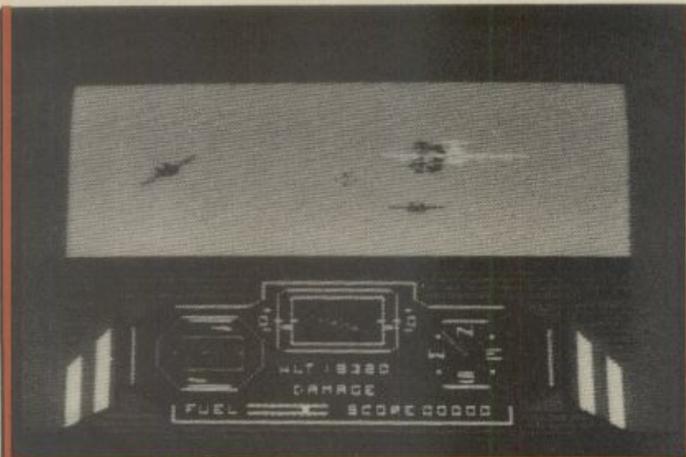

A gap left in the specifications of Basicode 2+, the universal interpreter used by the BBC's Chip Shop, has been filled. In addition to Dragon, Electron, Oric and Spectrum, MSX machines can now run Basicode 2+ software.

The BBC is rubbing its hands over the provision that Kuma (07357-4335) has made for MSX. 'This is the first time we have been able to offer the Basicode facility for hardware in advance of it appearing in the shops,' said Trevor Taylor, producer of the Chip Shop series.

Unlike other MSX software, Basicode programs are as free as air — the BBC broadcasts them for users to download, provided they can see straight to plug their micros in at the transmission time — 5.55 am.

Commodore, BBC, Apple and Tandy owners were already catered for in the original Basicode. The translation program for Basicode 2x comes on a tape with a manual, which costs £4.95 from BBC Broadcasting Support Services.

Some readers reported difficulty contacting Broadcasting Support Services after our article on the new Chip Shop season, so here's the address again: 2 Cater Road, Bristol BS13 7TW. Telephone 0272-279494.

HIGH FLYER — Flyer Fox, which was shown along with Gandalf by Tymac at the PCW show, will be available soon at £9.95. The range is subtitled Tymac Talkies because the games use the 64's sound to synthesis speech. The programs load with Novaload and the graphics are of above average quality — we'll be reviewing them both shortly. Tymac is set to import more games for the 64 and the Atari, Vic 20 and IBM PC. Tymac also imports peripherals such as Expand-O-RAM for the Vic and The Connection, a Centronics interface for the Commodore 64. Details on 021-643 8899.

Speedy Amstrad runs dot matrix printer

Amstrad has rounded off its line of micro products by launching a dot-matrix printer for the CPC464 and DDI-1 disk units.

The printer should go on sale almost immediately at £200. If there are no hitches, Amstrad will deserve another pat on the back for the pace at which it is producing add-ons for the CPC464 — look at how long it took Oric, Sinclair and others to

come up with storage systems and printer for their respective micros.

Called the DMP-1, the printer is a 50 cps 80-column dot-matrix unit. Amstrad has opted for a standard Centronics interface but the DMP-1 has instruction extensions to cope with the Amstrad micro's dot-assembler graphics.

It's characters are formed from a 5 by 7 matrix, and in graphics mode the pitch is 60 dots an inch.

IN BRIEF

The chequered career of the Bytec Hyperion has finally ended with the decision by Anderson Jacobson to drop the portable IBM clone from its list. AJ launched the Canadian micro last year, calling it the Ajile. AJ will continue to support dealers 'as long as the spares situation will permit'.

Logo is due to get its very own trade early year, on London. The event is being organised by the London New Technology Network. There's still time to get involved if you want to help plan it — LNTN (01-482 3816) wants to hear from you.

Graffel has launched a follow-up to the VP200 series of video processors that have proved such a handy add-on to IBM PC users. The new VP 201/2 dumps a colour graphics display from the PC's screen to a printer and costs £560. Telephone 0252-510200.

For a limited period Apple is knocking hundreds of pounds off the prices it charges schools and colleges. If you can twist somebody's arm before December 31 your school could pick up a Lisa for £3,099 (usual price £4,135), a IIe plus disk drive for £595 (£795 to anybody else) or a 128K Macintosh for £1,349 (down from £1,795).

HOMEFRONT

Twilight hour of the micros we know

The nearest star (apart from the sun) is more than four light years away. And, as anybody who watches Top of the Pops will know, stars come and go. When you look at the night sky and see the twinkling pinpricks of light, it's sobering to realise that the celestial body emitting that light could well have popped its clogs years ago. It's a romantic thought, in a way. The star dies but its final flickerings

struggle across infinity for years to give NASA, Patrick Moore, and lovers everywhere something to swoon over.

The Enterprise 64 has a lot in common with stars.

Putting a brave face on matters, the Enterprise has flickered intermittently — at the PCW Show last year, at a Scottish trade fair this summer, and again at the PCW Show this autumn. When it finally gets into the hands of whoever is still intent on buying it, something will have died. The smart money at the moment says that the casualty will be the market that the crippled Starship Enterprise was intended to serve. Home computers as we know them are on the way out.

Says who? Says Sinclair, Acorn, Commodore, and Market Assessment Information Services.

The big three home computer makers seem to regard Christmas 1984 as a shoot-out in the UK corral. There will be a final apocalyptic blaze of activity and the survivors will head for Re-Boot Hill as the market for

home computers leaves the traditional offerings behind.

The systems that are expected to take their place will be more serious and useful, reflecting a view that has been gathering strength all year. Market Assessment Information Services, in a survey published last week, predicts that 'as a home work station, with a link to the place of employment, computers in the home have a strong future.'

This sounds about as exciting as watching grass grow but if it's what the suppliers think, it's probably what you'll have to get used to. The survey doesn't say that home micros will be swept away overnight, but it does conclude that 'a reduction in the number of models available seems inevitable'.

Frivolity is finished — games have no future. By linking home computers to places of work, the manufacturers are putting a premium on the kind of features that haven't been prominent in the past — reliability for one.

Don't panic just yet. The

leading machines will carry on and the kind of things you do with them will be hard for the old sober-sides in high places to stamp out. But they will become a side-show. You'll be on the point of annihilating the Thyroid Empire or discovering the all-important Key of Fleet Wood when a message will take over the screen: 'Pardon me while I take time out to activate the curtain closing mechanism in your office by means of the miracles of telecommunications.'

Or is the prediction just so much precious nonsense? What lies behind it is the suggestion that next year sales of home computers are going to start falling.

When all the home micros that can be sold have been sold, the manufacturers have to find something else to offer. It will probably be the same machines doing the same thing.

This being the case, there's no reason for astronomers to start re-drawing their charts. If an occasional star drops out, another is sure to take its place.

Imagine's game rises again on the QL

At last, proof that there is life after death in the microcomputer business.

Bandersnatch, the 'mega-game' that was Imagine's final undoing, has risen phoenix-like from the ashes with a Sinclair label and aimed at the QL.

And the architects behind this revival are none other than David Lawson and Ian Hetherington — former Imagine directors.

Lawson and Hetherington have bought an off-the-shelf company called Fireiron, bought the game from Imagine's liquidator and sold it to Sinclair.

Also involved with Fireiron is latter-day whizz kid Eugene Evans, the lead programmer on Bandersnatch before Imagine crashed.

What is not clear is when the game will hit the streets and how much it will cost.

In the Imagine days the suggested price-tag was around £40. The expense arises from the need to include a hardware dongle to improve the capabilities of the Spectrum and Commodore 64 micros it was originally written for.

Unfortunately, the game was

only 80 per cent complete when Imagine went under.

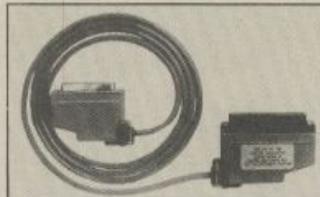

Bandersnatch existed only in prototype form on a Sage development system.

It just happens that the Sage uses a 68000 processor chip, similar to the QL 68008.

64 connections get a sight more style

Access Computer Company (061-477 6013) hopes to appeal to your sense of style with its serial printer interface and cable for Commodore micros.

Until now, the company says, 'the method of connecting an RS232 serial printer to either the Commodore 64 or Vic 20 has

Access interface — serial with style.

been both unsightly and expensive.'

We'd dispute this. Unsightly or expensive, perhaps, but rarely both.

Either way, there's no doubt that the Access interface and cable is a slightly piece of equipment. It costs £34.95 and hooks up to most serial printers equipment. It costs £34.95 and hooks up to most serial printers.

Rodime aims to double disk store

A tasty glimpse of the future is offered in reports of disk manufacturer Rodime's blossoming profits.

The Silicon Glen firm was the world's first manufacturer of 3½in Winchester disk drives (issue 1) and says it will be reporting a 56 per cent increase in its profits this year.

The company also says it is working on a 20Mb hard disk and expects to release a 40Mb version in 1985-86.

Which can only be good news for Apricot owners and others who find the current 10Mb capacity of Rodime's existing drives just a little limiting.

TURNING 64 — Micromega is going 64. The company used to focus exclusively on Spectrum games, many of them best sellers such as *Fall Throttle*, *Codename Mat* and *Deathchase*. The authors of these games, Derek Brewster and Mervyn Estcourt, are likely to produce software for the 64 shortly but the company's first 64 release, *Jinn Genie*, was written by Hanan Samara — could she be the first female programmer of a chart-topper? This screen shot is a still from *Jasper!*, Derek Brewster's latest and the two games are due to be released on October 22. *Jasper!* will cost £6.95.

VIEW FROM JAPAN

Brits lose their way on road to Japan

As I've often written (or complained) in this column, so far as computers go, there's more smoke than fire to the myth of superior Japanese technology (excluding the technology required for manufacturing and assembly). When you stop to think, all they've really managed to come up with (or in some cases steal) are our cpus, our languages and our operating systems. So it should come as no surprise to discover they've even borrowed some of our people. Equipped with my new toy (an acoustic coupler) and the logic of electronic mail, I conducted an electronic interview with one such person.

My choice was fortunate. Steve Bellamy is not only fore-

ign, but British, from Sheffield, with creditable credentials.

Doctorate in computer science. Research posts for both IBM and ICL. Holder of 26 patents in the computer field. Lecturer at four major universities.

Since then, he's managed to get his finger into a lot of other interesting pies. Director Mugen Associates (Computer Consultants). Director International Apple Core. Lecturer in Computer Science. Consultant to the Foreign Correspondents Club of Japan. Technical consultant to Fujitsu Research Centre. Contributing editor Byte, Infoworld. Author of books on Japan and computing.

With this background, I thought he might be able to offer some insight into how Britain's hard and software companies might get a foothold in Japan.

'British efforts in Japan have never got beyond the token representation stage. British software is good, in many ways superior to that of both American and Japanese manufacturers but the marketing is all wrong. On the one hand we have the hi-tech approach, all light and power. Good heavens, this is the land of hi-tech,

nobody's going to notice another bell-and-whistle company. Then we have the so-called joint venture company which usually means British ideas packaged with Japanese wrapping. Wrong! Wrong! Wrong! We need some defined purpose to our efforts.

'One good way would be a hardware and software blend coupled with strategic pricing to take into account the Japanese penchant for high-ticket foreign goods.

'A well-supported item, plenty of documentation, quality finish and a good marketing ploy such as IBM did with their 5550 (for which Mugen Associates can take a little credit) would really establish the UK as a viable entity over here. Any takers?

I also suggested that with MSX Basic about to burst on the scene in Britain Steve might give us an idea of what to expect. His answer was hardly encouraging.

'Frankly MSX is a dud that just doesn't want to go away. It's not a programmer's environment at all, more a packaging of a few general concepts. Unix is where we are seeing some real advances — in about two years

it will just have blown away all this non-compatible, non-expandable nonsense we have now. Alan Kay was right when he said the IBM PC was beneath comment. I can't believe that it is going to be around for another five years. Candidly, neither can IBM. Programmers have got to move up and away from this one machine, one user concept.'

Japan stands on the threshold of a breakthrough in hardware that will really stand the Americans on their heads but it's a case of so near, yet so far.

'Artificial Intelligence is all I hear recently. The software is really weak, just souped up CP/M and Cobol. It's when the hardware guys deliver: that will be the time to stand back — w-a-y back. I like what Sony has done with its disk drives, more for less and the laser storage technology of Toshiba is awesome. Pretty soon we are going to wake up one morning and find all our much beloved equipment obsolete. That's RSN — Real Soon Now. Anyone want to buy my IBM AT?'

Now, if I can just figure out how to use this modem to avoid going to the office... **Serge Powell**

Nutcracker Suite on the programme

'A sledgehammer to crack a nut' is how Lutterworth Software describes the popular word processing systems. So it calls its own the Nutcracker Suite and charges just under £50 for it.

'I've been lumbered with Perfect Writer,' said Lutterworth's John Everett, 'and it's fine for producing a manual but you try writing a four-line address with it. It can become very frustrating. And Wordstar is fine, but it's very difficult to remember all the things you need to remember.'

His verdict is that these systems are 'over-powerful' for many jobs and that they need a simple side-kick to take on the menial jobs. In the old days this would have been a typewriter, and the Nutcracker Suite is

intended to give you old technology with on-screen editing.

The version due to be released on November 1 is for the IBM PC. Everett says the next target machine is the Sirius, and later on the Epson QX-10 and the Wren portable may be cracked.

The suite — three separate programs — is supposed to operate alongside other word processing software and is designed to integrate with them. Its own text files have no control codes and so can go straight into other systems, and it can read and unscramble Wordstar document files.

It can be learnt in five minutes, says Everett. This may not be as extravagant a claim as it sounds, since all the operator needs (apart from some typing ability) is an idea of how to use cursor control keys.

The system will be available through IBM dealers.

M21 COMPLETE — Olivetti's IBM-compatible luggable, the M21, is now starting to be delivered to UK dealers and a price has been fixed for it at last. When we Pro-Tested it (issue 81) the company was still hedging its bets but it announced last week that the starting price will be £1,550, and a configuration with 128K and twin 320-360K floppies will set you back £1,889. PCN's verdict? 'If you want a smaller than usual unit, and if considerations of software and hardware support loom fairly large, it's certainly a machine to consider.'

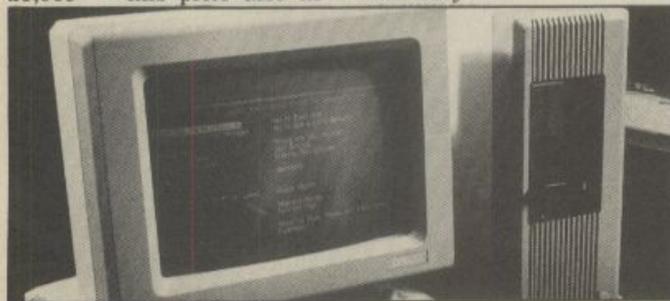

STC slashes Xtra prices and range

One of the more highly fancied IBM-compatibles has come down in price but there's a hint of the way the wind is blowing in a second move from STC Business Systems.

STC, which sells the ITT Xtra in the UK, has cut the 256K Xtra 130 by just over £700 to £3,063 — this price also in-

cludes a 10Mb hard disk. At the same time it has withdrawn the 128K model, called the Xtra 125.

The reason is that the kind of software you're likely to run on an IBM-compatible business machine usually needs more than 128K. 'Hard disk systems with only 128K of memory are rapidly becoming redundant,' said STC's Stewart Goldberg ominously.

Xtra for less — but less choice of Xtras from STC.

Do you have a 1st Class Honours Degree?

OASIS SOFTWARE are looking for an in house programmer to work with a team producing highly innovative dedicated languages. The successful applicant will have:

- A first class or upper second honours in computer science, electronics or mathematics.
- At least twelve months experience of Z80 Assembly Language programming.
- An ability to work long hours when required.
- A love of computers.

The rewards are challenging work with a young and enthusiastic team in a very pleasant seaside town close to Bristol. Salary negotiable.

Send CV and address of one academic and one non academic referee to:

Programmer,
Oasis Software,
Alexandra Parade,
Weston-super-Mare,
Avon,
BS23 1QT.

To celebrate the new-look PCN we decided to give our 'star' contributors a pay rise — the best letter of the week will now earn you £15. So send in your contributions to: Random Access, Personal Computer News, Evelyn House, 62 Oxford Street, London W1A 2HG.

Why Memotech came out on top

In issue 81, J Waller noted that the Memotech gets little magazine support. My

own experiences may help to emphasise the injustice of this 'Catch-22' situation.

I decided to spend £300-£400 on a computer. I spent months looking and reading round; eventually shortlisting four machines: Electron, BBC B, CPC 464 and MTX 512. After isolating the strengths and weaknesses of each in relation to my own needs, I wrote to Acorn, Amstrad and Memotech.

Acorn did not reply. Amstrad was helpful, but sent me promotional literature printed in French. Memotech was equally helpful, and also supplied a list of local dealers.

After further research, and a visit to MEP in Manchester, I reduced my shortlist to two machines: CPC464 and MTX512. I was then able to be much more specific about my requirements and queries.

Consequently I wrote once again to Amstrad and Memotech, and also to Kuma whose Logo package for the CPC464 looked interesting. I also asked Amstrad for an English version of its leaflets.

Neither Amstrad or Kuma replied. Memotech replied promptly (this time my queries were answered by its technical advisor) and put me in touch with a local user group.

Memotech is clearly committed to supporting its products with an effective before and after sales service. Dealerships — although rather too thin on the ground — appear to be well informed and expert.

PCN is right: it is a 'chicken and egg' situation. But don't ignore Memotech just because of weak support in magazines. It's largely up to you. Send in those listings.

Alan Sturgess,
Keighley, Yorks.

Dongling a solution to piracy...

The most popular topic of discussion in PCN — right from issue one has without doubt

been software piracy; in fact, I was one of the first people to correspond on the subject. However, although I condemn software piracy in all its manifestations, I have recently had much less sympathy with the software companies.

What is the only sure method to prevent both commercial and home software piracy, and yet allow the user to make back-up copies of his own software? The answer is, of course, the fabled 'dongle', which — for the uninitiated — is a small piece of hardware attached to your computer, without which software is unable to run.

'Aha' argue the software companies, 'dongles are much too expensive to produce — they would increase the price of software and thus reduce the amount sold.' But I thought Nick Alexander said in issue 80 that 'all forms of piracy cost the industry £100 million last year'.

If this were the case, surely this money could be saved by 'dongling' all software, (which would cost only a fraction of the 'lost' £100 million).

James Mortleman
South Woodford, London E18.

... but slapped wrists to us

After reading the article in PCN (issue 80), regarding software piracy, I was somewhat amazed to see a blatant advert in the classified columns for pirated software. The advert in question:

BBC B, radio cassette, b/w TV, 150 games (mostly copies), m/c book vgc £600... etc.

It does not take any intelligence to see that this person is openly offering pirated software for sale. I often see adverts for copied software in your magazine and I object to paying for a magazine that carries this sort of advertising. I am fed up with reading about loss of revenue due to piracy but to read about it and then to see an advert in the same magazine is a little too much.

Perhaps I am a little unusual in not having any copied software, but I believe that if I want a program badly enough I will pay for it. I object to paying inflated prices for my software due to piracy etc and feel that it should be stopped. Your magazine could help by not allowing

ANY adverts of this kind to appear in PCN.

Ian White,
Reigate, Surrey.

Dear Angry of Reigate, we try to stop that kind of thing appearing in *Billboard* but they do occasionally slip through. You're absolutely right, however... you are a little unusual — Ed.

Auction prices were not high — Crocker

We object to Mr Phillips' comments (issue 82) that the reserves at our recent auction, were '...ridiculously high'.

In the first place, the majority of lots were sold. Second, we know what prices the equipment should make. If there was no-one among the bidders who could find £800 for a brand new Macintosh sealed in the maker's box, with MacPaint and MacWrite, the fault is not with the reserve prices.

If a lot is entered as brand new, and it is still sealed, we do not open it. If we did, it would have to be classed as a demo/second-hand unit. This is why we issue a technician's report on most items that are not new. This goes further than any other caution that we know of to help the would-be buyer.

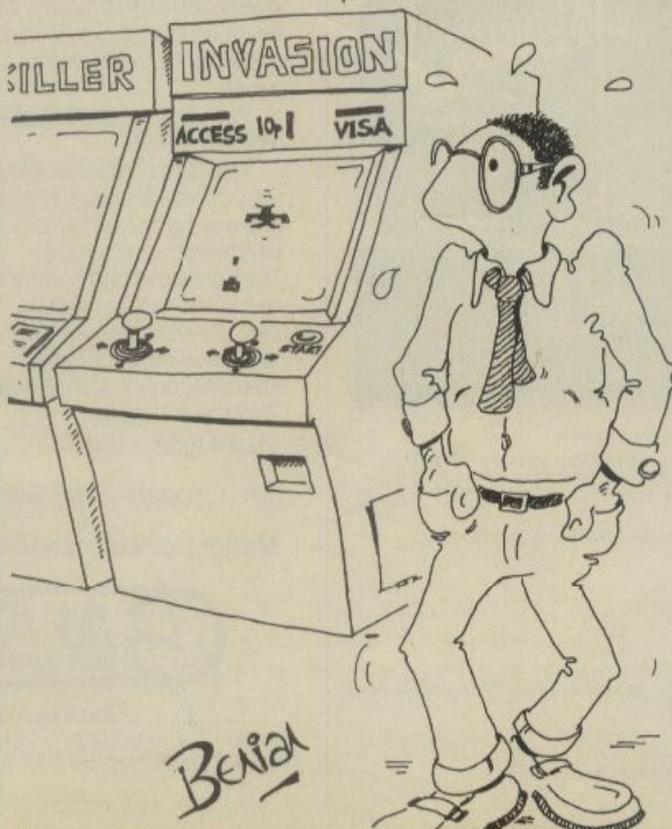

We are glad to note that Mr Phillips intends to come to our next sale, at the Bonnington Hotel on November 27 — (entries still being accepted).

R E Nicklin
Crocker Computer Auctions,
London W1.

Are you a forgotten Star winner?

Due to an administrative slip-up, we have cheques outstanding to the following winners of the Star Letter award. If the authors would send us their addresses, we'll be happy to send off the cheques immediately. The same applies to contributors to other sections of the magazine, particularly Microwaves.

Roy Tipping, of Blunham, Bedford; J Skidmore, of Trowell, Notts; R K Nicholls, of Sevenoaks, Kent; G K Mallinson, of Maesteg, Glamorgan; B Reid, of Newport-on-Tay, Fife; and M Jeanes, of Formby, Merseyside.

REGARDEZ

LANGUAGE LEARNING AIDS FOR
FRENCH, GERMAN & SPANISH

FOR BBC(32K) · ELECTRON
SPECTRUM (48K)

As used in numerous schools and colleges these programs provide a highly successful aid to modern language learning. Each cassette contains a sophisticated control program and a comprehensive series of vocabulary lessons which can be used in a variety of self-paced learning and test modes. Words, phrases etc are displayed with all necessary accents and special characters, different colours are used for masculine, feminine and neuter words to assist gender learning.

The programs are suitable for beginners, 0-level and beyond as simple commands enable new lessons in vocabulary or grammar to be created by the user, edited as required, then permanently saved for later use. Invaluable for homework and exam revision!

Two cassettes are available for each language, together these contain a vocabulary of thousands of words; Level A provides 16 lessons in general subjects; Level B provides a further 16 lessons including adjectives, adverbs and fully conjugated verb lists.

Available from your computer store or by mail order Price £9.95

Don't blame the equipment- it's most likely the mains!

In a perfect world, with a perfect power supply you'd have a right to expect perfect results from your computer, word processor, VDU or other electronically controlled equipment. Sadly, this is not always the case, due to mains borne interference. Even a dedicated line is only a partial solution because interference is generated by other equipment being used around you, typewriters, copiers, fluorescent lights and even the office fridge.

Galatrek do have an answer —

Apricot Sirius 1
Registered Products

the Ferro-Resonant Line Conditioner.

Simply plug it into the mains and your unit into the socket provided. Spikes, transients and other mains borne interference are now trapped in its circuits and voltage surges or dips are also catered for, as the output is highly stabilised. It also protects itself and the equipment against overload and gives system isolation. If you specify when ordering, it can be used as a step down or step up voltage supply.

You've nearly arrived at your perfect world — for as little as £145 + VAT.

The Galatrek Filter Plug, whilst only rated to carry 2 amperes of current, is designed to protect micros, minis and word processors from interference and surges.

The transverse and common mode attenuation circuits are very effective for these low powered units. Easily fitted, it simply replaces your existing 3 pin plug.

Price £19.95 + VAT.

Send for details or cash with order.

Master Distributor and Dealer applications invited.

Galatrek International Ltd.

Poor connection is at root of problem

QI have a slight problem with my 48K Spectrum. It's to do with the power supply — every time I move the connection at the back of the computer the whole thing crashes.

I would have taken the computer back to where I bought it from but the guarantee is void as I fixed a 'real keyboard' to it. I phoned Sinclair and it will cost £30 to repair that small item.

Could you tell me first where I can get insurance against my computer going wrong, and second, where I can get it fixed locally?

*J Mayo,
Great Yarmouth.*

A Getting someone else to repair it may not be necessary, as from the sound of it you've only got a very small problem. If it's only crashing when you move the jack plug then it's the connection that's wrong.

This could be one of two things. If you look inside the power input, you'll see a little spring which holds it in place, and if this has worn out you'll get a bit of wobble, cutting the power at inopportune moments. It might be worth your while soldering it in (making sure you don't short out the two terminals on the jack plug) and just using the wall switch to cut out the power.

Alternatively, the jack itself could be malfunctioning (if it still fits snugly this is probably your problem). This is cured by putting a new jack plug onto the end, and again you don't need a degree in electronics to fit it.

If you're wary of doing any of this, a local electrical shop might help you out if you explained the problem. We don't know of any repair services in your area, but you could try phoning the Hemel Computer Centre on Hemel Hempstead 212436, Trident Enterprises on Slough 48785, or Mancomp on 061-224 1888.

We reckon it's difficult to justify insurance for a micro as cheap as the Spectrum. The Micro Repair Club on 01-946 7777 will guarantee you repairs for £24.95 for the first year and £14.95 a year thereafter, and cover for more expensive machines can be arranged by Geoffrey Hoodless & Associates, Woking 61082.

Searching for the elusive Aquarius

QPlease could you tell me my nearest stockist of Aquarius Software, as I've been searching everywhere for a shop with no luck.

*Brett Emms,
Rainham, Essex.*

AYour chances of finding someone who regularly stocks anything from Aquarius, never mind software, are strictly limited. The machine's never been a big enough hit to appear in many shops, and even with the launch of the Aquarius 2 that's unlikely to change.

Fortunately, Radofin, the manufacturer of the machine, seems to be doing the decent thing. The company is handling support by organising an Aquarius User Group. If you want to make the most of your Aquarius your only option is to contact it on 01-205 0044.

Meanwhile, if there are any dealers out there who support the Aquarius on a regular basis PCN would be pleased to hear from them.

The business of winning the pools

QI am thinking of buying a Commodore 64 for business use, and I'd like it to assist me in doing football pools. Can you tell me what I would need to use for this?

*P Bush,
Lyndhurst, Hants.*

AThere are football pools programs available for most of the major micros, but as it's not really mass-market, you're unlikely to find a major manufacturer doing them. All you really need is a tape of the program, and you should find ads for these in the back pages of most micro magazines.

But a word of warning. The general idea is that the programs should come with an up-to-date database covering the form of the various teams in all the divisions. What you have to do, each week of the season, is sit down and hack in the results of all the matches.

This will take a long time, and unless you're prepared to do it every week (and bring it up to date, as we're well into the season already) it'll be worthless.

Dutch choices for home computer

QI'm very interested in buying a home computer. I want to do my correspondence and my home finances on it, and in the future I'd like to extend it with a modem. Considering that in Holland the software market isn't as huge as in the UK, I'm thinking of three machines: the Enterprise; the Sony Hit Bit HB75; and the Spectravideo 328 MkII.

I can't get any information about the first two in Holland, so could you tell me a little about them? Do you know if Enterprise is planning to join the MSX market, and is there a particular data recorder for the machine?

*R Vermond,
Holland.*

AThe Enterprise's launch has been put back until next spring. Apparently there are a couple of nearly finished prototypes doing the rounds, but in light of the number of changes that have been made to its specifications since the first announcement in autumn, 1983, PCN won't be reviewing it until we're sure it's the finished product.

We'll answer your other two queries when we see it.

As for the Sony, it's an MSX machine of a sort. And with any MSX we'd advise you to buy the cheapest machine you can find with a good keyboard and 64K RAM. Best bids so far are the Goldstar (reviewed in next week's issue) and the Spectravideo 728.

Now our question. What's a Spectravideo 328 MkII? If it's a 728 then that's OK, but if it's a 328 with the legendary MSX adaptor installed, please write.

Mail order house is out of stock

QIn January 1984 my wife bought a Biztec Pad electronic diary/computer via a mail-order catalogue. In the instructions a 'print out' machine is mentioned, and the mail order people put me in touch with the distributors, Domicrest.

I have written to them four times and phoned once, and they have not as yet replied to my enquiry about purchasing this printer.

Can you help me? Does the printer exist?

*Gary French,
Clacton-on-Sea, Essex*

AThe way the mail order trade works — excluding Sir Clive — means that it isn't usually a very good idea to try to buy a range of compatible items by mail order at different times.

In the main, the way these firms operate is to buy in a quantity of cheap and quite often little known products and sell them at a good price. They don't usually sell a set range of products for any length of time, so if you're trying to get add-ons for a specific product you'll all too often find yourself on a wild goose chase.

In the case of the Biztec you may be luckier than most. Domicrest tells us that it should be in stock by the beginning of next year, so if you sit tight, all should be well.

64 or Plus/4 which is the better machine?

QI was on the verge of buying a Commodore 64. Now after reading several reviews of the Plus/4, I find it suitable for my needs. However, I am worried by the fact that the Plus/4 has dropped the sprite and sound capabilities of the 64, making it a less likely choice for games software.

Will the popular games be converted to run on the Plus/4 and will the 64 die out as a direct consequence?

*Vincent Tuckwood,
Watford, Herts.*

AYou'll have Commodore eating its words, Mr Tuckwood. The company has always claimed that the machines are aimed at different markets. Sounds like it missed.

You're right about one thing, though. The Plus/4 isn't half the games machine the 64 is... or to put it another way, it isn't half the music machine.

Many of the best games around run on machines that don't offer sprites, so that isn't a big problem. However, it takes a while for any machine to attract a range of software and peripherals, so you won't see much for the Plus/4 this side of spring '85.

The only valid reason for preferring the Plus/4 over the 64 is if you think you can make real use of the former's integrated word processor and database, as opposed to buying similar or better independent programs for the 64.

Tips from readers to make programming easier or open up new avenues of possibility. A new look to PCN's pages means a new look to the payments too. Now £10 for every hint in print, and a hefty £50 for the *Microwave of the Month*. Send your hot tips to *Microwaves*, PCN, Evelyn House, 62 Oxford Street, London W1A 2HG.

Scrolling up an Amstrad window

A feature absent from Amstrad Basic is a SCROLL command. In Issue 77 one article featured a machine code routine producing upward or downward scrolls of the entire screen by a simple ROM call. Since the entire screen is scrolled any windows are ignored, and what one would often like to be able to do is to simply scroll an individual window.

A simple means of achieving an upward scroll is to locate the cursor at the bottom line of the window involved (remembering that within windows the Amstrad requires the cursor location to be the disposition from the top left corner of that window and not from the top left

of the screen) and then issue empty print instructions.

The required format is LOCATE #x,y,z:PRINT#x:PRINT#x where x is the window number and y and z are the necessary cursor locations. The number of print statements must be one greater than the number of SCROLL commands required.

Where you wish to scroll up several lines, a FOR/NEXT loop is more economical. Note that making the window which will most often be scrolled WINDOW#0 can also save memory since the window number can be omitted from the location and print commands will default to it.

This program is an illustration of the general technique. *K Denham, Wimborne, Dorset*

```

Amstrad's strength of character

The Amstrad's 100-character limit on function key expansions can be changed to a much greater value by allocating a new buffer using the firmware entry KM_EXP_BUFFER. The following program sets up a 1000-character buffer — the 1000 figure could be changed to any other value in the range 12 to 32,000 or more.

Since the patch to invoke KM_EXP_BUFFER is overwritten by the buffer itself you can only run this code once. The function keys are reset to their default state, but it is now possible to store up to 1000

characters on them, though you'll find each expansion token is limited to 255 characters — which should be enough for anyone.

Note that the program is meant for incorporation into an existing program and doesn't generally affect the behaviour of commercial programs loaded into your CPC 464 because the loading process resets the machine into an initial state which discards patches such as the ones given above. Also, since the program alters HIMEM, care must be taken to alter SYMBOL AFTER first if it is necessary.

Locomotive Software Ltd, Dorking, Surrey

```

```

Flash a message on Vic 20 screen

This routine will allow you to have two messages simultane-

ously scrolling across the top and bottom of your Vic 20 screen. The top message scrolls from right to left and the bottom from left to right.

The messages are contained in data statements at the end of the routine. Any messages that will not fit in one data statement can be contained in several and concatenated (as seen in the example) as long as the overall message does not exceed

211 characters.

The routine can be used to display instructions at the start of a game, or maybe adapted to flash up messages during a game.

David Waiker, Ellesmere Port, South Wirral

```

```

Vic 20 in scroll mode

The following routine prints a grid on the screen and then scrolls it down pixel by pixel in a downward direction.

This is achieved by swapping the bytes around in the user

defined character to create a constantly inverting character, thus giving the illusion of scrolling. Note this does not have to be used with a grid but can be altered to be used with any rectangular character.

Earth-shaking Atari display

A handy visual effect for use in games programs is a shaking screen to simulate an earthquake or large explosion. An obvious way of achieving this effect would be to use the Atari's scroll registers.

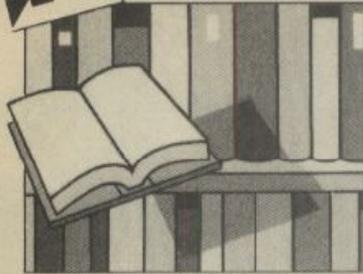

However, the following program demonstrates a much simpler method. The first byte of the Display List holds an '8 blank lines' instruction (decimal 112).

By poking different 'blank lines' instructions (eg 0,16,32,48,64,80,96) into this location, the screen's vertical position may be shifted by up to 7 scan lines.

Nick Pearce, St Leonards-on-Sea, Sussex

20 SOUND 0,34,0,14
50 NEXT I
30 FOR I=0 TO 40
60 POKE DL,112
70 SOUND 0,0,0,0
```

READOUT

'Getting the most from your BBC Micro' by Clive Williamson, published by Penguin at £5.95 (paperback, 208 pages).

A committed user with a journalist's training should be an ideal choice to write something that is intended to go with an official User Guide. With this book you might find it replacing the User Guide rather than sitting alongside it on your shelf.

Rightly deciding that there is no point covering BBC Basic with the thoroughness of Acorn's publication, Mr Williamson concentrates on the subjects that the BBC User Guide leaves alone.

The book makes a stuttering start; there is some lip service to The People's Friend, Sir Clive,

and a series of drawings to show you what you've bought and how it fits together. The first notes on programming aren't encouraging either — if anybody ever patented the flow-charts for making a cup of tea or starting a car they'd have made a fortune by now.

But at least it offers more on programming than merely listing and explaining the commands. The book also delves inside the machine to explain exactly what it is doing, laying the groundwork for later chapters on advanced techniques.

From this point, Mr Williamson assumes more computer expertise than you'll have picked up from the opening chapters — not that his writing is jargon-ridden or obscure, but the concepts introduced could easily deter anyone not fully committed to making the most of their BBC micro. **DG**

'Commodore 64 Data Files' by David Miller, published by Prentice/Hall at £8.95 (paperback, 428 pages).

You never thought anyone could come up with more than

400 pages of things to say about file-handling on the 64, did you? Well, neither did I. We were wrong — Mr Miller has done just that, and without a trace of padding anywhere.

Everything you ever wanted to know about files and data handling is here ... program files, sequential files, those tricky little random access files, even more tricky bits of sequential filing, even a chapter on DIF files (you didn't know about DIF files? Then this is the book for you).

Of course, not every right-thinking 64 owner is going to want this much detail on planning and creating a database, but those who do are not going to find a better guide. **PW**

'The Wordstar User's Reference Manual' by Valerie Hancorn, published by Duckworth at £12.50 (paperback, 204).

It is truly remarkable how a piece of software can continue to sell in large quantities long after the technology it was designed to work on has been superseded.

Wordstar was the among the

first, full-function word processing programs for microcomputers.

It has gone through its own transformations and is now available on a wide range of machines including 16-bit machines like the IBM PC.

This reference guide is aimed squarely at the IBM PC user with only passing reference to CP/M machines. Thus the screen illustrations feature the bottom status line, detailing the purpose of the IBM's function keys — a luxury not available to most owners of 8-bit CP/M micros.

It is difficult to assess the real value of the book. In places it is patronising and seems to be directed at the absolute beginner who knows nothing about micros and has to be told what a byte is.

As a reference manual, I have my doubts. There is little in the book that is not also in Micro-Pro's comprehensive Wordstar manual. And the layout and structure of the book is little better.

As a regular Wordstar user I would find little time for this book and would suggest that most users would be better off sticking with their Wordstar manuals. At least they come free with the program! **RB**

GREMLIN'S GARDEN

Tony Crowther's latest game is a challenging variation of an old favourite.

Here's something you can't afford not to type in — a game for the Commodore 64 by Tony Crowther, author of such best-sellers as *Monty Mole*, *Potty Pigeon* and *Suicide Express*.

Gremlin's Garden features some brilliant sprite animation and user defined graphics, and the action is machine code controlled for speed and smooth motion.

It's an update of an old favourite, *Snake* — in which you guide a caterpillar round a garden, collecting butterflies and avoiding mushrooms. To complicate matters, every time you pick up a butterfly, another mushroom grows and if that isn't tough enough, you have the option of adding an extra hazard in the form of a bird which sets after you in non-stop pursuit.

Average scores should be around 4,000 points — high scorers should look for 8-10,000 points.

How it works

0 Sets screen and border colours to blue, sets up four user defined graphics for the

mushrooms. Calls set-up routine at line 3050.

1-9 Switch to user defined graphics, set volume to maximum, select multicolour sprites and set sprite pointers.

10 Sets all sprite positions to 0, calls title screen.

11-16 Set initial positions.

18 Prints mushroom and updates score

20 Calls machine code routine for movement.

30 If nothing happens then loop.

35 If butterfly collected then update score, print another mushroom.

40-110 Print collision message, check for high score and update, restart game.

500-711 Data for redefined characters and sprites.

800-853 Data for machine code routines.

1000-1004 Define screen and colour strings and take a slice for random positions.

2110-2130 Get input for bird option and check joystick for start.

3000-4001 Set up sprites and machine code.

How to write for Personal Computer News

PCN WANTS YOU!

Whatever you want *PCN* will try to bring you . . . but we need your help. You tell us you want more programs, more features to help you get the most from your machine. Well, we've listened and we're offering more programs, projects and useful information than any other magazine. But if your machine isn't featured you've only yourselves to blame.

So we're making you an offer you can't refuse. Send us your programs and in return we'll send you upwards of £80 for each one published. We also welcome written contributions — tell us about the ways that you've conquered your machine; your best sound routines, those great graphics features, how you mastered disk and printer.

What we want

We're looking for programs and articles on any aspect of using personal computers — including games, graphics, utilities, and applications.

If you're sending a written contribution we require it in typed form (dot matrix printout is fine), with double spacing on one side of the paper only. Where possible include short, example

programs to illustrate the article.

If you've written a program we require a working version, on tape for any machine, or on disk if you prefer for Commodore 64, Atari, BBC or Apple. We'd also like notes on how the program

works, what it does, and any special features that you've included. A printed listing would be nice but isn't essential — on the other hand we can't consider listings without a working copy on tape or disk.

If you would prefer to make preliminary enquiries before submitting material, you should write — don't phone — to *Personal Computer News*, Evelyn House, 62 Oxford Street, London W1A 2HG. Questions about articles should be addressed to John Lettice, Features Editor; program queries should go to Nickie Robinson, Programs Editor.

If we decide not to use your contribution it will be returned to you if you enclose a stamped, self-addressed envelope but give us at least six weeks. You should receive payment four weeks after publication.

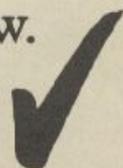

If you want to enclose photographs and screen shots, feel free to do so but make sure they are of good quality and make them colour transparencies or black and white prints. Do not send colour prints.

So, get cracking. Just think . . . two articles could pay for that printer, disk drive, or even a new machine.

If an advertisement is wrong we're here to put it right.

If you see an advertisement in the press, in print, on posters or in the cinema which you find unacceptable, write to us at the address below.

The Advertising Standards Authority.

ASA Ltd, Dept 3 Brook House, Torrington Place, London WC1E 7HN

ADDING MORE TO YOUR BASIC

In the final part of our series, Keith Hook gives the two remaining listings which will enable you to get more from your Amstrad Basic.

In the last two parts, Keith Hook showed you how to create your own Basic Extension and take the first steps to creating your own real-time game. Here he completes the process.

It is essential for a sprite to move

around the screen without destroying the background design, and as it is more or less impossible to PEEK the 464's screen, a routine must be devised to overcome this. With the help of the new Basic commands (PCN, issue 81) you

should be able to find many new ways of using your Amstrad. Here we show you just one possibility. Simply type in listing 2 and save it to tape. Then type in listing 3, save it, and then run the program.

Choosing a printer is a lot easier than choosing a computer.

THERE are dozens of quality printers from which to choose. With quality price tags of around £250.

The Brother M-1009, however, breaks all the rules.

Stays defiantly below the £200 barrier.

Though it has far more than its fair share of features, it maintains the extraordinarily low price of £199.95.

Travels at a steady fifty.

In the speed stakes, the M-1009 is certainly no slouch, being fully capable of up to 50 characters per second.

Providing bi-directional and logic seeking printing for normal characters and uni-directional printing for super and sub script and graphics.

Prints on any paper.

Being an impact printer, the M-1009 will print on virtually any paper, including letter headings, invoices and standard office stationery.

It will even print two copies together with your original.

A superb character recommendation.

In its price range, the M-1009 has a great deal more character than many printers.

96 no less, plus international type and graphic characters.

Reliability comes as standard.

Built to the same exacting standards as Brother's elite office

printers, the Brother M-1009 already has faultless credentials for reliability.

Its 9 x 9 dot matrix head, for example, has an astonishing 20 million character service life.

One printer that doesn't block out the light.

Many home computers tend to be a little on the large side.

In contrast, the compact M-1009, at only 7 cm high, keeps a discreet profile.

Well designed, reliable – and conscientious.

The Brother M-1009.

The future at your fingertips.

ADDING COLUMNS

A 64-column ZX Spectrum without an Interface 1? Follow this program by Stuart Nicholls to achieve this.

With this machine code routine you can use the Basic PRINT, LIST, LPRINT and LLIST commands in the normal way to produce 64 characters per line, which in the case of the PRINT and LIST commands allows all 24 screen lines to be used.

There are also several extra commands that are not normally available to Basic programmers. What is more, it works on a standard 48K Spectrum without the Interface 1 shadow ROM, does not use interrupts or PLOT the characters, but POKES each character onto the screen using an 8 byte form held in a new character generator as in the normal ROM PRINT routine.

The routine works, without the need to access it with a USR call, by diverting the ROM from its own PRINT routine to mine.

To enter the Machine code use your

favourite hexloader and enter the hex-dump as in LIST 1 which starts at address 65301 and is 2035 bytes long. Remember to CLEAR 65300 before entering the machine code, as failure to do so will result in the machine stack being overwritten, causing a crash. Once entered then SAVE the code using SAVE "Specwide" CODE 63501, 2035.

Instructions

To switch to 64 character printing enter the following lines as direct commands or at the start of your Basic program:

```
LET AA=PEEK 23631+256*PEEK 23632
POKE AA+5,244:POKE AA+6,251
To revert back to the Spectrum 32 character mode simply use the Enter key to obtain an automatic listing or enter CLS, both of which will switch to the normal print mode. If you wish to switch to normal printing use:
```

```
POKE AA+5,244:POKE AA+6,9
To switch the 64 character mode on again use:
```

```
POKE AA+5,244:POKE AA+6,251
The ZX Printer is switched to 64 column mode using:
```

```
POKE AA+15,244:POKE AA+16,251
and will stay on until switched off by using POKE AA+15,244:POKE AA+16,9
```

CHR. ie no '?' as in the normal Spectrum PRINT)

PRINT CHR\$ 8; = cursor left (with corrected backspace to top line error that occurs in the normal print mode). If at position, 0,0; this will scroll the whole screen down and print at 0,63;

PRINT CHR\$ 9; = cursor right. If at position 23,63; then the screen scrolls up and printing will continue at 23,0;

PRINT CHR\$ 10; = cursor down. If on line 23 the screen will scroll up.

PRINT CHR\$ 11; = cursor up. If on line 0 the screen will scroll down.

PRINT CHR\$ 12; = delete character behind the present print position and it will scroll down if at 0,0;

PRINT CHR\$ 13; = new line.

PRINT CHR\$ 14 and 15 = no print

PRINT CHR\$ 16 to 21 as the Spectrum codes ie INK to OVER. But note that INVERSE has no effect.

PRINT AT (CHR\$22) line, col; allows line, col values of 0 to 255, but line values greater than 23 and column values greater than 63 will wrap around the screen ie PRINT AT 25,70; = PRINT AT 1,6;

PRINT TAB (CHR\$23); allows values of 0 to 255 but see above for 63.

PRINT CHR\$ 24 to 31 : new graphics characters (not available from the keyboard).

All Spectrum characters will PRINT including graphics, UDGs and keywords. Also embedded print control

codes are acceptable.

INPUT will use the normal edit lines and print 32 characters per line.

ERROR messages will print on line 22 in 32 character mode. Programs can be edited normally.

Lprint commands

COPY: this will work in the normal way, copying the first 22 lines. However a new routine is included to copy all 24 lines or a block of screen lines:

LPRINT CHR\$ 1;CHR\$ line start; CHR\$ line end;

Line start and end must be in the range 0 to 23. For example, to copy lines 3 to 10 inclusive use LPRINT CHR\$ 1;CHR\$ 3;CHR\$ 10; note the semicolons must be used.

PRINT CHR\$ 3; = clear printer buffer without printing and set the LPRINT tab to 0.

PRINT CHR\$ 6 OR LPRINT, as the PRINT, command.

PRINT CHR\$ 8; as PRINT CHR\$ 8; if at tab 0 this will be ignored.

PRINT CHR\$ 9; as PRINT CHR\$ 9; If at tab 63 this will cause a printout of the buffer and the new tab will be 0.

PRINT CHR\$ 12; as PRINT CHR\$ 12; (but see LPRINT CHR\$ 8;)

PRINT CHR\$ 13; = LPRINT contents of the buffer then empty the buffer and set tab to 0.

PRINT CHR\$ 14 TO 20 = NO LPRINT

PRINT CHR\$ 21; = LPRINT OVER (either 0 or

1 as the PRINT command)

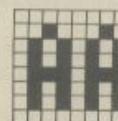

PRINT AT/TAB (both have the same effect) see PRINT AT/TAB for range and wrap-around effect.

All characters will LPRINT including graphics, UDGs, keywords and the new CHRS 24 to 31.

LLIST will produce a printout at 64 characters per line of a Basic program on the ZX printer.

You may wish to redefine characters. The new character generator starts at address 63501 with CODE 24 and continues to CODE 164.

The start address of a particular character form can be found using ((CODE-24)*8) + 63501. Each character is made up of 8 bytes and comprises a left and right character, for examples 'A' appears as:

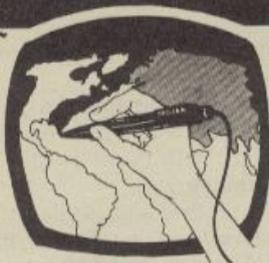

and starts at address ((65-24)*8) + 63501 + 63829.

Figure 1 is a screen dump showing all the characters from code 24 to code 255.

Listing 2, for the Assembly language programmers among you, is my assembly listing. Note that the code is from FBF4 to FF40 the character generator and UDGs occupying the rest of the code. ▀

LIGHT TO THE POINT

SPECTRUM 48K/COMMODORE 64

£17.25
DRAGON/TANDY
£11.50

inclusive
NO INTERFACE REQUIRED

Discover the exciting world of creating your own graphics on screen.

The Trojan Light Pen will draw boxes, circles, lines, freehand pictures, save and load pictures with full erase facility.

All in Hi-Res screen in any of 4 colours for the Dragon/Tandy, 8 colours for the Spectrum, and 16 colours for the Commodore 64.

For educational or leisure use.

!NEW VERSION!

Would you like to transfer your Spectrum programs from

- ① MICRODRIVE TO MICRODRIVE ③ TAPE TO TAPE
② TAPE TO MICRODRIVE ④ MICRODRIVE TO TAPE

Then do it with

TRANS-EXPRESS

TRANS-EXPRESS is the most comprehensive package of four m/c utilities for transferring Spectrum programs. They are user-friendly, simple to use, reliable & very efficient. They will enable you to transfer any kind of programs up to the full 48.0k length. TAPE TO MICRODRIVE will also automatically, if necessary, modify, re-structure & relocate both BASIC and m/c to RUN from microdrives.

TRANS-EXPRESS is an essential microdrive companion and an invaluable software back-up utility.

You can buy each of the four programs separately for £ 5.50 or TAPE TO MICRODRIVE & MICRODRIVE TO MICRODRIVE for £ 7.50 or an entire package of all four programs on one tape for £ 9.95 or on a microdrive cartridge for £ 14.95 only.

M'DRIVE TO M'DRIVE

Please send me a copy of TRANS-EXPRESS ①②③④ Please tick where applicable

I enclose cheque/P.O. for £17.25 (European orders please add £1.00 overseas £2)

Name/Address M. Nollema, P. Hendrickx, v. d. Oude

DIRECTORY ENQUIRIES

Disks without tears: access the Commodore 64 directory easily with Peter Worlock's programs.

The Commodore 1541 disk drive is a vast improvement on using cassettes for storage, but it's not without problems. Despite having its own built-in DOS the operating system lacks a few of the niceties that users of other disk systems enjoy. Not least of these is a DIR or CAT command to read the directory.

You can load the directory into memory but the 64 treats it as any program file with the disconcerting side-effect of obliterating whatever program you had in memory at the time. To get round this Commodore now supplies a DOS utility disk free with every drive and this features a DIR emulator. However, this solves only part of the problem; you can't incorporate the routine into your own programs, nor can you store the directory for manipulation later.

These two utilities solve both problems. Program 1 can be incorporated into your own programs. It reads the directory and prints it to the screen. Program 2 is a utility program in its own right, and uses a modified version of the routine to read and store a disk directory in an array. The directory is then available for manipulation in two ways: you can scratch a file, or load and auto-run another program.

How it works

Directory Enquiries is made up of a number of routines, with the directory-read at its heart. This starts at 1115 with a call to the disk command channel to initialise the drive. Though the repeated GET# commands look like sloppy programming, it's the simplest way to get past data on the disk that you don't want.

Lines 1145 to 1195 do the work of reading in the directory data character by character. They actually compile three separate sets of information, stored in the two arrays set up in line 1000. FL() is the file length, while FL\$() holds the file name in FL\$(x,0) and the file type — program, sequential, relative etc — in FL\$(x,1).

ST is the system 'status' variable, used to check for end-of-file markers on the disk.

With the directory read into the arrays, the program lists them to the screen. If there are more entries than will fit on one screen, you can pause the listing by hitting the space bar.

The Repeat command begins the directory listing from the beginning.

Scratch wipes out a file from the disk, while Load lets you read in a new program which auto-runs.

The auto-run uses the dynamic keyboard feature of Commodore computers. Lines 1220 to 1230 print the LOAD

Program 1: £ =

READY.

"I'M A TOSHIBA HX10
 I'VE GOT ALL THE
 BEST BITS FROM EVERY
 OTHER HOME COMPUTER.
 AND MORE. I HAVE A
 64K MEMORY, LIKE THE
 COMMODORE 64. A
 CASSETTE INTERFACE,
 LIKE THE BBC. TWO
 JOYSTICK PORTS, LIKE
 THE COMMODORE 64.
 A BUILT IN POWER
 SUPPLY, LIKE THE
 ORIC ATMOS. 16
 USABLE COLOURS, LIKE
 THE ACORN ELECTRON
 73 FULL STROKE KEYS,
 LIKE THE BBC. A
 CARTRIDGE SLOT LIKE
 THE COMMODORE 64.
 A PRINTER INTERFACE,
 LIKE THE ORIC ATMOS.
 SOUND OUTPUT THROUGH
 THE TV, LIKE THE
 SINCLAIR SPECTRUM.
 AN AUDIO/VIDEO
 OUTPUT CONNECTION,
 LIKE THE COMMODORE 64.
 RF BUILT IN LIKE
 THE BBC. AND:
 A SEPARATE 16K VIDEO
 MEMORY UNLIKE MOST
 NON-MSX COMPUTERS.
 32 SPRITES, MORE THAN
 ANY OTHER NON-MSX
 COMPUTER. AND I USE
 MICROSOFT EXTENDED
 BASIC, LIKE EVERY
 OTHER MSX COMPUTER."

"WOW. WITH A
 SPECIFICATION LIST
 LIKE THAT.
 NO WONDER YOU'VE
 GOT A 64K MEMORY."

You'd expect one of the best-selling home computers in Japan to have a specification list as big as its memory.

But the Toshiba HX10 doesn't just limit itself to that.

It was developed along with other Japanese home computers to operate

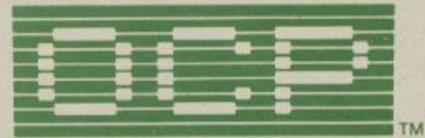

on one language: MSX. You can swap programs, games, cassettes, even peripherals like disk drives, printers, and joysticks: they're all compatible with every other MSX computer.

All of which makes MSX the system of the future.

So if you want a computer that won't be obsolete in a few years, buy an MSX. If you want one of the best-selling MSX computers in Japan, buy a Toshiba HX10.

TOSHIBA **MSX**

```

On a routine mission in the countryside you are suddenly confronted with an electrified maze which stands between you and your objective.

Tempted to turn and flee, you find that your tank has been damaged and the reverse gear is not operating so you have no choice but to take a chance on this tortuous route.

You must drive extremely carefully as touching the electrified walls with the front of your tank will destroy the tank and you with it. The maze is rather

complex and you will find that some clever manoeuvring is necessary.

As if this isn't problem enough you are also being fired at from an enemy above. The bombs dropped are creating giant craters in the maze and if you don't avoid these you will crash into them and will be unable to recover your tank. The bombs do also make an occasional direct hit but there is little you can do to avoid this so all you can do is hope for the best as you dodge between the electrified walls and the craters.

This game for the Oric 1 written by Paul Emms from Tonbridge in Kent has some rather nice finishing touches. All the prompts and scores are printed out letter by letter with a sound like a machine gun and there is a terrifying wailing noise when your tank is hit.

The tank is moved using the cursor keys and your objective is to reach the right-hand side of the screen without losing one of your three lives. There are four skill levels. The hardest is a more complex maze with more bombs. ▀

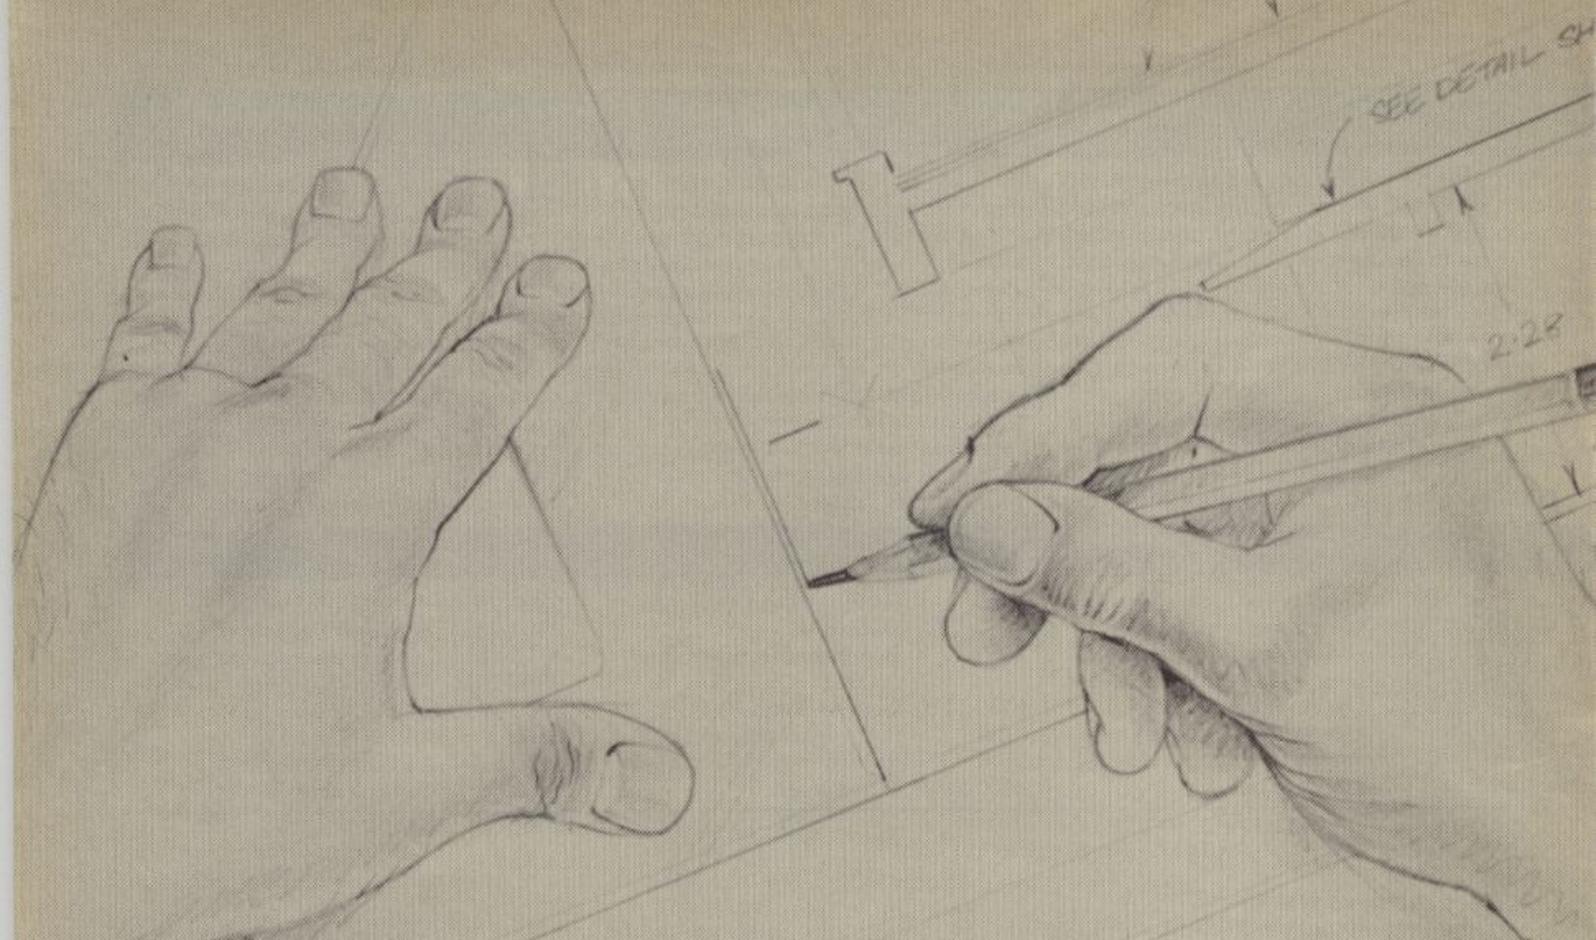

540-550	Display your score	1000	Random bomb or bombs near tank	2300-2365	Play opening tune
570-680	If high score, enter name and record new high score	1005	Bombs to destroy tank or maze	2380-2400	Ask for instructions
700-730	Display hi-score and holder	1020-1110	Display bomb	2410-2610	Display instructions
740-770	Option of a new game	1120	Record last position of tank	2900-2940	Ask for skill level
900	Subroutine to display double height characters one at a time	1130	Return from subroutine	3000-3010	Display 'bonus 200'
		2000-2100	Title screen	3020	Add to skill level
				3050	Add bonus to score
				3060	Go back to main loop

On IBM, Sirius, Apricot, Compaq, Zenith, Olivetti M24, AM-Stearn and Columbia, WORD PROCESSING, SPREADSHEETS, DATABASES have already become indispensable tools of the trade for many people. Now another dimension can be added to productivity and creativity on this equipment.

Doodle dms combines text and design capabilities to improve the presentation of every document that you create. It will enhance the way you work and become.....

The tool for your trade

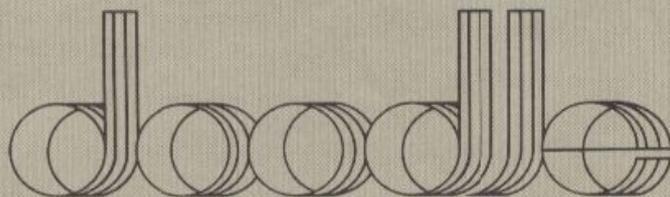

If you are.....

An Architect
An Engineer
An Interior designer
An Exterior designer!
In Administration
In Advertising
In Education
In Management

Doodle does.....

Plans, elevations
Drawings, illustrated manuals
Kitchen and bathroom planning
Garden and landscape design
Forms design, office planning
Layouts, presentations
Visual aids
Illustrated reports, organisation charts

Doodle is the tool for all trades

The Electronic Pencil

HAPPY MEMORIES

This Memory Monitor by Stephen Pate allows BBC and Electron users to view the 64K RAM and ROM.

Those of you who've used the earlier Commodore machines will be familiar with the machine language monitor (TIM), and will have mourned its loss on today's machines (even the Commodore 64). The Memory Monitor presented here allows BBC and Electron users to view their machines, 64K RAM and ROM.

The display is similar to TIM's, but the method used to alter the contents of memory is somewhat different. Once you've typed the program in and saved it, type O, which will display the monitor options as follows:

M displays the contents memory. Type in the start address either in decimal or in hex (preceded by & and four digits long). Input must be in the range 0-65536 (&FFFF). After each screenful press the space bar to continue scrolling, or one of the other option keys. If you press M at this point you will be asked for another address.

The I option allows you to insert hex digits into memory. First type the address (four digits and in hex) followed by a space, then type in the data as follows:

&81DF 1F-2013-10

All digits are in hex. In the example I've typed, the address 81DF followed by a space, then followed by the relevant data.

Pressing return places 1F in location 81DF, location 81E0 is left unchanged, 20 is placed in 81E1, and so on.

You can insert around 170 bytes at any one time.

X exits from the program and returns to Basic.

To save and load blocks of memory you should exit from the program and use *SAVE and *LOAD commands. To re-run simply type RUN.

Example screen dump

MERRIE ENGLAND

Mike Gerrard takes a time trip back to 13th century England and becomes emmeshed in the world of Robyn Hode, Maid Marion and the evil Sheriff of Nottingham. Now read on . . .

Adventures are becoming as well-researched as thrillers these days. After visiting the Holy Land in *Jericho Road*, you can now take a time trip to the 13th century of *Robyn Hode*, complete with 13th century spellings, but done courtesy of the very 20th century *Quill* adventure generating program, and the people at Runesoft deserve to be called scurvey knaves for not acknowledging the fact anywhere in the program or accompanying leaflet.

Ye storye so farre is that the Sherryffe of Notyngingham has imprisoned Maid Marion in Notyngingham Castle and charged her with treason for aiding an enemy of King John . . . that's you, Robyn Hode himself, and very fetching you look in your suit of Lincoln green, which is all that you have when you start this adventure. If you find the authentic spellings a little off-putting, don't panic (to borrow a well-known 13th century expression) as they don't appear very much in the program itself, apart from the proper names. The spellings and geographical facts have been thoroughly researched, with thanks being given to everyone from the Robin Hood Society to the Doomsday Book.

The adventure is text-only, though rumour has it that a graphics version of *Quill* is on the way. The historical accuracy of the descriptions adds to the game, and there is at least some attempt to give atmosphere to the text. But don't expect a screen full of purple, or even Lincoln green prose, as there are about 200 locations in each part of this adventure: reach the end of the first part successfully and you will be given a code to enable you to commence part two, which is on the other side of the cassette. This allows you to enter the castle, through Nottingham's famous caves, find Maid Marion and escape.

Marion's arrest

First things first. You begin outside the inn where news of Marion's arrest has just been brought to you by Much, the Miller's son: 'To the Southeast, the North road runs almost straight to Newerc. Bernesdale forest stretches to the South, towards Scherwode and Notyngingham.' It won't be long before you meet a rich nobleman, and you don't need a degree in Medieval History to know what Robin Hood would do to him . . . or what he would do with the proceeds.

The tasks do get a little harder, which is just as well, but the hundreds of locations aren't exactly littered with

objects. It's difficult to strike a good balance in an adventure between having the player trip over axes, dwarfs and dragons every time they make a move, and travelling endlessly without ever finding anything. *Robyn Hode* is towards the travelling endlessly side of the scale. You spend a lot of time wandering round forests, and the traditional maze isn't exactly difficult.

Nevertheless there are some perplexing problems. In several locations you are attacked by the Sherryffe's soldiers, sometimes being mortally wounded (when Lytell John arrives to carry you to Kirkless Priory, where you fire your last arrow to mark your burial place), and sometimes thrown into a damp, dark, smelly dungeon. You can sleep here in the comfortable straw, and the guard brings you a hearty breakfast regularly, but I haven't yet found a way of overcoming the guard and obtaining a key which will open the locked cell door.

There are also plenty of natural hazards, with holes, wells and cliffs to fall down if you're not careful, and apart from being pounced on by the soldiers (you soon learn where this happens, as it isn't done randomly), I like the way you're usually given sufficient warning of any situation where your life may be at risk. It's not the kind of game where inexplicable holes appear in the middle of the street or rocks fall out of the sky.

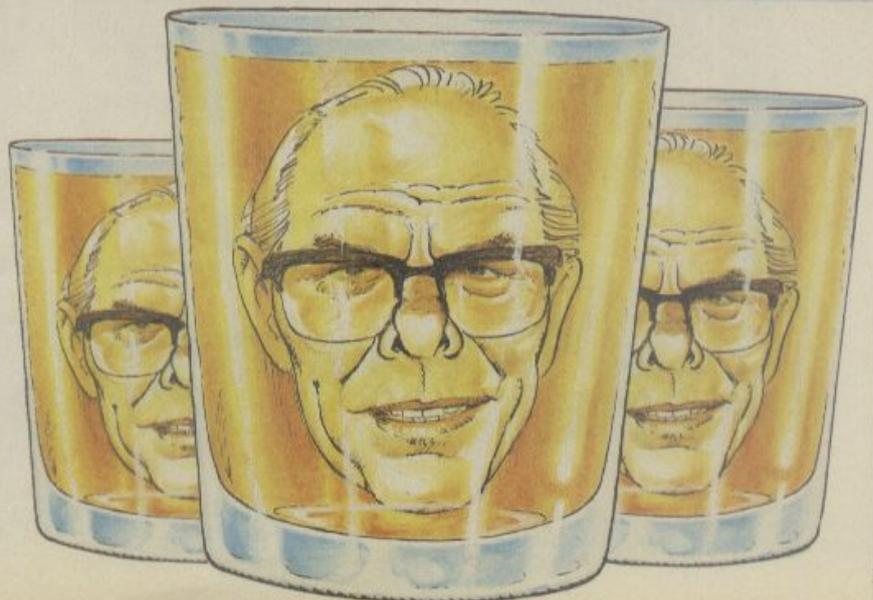

Robyn Hode's an enjoyable adventure, but hardly one you need to rush out and buy this very instant, particularly as it is rather highly priced at £9.95: although there are, in effect, two adventures, both written using *Quill* and only occupying one cassette. Spectrum software pricing

is very competitive, and it has to be an adventure that's something special to justify charging almost twice the price.

Making progress

Runesoft is one of the smaller software houses, and I'd also like to quickly mention its adventure *Paradox*, which came out a few months ago. There's definitely a vivid imagination at work here. You don't even know what your quest is, apart from progress and survival. Progress is through four different but connected divisions of the realm of Dream, the first being *The Tunnel*. As you leave your comfortable cottage behind you and enter into the network of tunnels, you become thirsty. It transpires that you have just 17 moves in which to find a drink (shades of *Dennis Through the Drinking Glass*, though in this case water will be quite sufficient). You find a pool of water, but if you drink from it direct you are poisoned. Just beyond is a flask, but as you take this way back to the pool is cut off.

Paradox is also *Quill*-generated, but shows how different you can make adventures using this system if you try. After *The Tunnel* comes *The Gameboard*, made up of 56 squares which you have to cross to reach the Palace, each square having its own vivid description and many of them containing riddles that you have to solve in order to move on. Not that you've much idea which way you're moving, or which way you ought to be moving. Several hours of play later I'm still stuck there, and intrigued. Worth watching out for in the shops, or from Runesoft at 67 Lower Parliament Street, Nottingham NG1 3BB.

PLUS 4 ON THE SPOT

Commodore is set to aim its Plus/4 at first-time buyers for serious home and introductory business use. Barry Miles reports on the moves behind this release.

Offering fundamentally the same operating system as the Commodore 16 (recently reviewed in *PCN*), the Plus/4 is aimed at the first-time buyer, for serious home use and introductory business use. Priced at £299.95, it competes on price with the Commodore 64 (£199 in most places), MSX machines at around £200 and the Sinclair QL at £400.

The Commodore 16, which has the same operating system, but one quarter of the memory, is bundled with a cassette unit (retail £44), Introduction to Basic Part I (£13.95) and four games.

For serious use, you need at least the cassette unit, making the Plus/4 look rather expensive at £350. Clearly Commodore is following its usual pattern of high prices to begin with, and progressive reductions over time.

This is a marketing method proven by its profits and the world-wide sales, currently said to be two million Vics, already; a similar number of 64s is expected to be sold by the end of 1984.

A design approach, similarly tried and tested by Commodore, is to say in effect: 'We are the volume producers, so our design is the standard.' Accordingly we have non-standard cassette connections, and cassette units, non-standard joystick connections, and serial disk connection.

A whole range of peripherals, including a fast disk drive and a new monitor is planned for the machine, all in the same tasteful shade of charcoal grey, and rather attractive too, according to the photographs.

So will it sell, at the price quoted? I think so. The sales of the Vic are against

the natural law of the market. It is astounding that a machine with under 4K of memory has continued to sell, against a market background of 16-bit, and perhaps 32-bit machines, with memories of 128K and 256K becoming commonplace. But is it so strange really? Now salesmen are told, 'sell benefits, not features'.

Persistent but unconfirmed rumours allege that a 128K version of the 64, capable of full 64 emulation, and with 128K addressable from Basic, with switching between 40 and 80 columns is on the way but Commodore maintains a dignified silence. If this machine really is planned then it will hit the Plus/4 market hard.

Features

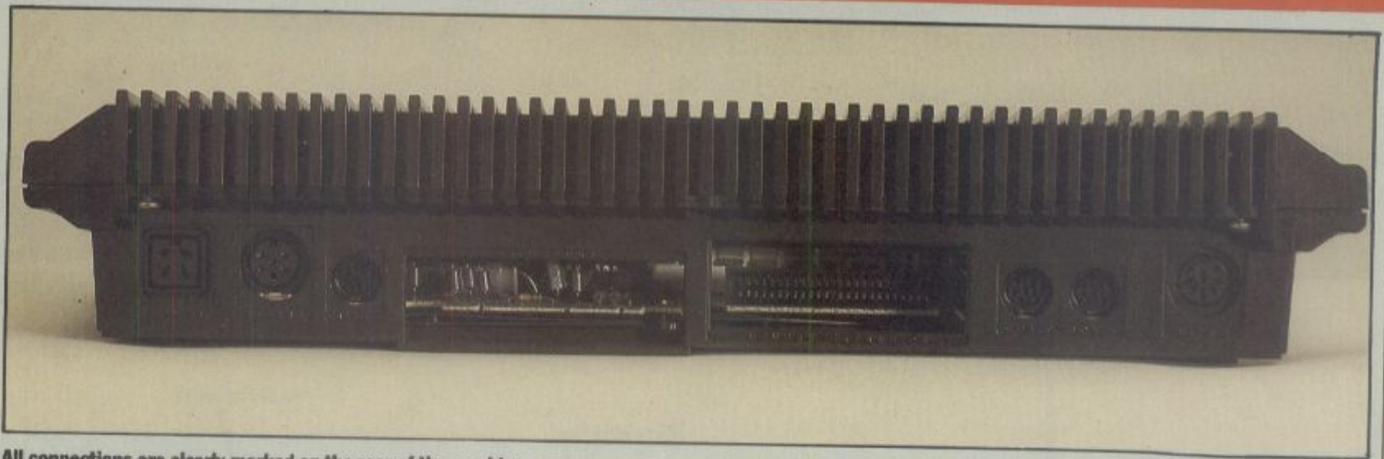

So what is the 'unique selling point' of the Plus/4? It is the integral software which gives the machine its character. A word processor, spreadsheet, filing system, and graphics package are available on power-up. Known as 3 Plus 1 (four packages), this selection offers windows, and genuine integration and a form of multi-tasking.

You can transfer figures from your spreadsheet directly to your word processor, in RAM, immediately, with the window (split screen) showing both documents at once!

The Plus/4's appearance is definitely in its favour. It resembles the lap portables in size and shape, and the keyboard slopes pleasantly down to a low profile nose. The function keys have a positive 'click-feel', which tells you very effectively when the keys have registered. The Help key, which takes

The keyboard is similar to that on the SX64 and the cursor keys are conveniently placed.

All connections are clearly marked on the rear of the machine.

the place of F8, is a great added convenience.

The keyboard is noisier than on the 64, but more gently sprung. It is very pleasant to use, and lacks only the shift-lock warning light to be as attractive as the portable 64's. The cursor control keys, four of them, are attractive and large. It is a little frustrating to have no numeric keypad, especially since the 364 alternative model, with such a pad, is to be marketed elsewhere.

The power connection has at last been removed to the back of the machine out of harm's way. Typically with Commodore, the plug is a new design. Also the cartridge or memory expansion slot is slightly narrower.

The joystick ports are different again. The Atari-type D-connector has given way to a new Commodore design. However, Commodore's own joystick will be analog.

The connection of disk drive to the computer is through the hated slow serial port. The effect is as before — user frustration. We can only hope that the 'fast-disk drive' turns out to be really fast. Connection to a television or monitor is provided for.

The new reset button is on the side of the machine and reasonably out of the way of accidental resetting.

Commodore's new Basic 3.5 has taken account of all the criticisms previously aimed at Commodore machines.

Structured programming is available, and proper control of sound and graphics is provided by new, and self-explanatory keywords. A good machine code monitor is provided, including the display of the ASCII equivalents.

The trade-off for all these extras is that sound has been cut to two voices compared with three on the 64, while the main reason for the 'serious home user' tag would appear to be the absence of sprites. Presumably writing games is not 'serious'.

Software

On the Plus/4 hitting F1 followed by the return key gets you immediately operational, in the word processor.

Commodore has paid attention to the statistical law about 80 per cent of the

value being in 20 per cent of the items. This implies that most people use only a fraction of the facilities to be found in these common packages.

Thus the field was wide open for packages which, while not providing all the bells and whistles of the fully-fledged software, would nevertheless offer most of what most people needed. Approaching all four packages in this way enabled them to fit into the 32K ROM.

Word processor

The word processor has a good range of commands. It works with the 40-column screen acting as a window onto a document which is a maximum of 77 characters wide. The major limitation is that the maximum length of a document is 99 lines — 22 lines appear on the screen at any one time. Unfortunately, you cannot quickly change to 40 characters width for rapid editing of the document, as you can in Vizawrite on the Commodore 64, for example. You can of course change the document width to suit you, and reset it for printing.

Word wrapping does not take place on the screen, although it does when you print the document.

For the first time Commodore has recognised that people may use non-Commodore printers with a Commodore computer. Accordingly you can send reverse field control codes from within your text, so as to take advantage of your printers' more esoteric capabilities, like elite, or italic compressed or double-width characters.

Also a special command, 'other', reverses the character set to standard ASCII, which should solve many interfacing problems. Some of the facilities in the word processor are very impressive.

Mail-merge can take place, and there's text movement and copying. Most of the instructions will be pretty easy to remember. All of these instructions are inserted into text in reverse video (obtained by hitting Control 9), following by the appropriate mnemonic code and Control 0.

Pressing Return takes you to a new paragraph. It also deletes the remainder of the line beyond the cursor. This is bad

news for experienced users of Commodore's screen-editor in Basic, who are accustomed to using Return anywhere in a line, to enter it as a Basic line. They will, on occasion accidentally delete lines which they wish to retain. However, help is at hand! There is what in trans-Atlantic parlance would no doubt be called an 'Oops' buffer.

Putting the cursor at the point where the accidental deletion occurred, and hitting the Commodore logo key followed by @, will restore the missing line!

Block insertion, deletion and movement are available. Blocks of text can be up to 16 lines long. This is not a major constraint, bearing in mind that the maximum document length is 99 lines. For insertion, you set a pointer at the end of the text already typed in, using the SP (Set Pointers) command. Then you move the cursor above this point and type in your block of text for insertion. You now have the end of the block indicated, but not the beginning.

To define this, you position the cursor at the start of the block and use the Create Block command. You then move the cursor to the place where the block is to be inserted, and use the Insert Block command followed by Return. The insertion occurs above the current cursor line, but not at the current cursor position in the line.

Although easier to do than to describe, this is pretty clumsy compared with the Insert mode of operation common to other word processors, which open-up the text, and creates space for inserted text automatically and apparently effort-

Cursor style: new to Commodore.

HARDWARE PRO-TEST: PLUS 4

◀ 37

lessly! Deleting the block which has been identified is accomplished by the DB command.

For moving a block, having identified — by Setting a Pointer, and Creating a Block, you use Insert Block (IB) to make your move.

The small maximum document length — 99 lines — means that linking files will be essential for work of any magnitude. The Linkfile command is

place, using a special file, 'tw' — temporary workspace.

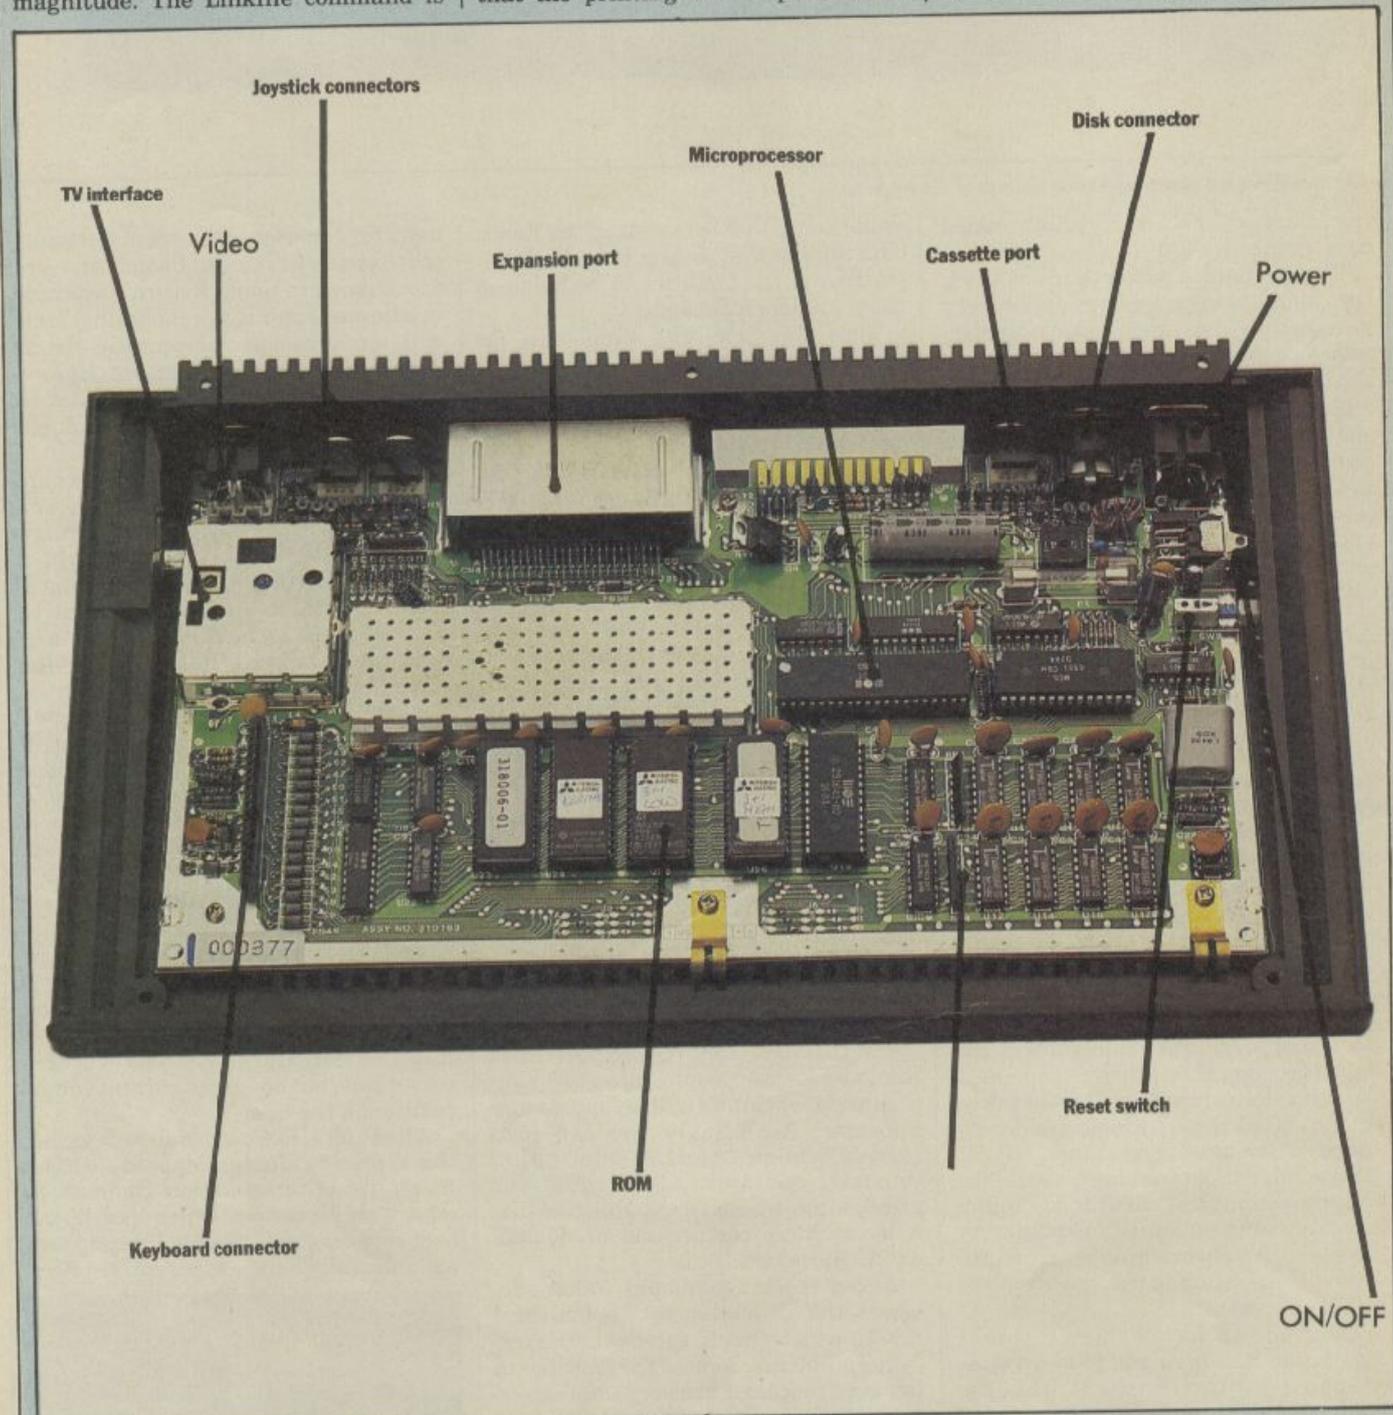

As soon as this has been done you can load any file you wish, and start work on it. You can set up a continuous printing operation, using a whole disk-full of linked files. A pause instruction at the end of the last file enables you to switch disks and carry on!

You may also be given an instruction that the printing should pause after

will send out the appropriate control codes to your particular printer.

Spreadsheet

On the spreadsheet, the cell locations are described by two numbers rather than by the almost universal combination of letters and numbers for rows and columns. This is a pity, because it leaves the way open for you to forget which comes first — row or column, — when

put at the end of any document, to enable the next part to be loaded in, and so on.

The Merge command is a disappointment. Simple enough to use, it appends the incoming text at the foot of the document. Of course you can then move it about, but that is a rather clumsy way of doing things. If you give the command PR, your document will be saved to disk automatically, before printing takes

printing of each page.

Free Cursor movement is a feature of this package. F1 Function key takes you to the left margin, F2 to column 41, Home to the top line of text, and Shifted "=" acts as a TAB key. There are no commands for boldening, double strike, underline, or similar special printer activities. For these you will have to use the ASCII function, which

you are giving cell references. When you are copying formulae into cells, this is particularly dangerous. You cannot point to cells by means of cursor movements, when making up formulae, but on the other hand, you can use labels for data instead of cell-references, which is a very good feature.

Function keys F1 and F2 are used to move from cell to cell, leftwards, and

rightwards and you can edit any cell-contents, using the left and right arrow keys.

The command to get to the top lefthand corner of your sheet is achieved in a roundabout way. You hold down the CBM logo key, and press 'C' followed by typing 'home'. I would have been much happier with the use of a Function key for this very frequent activity. Similarly the GOTO command must be typed out in full too.

The spreadsheet is comparatively small—50 rows by 17 columns. You can move about the sheet by using the cursor up and down keys. The spreadsheet is not intelligent in deciding whether you are typing in numbers, text or formulae; you must tell it.

For copying the contents of a cell, hold down the CBM key, hit c, then type 'copy', followed by the cell whose contents you want to copy, into the cell where the cursor is. The repeat command, done by holding down the CBM/ key and hitting Q, will enable you to copy the same data into a number of cells, such as with underlines.

Replicating formulae relatively is given the unusual name "fit". To copy a formula into a number of cells, you must use the repeat command, CBM Q).

Commodore offers windowing for the various elements in this set of packages. However, the window turns out to be a horizontally-split screen, with the ability to pass data from the spreadsheet or graphics package to the wordprocessor. You use the block map command to pass data from spreadsheet to wordprocessor, setting a rectangle to be transferred. The amount transferred is 11 characters per cell. Up to 36 characters per cell can be transferred by using the Map command. This will also enable you to transfer the formulae themselves into the wordprocessor, so that they can be printed out. This latter is a slower process, because you must proceed row by row.

The usual variety of formats is available for your number cell by cell. You cannot give a command to format globally throughout the sheet in integers for example.

The sum command works on rows and columns of data. Formulae are evaluated from left to right. This is common on spreadsheets, but some prefer the correct use of the hierarchy, as in Basic. But if you inset column or rows, the formulae require adjustments.

It is possible to copy rows or columns. This is not as helpful as we might hope: data only is copied, not formulae.

You can label a cell, and refer to it by label. This is a big advantage since the numeric system is capable of causing confusion. The use of IF True, with a number of operators, enables you to proceed conditionally. This feature will permit you to modify the order of calculation.

You can freeze and unfreeze values in cells, which is all to the good. You can

also left-justify numbers in a cell.

Numeric constants must be preceded by a hash sign. This comes more naturally to Americans than to us.

The spreadsheet requires rather more work, and alertness to use than more sophisticated ones. However, it has many useful features. The graphics are merely low resolution bar graphs and point graphs of any row of data on your spreadsheet. However, the graphs will print on any Commodore printer.

Graphs can be transferred into the wordprocessor for labelling and printing. The graphs are scaled automatically, which avoids the most tedious aspect of graphing. But the point graphs are created by eliminating all but the highest point in each bar of the bar graph.

Although the graphics are primitive, they serve a useful purpose. The whole package, wordprocessor, spreadsheet graphics and file manager are in a single 32K block of memory! So it is absurd to expect too much in the way of facilities.

File Manager

The File Manager is also the sort of cut-down version which you would reasonably expect. Nonetheless, you can have records containing up to 17 fields, with up to 38 characters in each field. A separate disk must be maintained for your data, because the Filer does not use the Commodore relative file system.

Random access to a record is not by key. You must either know the record number of the record (bad news!) or use a searching process, whereby your string of characters is looked for in any field of any record. This is not the fastest of processes. The maximum number of records on a disk is 999.

A faster Review command enables you to scan through the records more quickly, starting with any record you choose (by number). Reporting is done from within the wordprocessor, using special commands. An EOF command enables you to continue the report through the file, or the selected section of it which you have selected by your own criteria.

The Pick command carries out your selection of records, matching up to 38 characters. The Picked file can then be used for sorts or reports. You can use a delimiter of the Highrc Highrecord command. This enables you to specify the record at which the Sort, Pick, Search, Review or Reporting function is to stop.

The file manager will serve as a useful introduction to this type of operation.

Verdict

The Plus/4 is an interesting machine with a lot of good features. As with all designs, there are compromises. However, there is enough of everything to keep most purchasers very happy. Perhaps it is a little pricey. Time will tell. ■

Make Your Fortune in Computers!

Now available for the UK: **THE COMPUTER ENTREPRENEUR MANUAL**—
the bestselling American manual on the fastest growing business in history!
Start now and prosper in your own computer business!

- "The No. 1 authority on all facets of the computer business. If you've been thinking about entering this lucrative business, *The Computer Entrepreneur Manual* will make you do it."—Chicago Sun Times.
- "If you're really interested in making your fortune in computers, I recommend that you get a copy of *The Computer Entrepreneur Manual*."—Dr. Campbell, Bits and Bytes, *The Spokesman*.
- "America's foremost experts on the computer business: the computer business offers the best opportunities to make the proverbial million or to make yourself financially independent."—Business Opportunities Journal.

▶ All The Facts You Need To Succeed!

Don't let the profit windfall from the micro computer boom slip through your fingers—Now is the best time ever to start! You find all the information you need to plan and prosper in computers in *The Computer Entrepreneur Manual*. This bestselling US book on computer opportunities has inspired thousands of successful computer businesses in the US. The new UK edition contains the unabridged original and additional UK material in a deluxe ring binder divided into two parts for easy reference. The immense contents include over 100 lucrative computer business opportunities: systems house, consulting, freelance programming and selling your software, computer store, word processing service, importing, used computers, seminars, repairs, list maintenance and more. Invaluable facts and figures on how to start, capital needs, profits estimates, margins, suppliers, how to market, staying ahead of competitors, pitfalls to avoid, suppliers and success stories. How missing technical or business experience need not stand in your way. Business strategies like how to finance your venture including "shoestring" budgets and how you can start part-time while holding a job, surviving the crucial first year, the business plan, estimating your market before you start, negotiating techniques to double profits, how to get free ads and free merchandise, how to never pay retail again—even for one item right now while you're starting your business. No book before has given the facts on the exciting and lucrative computer business in such a direct and hard-hitting way. An indispensable tool that belongs in every prospective and existing computer business. Now at special limited time only NO RISK introduction offer—see further details below.

FIND OUT ABOUT NEW OPPORTUNITIES AND KEEP YOUR BUSINESS PROSPERING WITH

The COMPUTER ENTREPRENEUR JOURNAL

The Computer Entrepreneur Journal and Newsletter will keep you up with the latest exciting computer opportunities. In each issue features such as Dealer Hot Sheet tip you off on the best suppliers and special deals (like a recent sale where our readers could get Winchester disk drives and high speed printers for less than £150 and Apple II compatible computers for £30!). The Computer Market Newswire column covers new products, industry "inside" info, moneymaking tips and where to get free books, software & magazines and free on-line data bases. US franchise chains are becoming extremely profitable in Europe. We give you the facts on the up-and-coming US franchises like the lucrative software stores and repair franchises, still unknown in the UK, and which you can enter for considerably less than Computerland and other already UK-established chains.

The Journal also brings you: interesting reader letters; trade show coverage; event listings; invitations; product reviews and streetsmart know-how. Two new columns disclose inside moneymaking advice for consultants and programmers. Trade and barter with other computer businesses and announce your products and services in the Entrepreneur's Exchange. We forecast new trends: how you can best profit from new computer introductions (like recently the Sinclair QL and Apple's Macintosh) and from major changes in the marketplace, like the coming worldwide boom in UNIX-based systems, set off by a 24 billion £(!) bet by the US phone giant AT&T. In our Business-of-the-Month features we present at least two new major opportunities extensively in each issue, with start-up instructions, source references, profit estimates, case histories and more. And we will, of course, show how UK companies of all sizes can profit doing business on or with the US computer market. Find our yourself now, with our no-risk trial offer, why you will never want to part with *The Computer Entrepreneur Journal* in making your own success story happen!

The Computer Entrepreneur Society

The Manual and The Journal are two of the many services we offer computer businesses. We would also like to welcome you to join the only international association for computer businesses, *The Computer Entrepreneur Society*, at a special charter invitation rate to UK members. You'll enjoy an extensive list of benefits and join a select group of individuals as dedicated as yourself to their careers in their own computer businesses. Membership includes the Manual and a full one year subscription to *The Journal*, one free manual from those listed below, one free tape of your choice from our vast library of computer tape seminars (select one below or from the full tape catalog which will be sent with your membership package). These benefits alone more than pay for your membership, but there are many more including advisory service, access to the world's largest library of computer business information, directory listings, free ads, local chapters, conventions and seminars, special publication discounts, insignia to display on your promotions and advertising, diploma, privileged member bulletins, volume purchases, consultant and programmer's referral service and registry, software agency, software locator service, software development assistance, group insurance, barter service, joint trade show participation, reciprocal agreements with other organizations, on-line access and data bank to *The Computer Entrepreneur* and many other publications. Send in the coupon and join now at the special invitation rate of only £39.50 (less than you pay for *The Computer Entrepreneur Manual*, one manual from the list below and one tape separately!) You may continue your membership in coming years at this low rate—with equal benefits!!

Other profit making manuals from *The Computer Entrepreneur*:

• **The Computer Entrepreneur Software Writer's Market**—How to make money writing software: what programmes to write, what publishers are looking for, how much they pay, and how to present your software. Also an extensive list of software houses seeking free-lance programmers in the UK, US and Europe; self-publishing, finding distributors, documentation and commercial debugging. £12.50.

• **Moonlighting With Your Micro**—it's hard to start a business without a cash reserve. However, most millionaires got started moonlighting part time. This book covers the spare-time opportunities of the micro revolution: word processing, mailing list services, information brokerage and many other low start-up cost ventures. Also: a step-by-step course in advertising, free publicity and how to finance and manage your part time business. Make yourself independent while your micro pays for itself. £12.50.

• **Computer Consulting and Opportunities Abroad**—\$1,000/day New York consultant Richard Holt and UK overseas employment expert Kevin Oliver cover all aspects of computer consulting: marketing, finding assignments, CV's, how to bid and set fees, getting higher rates, profitable sidelines, contracts, getting started, what you must know, overseas considerations like taxes and visas. Extensive address listings for UK and abroad paying £200, £300/day and up. £12.50.

The *Computer Entrepreneur* has a vast selection of computer business seminars on audio cassettes. Each lasts one to two hours and features famous entrepreneurs like Microsoft's Bill Gates (the MS-DOS inventor) and Rick Inatome, the No. 1 computer dealer. Enjoy these seminars now for £5 each, which others paid £100s to attend. As a sampling we offer five tapes from our most popular series:

• (A) **On The Software Horizon** with Gates and AT&T computer boss Scanlon (Computer Marketplace Seminars), • (B) **Avenues of Success in Independent Systems Sales**, Reitano, Wang (ISO series), • (C) **Software Sales Forecast**, Juliusen, Future (Software Market Series), • (D) **Surviving the First Year in Business**, Skolnick, Desktop (Computer Store Series), • (E) **What Makes A Winner**, Inatome, Inacom (Winning in Computer Sales). All five £25. New Society members get one tape free and may optionally purchase the other four for £18.

RAVEN REMEMBERS

Want 20K of extra RAM to fly out of your BBC B? Then this £70 extension pack may be a reasonable solution, says Kenn Garroch.

The Raven is designed to solve your BBC software problems, but it creates one or two more.

The biggest drawback with the BBC micro is its lack of memory, especially when using high resolution modes 0 to 3. The Raven-20, from Raven Micro Products, is a RAM expansion that gives you 20K of extra RAM.

The RAM is placed behind what would normally be the screen memory for modes 0 to 3, that is, from &300 to &7FFF. All the system screen commands are redirected to switch in the Raven, plot to it, and switch it out again. This leaves all the memory that would normally have been used by the screens available for Basic and machine code programs.

Setting up

The Raven consists of the expansion board, the documentation, and a sideways ROM.

Fitting of the board was fairly simple, if a little worrying. First of all, the 6502 processor is removed from its socket (pretty worrying), and placed into the Raven board. One detail that the documentation doesn't mention is which way round everything goes. After a little thought, I discovered a notch at the top of the Raven's 6502 socket. The 6502 notch was matched to this.

Then the Raven board was placed into the BBC with the same notch facing towards the back of the machine.

The documentation also says that the 6502 should be placed into the Raven board after the board is plugged into the BBC. I found that it was better to put it into the Raven before inserting the board. Since the sockets are offset this makes things wobble a bit if it's done the other way round.

The last thing to be put in was the sideways ROM. Raven says that the Basic ROM should be put in the right

hand ROM socket and the Raven ROM in any other spare socket (if you've got any). What the firm actually means is that the Boot ROM should be put in the right-hand socket. Since I needed a Torch MCP ROM to write this with, I left it there.

On reassembling the BBC, the next thing to do was to switch on (very nerve-shattering). Bingo! it worked. Entering the *RON command turned on the extra memory, and *RTEST tested the board with no problems.

In use

Five commands are available from the Raven ROM:

- *RON to turn on the extra memory, followed by Break to initialise it.
- *ROFF to turn off the Raven although the manual recommends that the Break is used to do this since not all the pointers are reset.
- *SSAVE allows a screen to be saved to the current filing system. This is possible even if the board is in the off state.
- *SLOAD allows you to load a previously saved screen.
- *RTEST tests the Raven board and associated RAM.

Other commands available to control the Raven basically turn it on and off from machine code; *FX 111,1 turns it on, without the need to press Break, and *FX 111,0 turns it off.

The other method to turn on is with ?&D000=0 and off with ?&C000=0. These latter commands can cause some rather odd effects which seems to be due to the system intercepting only the plot and print VDU commands. The flashing cursor still appears at the same position as on the other screen and the logical colours are also common to both screens.

After fiddling with the other VDU

commands, I came across a bug. If the Raven is turned on, with any of the 'on' commands, and then a VDU 21 is used to turn off the screen, every time Return is pressed, a line feed is sent to the printer (presuming it has been turned on with *FX 5 1). VDU 6 stops this happening and turns on the screen again.

The easiest cure is to use *FX 5 0 to select a printer sink, as long as you don't want to use a printer at the same time as the screen is off.

The *SSAVE and *SLOAD commands enable screens to be saved from the Raven's RAM. These are of standard format, and can be loaded to the screen with the Raven board switched off (*LOAD 1fn). Alternatively, if you have a high-resolution screen that has been saved from the normal screen RAM, it can be loaded into the Raven RAM with *SLOAD 1fn.

What you can't do is switch between the two screen areas to achieve animation effects. This is a shame since most other micros allow some kind of facility for doing this with two high-resolution screens held in the computer's memory at one time.

Documentation

The booklet with the Raven is very light on the details of how the system works. All that you get is a general description, the fitting instructions, the commands available from the ROM and a note at the back that tells you to fill in your registration form so that you can be notified of software updates.

There is also a note stating that upgrade ROMs are available if you send your EPROM plus £1.00 to Raven. This is due, according to Raven, to the fact that there is lots of space left on the ROM and they might as well fill it with something (and also repair the bug).

Verdict

The Raven does solve the memory problem for the BBC, it gives you back all the memory that is normally allotted to the screen. Fitting is easy, even for those of us without waldo fingers. Its only problems are lack of technical details on the system, and one rather insignificant bug.

If you feel that you are suffering from lack of memory then the Raven is quite a good buy.

On the other hand, it will be almost completely incompatible with virtually any piece of software you are likely to buy.

ECHO I
£99.95*
ECHOSOUND
£49.95*
ECHKIT
£4.95*

LVL's ECHO I is a high quality 3 octave keyboard of 37 full sized keys operating electronically through gold plated contacts. The keyboard which is directly connected to the user port of the computer does not require an independent power supply unit.

The ECHOSOFT Programme "Organ Master" written for either the BBC Model 'B' or the Commodore 64 supplied with the keyboard allows these computers to be used as real time synthesizers with full control of the sound envelopes. The pitch and duration of the sound envelope can be changed whilst playing, and the programme allows the user to create and allocate his own sounds to four pre-defined keys.

Additional programmes in the ECHOSOFT Series are in the course of preparation and will be released shortly.

Other products in the range available from your LVL Dealer are our:

ECHKIT (£4.95)* - External Speaker Adaptor Kit, allows your Commodore or BBC Micro-computer to have an external sound output socket allowing the ECHOSOUND Speaker amplifier to be connected.

ECHOSOUND (£49.95)* - A high quality speaker amplifier with a 6" dual cone speaker and a full 6 watt output will fill your room with sound. The sound frequency control allows the tone of the sound output to be changed.

Both of the above have been specifically designed to operate with the ECHO Series keyboard.

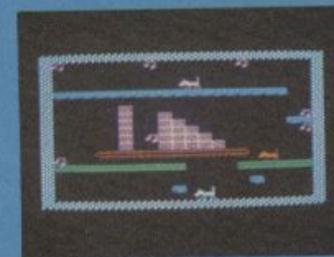

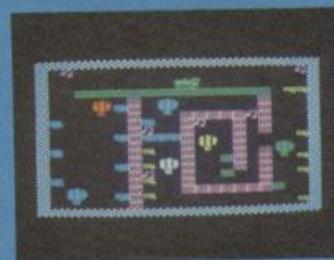

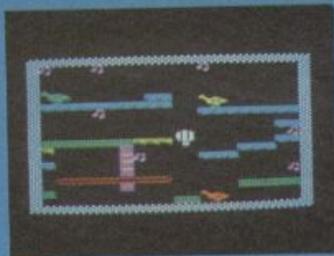

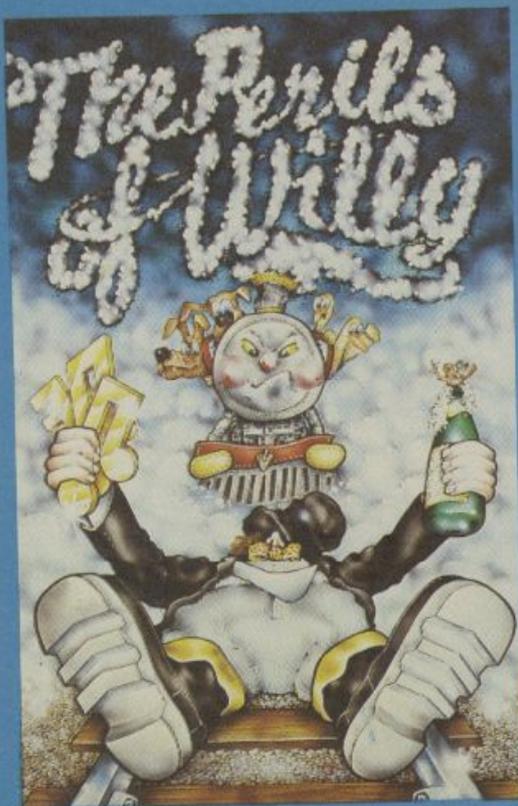

The ECHO PRODUCT FAMILY breaks both the SOUND and PRICE BARRIERS, representing outstanding quality and value for money.

Oh what a night, drinking, dancing and singing 'til dawn. Now it's time for all the revellers to make their way home. Being a little worse for drink, you decide to walk home in the cool night air, rather than taking a taxi. Singing merrily along the way, you walk through the park and skip lightly over the ducks and catch the notes of music that seem to hang in the air. But be careful when approaching the railway, trains still run at this time of day and wild dogs are in search of food! When you have collected all the notes on the level you are on you will proceed to the next, collecting a time bonus on the way.

Miner Willy's first outing on the Commodore VIC 20.

Available on the VIC 20 + 16K expanded

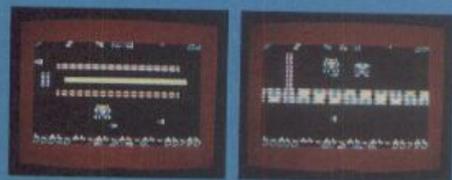

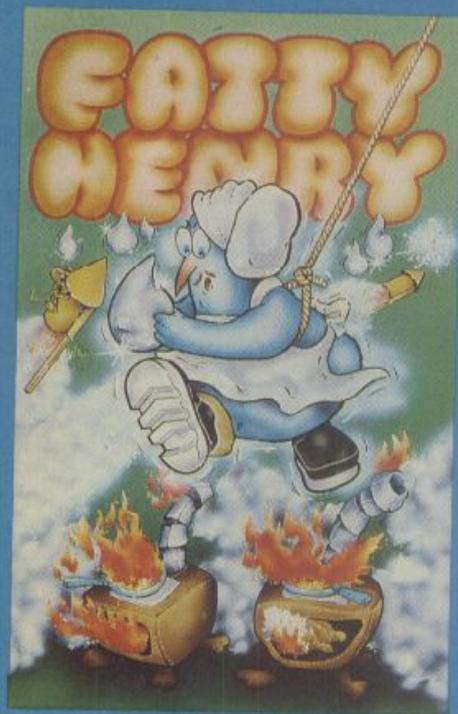

Its army to enormous dimensions, soon its attack on mankind will commence. Exploring the outer regions of a weird landscape, your secondhand 'ground skimmer' has only a single laser in its armoury. Discovering the Dodo's secret means you must destroy as many beings as possible, as the Dodo will try anything in its power to prevent the secret getting out. The game has 9 attack waves with progressive difficulty and speed. There's a bonus life every 10,000 points and bonus points after every wave, dependant on which level you are on (Bonus = Wave Number x 1000). After the wave bonus the Dodo must be hit 12 times, by bringing the number on the right of the score from 88 to 100. The number of 'Mults', 'Wallys' and 'Bulldas' is also dependant on the wave number. WARNING: 'Mults' are not affected by laser fire, but in fact, feed on it. The 'ground-skimmer' can be destroyed on collision with any enemy or enemies weapons, or by letting the 'BBs' (purple coloured enemy) getting to the far right of the screen.

Available on the unexpanded VIC 20

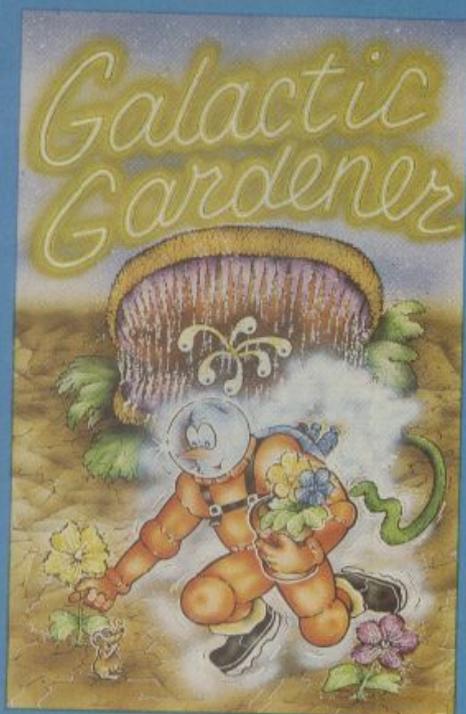

SOFTWARE PROJECTS

Software Projects Limited, Bearbrand Complex, Allerton Road, Woolton, Liverpool L25 7SF.
Telex: 627520 Telephone: 051-428 9393 (4 lines).

Deep in the kitchen of one of the towns first class restaurants amongst the hustle and bustle, Little Thwifty Thwilly has just been selected from the aquarium as a customers main course . . . panic . . . sitting in the oven his first thought is survival and how to escape. As the oven is ignited and the flames start to rise he realises his only hope is to collect the dripping condensation from the pipe at the top of the oven and try to extinguish the flames. It's going to be tough, he must survive through ten different ovens and face added hazards such as the rotating spit, spinning food debris, oven foam and the restaurants pet dog, Fatty Schizo Henry, who by the way often enjoys a snack from the restaurants aquarium. Can you help him?

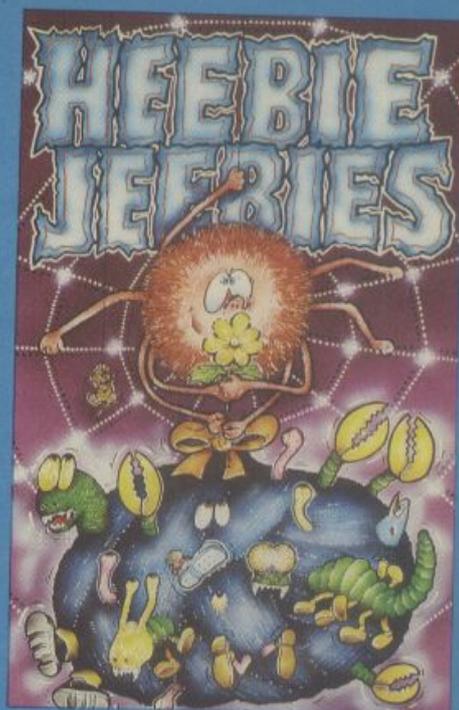

Available on the unexpanded VIC 20

Once you were the head gardener in charge of a group of ten power-flowers. These have been stolen and hidden in a set of caves, from which you must retrieve them. The flowers are protected by forcefields, gates, begonias and patrolling snap-dragons. Be careful as the flowers are poisonous and you must find a pot to put each flower in before you try to pick it up.

The beans in the cave are harmless and extra points will be achieved by picking them up along the way, but don't touch their stalks. If anything is touched other than a pot, beans, fuel dumps for re-fueling, sprays which can be used to stun the snap-dragons, or a plant if you have a spare pot, the result will be that you are teleported to the start of the game. It is possible for you to leave your transported back to your teleport. You begin the game with four teleport charges and an extra charge is gained for every flower collected.

Available on the Commodore 64

You play the roll of a spider in this extremely compelling game and you are faced with escaping from some very perilous situations.

You are trapped in a hole from which you must escape, but there are other insects in the hole which make your task more difficult, as contact with any of them will lead to instant death. However you are not totally defenceless you are capable of leaving a web trail which only snails can cross. By collecting the twigs that are littered around and storing them against the left hand side of the hole between the two stones a bridge will form and you will be able to climb out. But be careful — there are 15 hazardous situations to contend with — each one more difficult than the last.

Available on the Commodore 64

CHEETAH CHOICE

The latest add-on keyboard for the Spectrum has the feel of a professional about it, although praise for the Cheetah might be somewhat muted because of its strange layout. John Lettice runs his fingers over the new keyboard and compares it with the Transform.

A Spectrum keyboard that makes your machine look like its deadliest rival, provoking outraged cries of 'Strewth, it's a Commodore' from your friends, may not immediately seem the smartest of ideas. And in a favourable light, the Cheetah 68FX1 looks a dead ringer for a mysterious new relation of the 64's.

But wait before you pass by on the other side. One of the intriguing things about the Cheetah keyboard is that it could easily pass for a commercial micro, and in this sense it's leaving behind the more or less hacker-style cases we've been used to up till now. The professional look of the Cheetah is a sign that the add-on keyboard market is growing up.

couldn't get the arrangement to fit properly inside the case, and anyway the screw holes seemed to be in the wrong position, so I gave up, noting along the way that there didn't seem to be any provision for a ribbon cable to the Microdrive anyway.

Fortunately, the Spectrum PCB fits well to the back of the Cheetah, so you can still use Interface 1 externally, although it spoils the typing angle.

You certainly can't get the power supply inside the case, but trying to fit one can all too often be a bed of nails, so this is no bad thing.

Keyboard

The keys are laid out in two sections —

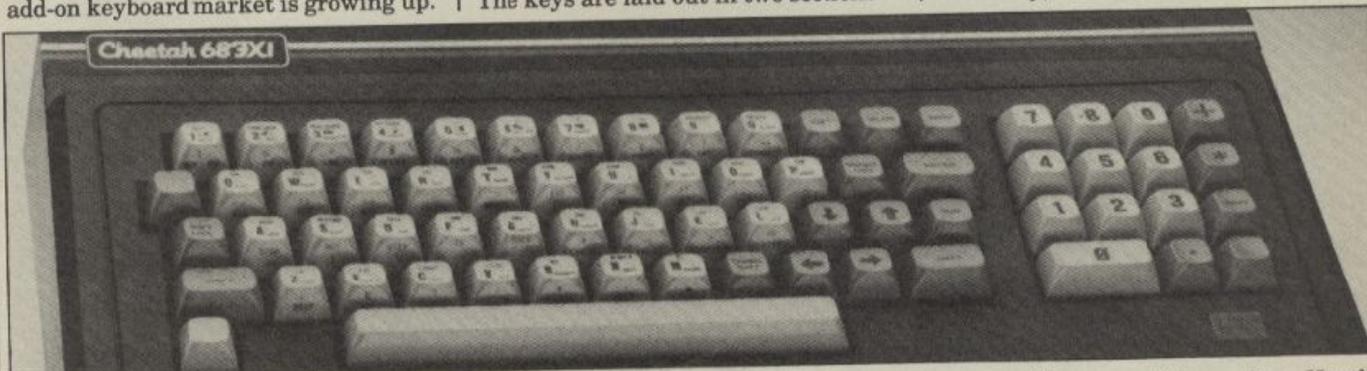

they're to be used for later amendments.

Considering the fact that a couple of extra keys have been added, it's puzzling that the Cheetah doesn't have separate punctuation keys. With the addition of these it would be a reasonable option for word processing, but without them its scope is severely limited.

Verdict

The basic concept of the Cheetah is good, but the execution lets it down badly. Some keys have been added for no good reason, while the keys that could have made it a good buy have been omitted. Of course there are other cases around that it outclasses, but it's expensive, and in its chosen price bracket it's competing against the Transform model.

Sure the Cheetah makes the Transform look unwieldy, but the latter does have the extra punctuation keys, and the layout is considerably more sensible. Similarly, although the Transform's

Construction

The top of the case is moulded in stiff black plastic, and a metal base fits snugly into this. The whole set-up is solid and robust without giving the impression, as so many Spectrum keyboards do, of being a throw-back to the 'build your own micro' days.

The quality of the printing on the keytops reinforces this impression—the legends are clear and easy to read and gentle scraping with a fingernail failed to make any impression on them, so they look to be fairly durable.

The Spectrum's printed circuit board bolts onto the Cheetah's metal base, using a series of nuts, bolts and metal pillars. The review model came with eight washers to facilitate this, and no matter how I puzzled over it, the instruction sheet seemed to require 12, but it seemed to fit well together with what I had.

Fitting Interface 1 was more of a problem. The instructions tell you to take off the base of Interface 1 then 'marry Interface 1 to 28 position slot of Cheetah'. Having done this, I found I

the main keyboard and a 15 key numeric pad. The feel of the keys is good, but the space bar has just a little too much of a rattle and, in my view, the layout is weird.

The basic Spectrum layout is used, but at the bottom right of the main section there are four extra cursor keys, an extra shift, and a RUN key. I don't see the utility of the latter at all as, although single-key entry may be a useful addition to other micros, it's a bit pointless considering the Spectrum already has it.

The end result of the additions is that the symbol shift is lost among the rest of the keys (you keep hitting the extra shift instead) and the Enter key is displaced up to the second top row. There's an extra graphics shift key next to Enter, and at the top right are Edit, Delete and Break keys. Delete is useful, but Edit is limited by being mixed up in the body of the keys again, and considering Break duplicates the space bar, it's probably the most useless key ever to grace a keyboard.

Apart that is from the three blank keys on the Cheetah we reviewed. I could find no role for these, and imagine

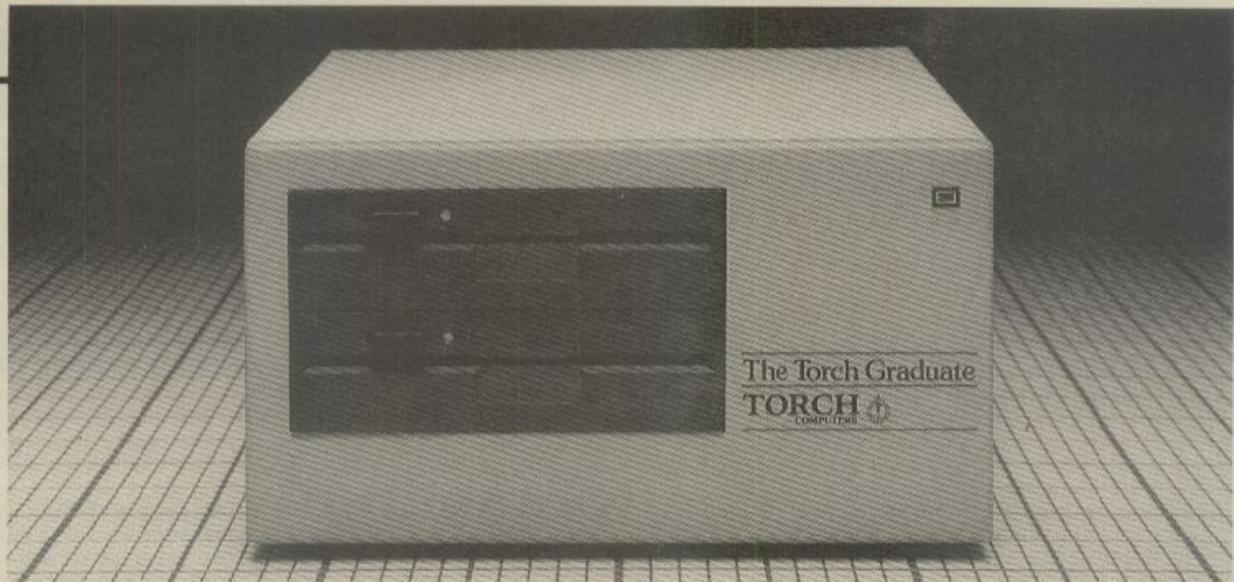

insides have something of a Heath Robinson aspect to them when filled with PCB, Interface 1 and power pack, at least there's no question that you can get them all in!

Having said that, the Cheetah is certainly of a quality to allow it to take its place among the great extension keyboards of our time, and with the caveat that wiring in too many extra keys to a Spectrum can cause considerable problems, rearranging layouts and wiring up different keys is only a minor expense for keyboard manufacturers. So if I'm right about layout problems' it would seem likely that the Cheetah will be amended and will be a more worthwhile buy.

The Graduate. The first IBM PC compatible upgrade for the BBC model B micro.

From only £764.00 the new Torch Graduate will upgrade your BBC Model B to a powerful 16 bit business computer.

Disc and hardware compatible with the IBM PC, the Graduate is the latest addition to the Torch range of BBC upgrades. It's MS™-DOS operating system is customised to IBM compatibility allowing exploration of the massive range of IBM compatible business software, programming aids, compilers and languages universally available from most major software houses.

Introduction to MS™-DOS

The Graduate offers two levels of upgrade, the G400 and the G800, both with 128K on board user memory as standard (optionally 256K). This can be increased to 1.2 Mbytes with an IBM compatible expansion board. The G400, contains a single, double sided 320K formatted disc drive and provides the low cost introduction to MS™-DOS for the

TECHNICAL SPECIFICATION

- 8088 16-bit processor running at 5 Mhz
 - 128K or 256K RAM
 - MS™-DOS operating system customised to IBM compatibility
 - Model G400 - Single, double sided, high density disc drive (320K formatted)
 - Model G800 - Twin, double sided, high density disc drives (640K formatted)
 - Integral stabilised power supply
 - 2 IBM PC compatible hardware expansion buses
 - Software compatibility allows Lotus 1-2-3 and all popular IBM PC business programs to run without modification, subject to the constraints of the BBC keyboard and display
 - Disc interface is not required
- Keyboard text and graphics supplied by BEC Model B

• THE GRADUATE •

user who wants real 16 bit power from his Model B.

More data storage

A step up from the G400 is the G800 which offers twin, double sided 320K disc drives for extra data storage. Both the G400 and the G800 provide the possibility of

further expansion for networking, modems, etc., via the IBM compatible hardware slots provided by the Graduate models. Each model comes complete with a well written user/technical manual and connecting leads.

Just plug it in

Unlike other add-ons there is no need to open the BBC to make the connection. The compact and tidy Graduate models simply plug in to the 1MHz bus on the Model B. Within minutes you can be up and running with an IBM PC compatible system that really means business.

The range

Add 256K RAM, 640K disc storage and IBM PC compatibility to the BBC Micro for less than £1000 ex.VAT.

Graduate G400 (128K) £764 inc.VAT
Graduate G400 (256K) £815 inc.VAT
Graduate G800 (128K) £949 inc.VAT
Graduate G800 (256K) £1087 inc.VAT

We take a peek at the new software packages, and give you a taste of things to come. Note to software publishers: If you wish your company's product to be included, please send only the very latest releases to **Bryan Skinner, Software editor, PCN, 62 Oxford Street, London W1A 2HG.** Please don't forget to include prices and telephone numbers.

AMSTRAD

Ghouls, an example of how the standard of Amstrad software is rocketing now, is a very competent translation of Micro Power's BBC and Electron game. It's a platform affair with Pacman overtones, but the graphics are very well done.

ASK's latest educational program, *Number Painter* is

designed to improve mental arithmetic. Players move Mr Painter up and down ladders to collect numbers, trying to prevent him from falling down.

If you've ever fancied yourself as a landlord, *Country Cottages* should interest you. It's a property game — you buy and rent cottages, struggling against hazards such as burglars, fires and ghosts, the aim being to reach a specified target of capital.

Ghouls	£6.95	Micro Power 0532 458800
Number Painter	£8.95	ASK 01-874 6046
Country Cottages	£7.95	Sterling Software 01-258 0066

SPECTRUM

Fancy a bit of martial arts? Well, *Kung-Fu* is just for you. The game features wire-frame pugilists, movement is smooth and there's an option to see a slow motion replay of winning strikes. Played against Oriental backdrops, you take on another player or your Spectrum. The theme's novel, nicely done and deserves to do well. Bug-Byte's other release, *Turmoil* is a platform game with neat graphics and a good theme. Your task is to fill a car with oil — you must collect an oil can, then stand under an oil tank from which oil drops descend. Then you take the filled can to the car. Life isn't made easy by the sword-wielding Arabs, nor by the screen layout, nor by having to stand on moving walkways. Fortunately, there's a training mode.

Setting a time limit to adven-

tures is unusual, but that's the name of the game in *Assignment East Berlin*. It's a text-only adventure, with a noun-verb only phrase analyser.

Eclipse continues to turn out astronomical programs. Latest is a computer version of a globe. Continents are drawn in outline, any point on the planet's surface can be at screen-centre and you can rotate the globe in one or 15 degree (hourly) intervals. Expensive at £7.45, but interesting.

Want to get to know yourself? *Life-Line*, it's claimed, presents a fascinating new way of analysing your character, distinguishing between the personality you project and your real self. Fun and instructive as they are there's an argument that computer questionnaires are worse than those in magazines, as people tend to believe what the computer tells them. *Life-Line* categorises you into a personality type, such as Leader, Coordinator or Researcher.

Kung-Fu	£6.95	Bug-Byte 051-709 7071
Turmoil	£6.95	Bug-Byte 051-709 7071
Life-Line	£14.95	Stuart Systems 098064 235
Battlezone	£6.95	Quicksilva 0703 20169

Country Cottages	£5.95	Sterling Software 01-258 0066
Assignment East Berlin	£5.95	Sterling Software 01-258 0066
Beach-Head	£7.95	US Gold 021-832 6633

BBC

Castle of Gems features Bertie Bear trying to collect gems, and stay one jump ahead of gem gobblers, gremlins and trees. The scenarios are Escher-type staircases, but the perspective can be more than a bit strange. Gems are scattered around, and as with Pacman, walking over them collects them, with an additional bonus if you get the last one on the screen. Some antagonists can

be despatched easily, but others are immune to your efforts. Graphics are quite well done, but there's barely anything else to it.

LSL Logo is a 16K EPROM, hence the price, and is the result of two years' development by Catsoft, the company commissioned by the DTI for the feasibility of a BBC Logo. Written entirely in assembler it takes Logo away from the primary school image it seems to have acquired, offering floating point arithmetic and list processing.

Logo	£59.00	Logo Software 01-891 0989
Castle of Gems	£5.70	MRM 0472 44304
Felix meets the Weevils	£6.95	Micro Power 0532 458800
Swag	£6.95	Micro Power 0532 458800
Plutonium Plunder	£6.95	Micro Power 0532 458800
European Knowledge	£6.95	Micro Power 0532 458800
Number Painter	£9.95	ASK 01-874 6046

COMMODORE 64

Good news for 64 owners is the recent deluge of 64 software. Even better news is that the majority is pretty good. Quicksilva's *Summer Games*, from Epyx is probably the definitive Olympic games program, way ahead of even *Daley's Decathlon*, *Micro Olympics* and *Decathlon*. *Doodle* looks to be a very nice piece of graphics software.

So you thought straight 'Invaders' shoot-em-ups were dead? Mr Micro's *Ad Infinitum* shows there's life in the old dog yet.

What with all these literary and mythical games — *Pegasis*, *Avalon*, *Gandalf* etc, it's not

surprising that someone's gone back to the Greek classics and come up with an adventure based around Orpheus. In your travels through the 120 screens, you encounter fireballs, deadly birds, poisonous plants and the like, while new lives are gained by touching the 'Sterling' logo. Treasures are collected for points.

Catastrophes is a curious mix of game-styles. Your task is to manoeuvre your helicopter to collect bricks and build as tall a building as possible. Hazards include low-flying aircraft, storms, earthquakes and flood. In *Star Egg* you must first overcome the Guardians, and enter the hatchery to kill off newly-hatched aliens. The hatchery is a network of levels, ladders and lifts.

SPECTRUM

AMERICAN FOOTBALL

After you've finished watching American Football on Channel 4, you can flick round to channel 36 on your Spectrums (and soon I understand, your Commodore 64s) and play the game yourself, minus the bruises.

There are probably two ways to design a game based on the Gridiron. One I played years ago on a Tandy (of course) required you to take direct charge of one of the players using a joystick. As soon as the whistle went the screen was a mad blur of stick men running in all directions.

Those primitive days are over — technology forges on. *American Football* from Argus Software casts the player as coach. Your job is to choose the offensive or defensive 'play' most likely to succeed under the prevailing circumstances of the game. Once you've issued instructions, your team of minions gets on with it.

The outcome seems to hinge on a combination of mostly luck and a little good judgment. You obviously don't know which play your opponent is going to choose and there seems to be a random element built in so the outcomes of identical offensive/defensive plays don't produce predictable results.

I imagine much careful coding has gone into this. The screen action is very good — all the little figures do a remarkable job of running about at the same time. Argus has thankfully provided a fairly comprehensive rules and strategy guide as a primer to the finer points of the game. It's not exactly action-packed, as you spend a fair bit of time just sitting there waiting for your team to take up positions. But I suppose you could always resort to hot dogs and popcorn to fill in the odd moments, just as you would at a real match.

American Football is well designed with a nice HELP facility and a scoreboard. It would have been a good touch to include those inane little phrases of organ music that come over the speakers at the real thing, but there you go.

COMMODORE 64

FALCON PATROL II

Your VTOL jet (that's Vertical Take-Off and Landing to the uninitiated) seems to have got right up the enemy's nose. You have gained the upper hand in the war and they are about to launch their final, all-out attack on your shattered town. So FPII is the follow-up to the original *Falcon Patrol*.

Being a VTOL jet the *Falcon* is a pretty nippy little aircraft. It's highly manoeuvrable but requires considerable slowing down before you can hover or change direction to chase the enemy. But the enemy is no pushover. Its helicopter attack squadron contains colour-coded transports which, although unarmed, drop flak batteries and radar jammers, and there are gunships designed to lure you into making mistakes. Once dropped, the flak batteries release their deadly contents into the air and the radar jammers distort your radar screen which indicates the position of the enemy helicopters. Blasting the radar jammers will deactivate them.

Fully fuelled and fully armed, the *Falcon* carries 100

missiles but these won't last for ever. At times you will need to both refuel and rearm in order to carry on the battle. To do this you will need to drop in on one of the strategically located landing pads. But beware — those which have sustained more than 75 per cent damage will be out of action and you may find yourself grounded. That'll teach you not to fire indiscriminately.

An audible warning sounds when fuel gets close to danger level. There are 16 levels to proceed through and you gain an extra life at every fifth level you crack. Not surprisingly, the further you proceed, the heavier the enemy forces seem to get. Time to get stuck in, I think. Very good. Keith Mason

SPECTRUM

HAMPSTEAD

I thought climbing the social ladder would be a piece of cake — but after playing *Hampstead* I've had second thoughts.

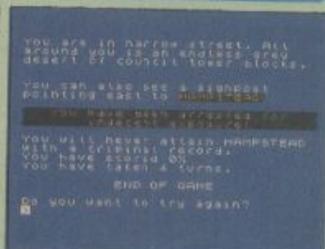

Because you've got to climb up, you naturally have to start at rock bottom. So here I am sitting in the lounge of a smelly council flat in North West London, watching '3-2-1'.

To move in a direction, it's a single letter command, so I went East. There I hit the kitchen where there's a pile of dirty plates and take away cartons. Being a house-proud person I decide to 'Wash Plates' (as I thought that this was the kind of thing you'd have to do to attain *Hampstead*). The response I got was: 'You Can't Do That'.

Anyway, I go further East, and there's a backyard with a locked shed and a closed gate. After several attempts I get the gate open and go down a narrow street towards the dole office to get my money.

In the distance is the sign post to *Hampstead*. But alas, I've forgotten to get dressed and get nabbed for indecent exposure. Then I'm told I'll never attain *Hampstead* with a criminal record.

Next time round I explore more of the flat where I come

across live fungi on the bedroom walls and the remains of last night's vindaloo and chips in the bathroom. I can't imagine, why this distasteful description should add to the game — it just made me feel sick.

In the bedroom I find a tracksuit and work my way back to the gate, to once again tread the short and narrow path to *Hampstead*. But my luck ran out when I got mugged by a gang of thugs. Oh, well, *Hampstead* was just never meant for me.

This is quite a good game in terms of a challenge. There's no graphics to add to the text — on second thoughts, I don't think I'd like to see the remains of chicken vindaloo. But the documentation is well done, setting the scene and giving a few hints.

COMMODORE 64

ZIM SALA BIM

If you've always wanted to star in one of those turkish delight advertisements but have never been asked, here's the game for you as the sole survivor of the Sultan's vicious raid on the village of *Zim Sala Bim*. There's no money left and there's no food, so it's been left up to you to break into the Sultan's palace and recover the gold he pilaged. After that you have to find the secret cave and give the gold back to the village elders. What could be easier? You've only got to get across the burning desert to the palace walls, break in and grab the loot.

But with marauding nomads intent on robbing you and leaving you for the vultures, there's also the problem of running out of water. Believe me, there are no Perrier bottles out there.

So you've reached the palace walls and carefully avoided the guards only to be faced with the pitiful sight of a poor beggar slap bang next to the food stall. If like me you're chivalrous, you'll try to get food for him —

but beware Islamic law. Even when you get inside the palace you are nowhere near safe and dry. One little slip up and there you are — slung in a damp, dark dungeon, life slipping away and nostrils assailed by the smell of rotting food. If there's a way out of here, I couldn't find it.

The graphics on this game are amazing. Wherever you travel on this scrolling screen, you can see your immediate surroundings in full colour. All the objects you have to collect are there to see and the obstacles are only too obvious. And all accompanied by the most atmospheric Eastern music.

The Sensible Solution -separates the business tools from the toys!

The **SENSIBLE SOLUTION™** is an innovative approach to micro-programming – a truly multi-user relational data/procedural language.

SENSIBLE SOLUTION is a complete language, with programs so compact that one page of its source code is equivalent to ten pages of BASIC language programming. Shorter programs and English Language commands make program creation, modification and debugging a pleasure.

SENSIBLE SOLUTION runs on CP/M,™ MP/M,™ MS-DOS,™ DPC/OS,™ Turbo DOS,™ MM/MOST,™ n/STAR,™ NOVELLE™ and many other networks, with Unix™ soon available.

Features include

- Automatic screen and data file creation.
- Multiple screens in one program.
- Multiple key, multiple file B-tree data file handler.

- Virtually unlimited program size even in 64K RAM.
- Multi-user record and file locking on multi-user systems.

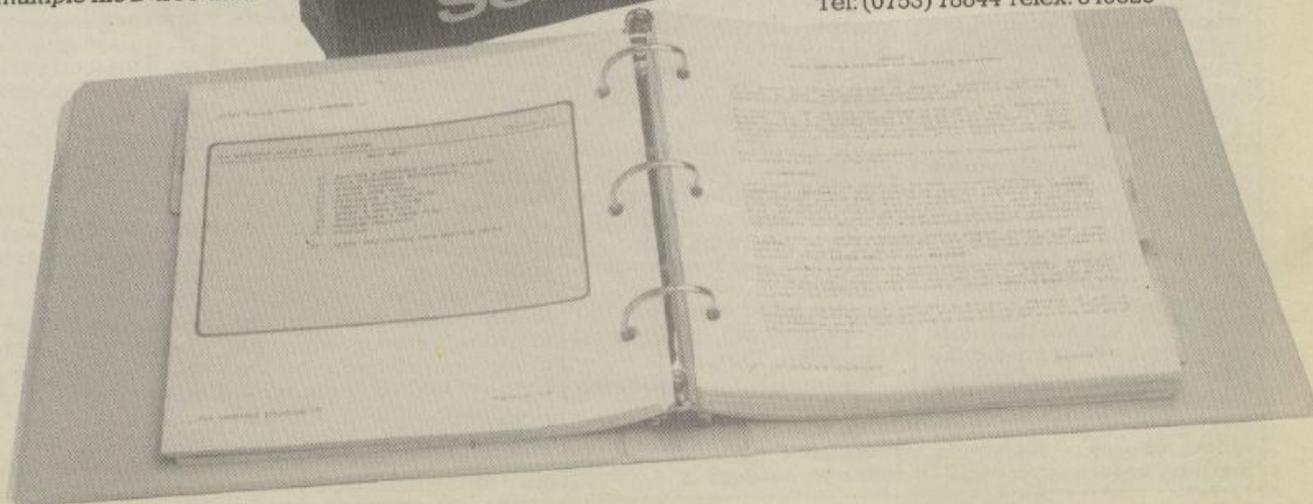

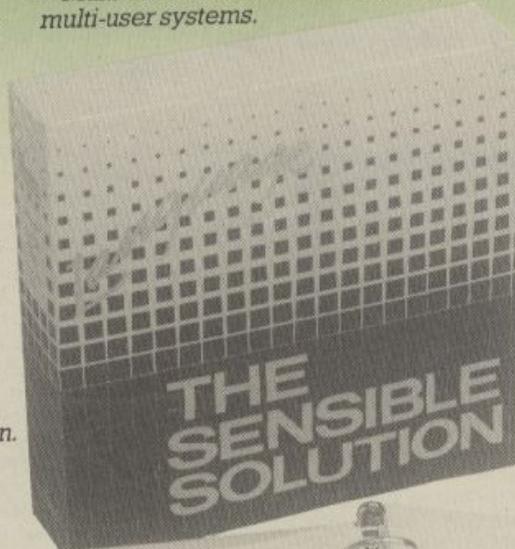

- Totally portable between operating systems.
- **INQUIRE™** quick report utility.
- Easy-to-follow English language source code and commands.
- Program compiler – protecting source and increasing speed.

And now – accounting packages written in SENSIBLE SOLUTION which you, the end user, can easily modify to suit the personality and special requirements of your business.

Even if you've never used a computer before, you can program with SENSIBLE SOLUTION right away. It isn't just user-friendly, it's positively sociable!

Ring us up and we'll be delighted to show you why.

SPECTRUM

HUSTLER

Hustler is a pool simulation, but don't unpack your trunks—the weather's terrible and it's the other sort of pool.

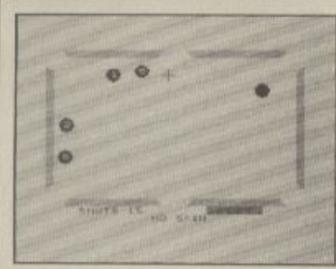

On loading, you're treated to a wonderful rendition of some purdy tune while you browse through the game options menu or the high score table. Actually, the music's great.

There are six game variations for one or two players: for the single player—any ball in any pocket, balls in order and ball in its pocket; two players—score the pockets, mini pool and lowest and highest.

Score the Pockets involves getting a numbered ball into its correspondingly numbered pocket. Mini pool is just like club pool, but instead of potting spots and stripes, you pot numbers one to three or four to six depending on who pots what first. Lowest and highest simply involves player one potting balls one to three while player two pots four to six; last one out's a sissy.

Built into *Hustler* is a remarkably diligent referee who not only keeps score, but spots fouls and awards extra shots to the opposition accordingly.

Another nice feature is the spin option. Besides hitting the

cue ball with varying force, you can also add top, bottom, left or right spin, with a touch that ranges from ever-so subtle to quite devastating. Theoretically at least, some nifty shooting should be possible here.

I say theoretically not because of some fault with this particular game, but more a failing with all versions of computer pool. None of them even attempt to transpose the real 3D, sideways on view of a pool table in the simulation. Even with the smooth graphics, it's not a simulation at all and it's a rather boring way to spend your time.

As far as computer pool goes this is a very good version, but it just doesn't go far enough.

48K SPECTRUM

KENTILLA

In the footsteps of the great warrior Ashka you trudge round Caraland looking for the evil Grako. Ashka, sadly deceased (and foul play is suspected), is no help at all except that he has left you his sword. Nobody else is much help either; the main feature of the evil Grako's kingdom is frustration.

You have to sort out friend from foe; at the same time you have to navigate through the arid plains and dense forests by means of direction commands that don't always make sense. North and East are treated at one point as opposite directions, and there is more confusion when Ups and Downs come into play. Then there are the objects to be collected, but that's only half the story; finding out what to do with them is another matter.

So far, so familiar. There are 29 commands at your disposal to help you grope around Caraland, and the game includes an editing feature to let you recall and overwrite the last command.

None of this is much help when the Urga-Mauls descend on you in strength. These, you'll find, are the worst of the early

obstacles; the Cavezats fight only in self-defence but need to be bribed to part with any objects; the Ratling Quarg is a run-of-the-mill adversary; and Ogeron, though friendly, is a man of few words. For example, he tells you that Grako is in the Black Tower but stays silent when asked where it is.

Elva, a creature you'll meet again and again as the Urga-Mauls overpower you, appears totally inert until you learn how to get on his right side.

The text is sprinkled with pictures to cover most of the locations.

As the frustration builds, so does the sense of satisfaction in making progress. It seems a perverse way of enjoying yourself.

COMMODORE 64

TERRORIST

It could be the railway station, the airport, the telephone exchange or something more mundane... whatever it is one thing is for sure, the town has got a serious case of the terrorist attacks.

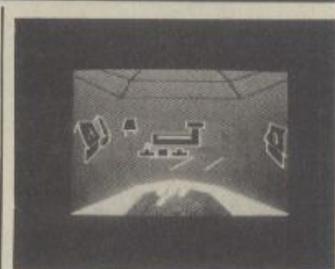

The authorities have called in Red Leader and the anti-terrorist squad.

You have the option of four skill levels: private, sergeant, captain or colonel and doubtless egotism will rule here. As you rush to the main trouble spot, you're given a map of the area.

The longer you take looking at this, the more points you lose from your initial allocation of a million.

To transport you around the attack zone you have the choice of a police car, a boat and a helicopter gunship. You can transfer from one to another by pressing the relevant function keys. They each have their uses, the boat for discovering the rivers on the map, the car for uncovering the roads and the helicopter for rushing to the scene of a terrorist attack as well as transporting the boat and the car to other locations.

Points are scored for uncovering the roads, rivers and the attack locations and lost for

going in the wrong direction or not moving at all.

But in doing all this you have to watch your fuel levels very carefully.

Fuel can be transferred from the helicopter to the boat and the car but don't let the helicopter run out, you have only three at your disposal. All attack areas are indicated by a shell burst and as you reach them the screen changes to show the area in more detail. Silhouettes of the terrorists will appear but you must be sure to shoot them before one of your men does. At the end of the battle the casualties are totted up and the area declared either safe or in enemy hands. How does it end? Well, it's a fight to the death. Excellent.

COMMODORE 64

MAGIC MICRO MISSION

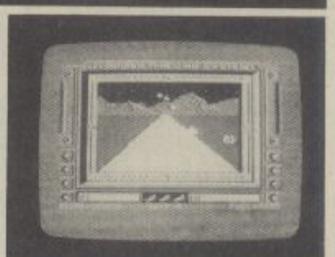

Although based on Central Television's new programme, this one from Quicksilver turns out to be just a couple of old refashioned games, neither of which is up to much.

The first is a Buck Rogers type of affair. Looking down a highway towards some distant mountains, you move a cross-sight to pot oncoming flying saucers. The highway's moving bands of colour do nothing to give the game a sense of movement or depth. If a saucer gets too close, the screen just freezes.

The saucers are stubby, stylised representations and, look more like shopping baskets than intergalactic vessels. While the sound effects are not bad, six screens of pretty much the same fare is tame stuff by today's standards.

Movement is a bit stiff on the second game and the maze is smallish and uninspired. Again, the graphics are fairly crude. The idea is to move Zog, your robot, around the channels dodging the RAM chips and resistors that patrol the area.

The title page is splendid but the game selection instructions disappear off the screen before you have the chance to read

them. The program is not even crash-proof pressing RESTORE and RUN/STOP together doesn't, as with many programs, restart the game but plonks you back into Basic.

No amount of typing RUN will get it going again.

Both games are old hat and look as if they have been written in Basic. They have been done much better elsewhere.

Two for the price of one, even with a splendid title page, is no bargain in this case.

Quicksilver has infinitely superior programs to offer, and it's hard to see why they should want to damage their excellent reputation by pushing this turkey on to an unsuspecting public.

STAR GAME

COMMODORE 64

BOULDER DASH

If there's a game that'll get you hooked it's *Boulder Dash* with its brilliant graphics and sound. You search caves and collect as many jewels in as short a time as possible to go through each mysterious tunnel to the next level.

If this sounds easy, you're in for a shock.

What you need to master this game is strategy and planning — these will help you to detect where boulders are going to fall. And with 16 caves and five difficulty levels you're bound to

be kept busy. If you want to see how to play there's a demo that'll give you a hint.

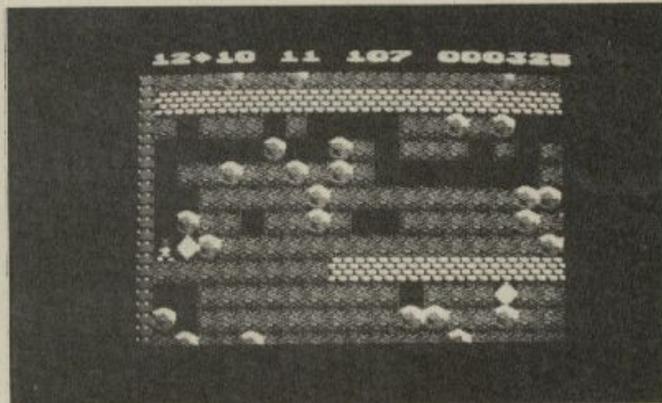

I started in cave A, level one. Then, to a bubbly tune, the screen scrolled backward with boulders and jewels appearing randomly. As if by magic, Rockford appeared with his hands on his hips, blinking his eyes and tapping his foot as if to say: 'Well let's get moving'.

At the top of the screen a tally is kept on your running score, the number of jewels you have to collect to go through the escape tunnel and a timer that starts at 150. You start off with three lives.

Controlling Rockford is just a matter of good joystick control. As he trunches along, shifting boulders with the strength of Atom Ant, the screen scrolls smoothly, vertically or horizontally, in whatever direction you want to go.

You have to work out carefully which of the brown boulders to shift because if you're not careful you'll find that they'll all come tumbling down sending the unfortunate Rockford to an early grave.

The next proved to be a killer, so I paused the action to plan a strategy. But this was to no avail because a warning sound

came on to tell me I was running out of time.

Tackling other caves at various levels was an even greater challenge. In some you have to fight against deadly fireflies, in others there are enchanted walls, butterflies and more. In all Rockford has a lot to keep him busy, when he has to outmanoeuvre fireflies, black growing amoebae, transform butterflies and overcome other obstacles. If you're good you'll get a bonus try for every 500 points.

Completing caves D, H, L and Pentiles you to play a 'playable intermission'. Here you have to zap through four short interactive puzzles — if you complete

them successfully you get a bonus Rockford.

The graphics in each cave are colourful and superbly done. As for the scrolling — well, it gets top marks, it's so smooth. The sound is also done well, and it's faithful to the action on the screen. For instance, when the boulders come crashing down it actually sounds as if an earthquake is about to begin.

Boulder Dash will give you plenty to do, there's lots of choice and a variety and some of the caves are really difficult to master.

SPECTRUM

TROUBLE BREWIN' / SUPER MUTT

This tape is like an old 45, with an A side and a B side. *Trouble Brewin'* is definitely the B side, for in *Super Mutt* Silversoft has created a character to rival Jeff Minter's battling sheep.

Super Mutt flies, leaps, and jumps vertically. Ears pinned back he skims the roof-tops in a quest for energy-giving green apples; defying gravity he vaults from ledge to ledge collecting floating letters that will give him the password to rescue his friend the Pup at the end of the game.

At the same time his remarkable (and energy-sapping) agility comes in handy for dodging various airborne hazards. He lacks fire-power, relying on nimble paw-work to reach his goal, but the letter collection makes this an agreeably educational game that doesn't need any mayhem to be enjoyable.

The graphics throughout are

fine; the quest takes in 24 rooms and 60 landscapes, with a variety of adversaries for the paranormal dog. The game needs patience and a certain amount of ingenuity; the margins for error as you try to keep the dog's energy levels up are slight, and although some of the green apples are easy targets, the aerial bombs in many different disguises are all over the place.

Trouble Brewin' is similar in style, the aim being to collect ingredients and utensils and use them to make wine. There are five stages, all more or less the same — they differ only in the items you have to collect and the nasties you have to avoid.

The brewer jumps, climbs and waddles, but he has none of Super Mutt's charm. Once you've seen one screen full of ladders and ledges, you've seen them all unless there's something outstanding about the graphics. But Super Mutt may be demanding enough to make *Trouble Brewin'* a source of relaxation, especially as you can stay on the five practice screens instead of taking on the whole game.

BBC B

KENSINGTON

About a year or so ago, a new board game, *Kensington*, was a runaway success. It has now been converted for playing on your BBC B or Commodore 64.

Chess and Scrabble apart, board game conversions have not always fared well. *Kensington* is a happy exception, not least because the game itself is so engaging.

It is simple to pick up but can make high demands of the players' strategic skills.

The board consists of a series of triangles and squares, so arranged that they interconnect to form several hexagons. Each hexagon is either red, blue or white.

The contest is between two players, each of whom has 15 counters, blue or red.

The counters are placed in turn on the points of the shapes and thereafter slid along to adjoining points.

Capturing a square or triangu-

le allows you to put the boot in by shifting one of your opponent's counters to any point on the board.

The winner is the first player to capture all points of either a white hexagon or one of their own colour.

It may not sound much but in practice the game is gripping.

The board is attractively represented on screen, the counters being fairly large blobs of colour.

You can use the program to play against another player or pit your wits against the computer on any one of three skill levels. It plays a mean game.

Placing of your counters can only be accomplished using a set of keys as cursor controls — joystick movement would have been better. There are a variety of options including sound effects and being able to watch the computer 'thinking' at any of ten speeds.

Kensington is an excellent game, extremely easy to learn but not one to tire of easily. There are hidden depths to this apparently simple game. If you want to give those grey cells a shake out, this is the one to go for.

Now No. 1 BBC
game on Micro Deal
Top Fifty chart

YOU can go for gold ...with the

Fancy pitting yourself against the world's best at this summer's Olympics?

You can do so without going anywhere near Los Angeles — with the most challenging package of programs of 1984.

MICRO OLYMPICS is more than a game. It's a brilliantly written collection of ELEVEN track and field events.

And because we know we're going to sell many thousands of them we've brought the price right down — to just £5.95.

Ever imagined yourself as another Seb Coe? Then try to run against the world record holder at 1500 metres. And if that distance is too much for you then there's always the 100, 200, 400 and 800 metres to have a go at.

Not much good at running? Don't worry, MICRO OLYMPICS has many more challenges for you. Why not try your skill at the high jump or the long jump?

And if you can't beat the computer at running or jumping then you can always throw things around in frustration! The trouble is that it's just as hard to be a champion at the discus, the hammer or the javelin.

And the pole vault takes the event to new heights!

Yes, it's fast, furious fun, pitting yourself against the world's best times and distances on your micro.

You may not be another Steve Ovett or Alan Wells, but with practice you COULD become the Micro Olympics Champion!

Also available from WHSmith
and all other leading stores

COMPETITION

JOIN THE ELITE

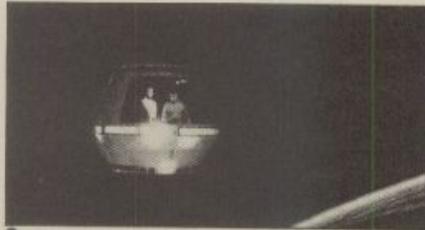

Don't miss this chance to play one of the greatest games in the history of computers — Acornsoft's Elite. We're giving away an Acorn Electron, cassette unit and a copy of Elite to the winner of our exclusive competition. And there are 30 runners-up prizes of disk or tape copies of the game.

All you have to do is identify the film stills below. They're culled from smash science fiction films featuring space travel and computers. To make things a little easier we've listed eight movies — just pick the correct six and match them to the numbered pictures.

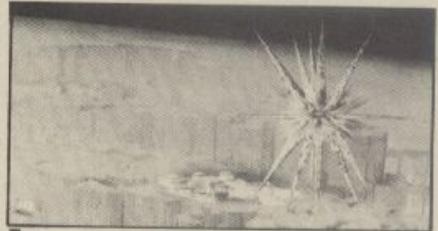

The first all-correct entry out of the hat wins the first prize. The next 30 correct entries win copies of Elite. All entries must be received by Friday, November 23.

PLAY THAT TUNE

Peter Worlock turns his 64 into a music synthesiser with a complex package and produces sounds to rock to all night long.

The Commodore 64 has enjoyed a spate of graphics packages recently; now it appears that the sound synthesiser is about to take the spotlight.

The need for extensive software support is obvious after a glance at the specification of SID — the 64's Sound Interface Device — which features three sound channels, fully programmable ADSR envelopes, four waveforms, full filtering and a range of special effects such as ring modulation and synchronisation.

Any software intended to fully control the complexities of SID is likely to be complex too.

Such is the case with Musicalc. The documentation claims: 'It takes minutes to learn, a lifetime to master.' Possibly, though most of us reckon that many minutes in hours and days.

However, the demonstration pieces on the disk prove that it's worth persevering.

Features

There are two main aspects to Musicalc and they allow you to use the 64 as a music synthesiser and as a sequencer. A sequencer allows you to edit and store a sequence of notes and play them back.

In either mode you have full control over all of SID's features with on-screen displays showing the values for attack, decay, sustain, release, and tempo.

Using the editing modes you can recreate natural sounds or imitate an enormous range of musical instruments. The package comes complete with a set of 32 ready-to-use disk files that give you a built-in orchestra from guitars, pianos, drums, harpsichords and violins to all those weird electronic noises adorning the hits of our times.

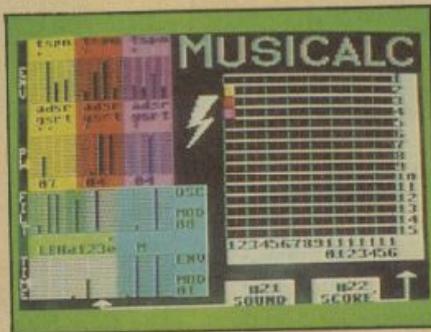

Added to this are 32 music files offering simple jingles and longer classical pieces which you can use, play along to, or change.

Documentation

Given the immense complexity of the subject, the documentation is a model of clarity. After starting with an overview of the package, it gets straight down to business with step-by-step instructions on booting up the program, finding your way round the controls and putting them into practice.

By following the booklet and working through the examples you'll get a good grounding in how to operate Musicalc.

The main 72-page manual is supplemented by a fold-out leaflet touring

the main features, and thankfully there is a glossary and handy guide to the controls — all 114 of them.

In use

This is the crunch — in their attempts to relieve the complexity of SID the programmers have largely substituted one morass of complication for another. Anyone who has used Wordstar will know and loathe its web of control codes and menus. Musicalc suffers from exactly the same problem. For example, the simple task of clearing one voice involves no less than six instructions.

What makes things worse is that for most operations the screen display remains the same, the tunes carry on playing and the only indicator that you are in some particular mode is the border colour. At the same time a multitude of keys perform similar or different tasks, depending on which mode you're in.

Once you've developed some familiarity with the controls you can create some remarkable music. In synthesiser mode you can start from any of the present sounds and tunes and simply add your own accompaniment over the top, or change any facet you like. For example, take a Bach piece. Change one of the

instruments, alter the tempo, add a samba beat, or put in a percussion line — you can do whatever you want. Alternatively, you can start from scratch and set up your own sounds.

Sequencer mode is just as powerful, and complicated. You are allowed up to 255 notes split between up to three voices. In other words, you can have all voices play a piece of about 85 notes, or two voices playing 127 notes, or a bass and percussion track of perhaps 16 notes, with a 240-note melody.

You have a full range of eight octaves to play with. Once the initial set-up routines have been performed, creating the music is fairly simple. The sequence is set out as a 15x16 grid filled in using a combination of cursor and function keys. The bonus is that the voices constantly 'scan' across the grid, so as each slot is filled-in you can hear immediately how your music sounds. If you strike a sour note, simply cursor back and try again.

Those set-up routines are involved but not difficult and allow you to define the start and end point for each of the three voices, giving you immense flexibility in setting up melody line, harmonies, backing tracks, etc.

The real joy of Musicalc comes in combining sequencer and synthesiser modes. For example, you can define a 200-note backing track using two voices as bass and percussion, then switch to synthesiser mode and while the 64 plays the backing, you can play melody.

Verdict

Musicalc is without doubt the most powerful program around for making music on the 64. Sadly, the complexity of using it is directly proportional to its power. Lots of practice will make things easier but it is never going to become second nature.

Its only failing is that there appears to be no way to use the music files you create. Beyond that, Musicalc and your 64 will allow you to experiment, compose and play music until your family and friends beg for mercy.

ESSENTIAL BOOKS FOR YOUR ELECTRON

THE COMPANION TO THE ELECTRON

All **Electron enthusiasts** will find this book an invaluable guide whatever their experience and expectations.

Jeremiah Jones and Geoff Wheelwright have combined their computing expertise to provide an essential reference book which covers the inbuilt capabilities of the Electron and explores the expansion possibilities of this superb machine. Graphics, sound, word-processing and peripherals, games and utilities are all described, explained and analysed enabling the user to unleash the full explosive power of the Electron.

SIXTY PROGRAMS FOR THE ELECTRON

Explosive games, dynamic graphics and invaluable utilities are all featured in this new book.

The most successful software writers have pooled their talents in this specially commissioned collection which takes BASIC to the limits and beyond.

Whether you are a games player or a serious user here's the book to make your micro work for you.

Where can you get them?

From all good bookshops. Or fill in the coupon below and return it to Pan Books Ltd, FREEPOST, PO Box 109, 14/26 Baker Street, High Wycombe, Bucks HP11 2TD.

For immediate 24 hour service phone 01-200 0200 and use your credit card.

PICTURE THIS, MAC

Apple's Filevision for the Mac files by using pictures. Sounds childish? Geoff Wheelwright says it works very well.

When Apple's Macintosh first appeared, there were great pronouncements about how many companies were going to be producing software for the machine and how the Mac would be setting the 'next' software standard.

As it happened, many software companies still hadn't finished with the 'old' one (PCDOS on the IBM PC) and the Macintosh had to learn to co-exist in a multi-standard world. The very fact of this multi-standardness meant that the first few software packages to appear on the Mac were conversions of successful IBM PC programs — and thus were not necessarily designed with the idea of making the most of the Mac.

Programs such as Microsoft's *Multiplan* (financial planner) and *Word* (word processor) were no doubt powerful programs, but they were not designed exclusively for the Mac. The question was always, 'how can we make more of this PC feature on the Mac?' — instead of building the system from the ground up.

Despite all the companies offering software support for the machine, the most inventive program to take advantage of the machine's unique talents so far has been Apple's own *MacPaint* — the painting program which comes with the machine.

Mac users have been waiting for months for the next 'MacPaint' — a piece of software that will truly exploit the high-resolution graphics and the 68000 that lies at the heart of the machine. Well, you'll be happy to know that a product which claims to do just that has

now arrived. It's 'a picture-oriented database' known as *Filevision*.

Features

Filevision is a database that looks nothing like a database. Its closest relative is the cardbox program developed on the touch-screen HP-150, where you are shown a screen-representation of a card file and you point at the card you want — but Filevision goes one step beyond that.

A traditional database has field names and records which are contained in each of those field names. Filevision uses 'field pictures' instead — each represents a category of information and can be accessed simply by moving the on-screen pointer to the appropriate picture and clicking the mouse button.

In use

As with all Californian products, the first example database on Filevision is 'Mellow'. It involves using the program to keep track of all those lovely bottles of Californian wine in the wine cellar (of course you've got one, hasn't everybody?).

When you open the 'Tour' file, you're presented with a MacPaint-style screen that contains drawing icons down the left-hand side of the screen and a wine-cellar pictured in the middle, complete with racks and wine bottles.

Each of the wine bottles, the wine bins and the wine cellar itself is considered an 'object' in Filevision parlance. So to get information about a given bottle of wine, you first use the pointer to choose 'wine' from the 'object types pull-down menu' and then select a wine bottle with the 'object selector' arrow.

There are two types of on-screen arrows, the object selector and the

element selector. An object is a picture, which can be made up by a number of elements (if you've drawn a house, for instance, you might have the roof and door as separate elements in the 'house' object). It sounds complicated for a supposedly user-friendly package, but when you're using it all does, in fact, make sense.

Getting back to the bottle of wine (the one on the screen) — once you've selected the wine bottle, a title for the wine will appear on the bottom of the screen and you can get more information on it (ie the whole record) by clicking the mouse button twice. You'll then see a standard cardbox-style card with information about the wine's colour, year, price, how many bottles of the plonk you've bought and other necessary information.

Filevision has all the standard sort of database mixing, matching and report facilities, but its biggest strength lies in letting you easily develop graphic symbols to represent groups of bits of information. Aside from the standard collection of lines, boxes, polygons, letters and patterns (as with MacPaint) you also get a whole range of pre-defined shapes through a 'Symbols' menu that contains 20 sprite-style characters including a telephone, a bicycle, a skier, a car and a pith helmet (or maybe it's a birthday cake — it's hard to tell). There is also a strange 'typeface' called Cairo which contains an additional set of shapes ranging from funny faces to standard household appliances.

Verdict

Filevision is a wonderfully inventive package that offers the opportunity to change the way people think about databases.

My only concern has more to do with the Macintosh than the package itself. Because the Filevision pictures in database files take up lots of disk storage and need lots of memory, the average 400K single-drive Mac with 128K will have trouble making the most of it. Filevision would, however, be a superb database to use with the 512K 'Big Mac' and a hard disk system.

As it stands, however, Filevision will easily handle the organisation of wine cellars (and other similar jobs) up and down the land — whether they're stocking Californian wines or not.

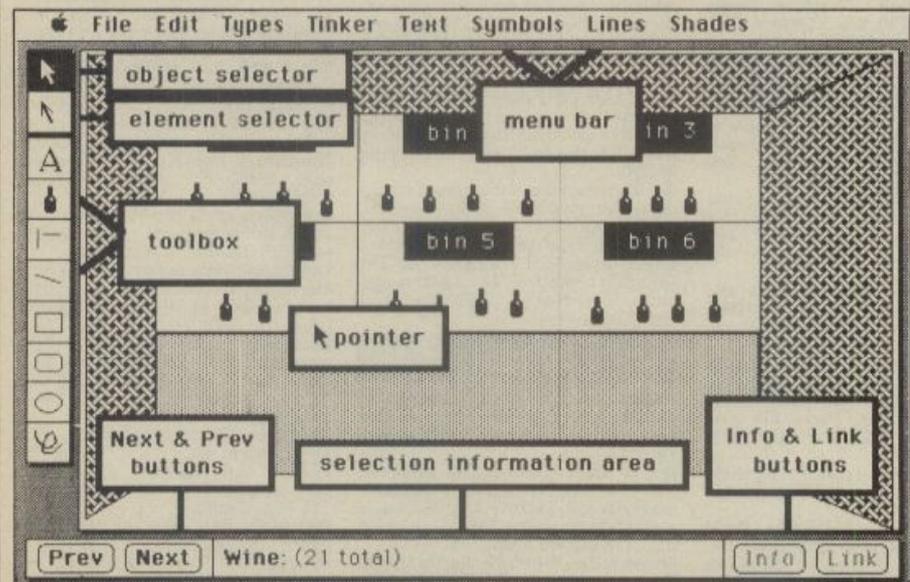

Diagram of the Filevision screen: functions and facilities.

Abingdon, Oxon.
or Tel: 0235 28359
for further information.

WDS software

QL Utilities (£10 on Microdrive)

This package offers single-key loading, running or deletion of files, multiple formatting of cartridges, and auto backup of files from one or more cartridges to another with optional over-writing of namesakes. In addition, a directory of 60+ files can be viewed without screen overflow. NB a VERIFY program is unnecessary — QDOS does this automatically. Now includes directory print-out and 'qprint' to print any or all files on a cartridge with optional dated titles. Owners of the earlier package can update by sending OUR cartridge and 25p.

Current Spectrum Software

Tradewind (£5 Cassette)

Buy a ship, provisions and cargoes to trade between the harbours of the Coral Islands. Make a fortune if the weather and pirates let you live long enough to master seamanship and economics. A strategy/adventure game with graphics for 48K.

Jersey Quest (£5 Cassette)

Following an accident, you are stranded in the labyrinth of time and must find your own way back to the present with the aid of persons and objects from Jersey/Folklore. Meet the Black Horse of St Ouen, the Dragon and Knight of La Hougue Bie, the Black Cat of Carrefour a Cendre, the Witches of Rocqueburg and many others. A text-only adventure for 48K in machine code (Quill).

Morse Tutor (£4 Cassette)

This one has it all! 4-19 words/minute, variable spacing, variable number of groups of random letters numbers or mixed, random sentences, own message, single characters (including punctuation), variable pitch, FEEDBACK via screen, printer or SPEECH (phonetic alphabet via Currah w/Speech on 48K version only), and repeat facility. Takes you to and beyond RYA and Amateur Radio receiving standards. 16K and 48K versions on one cassette, 48K only on Microdrive cartridge.

Spectrum Programs on Microdrive

All the above are available on Microdrive cartridges at a price of £4.50 for one cartridge + the price of each program as shown above. E.G., a cartridge with Tradewind and Morse Tutor would be £13.50. As a bonus, Gavin Monk's Indexed Loader is included free with each cartridge.

On the other end of the line

Every now and then a magazine editor has a bright idea. In most cases the assembled minions gratefully frame it, but sometimes this idea is fairly easy to implement, and it therefore makes it into the paper.

One hardy perennial (we didn't say they had to be original ideas) is the list of useful statistics/phone numbers. 'Think of all those readers with bent machines out there,' cries Scoop excitedly. 'If we printed a list of the phone numbers of the major home micro companies they'd be eternally grateful.'

And so it comes to pass. But what Scoop doesn't realise is that phone numbers are a bit like fresh vegetables — they go off.

Step forward *Your Computer*, proprietor of 'Hot lines,' which has apparently remained unchanged since it was unearthed along with the ten commandments.

This handy little tool for the readers lists numbers for ten micro manufacturers. These include Dragon Data (gone bust, number unobtainable); Camputers (ditto); Commodore (number unobtainable, but

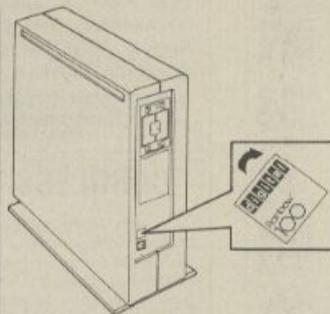

rumoured to be still trading); Texas Instruments (line still works, but has gone a lot cooler since the company pulled out of home micros) and Atari (number perpetually engaged when we tried).

Prizes go to Acorn, Sharp and Tandy, who still answer their phones, and if it helps the hard-pressed staff of YC the new number for Sord is 01-631 0787. Sinclair's new number is 0276-685311, and sub-editors should be made aware that the dialing code is Camberley, not Cambridge.

Have you heard the one about...

PCN's Lidless Eye department spotted a bizarre snippet in the US magazine *Popular Computing* the other day. Apparently our American cousins are getting into a lather about possible MSX invasions, and the good people at *Popular* consulted a number of companies, Spectra-video among them.

Here we pass the story over to the Oh, What a Whopper department. A Spectra-video executive told the paper that while the machines hadn't gone down too well in the States, the company had a 15 per cent market share in every European country.

In the forefront on micro fashion

A copy of Digital Equipment's Rainbow installation guide dating from January 1983 should probably start 'First find your Rainbow,' but page 48 is the really interesting one for followers of micro fashion.

In issue 79 we hailed IBM's swivelling logo as a major step forward in micro design. You can't win them all — DEC was there first. Thanks to Mr Heinrichsons of Wokingham for pointing it out.

The real breakthrough, of course, will come when pioneering manufacturers like DEC and IBM are able to offer swivelling disk drives so that when you tilt the unit to stand upright on the floor none of the data will drop off your floppies.

SYNTAX ERROR

In last week's review of Pyjamarama we mistakenly gave the name of the publisher as Automata. It is, of course, Mikro-Gen (0344-427317).

Last week's look at the Microsound 64 Keyboard for the Commodore 64 ended cryptically 'Price to be announced.' To put your minds at rest, it's £169. The official distributor is Auto-graphics on 0491-575469 — Tomorrow's World Today is a stockist.

In Monitor we quoted a Microsoft spokesman as saying: 'Microsoft in the UK was never intended to play a major part in the promotion of MSX.' We acknowledge that a word got lost, and that what he actually said was: 'Microsoft in the UK was never intended to play a major part in the promotion of MSX machines.'

NEXT WEEK

MSX lands

Toshiba and Goldstar have won the race to bring MSX micros to Britain. We Pro-Test both of them in a loose-coupled double header.

Gamesmanship

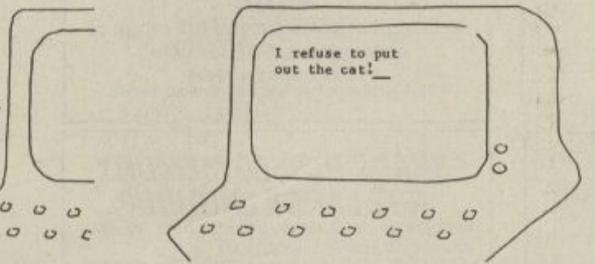

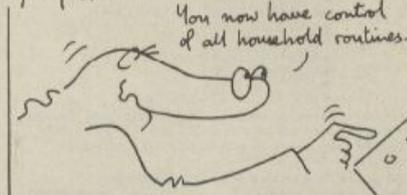

Maybe you didn't win an Amstrad from us at the PCW Show, but here's another chance to play the popular PCN game.

Output

There's a mastermind program for Spectrum owners, football on the Commodore 64, and the concluding part of the Amstrad sprites implementation in our DIY section.

THE FIRST GENERATION of Eye-friendly Filters.

Treat your eyes to a Romag CEAF. Only £19.95

Unique technology: British made laminated glass, aspherically curved Contrast Enhancement Antiglare Filter.

Up to now, contrast-enhancing filters have always been flat—and so has their performance, because the screen of your TV, monitor or VDU is curved.

Up to now, most filters have been plastic—because it takes mindbending technology to bend optical-quality laminated glass.

Up to now, filters have been expensive—awkward production techniques have meant price tags from around £50 to well over £100.

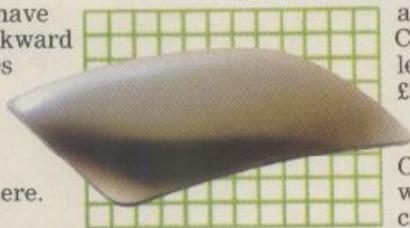

Forget all that: the Romag CEAF is here. British designed and manufactured by space age military technologists, CEAF is profiled to fit your display screen, giving you the ultimate in contrast enhancement and antiglare performance. For under £20, this first generation of eye-friendly filters diffuses all specular reflections, gives sharper image clarity from edge to edge of the screen and greatly enhances display colours.

Mounted and removed in seconds by invisible velcro fastenings, the anti-static, anti-shatter CEAF is a major step forward in the operational safety of

computer displays—unprotected screens can cause blurred vision, watery and itchy eyes, headaches and (according to such authorities as the Institute of Ophthalmology) even permanent changes in eyesight.

Scratch-resistant, durable and easily cleaned without expensive sprays and agents, 9", 12" and 14" CEAFs are available from leading retailers at only £19.95 including VAT.

Or fill in the Freepost coupon and your CEAF will be despatched within 48 hours. Orders can also be placed around

ROAD PROG by courtesy of Ocean Software.

MTA 4628

the clock by phoning the CEAF Department on (091) 414 5524, quoting your Access Card number. For other screen sizes, please ring or write—the CEAF prices for 'specials' would be considered very competitive.... if there was any competition!

How to teach your Micro a thing or two

Thousands of home computer owners have yet to discover their microcomputer's potential to help with many of the problems and decisions that come up every day in the home or office.

Perhaps you have always promised yourself that you would teach yourself programming, but have been put off by manuals which seem to assume a lifetime spent studying computer science and mathematics. Maybe you have looked at other computer books, but have yet to find one which is free of unnecessary jargon or where the program examples bear some relevance to real life and not space invaders.

Relax, your search is over.

The 'Learn BASIC' tutorials from Logic 3 are the latest development of a teaching method pioneered by Professor Andrew Colin and perfected

by testing on 3 generations of students at Strathclyde University. The 'Strathclyde Method' has been translated into 8 languages and used by over 300,000 microcomputer users.

'Learn BASIC' is a jargon free, step by step, course in computer programming, which explains everything clearly in English, not computer talk. In a matter of hours you will be writing your first programs.

'Learn BASIC' is designed for people who want to keep abreast of the computer age, for people who realise that understanding computers is a key to future success at work, at school, and as a parent.

Get 'Learn BASIC' and teach your micro how to be useful! (Available from major branches of W.H. Smiths, Boots, Laskys, Greens, John Menzies and better computer shops nationwide.)

Please send me more information about your:-

(Tick appropriate box)

- 'Learn BASIC' tutorials
- Logic 3 Spectrum Club
- Logic 3 Commodore Club (64 and VIC owners only)

I have a:-

- Sinclair Spectrum
- Commodore 64
- Acorn Electron
- BBC Microcomputer
- Dragon
