35p 30 December 1982 Vol 1 No 36

This Week

Vic20 software

Mike Grace looks at some of the latest arcade-type games available on the Vic20. See page 12.

6502 disassembler

David Angier presents a disassembler program which can be used for all 6502 based micros. See page 23.

The Hobbit

David Kelly talks to the men who produced *The Hobbit*, a new graphics adventure game for the ZX Spectrum, on page 11.

Dragon repeat

Peter Chase explains how to produce autorepeat keys on the Dragon and presents a simple Invaders program on page 25.

News Desk

Prime Minister Margaret Thatcher.

IT — the race we must not lose

THE Prime Minister, Margaret Thatcher, has warned that many jobs will be lost if British companies do not adopt information technology and compete successfully with other countries.

Speaking at the opening of the IT '82 Conference at the Barbican Centre in London she said "If we lose this race (to adopt new technology) we shall be priced out of not just particular products or processes,

but out of whole industries.

"The Japanese electronics industry alone is now producing goods worth more than £9bn a year. Nothing can stand in the way of a similar success story in the UK except ourselves" she said.

In her address Mrs Thatcher drew attention to the "outstanding success" of Sinclair Research. The company is ex-

Continued on page 5

Ace comes up trumps

FORTH goes to the high-street as the only low-cost micro to use the language — the Jupiter Ace — begins to be sold retail.

From mid-December the machine has been available through specialist micro-computer retailers and selected branches of Laskys and Debenhams.

The machine is being sold at £89.95 complete with manual, demonstration tape and the necessary leads. Previously it has only been available by mail-order.

Michael Scott, managing director of Micro Marketing who are handling its distribution said "All production until mid-January has been accounted for and production is being stepped up to almost double.

"We are looking to take 25 percent of the market for micros costing under £100" he said.

In January the company will also be marketing a range of games and utility software for the Ace.

BATTLESTAR IS COMING — SOON

*****SPECTRUM AND ZX81 SOFTWARE*****

Specialists in high quality intelligent games.

*****SUPERCHESS*****

Play against the most powerful ZX chess program. •10 levels of play •choice of positional or tactical evaluation •substantial book of openings, e.g. French Defense, Sicilian, Ruy Lopez, Queen's Gambit •high quality display with hi-res, pieces and board, list of moves, playing level. Many more features too •self-play •recommended move •analyse. Each cassette comes with full instructions.

16K ZX81 £6.95 48K SPECTRUM £7.95

*****DRAUGHTS*****

Did you know that a computer draughts program has beaten the world draughts champion? Draughts is an ideal game to apply tree searching techniques to. Our program analyses each position in depth, making it a formidable opponent. Choice of colour, 10 levels of play, at level 5 (response time —20 seconds) it beats its own programmer!

16K ZX81 £6.95 48K SPECTRUM £7.95

*****BACKGAMMON*****

Play this fascinating game of skill and chance. High resolution colour display, with dice roll. Can be used by expert players and also has documentation to enable beginners to learn the game.

48K SPECTRUM £6.95

*****SPECTRUM SPEECH*****

Yes it's possible! Software driven speech from the Spectrum. Simple to use in your own programs. Each cassette comes with user documentation and demonstration program. No extra hardware is required, uses Spectrum speaker and top 32K Ram. SOFTALK 1 "Maths Multiwords" 60+ words (0 to 1 million, plus, add, go, limit, right etc.). SOFTALK 2 "Spacegames" 60+ words (numbers, red, alert, damage, fire, torpedoes, bearing, south etc.)

48K SPECTRUM £6.95 each

*****SPECTRUM ASSEMBLER*****

An essential aid for m/c programmers. User documentation supplied with each cassette.

16K and 48K SPECTRUM £4.95

All prices are inclusive. Dispatch within 48 hours of receipt of order. Send cheque or postal order (and state whether ZX81 or SPECTRUM) to:

DEALER ENQUIRIES WELCOME

HORSE RACING (Derby Day) for the 48K Spectrum

ONLY £6.95 inc p&p

Gambling on any horse in the field up to 5 players can lay bets with Honest Clive Spectrum the bookmaker as the horses circle in the parade ring. Will Clive keep that smile? Watch the race begin as the tape lifts and marvel at the amazingly realistic 3D perspective animation as the riders jockey for position. See the horses and riders in full flight as they pass Spectators (no pun intended) and into the home straight past the stands. Hold your breath at the slow motion finish. Sound and Colour is used to its fullest in this 22K of superb programming. Not recommended for compulsive gamblers.

Soon to be available in W. H. Smith

ST GEORGE AND THE DRAGON for the Dragon 32 ONLY £6.95

Can you slay the fire-breathing dragon? Can you cross the slippery bridge and smite the magic stone to lift the curse from the castle and its beautiful maidens? Don't get roasted by the dragon and mind the river and pond. If you fall in, your armour will send you to a watery martyrdom. Two versions for Joystick and keys are contained on the tape. Using sound, the program also pushes the Dragon High Resolution to its full capabilities.

JACKPOT for the 48K Spectrum ONLY £4.95

A complete simulation of a popular fruit machine, using definable graphics to the fullest. It contains a complete introduction to the rules of its HOLD, NUDGE, GAMBLE and FEATURE BOX with animated demo. Memory mapped reels, simultaneous revolution, staggered stop, animated bet and payout, payout board and realistic sound effect re-create the original. A must and a wallet saver for any fruit machine buff.

Soon to be available in W. H. Smith

RESCUE for the 48K Spectrum

ONLY £5.95

How can we summarise in a short ad, an adventure game that needs a Special Program to detail its Rules! Very, VERY simply, you must find the Map and Radio then plot your route and monitor patrols as they scour the 40+ locations you are travelling through. If you have the right equipment you can cross into Secret Territory in search of the Castle and the imprisoned Princess. If you manage to find it and gain entrance there are many trails and tests. If you manage to find the Princess you must still return to base with her. Utilises all the Spectrum's facilities and takes hours to play.

THE ORB for the 48K Spectrum

ONLY £5.95

Quite simply The Orb brings the world of Dungeons and Dragons to your Spectrum. You must find The Orb and its Base and Studs so that the Kingdom can bloom again. Choose your role, as a Wizard, Mercenary or Philosopher etc. With a myriad of monsters, excellent sound and graphics, real time battles and a complex and evil land which will only give up The Orb after hours or most likely, days of enthralling play. Save facility provided for Survivors needing food or sleep.

Soon to be available in W. H. Smith

HANDICAP GOLF for the Dragon 32

ONLY £6.95 inc p&p

An 18 hole, 1 or 2 player handicap game. There are Bunkers, the Rough, Lakes, Trees, Gorse Bushes and Gusting Wind which all have to be taken into account as you choose the strength and direction of your shot. The Computer decides the length of the hole and its par, making sure you never, EVER play the same hole twice. Watch the Dragon 32 build up the hole in a fascinating graphics routine. Full use of sound and colour.

How to submit articles

Articles which are submitted for publication
should not be more than 3,000 words long. The
articles, and any accompanying programs,
should be original. It is breaking the law of
copyright to copy programs out of other maga-
zines and submit them here — so please do not
be tempted.

All submissions should be typed and a double
space should be left between each line. Please
leave wide margins.

Programs should, whenever possible, be
computer printed.

We cannot guarantee to return every submit-
ted article or program, so please keep a copy. If
you want to have your program returned you
must include a stamped, addressed envelope.

Accuracy

Popular Computing Weekly cannot accept any
responsibility for any errors in programs we
publish, although we will always try our best to
make sure programs work.

Editorial

Those of you who have been watching
Shogun will be familiar with the story
of Captain John Blackthorn, the 16th
century Englishman who goes to
Japan and becomes a Samuri.

Twentieth-century Japan, the land
of the rising micro, is a very different
world to its 16th century counterpart.
Today's Samuri is more likely to be a
corporate salesman, selling cars and
electronics goods to the rest of the
world.

Instead of moaning at Japan's suc-
cess, we should be selling our goods
to them. Sinclair, via an agreement
with Mitsui, is the only British manu-
facturer selling micros to the
Japanese in any quantity. And even
Sinclair is not doing as well as it might.

Similarly, there are few, if any,
British software houses, selling their
programs in Japan.

There is a large potential market in
Japan, for both micros and software.
But, to succeed in that market, British
companies will have to go to Japan
and actively sell their wares.

The Japanese are not going to beat
a path to our door. It is up to us to
adopt a Samuri approach.

Next Thursday

Are you an arcade addict? Can you
stop the aliens from penetrating your
defences? Find out in *Missile Com-
mand*, a new game for the ZX Spectrum
by Chris Wood.

Also next week, Kevin Griffiths ex-
plains how to transfer data from one
program to another on a ZX81. And G
Morton presents a graph plotting
routine for the Dragon 32 which repre-
sents data on an x,y scale.

IT conference

Continued from page 1

pected to show a £50m turn-over next year — a hundred-fold increase over the corresponding figure for 1979. She also noted the importance of software in the application of microcomputers in this country. As well as considering large companies such as Plessey, Mrs Thatcher singled out Bug-Byte as an example of a successful smaller software house.

The IT '82 Conference, held on 8-9 December, marked the official close of IT '82 Year in Britain. Viscount Davignon, Vice-President of the European Commission, Kenneth Baker, Information Technology Minister, and Alan Benjamin, Chairman of the IT '82 Committee were among those who addressed the conference.

£½m boost for primary school software

LOCAL Education Authorities may be given a grants boost next year to help them develop software for schools. The Department of Education hopes to increase its Micro Electronics Education Programme budget by £½m to £4.3m in 1983.

Most of the projected increase is expected to be used to develop software for use in primary schools as a back-up for the Department of Industry's Micros in Primaries Scheme.

At present only about 50 programs are available for primary schools to use. This compares with over 300 designed for secondary education.

Record hire ban bodes ill for software libraries

EMI has won a High Court action prohibiting a record retailer from hiring out its records.

This first successful legal action against a high-street 'lending library' has possible implications for companies currently offering a similar service for computer software cassettes. Home copying of tapes hired from such companies is causing concern for the software industry.

Push-button keyboard

AN inexpensive solution to the problems of the ZX81 keyboard is now being offered by the London-based company, Filesixty.

The Buttonset is a push-button keyboard for the machine costing less than £10. Fixing the unit requires no modification of the ZX81. It simply locates over the machine's existing keyboard, and is held in place with self-adhesive strips on its underside.

When a particular key on the Buttonset is selected a specially moulded dimple is

pressed against the, corresponding portion on the ZX81's membrane board.

"Most people buy the ZX81 as their first computer to find out what computing is all about" said Filesixty's William Watson.

"Our Buttonset makes using it very much easier at a price which is a comparatively small proportion of the cost of the machine itself."

The Filesixty Buttonset costs £9.95 (inc. VAT and p&p) and is available from 25 Chippenham Mews, London W9.

Microvitec wins industrial achievement award

MICROVITEC, the Bradford-based video display unit manufacturers, has won the 1982 Industrial Achievement Award.

The company was selected from among 10 regional finalists by the IAA jury, chaired by Sir Monty Finniston.

Presentation of the prize — a silver trophy and £15,000 cheque — to Microvitec Chairman Tony Martinez by Sir Jeremy Morse took place on 1 December.

In 1979, after ending its first year of trading with a £188,000 turnover, Microvitec has grown rapidly to become the UK's leading supplier of col-

our video display units. In October this year the Department of Industry selected the company's Low Complexity Colour Display for use in its Micros in Primaries grants scheme.

Competition winner

JEREMY Hill of Wimbledon has won a Jupiter Ace in our *Better than Basic* competition.

His winning entry, written in Prolog, was a program to determine the name, atomic weight, number and symbol of various elements. Co-judge Steve Vickers commented that the program "demonstrated how a non-Basic program could do some jobs much faster than an equivalent Basic program".

Other competition entries worthy of mention include M Graven's dictionary program, written in Forth, and Bentley Thomas's Towers of Hanoi program, written in micro-Forth.

One micro per school

JUNIOR Information Technology Minister, John Butcher, has rejected a demand that the Government's micros in Schools scheme should be 'more flexible'.

Austin Mitchell, Labour MP for Grimsby had urged the Government to consider extending its schools schemes to include more than one micro per school. In particular Mitchell asked for the schemes to be changed to allow schools to vary their purchase within the specified range of equipment but up to the cost of the most expensive machine currently allowed."

The most expensive option that a school can choose is the Research Machines 480Z package. At £922 this is almost exactly double the cost of a similar package (with colour monitor) using the ZX Spectrum. With a monochrome monitor the Spectrum option is only £346.

In rejecting the move to give schools the choice of buying two Spectrums rather than one RM480Z Butcher warned that it would lead to an increase in the cost of the scheme.

IBM v Hitachi action rested following deal

IBM has temporarily halted its US civil legal proceedings against Hitachi in the IBM 'secrets theft' case (see *Popular Computing Weekly*, 8 July).

In return Hitachi has agreed to hand over to the court the allegedly stolen material for use in the criminal trial that was proceeding at the same time as the civil action.

Eighteen employees were accused in June of acting illegally in acquiring confidential information concerning IBM's new 3081 computer and 3380 disc drive.

Under the civil suit, now stayed, the eighteen were charged with conspiracy, unfair competition, copyright infringement and racketeering. If IBM is satisfied with the material handed over to the courts then it will suspend its civil action until 20 days after the criminal proceedings are resolved.

RAM SOFTWARE FOR VIC-20

ELECTURE allows you to draw+store electronic circuit diagrams from R-C networks to logic. 128 circuit symbols, 4 way scrolling over 66 x 69 drawing area, examples and instruction program free. M/C code aided. £10.95 11K

MEDUSA monitor / assembler gives you access to VIC-20 machine language. Functions are:- Move, Execute, Dump, Unassemble, Save, and Assemble code. £9.95 6K

MEDUSA 2 machine code version of above, faster, smaller, resident, more functions, relocatable. £11.95 3K

RENUMBER allows you to alter line numbering in a BASIC program, insert lines, tidy up finished programs, and save precious bytes. £5.00 Less than 1K

Linsac's ZX Companion series has received excellent press reviews:

"Far and away the best" — *Your Computer*

Thoughtfully written, detailed and illustrated with meaningful programs ... outstandingly useful" — *EZUG*

'The Spectrum Games Companion' is the latest addition to the series and is aimed at the games player and programmer alike. Twenty-one games designed specifically for the ZX Spectrum are included, with clear instructions on entry and play. Each program is explained fully with complete details on how it is designed and written. Introductory chapters show how to set up and use the Spectrum and how to create your own games. Later sections cover number games, word games, board games, simulation games, dice games, card games and grid games. If you want to enjoy your ZX Spectrum and learn its secrets at the same time then this is the book for you!

Bob Maunder is co-author of 'The ZX80 Companion' and author of 'The ZX81 Companion'. He is a Senior Lecturer in Computer Science at Teesside Polytechnic, holds an MSc degree in Computer Science, and is a Member of the British Computer Society.

The Spectrum Games Companion is available from good book shops, or send £5.95 to:

Library fines overdue

I am writing to express an opinion which I know cannot be unique in the software business. In the last few months several 'software libraries' have come into existence, some of which have bought advertising space in your magazine.

These libraries make their living by buying commercial software and then hiring it out to anyone who wants it for a fee ranging from £1.50 to as little as 50p. I consider this hiring to be little short of a do-it-yourself piracy scheme, for the people running these libraries know full well that it is the easiest of tasks to link two cassette records (if the program cannot be broken into) or even to Save a borrowed program direct from the computer and then to send the cassette back to the library.

As far as I know, many (if not all) of these libraries do not pay any royalty whatsoever to the producers of the cassette for the privilege of lending out software that has taken large amounts of work and money to produce.

While I accept that some book libraries do not pay the publishers, this can in no way be used as an excuse by the software libraries. For a person to copy a 200 page book would cost between £5 and £10 in photocopies and a great deal of time on a conspicuous public photo-copying machine, whereas to copy a program worth £5 or more takes only a blank cassette (50p or less), a domestic tape recorder and a few minutes of your time.

Without the attraction of copies of the best commercial software for only £1 a time, I doubt very much whether some of these libraries could find enough customer support to stay solvent.

My criticism of this appalling situation is tempered with advice. I strongly urge that the following should be done before the 'library bandwagon' gets out of control:

- (1) All software producers should follow 'Quicksilver's' example and include in their cassette packaging the words "Unauthorised copying, hiring, lending, public performance and

broadcasting of this cassette is prohibited".

- (2) An association of software libraries should be formed. All member libraries would have to obtain permission from and negotiate a payment to the publisher (on a royalty basis or otherwise) of any program that they wished to lend.
- (3) Any library who refused to join the association (the sole purpose of which would be to ensure 'fair play' between libraries and publishers) should be banned by the press from advertising the library in all microcomputer publications.

The above proposals are not as radical as they might seem. As a publisher yourself, you must know that the Advertising Standards Authority has worked particularly effectively over the years in all areas of the printed press, and anyone who 'steps out of line' (such as Mettoy with their 'Read this ad to your wife' advertisement) withdraws the offending advertisement on receipt of enough complaints.

I hope the above suggestions will be of some use in resolving the current situation of software libraries profiting too much from other people's work.

David Webb
(Software Author)
Southholme
9 Park Road

Surrey GU22 7BW

This is an issue which is rapidly growing in importance. The number of software libraries springing up, which do not pay any sort of royalty for the cassettes they hire out, is alarming.

The legal position of these software libraries is unclear. The law, unfortunately, has yet to catch up with the micro revolution. And the government is unlikely to do anything in the immediate future.

As we said in our editorial of November 18 "Irrespective of the legal position, software libraries should be morally obligated to pay royalties (preferably at least 20 percent) to program authors".

David Webb has made a number of constructive proposals which, if followed, would do much to alleviate the prob-

lem. We would be very interested to hear readers' reactions to his proposals.

We also think that David Webb has inadvertently highlighted another problem. At the moment, software authors can only speak as individuals. They have no one to represent their interests.

Why not take a leaf out of the British Micro Manufacturers Association and form a British Micro Software Authors Association? Such a body could represent its members interests on such fraught questions as copyright and software libraries. And, where governments and companies tend to ignore individuals, they are often more receptive to organised pressure groups.

Dragon colour scheme

I bought my Dragon a few months ago now and have found out one or two useful things which are not in the manual that I think might interest you. If you want to print in red letters on an orange background, instead of the dreary old black on green, then try this little program:

```
10 REM**RED ON ORANGE**
20 PRINT "THIS IS IN RED ON AN
ORANGE BACKGROUND"
SCREEN 0, 1
30 GOTO 30
```

As you can see it's the Screen command that does the work. If you have the print statement after the Screen, it defaults to black on green.

Also, do you know of anybody who has started a Dragon Owners Club who would like at least one more member? PS For a fault in the Rom try 10 CLS(J) where J=9. The top of the screen prints out something that shouldn't be there!

'ear 'ear my friend

I have recently received my long-awaited Spectrum. On reading the chapter on Saving, the manual confirms what one of your readers described as a 'design fault', ie the removal of the ear lead before Saving. As I use an Hitachi TRK 5280E stereo/cassette radio, it occurred to me that I might be

able to use the L/H channel for loading and the R/H channel for Saving. In practice, this just achieved loud squeals.

However, I discovered that if I used the L/H ear and the L/H speaker sockets and just turned the volume down while Saving, it works perfectly and no unplugging leads. To Load just set the volume to normal.

I doubt it will work for all recorders as Sinclair explains in the booklet, but it is worth trying even if it is to save that inevitable loose plug connection.

Manual bugs wanted

Having just had a look through a friends' Spectrum manual, I feel I must tell you of a 'bug' in it. It's not a drastic error, though it's rather a stupid mistake which might cause a few red faces in Sinclair circles. Have a look at page six where you are shown how to set up the Spectrum. See it? The keyboard is not that of the Spectrum. Anyone with previous ownership of a ZX81 may recognise it. Yes folks, it's an '81 keyboard. Can anyone find a better 'boob'?

Another point. I have just bought issue 29 of Popular Computing Weekly. Where has the cover gone? What's happened to the full colour artwork? Without a decent cover Popular Computing Weekly looks like the Beano. Come on. Pull your socks up. This just isn't good enough.

PS: Bring back Citizen Pain!! (please).

Glasgow G73 5PS

I am afraid the cover has gone the way of Citizen Pain. Dispensing with the cover has enabled us to give you more news and programs than before, which is what most of our readers seem to want.

If you have an opinion you want to express, or have spotted an error that needs correcting, write to: Letters, Popular Computing Weekly, Hobhouse Court, 19 Whitcomb Street, London WC2.

Dim Nim

A new game for Vic20 by Czes Kosniowski

Dim Nim is a game for two players. As the name suggests, it is a disguised version of Nim.

On a chess or draughts board appear eight hearts and eight diamonds. One heart and one diamond in each row. The

two players choose between hearts and diamonds.

Each player, in turn, chooses a row and moves his or her piece anywhere within that row — but without jumping over the opponent's piece. The game ends when

the pieces in each row are next to each other. The player creating this state wins.

The piece that can be moved is flashing. You can move it by pressing:

L for LEFT, and/or

R for RIGHT.

If you want to move a different piece instead, press:

U for UP, and/or

D for DOWN.

When you have decided which piece to move and where to move it to, press *.

The program will Run on any Vic20, expanded or not — line 11 takes care of the necessary changes. The many Rem statements explain the program.

And now for the big picture.

TRADER A trilogy of 16K programmes that combine to give an epic 48K graphic adventure. As a galactic trader, you deal with some very bizarre customers indeed. Will you live to tell the tale? ZX81 £10.50. VIC20 £18.50 (tape or disc).

SUBSPACE STRIKER Our top selling, big screen graphic game. With your deadly Antimat torpedoes, you unleash havoc in the Federation spacelanes and try to dive back to the safety of subspace, fast. ZX81 £5.50. VIC20 £9.50. 16K.

STARQUEST A voyage of discovery and adventure in the cosmos. With the help of your onboard computer, you seek a habitable planet amidst the perils of deep space. ZX81 £5.50. VIC20 £9.50. 16K.

ENCOUNTER Would you know what to do if you encountered extra-terrestrial beings? In this adventure, you are snatched off the Earth and the space invaders play YOU! ZX81 £5.50. VIC20 £9.50. 16K.

ZOR Battle of the robots. Fight for survival in this action-packed strategy game. Megajoules of destructive energy in a futuristic duel. ZX81 £5.50. VIC20 £9.50. 16K.

PIXEL POWER At last it is easy to create your own custom characters on the 8K plus expanded VIC20. A graphics workshop packed with useful features like Create, Amend, Save, View Set. £9.50. Refreshes the pixels that other programmes can't reach. (See Pixel Power in action in Trader and Subspace Striker)

HARVESTER Reap your reward in the Boosterspace fields around the planet Delta. A cut-throat strategy game for 2 to 4 players for the unexpanded VIC20. £4.50.

BRAINSTORM The telepathic emissions of the friendly Psions can wreck a human brain. Can you get our three space explorers across a river of nasty goo without blowing their minds. Unexpanded VIC20. £4.50.

GUITARPIX 1 For the VIC20 owner who wants to play the guitar. The first of a series that shows how to tune the guitar and demonstrates some elementary chords. Unexpanded VIC20. £4.50.

Send SAE for more details.

Hobbit makers Milgrom (left) and Mitchell turning winter into summer down-under.

Just hobbiting along

David Kelly talks to Alfred Milgrom and Philip Mitchell about *The Hobbit* — a new graphics adventure game.

An adventure program based on the story and characters of J R R Tolkien's book *The Hobbit*?

It sounds an impossible idea — the kind of program that could never hope to live up to users' expectations. Yet, strangely, *The Hobbit* program (from Melbourne House for the 48K Spectrum) does manage to capture some of the magic and mystery of the original.

In *The Hobbit* you take the role of Bilbo Baggins (neatly brushed feet are, however, not a prerequisite of playing the game) and attempt to steal the Dragon's treasure. Accompanying you in your task, you will discover Gandalf, Thorin and many other characters from the Tolkien book.

A unique feature of the game is that all the characters have independent lives of their own. They are each capable of reaching their own decisions and acting with you or with each other, depending both on what you do and what they do.

"It is much more than just another adventure game," explained Alfred Milgrom, Melbourne House publisher and co-author of the program. "We looked at ordinary adventure games and decided that we wanted to do something that would go further and really stretch micros to the limit."

"In all it took four of us eighteen months to write it. Originally it was to have been for the TRS80, but when the Spectrum was announced it seemed an ideal vehicle for the program — the hi-resolution graphics and colour make all the difference to the way it looks."

Philip Mitchell, another of the group who developed the program, continued: "We had almost finished a basic TRS80 version when the Spectrum came out, but because both machines are Z80-based there was very little conversion."

"The program has been written in three very distinct parts. First there is the English language analysis program, then the database program that defines *The Hobbit* parts of the game and then there is a separate section which stores and generates the illustrations. Converting to the Spectrum presented few problems as far

A dreadful drop to a dim valley awaits Bilbo.

as the first two parts were concerned, but since the TRS80 has no hi-resolution graphics or colour we had to start from scratch again with the illustrations."

After the group had been working on the project for about six months, they approached the Tolkien Estate with a view to gaining permission to use the characters and story from the original book.

"*The Hobbit* was always the project I wanted to do," says Alfred. "I think it is the premier fantasy adventure in British literature and that's why we went for it. We had some contingency plans if the Tolkien Estate could not give us permission to do it, but luckily they were delighted with the idea."

"The only stipulations they made were ones we were intending anyway. For example, they suggested that the program should only be available in a package including a copy of the book itself. We had always thought this was a good idea, because that way you get clues on how to solve the adventure from the book. It also fills in many of the details we just didn't have space for in the 48K of Spectrum memory."

The program is taken directly from the book. There are some 80 locations you can get into — 30 of which have an illustration. There are 12 main characters in the adventure, with lots of other animals and creatures in minor roles.

Most of the work of translating the book into a story suitable for a computer program was undertaken by Veronica Megler. She selected the locations that were to be

used and worked out what sort of characters each of the creatures should have.

An artist, Kent Rees, was commissioned to come up with a series of illustrations depicting Veronica's chosen locations. Philip Mitchell then converted these illustrations into graphic pictures on the Spectrum.

Tying the whole program together and making it work is the artificial language recognition program which links the player to the game. "We were very fortunate to have the services of Stuart Ritchie who developed what he calls his English program," explains Alfred. "Stuart did a dual major in English Linguistics and Computer Science so he was really the ideal person to do it."

"All the time when we were writing the program we had to be very conscious of memory space."

Philip eagerly explains: "Usually in an adventure game, most of the memory space is taken up with word storage. By dealing with words in a special way, using syntax constructions, we have been able to get down to an average of about two bytes per word."

"We also spent a lot of time optimising the coding of the graphics illustrations. This was somewhat complicated because we changed the screen format of the Spectrum. Normally it shows 32 characters per line, but because of the detail we wanted to be able to show, we redesigned the character set to have 42 characters per line."

"We have managed to store each picture in about 3-400 bytes, ten to twelve times less than a complete screen full. A range of different commands have been developed to economically produce different shapes and types of drawing on screen."

"Kent Rees' original paintings obviously contained more detail than we were able to show on the Spectrum and they had to be simplified but I don't think we were forced to leave out anything significant to *The Hobbit* story."

"Developing the game has been a really strange experience," says Philip. "At times it had a life of its own. We'd be testing one part of the program and one of the other characters would just suddenly wander in. The conversations we had with these creatures — people thought we were mad!"

"It wasn't uncommon for Veronica to have difficulty in finding a particular animal she wanted to test the character and reactions of. It would just have taken itself off to another part of the program, seemingly of its own accord!"

After eighteen months, *The Hobbit* has now been completed. Because of the modular design of the project, a whole range of other adventures will also be possible using the basic *Hobbit* framework, but using different illustrations and text.

"The next one shouldn't take that long," says Philip. "At least I hope not — it's a very long time to work on one program."

Shark attack

Mike Grace takes a look at some of the latest Vic20 software.

My first experience of a computer game was the Commodore version of Space Invaders (named *Avenger*), which was about the only software it was possible to buy when I purchased my Vic20 early this year. I can well remember the excitement I felt as I carefully plugged the cartridge into the back of the Vic and switched on — for over an hour I became hypnotised by the blips and explosions amidst a whirl of colour and speed as I struggled to defeat wave upon wave of menacing meanies descending the screen. Of course I never won, but the thrill of trying (and of beating my highest score so far), was all that mattered.

The software scene is completely different now. New games, new ideas, copies of old games, cassettes and cartridges seem to explode on to the pages of the magazines or into the classified ads and computer shops. When I began I had the choice of two games only — now it must run into several hundred. The difficulty is knowing which are worth buying, and perhaps more important, which are really fun to play. And that is where the role of a reviewer must be seen in perspective — for I can only describe what I like and what I find fun to play.

Let's start though with a survey of the games that seem to mimic Space Invaders, which I loosely term 'all speed and spacemen'. This category covers any game that involves shooting down aliens or steering cars along roads or moving something at speed to catch or avoid being caught. It's a pretty large category, but I use it to distinguish between what I shall term 'thinking games' or 'adventure games' which will be covered in later articles.

The main attraction of these speed and spacemen games is the skill required to manipulate a joystick or press appropriate keys. Brainpower is virtually eliminated in favour of reaction time. Devotees could criticise me on this last point, since a certain amount of thought is needed to progress from one level to another. But, I am approaching the review from the viewpoint of a part-time player rather than a master.

The first two I tried were *Cosmiads* and *Vic Asteroids* from Bug-Byte. Both are cassette-based, priced at £7.00 and are versions of arcade games.

I found both games slightly disappointing. *Asteroids* was the worst as I found it extremely hard to control the 'spaceship' — represented by a white arrow and not very exciting to look at — and the asteroids themselves often did not break up when fired upon. The ship would steer itself erratically across the screen without responding to controls, and the overall quality of the graphics was poor.

Cosmiads, on the other hand, was an extremely slow version of *Galaxians*. It was possible to achieve very high scores indeed and the competitive aspect of the game soon palled. Add to that the factor that again the base ship would fire upon some of the aliens without achieving anything, and the cost of £7.00 for either of these seems to be too high. The only advantage with *Cosmiads* is that a slow player like myself can at least get a good score — but even I soon became bored.

Next on the list are two games from Romik Software. The range of Romik games is a little wider than Bug-Byte and the information on the sleeve a little fuller (but not much — a factor I feel could well be improved). Romik's advertisements contain the message "Romik promise a minimum of one new game every month", a promise that I hope they keep only providing the quality of the games is not impaired. But back to the games themselves.

Martian Raider is a 'skim along the surface of a planet firing and dropping bombs as you go' type which I find exceedingly difficult to play, but which is a hot favourite with my children. In fact, my eight-year-old son is extremely proficient at this version and explained some features of the game which had been omitted from the instructions but which dedicated players would probably pick up without thinking. For example, a purple line repre-

senting time running out gradually moves along the top of the screen as you play. Once it has run out of space, you lose a life — which I doubt I would have spotted myself in view of the fact I was too busy trying to avoid hitting the ground with my ship.

Sea Invasion is really space invaders with crabs, starfish and octopi — instead of various aliens — descending on you firing with manic ferocity as you guide your 'ship' from side to side firing as you go. It is extremely fast (you feel physically exhausted at the end) and harder than Commodore's *Avenger*.

The last Romik game was *Shark Attack*, refreshingly different to me in that the idea is to trap sharks inside a net which you draw on the screen, and 'trail' behind you. The sharks are easily trapped, but then eat their way out of the net. If they get to you there is an explosion and you lose a life. On the assumption you survive the sharks and cover the entire screen with your net, then some attractively-drawn green octopi appear to menace you as well.

Romik Software costs £9.99 a cassette. It has a slightly more original approach than Bug-Byte (especially *Shark Attack*) and is much faster. Instructions for the games are well-presented and each cassette contains a version on both sides to allow for loading errors — a feature I was grateful for as I did experience quite a few. On the whole £9.99 still seems expensive when compared with the cost of the cartridges available which do offer much better graphics and speed, but compared with much of the material around I feel Romik to be good value.

Speaking of cartridges, let's look at a new entry into the Vic field, Thorn EMI. Their first catalogue features a host of various offerings, mainly for the Atari, including Soccer games, Jigsaw Puzzles, Nursery Rhymes, Darts and Dominoes — it looks very promising for the Vic Owner in the future.

The Vic cartridge I had for review was *River Rescue*, packed in a video cassette pack which contained a separate instruction booklet (hooray!), and which is really just another version of Road Race. You are in control of a ship which you can steer along a river at various speeds, dodging or firing upon the hazards along the way. To add interest to this game though, Thorn has added the factor that you occasionally come across a dock where you stop the boat to try and pick up an 'explorer' and add him to your crew. If you can pick up three men and then dock all three safely, you are awarded bonus points.

The game is not only very difficult to play, but as your skill increases so a higher level appears in that the river changes colour and the hazards become more difficult. Also, the faster you move the boat the more points you achieve. I found this

game more fun to play because of the extra variables introduced (although when I started I was so poor at even moving the boat any distance at all before losing a life that I almost gave up). At £24.95* it is good value.

The final game in this review is *Subspace Striker* distributed by Pixel Productions. Interestingly, this game is vastly superior graphically to the others I have reviewed, yet the advertisements in the computer journals are much less appealing. Is there some form of subtlety there? I doubt it myself, but it is interesting.

Subspace Striker requires 16K expansion, unlike all the other cassette-based programs so far, and is not really in the same category. Speed is less important, whereas interest and versatility are.

The essence of the game is that you are at the controls of a spaceship which is capable of jumping out of hyperspace to fire torpedoes at enemy spaceships and then slipping back into hyperspace when the enemy tries to fire back at you. Most of the time the screen displays a view as if you were looking out of the window of your spaceship, or at your firing screen, but occasionally you see the spaceship fading in and out of hyperspace in a dramatic 'Star Trek' fashion.

The graphics in this game really are superb, whether it is the picture of a passing Altair class cruiser or an Orion sweeper attacking you head on. As you appear out of hyperspace you get the chance to fire at the enemy ship as it 'blips' across your radar screen, but you may also be fired upon and have to 'dive' back into hyperspace before being hit. A most enjoyable variation is that the enemy can drop mines into hyperspace to follow and destroy you, and you have to sit watching the screen and waiting as the mines drop around your ship before exploding. If they are too close — that's it! This aspect really adds suspense, a feature usually lacking from this type of game.

The price of this game is £9.50 which I feel to be excellent value, partly because of the graphics, but mainly because this

game adds a slight element of skill, a large element of interest and a terrific element of fun. *Star Wars* fans can imagine they are sitting in the Millennium Falcon along with Luke and Han firing the buttons — a hit rewards you with a multicoloured display of debris and wreckage in true sf style. The first time I made a kill we all cheered just like they did in the cinema.

Pixel also provide a few words of help in the nicely-typed leaflet which accompanies the game. As you can tell, this is my favourite of the games I've reviewed, and also my favourite of the games I've ever played in this category.

A couple of general points. All the games, with the exception of *Subspace Striker*, can be played with a joystick, but of course will also work on keys. Romik scores here in that an attempt has been made to standardise various keys to various functions throughout their range of games, but I find that manipulating five keys as in *Martian Raider* is just too much for me. Nonetheless, if you do not have a joystick it must be better to know which keys do which operation, as watching keyboard and screen simultaneously is virtually impossible. The other point is that

all the games run on the unexpanded Vic (again with the exception of Pixel's *Subspace Striker*). It is good to see what are essentially good graphics and in Romik's case basically good speed in the limited memory available.

I have just dipped into a few of these games to get a taste of the market, covering a fair range of what is available. The essence of the arcade-style game must remain the speed and skill of shooting down or dodging the enemy. While it is addictive at times, I also feel it is often not satisfying for long. As such, games like *River Rescue*, with increasing levels and versatility, or *Subspace Striker*, with its different approach and excellent graphics, must come out on top.

For younger children the alternatives provide just that — an alternative — but often the price seems too high or the game too slow or with too many faults. But, as with all reviews, do remember this is my own opinion.

My best advice is to try and see the game before buying, either at an exhibition or a computer shop. And do remember — the aim of this type of game remains that it should be fun.

Firm	Program	Cassette or Cartridge	Cost	Value (1-10)

ROMIK SOFTWARE

24 Church Street, Slough SL1 1PT. Telephone: Slough (STD 0753) 71535

**ROMIK PROMISE
A MINIMUM OF
ONE NEW GAME
EVERY MONTH**

Britain's leading games software house are proud to announce our new range of exciting games and other software for Vic20, DRAGON and ZX81 (see panels) (Games for BBC, Spectrum and Atari available soon.)

**ALL ACTION GAMES CARRY A FREE ENTRY TO NATIONWIDE COMPETITIONS WITH FANTASTIC PRIZES
ALL PROGRAMS ARE £9.99**

MARTIAN RAIDER

For unexpanded Vic20

Skim as close as you dare to the surface of the planet, devastating the Martian cities, destroying ammunition dumps (gaining more time), shooting down the ground-to-air missiles

"A real action shot of the game"

MOONS OF JUPITER

For expanded Vic20, 3K, 8K or 16K

You are the Commander of a fleet of destroyers looking on from the safety of a mother ship, you send in one destroyer at a time to blast a passage through the MOONS OF JUPITER. Your destroyers have to dodge, and blast the UFOs... Watch out for the Gologs they can smash your destroyers, but you cannot harm them.

A MACHINE CODE ARCADE QUALITY GAME

MIND TWISTERS

For unexpanded Vic20

Four games to stretch your brain

Blackjack, Decipher, Four Thought and Teaser are our computerised versions of very popular home games and will test your mental agility and skill for many a long hour.

SUPER NINE ZX81

NINE 1K GAMES

1. CANYON
2. ASTEROIDS
3. ASTROBLASTER
4. DEFENDER
5. SQUASH
6. SCRAMBLE
7. SKETCH
8. COSMIC RAIDER
9. FOUR THOUGHT...

SEA INVASION

Unexpanded Vic20

Fight off the attacking sea creatures for as long as you can. Shoot the whale for a surprise score, watch out for the crabs, starfish and octopuses.

SHARK ATTACK

For unexpanded Vic20

You are in shark-infested waters after being thrown overboard from a pirate ship. Your only protection being an atomic net which you trail behind you, trying to cover all the visible ocean and ensnare the sharks at the same time. Beware of stopping or covering your tracks for too long, if you do, then the sharks will escape and come after you. Watch out for the ever increasing deadly octopi (sometimes the sharks will eat part or all of one!)

"A real action shot of the game"

MULTISOUND SYNTHESIZER

For the unexpanded Vic20

The Vic Multisound Synthesiser is very flexible and can be played in more ways than can ever be explained here, to create music and special effects. For example, create any tune, up to 255 notes (after following appropriate instructions), then press "F1" or "F3", then key "9" and enjoy the added effect. Now hit "+", listen to the difference. For a surprise — hit "8" then "7" — now play a melody, or experiment. Have fun!

STRATEGIC COMMAND

OUR FIRST GAME FOR THE DRAGON

A strategy game for two players. Will keep you active for many hours. Air, sea and land battles!!!

NEW NEW NEW SPACE ATTACK

For the unexpanded Vic20

SPACE ATTACK is a game of skill. You as the pilot of an intergalactic battleship have to fight your way through wave after wave of various alien spaceships.

Open Forum is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

Parachutist

on Spectrum

The first thing to do on running this program is to load the user-defined characters. Type in and run lines 10-30 first.

User-defined characters are used in lines:

90 'B + 9 + C' - 'A'
100 'D + E'
101 'F + G'
102 'A'
120 'SPC + H + I + I + J + SPC'
140 'L'
170 'K' - 'L'

```

BBC PET VIC NASCOM

MAINS INTERFACE

No longer is your computer limited to controlling space invaders.

A new accessory allows your computer to control the real world.

The 5 computer controlled 13 amp socket outlets allow you to control domestic appliances, industrial machinery, security, disco and shop lighting, central heating, model railways, etc.

A high quality unit for industrial or home use.

Uses MK Safety plug and sockets.

Indicator lights on all outputs.

No electrical experience needed, just plug in and load the demonstration/teaching cassette.

BBC (B) PET VIC NASCOM — £65

BBC (A) (no soldering) — £69

Optional extras

2 mains input ports — £7

PET sound output — £10

All include P.P. & VAT

ZX81/ZX SPECTRUM HARDWARE

TV stand removable for access to add-ons, wiring, etc. Can be used separately from the base.

Desktop console for the ZX81. It raises and tilts the TV to minimise eyestrain, holds in place the ZX81 printer, RAM packs (and other add-ons), power supply, tape recorder and hides most of the wiring. Provides storage space for cassettes.

Optional: Two built-in illuminated power switches. Similar unit for the ZX Spectrum also available which holds ZX Microdrive in place.

Music trainer

on Vic-20

This program is designed to show the musical scale and what notes come where. The program draws the five bars

and you use the keys 1 to 9 to create music like an organ.

As you play the notes appear on the bars and when they come to the end the bars are scrolled up the screen and more drawn. The three voices can be selected

using c, q, w and e.

Program notes:

100 to 123 Input the notes and voice.
124 to 160 Draw the note and play it.
500 to 540 Draw the bars.
600 to 660 Initialise the variables.
700 to 780 Print the instructions.

Card addition

on BBC Micro

This was designed to help my young children recognise groups and to assist

them to add up in a fun way. The program is properly structured and has been thoroughly tested on a BBC Model B. The program uses colour and high resolution graphics as well as user-defined characters. Instructions are given in the program.

Copy-colour

on Dragon

Copy-colour tests your memory recall of a sequence of colours and sounds. At the beginning of the game the computer asks for the maximum length of the sequence to be attempted. The colours used are Red, Yellow, Blue and Green. The player memorises the sequence and types it back in using the first letter of each colour. It is not necessary to press enter after each separate entry. After each correct entry the

sequence increases by one colour. If an incorrect guess is made the game ends.

```
10 REM COPY-COLOUR
20 INPUT "MAXIMUM LENGTH OF YOUR SE-
  QUENCE";K
30 NC=1: DIM A(K)
40 A(NC)=RND(4)
50 FOR F=1 TO NC
60 CLS A(F):SOUND A(F)*50.5
70 CLSO
80 NEXT F
90 CLSO
100 FOR F=1 TO NC
110 Z$=INKEY$:IF Z$="" THEN 110

Colour-display

on Dragon

This program, simple as it is, sets up an ever changing display of coloured squares on the screen. It is an ideal starting point for experimenting with perpetual generation programs.

As written, the display starts with a black screen. Try changing line 10 to: 10 CLS 3.

This not only changes the screen colour; it also cuts out any black from the display. Now add line 59 RESET(P,K) and the display will be more attractive, but will begin to deteriorate until you are left with just a multi-coloured square with a flashing point of colour.

Finally add lines 55 S = (RND(255)) and 58 SOUND S,1 and you have Dragon's version of "INDOOR FIREWORKS".

```
10 CLS 0
20 P = (RND(62))
```

```
30 K = (RND(30))
40 L = (RND(7))
50 SET(P,K,L)
60 GOTO 20
```

Program notes:

```
10 Sets screen colour.
20 to 30 Set random position on screen.
40 Sets random colour.
50 Prints coloured point.
60 Creates loop.
```

by David
Windle

Shootout

on Spectrum

The object of the game is to shoot as many cowboys as possible on the left of the screen, with your figure, before the opposite cowboy homes in and shoots you.

When run, your figure will appear on the

far right of the screen, coloured black. The computer's figure starts at a random position on the far left, coloured red. Each cowboy can only move up and down, and your cowboy is limited to four shots.

To move down press "6", and up "7". To fire press "0". You score one point per cowboy and you have only one life.

Replace the capital As in lines, 105, 2002, 9001, with a graphic "A". Replace

the capital Cs in lines 104, 1002, 2002, 9001 with a graphic "C". Replace the capital B in line 85 with a graphic "B". These characters will be replaced by cowboys and a cactus when you run the program.

The program contains instructions and the score is constantly displayed along with the number of shots left on the screen.

Scramble

on Vic 20

This game uses no sound and only one colour but, for its size, is both addictive and difficult. The program was written as a test routine for a machine code scroll right routine. This routine, lines 120 to 150, scrolls a portion of the screen right. Since the colour array is not scrolled, the use of

colours is not really feasible. By altering portions of the code, any window in the screen can be scrolled.

The eighth and twelfth bytes in line 120 (current values 220 and 30) are the address of the top left corner of the window. The ninth byte in line 130 (currently 12) is the number of rows scrolled and the eleventh byte in the same line (currently 22) the number of columns.

If the whole screen is to be scrolled. The top corner is 7168 (\$1E00). The address bytes in line 120 become 0 and 30. The number of rows will be 23 and the number of columns 22.

To play the game, use the A and Z keys to move the spaceship up and down. You must avoid the asteroids moving left to right either by moving or by firing a laser (* key).

ZX81 USERS!!!

here are

THE FARTHEST OUT COMPUTER TAPES IN THE WORLD!!!

Professionally designed. Send postal orders for speedy service. No
delay as prices include AIRMAIL postage!!!

1. KINGFORTH KINGFORTH KINGFORTH This is the ZX81 program to
cause a computing revolution! It provides the ZX81 with multi-language
facility like bigger micros ... but it also is a compile speed language that
enables the ZX81 to operate at 30 to 40 times the speed of SINCLAIR
BASIC! KINGFORTH is compatible with the word set of FORTH-79 so
programs from other sources can be readily used. Includes complete
compiler security and stack security, is cunningly interlaced into the
SINCLAIR ROM to enable new flexible use of key action and line printer
function, includes both a TEXT EDITOR, FILE storage, and a sophisticated
ASSEMBLER that covers all Z-80 commands in only 80 powerful
commands. Price £16.99

Moving graphic games can now be programmed at home at lightning
speed! KINGFORTH is also unique among FORTH languages in that it
contains a complete DECOMPILER enabling total replay of even compiled
code.

2. WORDPROCESSOR Enables typing and printing of eleven pages of
script. Includes automatic editing of script to arrange broken words and
paragraphs. Price £5.99

3. DATASYSTEM Enables not only saving and loading of data, but also
the merging of several BASIC programs into one from separate tapes.
Turns your BASIC system into one where new facilities can be added from
a resource library. Includes several facility programs for deleting blocks of
BASIC etc. Price £5.99

4. SNAKE Ten levels of play, 3 modes of operation. This classic game of
guiding the snake to eat squares can be played to the impossible level
where the snake fills the whole screen. Price £5.99

NOTE: For just £6 you can get the KINGFORTH construction manual
which enables you to build KINGFORTH in a day or two's programming.
Complete instructions and a full printout enable complete and rapid
generation.

Disassembling machine code

David Angier presents a disassembler program for all 6502 machines

A disassembler is very useful for understanding other people's machine code and debugging your own. For example, I had written a plot routine in machine code and it kept crashing. After several days rewriting the code I found by using the disassembler that my original version had the

wrong address modes in a certain region of the program.

The following program is very easy to implement disassembler for any computer with 2K of Ram and the basic commands *Read*, *Data* and *Restore*. It was originally written for a Vic20, but should run on any 6502 machine.

The program itself consists of two major loops. The outer loop fetches the opcode from memory at the address *Pc* and increments this each loop until *Pcmax* is reached. The inner loop then searches all the data statements for this opcode and, when it is found, takes the next bit of data which is a code for that opcode. Next, it states the length of the instruction, includ-

ing the operands and the address mode of that opcode for display purposes. Then the data is scanned for next '*', because the mnemonic of the opcode is after this.

The only machine-dependent instruction is at line three. The heart-shaped sign is a clear screen control code — replace it with any other command which does the same thing.

Lines 200-290 convert decimal numbers to hex, while lines 499-520 are opcodes and mnemonics, with address mode codes. Line 600 is the data for each type of address mode.

Improvements may consist of changing the program to print destination addresses of branches and ascii values, etc. ■

Telescope file

In part six of our extract from The Working Spectrum we continue adding modules/sub-routines to the Unifile program, designed to enable a single program to cover a variety of filing tasks without the need for constant re-writing every time a new use comes along.

MODULE 7

This module contains the special search routine mentioned last week.

Commentary

Line 2940. C4 is the indicator used to show, on return to Module 6, whether the specified combination of characters has been found.

Lines 2980-3010. C1 is first set equal to the start address of the entry under examination. To C1 are added the indicators attached to the X items in the entry, thus making C1 now equal to the start address of the next entry. Note that we are now talking about the start address of the next entry in the main file, not the next entry in alphabetical order.

Lines 3020-3060. The entry is examined character by character for a match with the combination of characters specified in the search instruction.

Testing Module 7

Enter a series of character combinations, some of which are present in the file and some which are not. Do not forget to precede them with SSS.

MODULE 8

This module gives the user the option of changing or deleting the entry presented to the module by the search function.

Commentary

Lines 2050-2130. You may recall that in Module 4 new entries were constructed in the form of R\$. In these lines a modified R\$ is created, made up of either items taken directly from the entry in the file, or of items input to replace the originals. The original entry is then deleted from the file by calling up the subroutine at line 3130.

Line 2140. If the user has not specified that the entry is to be deleted, the modified entry, in the form of R\$ is presented to module 5 which inserts it in the correct place.

Testing Module 8

Full testing of this module must await the entry of the next module, but you can test that the module does display the selected entry item by item and that any changes entered are registered in R\$. After displaying all the items of the entry the program will stop with the report 0 OK,2130:1.

MODULE 9

When an entry is deleted from the file, it

leaves a gap which must be filled. The function of this module is to delete a specified entry by telescoping the file down over it. The file is not moved entry by entry but in chunks of 1,000 characters.

Commentary

Line 3170. This loop sets C1 to the start address of the next entry.

Lines 3210-3260. This loop shifts 1,000 character chunks of the file downwards the length of the entry to be deleted, the first chunk starting at C1.

Lines 3230-3240. If B\$ had been mentioned on both sides of an equation — e.g. LET B\$(C TO C + SHIFT - 1) = B\$(I TO I + SHIFT - 1) — a shadow of B\$ would have been momentarily created and the program would have run out of memory.

Line 3270. The pointer to the deleted entry is removed.

Lines 3280-3350. All the entries which have been shifted down the file must now have their pointers amended since their start addresses are now different.

Testing Module 9

Use the AMEND function to delete one or two items, then change the first items of some entries in such a way that they must be moved within the file. After each change or deletion, use the SEARCH function to check that the file is still in the correct order. If the tests are satisfactory, the program is now complete.

Summary

You have now completed the input of a substantial and complex program which, I hope, will be of use to you in a variety of circumstances. More important than that, however, you have learned a variety of techniques which will be of use to you in future programs which must handle large amounts of non-numerical data in an economical way.

You have learned how to structure packed data by the use of pointers and indicators. You have seen how strings can

be effectively used to store a limited range of numerical data. You have a working example of the powerful binary search technique.

Best of all, if you have taken the trouble to understand what you have been entering, you will have gained confidence that large and complex bodies of data can be processed without the whole thing degenerating into chaos — after all, a major part of the art of programming is having the boldness to jump in and tackle applications which look hopelessly complicated, coupled with the perseverance to follow the task through to the end.

Going Further

If you have understood what you have entered, you might like to tackle some of the following tasks:

1. The program is deliberately written with few multi-statement lines. Once the program is working it would be a good idea to try and shorten it by combining lines — you will learn a great deal about the strengths and weaknesses of multi-statement lines.
2. I have already mentioned that no use is made of the binary search in the actual search module. Why not add another search instruction which refers only to the first item in each entry and which calls up the binary search routine to accomplish the search.
3. The program as structured cannot cope with files or entries which have a variable number of items. This type of structure is quite common, e.g. recipe with title, variable number of ingredients and instructions. It is a fairly simple matter to alter the program so that it works on three items per entry, but with the second item being subdivided into a number of sub-items. The AMEND function should be capable of adding or deleting sub-items.
4. The program makes no provision for sending entries to a ZX printer — this could be easily rectified.

Repeated discovery

Peter Chase reveals some of the mysteries of the Dragon and presents Falling Invaders.

Since acquiring a Dragon 32 computer in September, I have discovered a number of interesting things which are not in the manual. Peek 65280 does more than contain the status of the joystick buttons. It also contains useful information about the keyboard which allows repeat keys to be used.

When a key is pressed, it will contain a code which tells you which group of keys is being pressed. I have used this to write a short program to produce keys that repeat after a short delay, as on the Spectrum or BBC computers:

Autorepeat keys for Dragon

```
10 CLS
20 PRINT CHR$(128);
30 K$=INKEY$:IF K$="" THEN 30 ELSE PRINT
  CHR$(8); K$;:CO=0
40 CO=CO+1:IF PEEK(65280)=127 OR
  PEEK(65280)=255 THEN 20 ELSE IF CO<18
  THEN 40
50 PRINT K$;:IF PEEK(65280)=127 OR
  PEEK(65280)=255 THEN 20 ELSE 50
```

I should be very interested to hear if any readers have found other methods of producing repeat keys, as my program requires that if two keys are within the same coding group then the first repeating key must be released before the second key is pressed.

Peek 135 contains the ASCII code for the last key pressed.

More colours can be produced in high resolution graphics Pmode 3 by taking two colours and colouring alternate pixels, as on a chessboard, using Pset commands.

The joysticks cannot be accessed at random, but only in the following combinations:

- a) JOYSTK(0) on its own
- b) JOYSTK(0) and JOYSTK(1)
- c) JOYSTK(0), JOYSTK(1) and JOYSTK(2)
- d) JOYSTK(0), JOYSTK(1), JOYSTK(2) and JOYSTK(3)

If you wish to access only Joystk(3), for instance, you must read the values of the other axes of both joysticks into dummy variables.

In Print statements the Dragon does not require punctuation between items, although the comma after Print @ is compulsory (see lines 30 and 40 in the Falling Invaders game).

The Dragon uses the 6809 micro-processor which is very versatile and relatively easy to program. Unfortunately, the Dragon manual gives no details of the 6809 coding although we are promised an assembler soon. In the meantime if owners wish to experiment with machine code, I suggest they purchase a copy of the Motorola 6809 Programmers Manual (available from Lock Distribution, tel: 061 624 0333, price about £5.50 exc. VAT).

Falling Invaders

Here is a short games program for the Dragon 32 which uses a machine code section to move the screen display. Although a very simple game, it is challenging to play and can form the basis for more complicated games — for instance,

by making the invaders fire back.

The program contains all the necessary instructions when run. You must stop the invaders from landing. The game can be played from the keyboard or with a joystick. For the joystick version, replace lines 30,40,210 and 220 as shown.

```
10 CLS0:PRINT "FALLING INVADERS"

A broken promise

Last week we looked at a subroutine which acted as a Z80 multiply instruction. Working in 8-bit registers for the sake of simplicity, we explained how to shift left and right while multiplying in binary.

Note that we did not assign actual addresses to the program, but simply started at zero. This is because all the jumps are relative, so actual addresses are unimportant — only displacements matter. For example, with 16K you can replace all 43s in last week's program by 7Fs, to work with a 256-byte attic.

You will also need to *output* the answer — at the moment it's just sitting in the A-register. A simple way to do this is to stick the answer into the display file by adding the following code at the end, *in place of the C9 (Ret) instruction*, which is there only because we said this was going to be a *subroutine*.

0013	LD HL (D-FILE)	2A 0C 40
0016	INC HL	23
0017	LD (HL) A	77

Add this at the end, add the bytes 07 and 08 at the front (or *Poke* them later) and enter using *Loader* with 2 data bytes. The letter "S" will appear at the top corner of the screen. The code for S is 56 — and that's the product of the two numbers 07 and 08 you *Poked* in. Of course a more elegant display routine would be nice: think about *Print Usr*. But for a test, this method suffices.

Now, we have a confession to make. There is an easier way of testing to see if the junior bit of E contains 1. There is an instruction *Bit 0, E* which does the job. So:

```

LOOP: LD L, A      6F
      LD A, C      79
      AND A, E     A3

```

becomes just:

LOOP: BIT 0, E CB 43

and the $Ld A$, L has to disappear as well.

Why didn't we tell you that in the first place? Well, firstly, we promised to use only the subset of instructions in the table, a promise we have now broken. But we have made an important point in the process — that it is possible to do things satisfactorily without knowing the full instruction set.

Reproduced from *Machine Code and better Basic*, by Ian Stewart and Robin Jones (price £7.50), by kind permission of Shiva Publishing Ltd, 4 Church Lane, Nantwich, Cheshire CW5 5RQ.

If you have any machine code sub-routines/tips/games, please send them to: Machine Code, *Popular Computing Weekly*, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

So now for something more clearly useful. Fed up with Basic ability to draw graphics lines at a snail's pace? Let's see if we can write a machine code subroutine which will draw straight lines from any point on the screen running horizontally, vertically, or diagonally. At least, that's the target.

Let's deal with the problem in easy stages. Obviously, we need to know something about how the ZX81 handles displays before we can get anything on the screen. As you have probably seen from the *manual*, there is an area of memory called the *display file* from which the screen display is generated. All we have to do is store character values in this region to get them displayed.

The position of the display file is not fixed (it depends on the program size). There is, though, a pointer to its first byte, called *D-file* which has the hex address 400C, decimal 16396. So the display file starts at *Peek* 16396 + 256**Peek* 16397.

The size of the display file is not fixed either (at least, it isn't on 1K systems, and although it normally is on 16K systems, this is not guaranteed). The display file begins with a newline character, and ends every line with one as well. So, for instance, the state of the display file after the following statements:

```
10 CLS
20 PRINT "ABC"
30 PRINT "DEF"
```

would be:

in 1K, or in 16K if Ramtop has been lowered to under 3¼K. With more than that size of memory, it will be padded out with the "missing" blank spaces (we are using "<" to represent *Newline* and "□" to represent *space*).

This is a neat way of saving precious memory when only a small part of the screen is being used, but it does not make our problem any easier.

Let's try something simple, like putting a graphics symbol at the top left-hand corner of the screen. If the screen is blank to start with, there will just be 25 newlines in the display file. So our problem is to overwrite the second of them (where the "A" is in the above example) with our chosen symbol.

First, Load *HL* with a pointer to the display file. This is *D-file* which is at 400C hex:

LD HL, (400C) 2A 0C 40

Now bump *HL* to point to one character further along:

INC HL 23

Next put the graphics character (88 hex, say) in the A-register:

LD A, 88 3E 88

and, finally, put this value where *HL* is pointing:

LD (HL), A 77

This works OK, but we should think carefully before extending the idea. After all, we have just overwritten one of the newlines, which is doubtless being used by one of the ZX81's system routines to

handle the display. Sooner or later we will confuse that routine if there are not enough newlines left for it to play with. Of course, if we are overwriting a character that is already in the display, this problem does not arise. So, for instance, we could change the *A*, *B* or *C* of the first example without affecting the newlines at all.

One way out of the problem, then, is to fill with spaces the portion of the screen we are interested in. On a 16K machine with Ramtop above 3¼K, CLS does this, creating 24 lines of 32 spaces each. On a 1K machine we could write:

```
10 FOR L = 1 TO 5
20 FOR C = 1 TO 32
30 PRINT "□";
40 NEXT C
50 PRINT
60 NEXT L
```

to set up the top 5 lines to spaces.

Now for something more ambitious. Bored with the same old display all the time? How about white-on-black? We will write a routine to invert the display file. The principle is simple: run through it changing each character to its inverse, except for *Newlines*. For comparison, here it is in Basic.

```

10 LET D = PEEK 16396 + 256*PEEK 16397
20 LET B = 22
30 LET D = D + 1
40 LET P = PEEK D
50 IF P = 118 THEN GOTO 100
60 POKE D, P + 128 - 256*(P>127)
70 GOTO 30
100 LET B = B - 1
110 IF B = 0 THEN STOP
120 GOTO 30

```

Type this in, set up a nice display, and run the beast. Yes, well, it's a bit *slow*, isn't it? A machine code version ought to be faster. The machine code follows a very similar pattern to the Basic program:

00000	LD B, no.-of-lines	06 16
00002	LD HL, (D-FILE)	2A 0C 40
00005	LOOP: INC HL	23
00006	LD A, (HL)	7E
00007	CP A, newline	FE 76
00009	JRZ, SKIP	28 05
0000B	ADD A, 128 dec	C6 80
0000D	LD (HL), A	77
0000E	JR, LOOP	18 F5
00010	SKIP: DJNZ LOOP	10 F3
00012	(tack on standard ending via LOADER)	

The addresses are relative ones: load this up as usual with the *Loader*. Now set up a Basic routine to print out a nice display, and call the above machine code via *USR*. Now it's very fast indeed! Note how the machine code mnemonics parallel the Basic. And, a bonus in machine code: to invert video, add 128 (hex 80) to the code. Do not worry about going over 255, because the extra carry digit just drops off the end of the register (NB: with 1K, not all of the display gets inverted. Why not? Which bit does?).

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem *Peek* it to Ian Beardsmore and every week he will *Poke* back as many answers as he can. The address is *Peek & Poke*, PCW, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

WIRING UP FOR TURKISH SYSTEM

Osman Ardali of Istanbul, Turkey, writes:

Q Because the ZX81 is not available in Turkey, I recently bought one in France. Unfortunately, it would not work on my television at home. The system here is the same as that in England except that it is VHF not UHF, but that is not the problem as I have a German set that is capable of receiving UHF.

Looking at the pcb, I can see that it has wiring facilities for England, France and the USA. All I need to do is rewire it from French to English mode. I suspect that all this entails is to invert the video signal, but I have not got a circuit diagram to do this. I wrote to Sinclair but they were not much help and advised me to contact the French distributor. But they cannot help either because the system I want to use is the English one. Can you supply the details?

A Do not worry about the reaction you get from Sinclair. Customers in this country are used to the delay and sometimes inappropriate response that they get from Cambridge. To be fair to Sinclair, as you have got your computer from a dealer, then they are strictly speaking correct in referring you back. But with the ZX81 travelling all over the world now, a little extra help might not come amiss from time to time.

All the ZX81s have the same ULA, but there are modifications in the video lead. In the US model a resistor and a diode have been added, while in the French model a small two-transistor circuit has been added, which is clearly marked on the pcb. To convert your computer back to the UK mode, you will have to run a wire direct from the video output, to the spot marked UK1 on the pcb, thus by-passing the added circuit,

which you must then take out by simply cutting the components out. This will return you to PAL B UHF which should then be compatible with your German television set.

TUNING IN WITH A MATCHSTICK

K Ayre of Park Road, Hartlepool, Cleveland, writes:

Q I received my Spectrum after 11 weeks of waiting and am very pleased with its capabilities and its keyboard, despite what other people might say about it. But, after being switched on for one to one and a half hours the colours start to flicker and soon the display goes black and white. It also becomes very hot around the speaker (where the heat sink is located). The colours change even more easily when the *Beep* command is used.

I wrote to Sinclair about a month ago, but so far I have had no reply. I would be very grateful if you could help me out.

A Some problems with the Spectrum, such as overheating, are beginning to make themselves apparent. In some cases this is bad enough to cause decay of the memory, though I do not think this is true in your case.

It could be that the tuning of the colour output from the computer itself is slightly off, the problem only becoming apparent when it is aggravated by overheating. On the underside of your Spectrum you will see a couple of very small holes, at the bottom of which is a very small brass screw. The one nearest the keyboard will need careful adjusting. It is important that you only make small adjustments, as it would be easy to make the picture worse, not better. It is also advisable to use a small piece of wood instead of a metal screwdriver. A matchstick which has one end specially cut to fit the slot of the screw would be ideal.

RE-WRITE THE WRAPROUND

R Yeardly of Doncaster, Yorkshire, writes:

Q I have recently tried to write some software on my BBC micro, with a sideways screen scroll. I tried using *Vdu 23;13 number 0;0;* statement, but this scrolls with a wraparound effect. I wanted the left-hand edge to disappear and new information to appear on the right-hand edge. Can you suggest a way of doing this?

A Essentially what you have to do is re-write the wraparound. This will mean clearing the last column as it disappears off the edge of the screen and writing new information on it. Thus when it appears on the other side of the screen with the new information, it will give the appearance of movement. *Vdu 23;13* is a carriage return, so it would be best to re-write the new information before this command is executed. Without seeing the routine I cannot tell you how to actually incorporate it into your program.

YES, TO THE THEORY NO, IN PRACTICE

Ian Watts of Queen Street, Middleton Cheney, Oxfordshire, writes:

Q I was looking at the Spectrum 'Specs' in Uncle Clive's literature and saw the magic phrase 'User software can generate 40 characters per line, or other settings.' 'Wow' I thought, 'surely 320 x 192 pixels.' Not so, according to Clive, or any one else for that matter. Is it possible? Is there a magic *Poke* that will enable me to use this setting, indeed are there any other settings that can be *Poked* or does it require a complete program?

A It can be done, but only by fiddling the character set. What you need is to re-define the character set into a 5 x 7 format. That would allow 40 characters across, with one byte of space at each end, to act as a margin (each character would be defined on a 6 x 8 grid, with the last column and the eighth row left clear for

spacing between individual characters).

In theory, if you only wanted your characters to be one bit wide, you could have a 128 x 24 display. But whatever the definition of your set, you would then have to place each character on the screen using *Print at* and *Over*. To the best of my knowledge, there is no program available to do this.

WIRING UP TO A MONITOR

M R Hildyard of Wodland Avenue, Guildford, Surrey, writes:

Q I would be extremely grateful if you could clear up the following questions. Would it be possible to reduce the 'dot crawl' on my ZX Spectrum (48K) if it was hooked up to a colour monitor of some sort? If so, how could this be achieved, and what particular type would you recommend?

I do not think that my computer is damaged, as other Spectrums that I have seen, seem to suffer from similar problems.

A Yes, if you hooked your Spectrum up to a colour monitor then there would be a significant improvement in the quality of your screen display. Most computers tend to wander off channel 36 a little, so you might find that careful retuning each time, before using your computer, will help.

If you do wire up your computer to a monitor, remember that the braided part of the lead is connected to the case of the modulator, which is the outer part of the connector. The inner part of the cable is connected to the inner pin of the lead.

I cannot recommend any one particular type of monitor, though obviously you would want a colour one. The best think you could do would be to look at the various monitors being advertised and find out which you think best suits your pocket and your needs. For example, do you want a simple monitor or a combined television/monitor? The latter is considerably more expensive.

You are correct in assuming that dot crawl is not the sole prerogative of your Spectrum. Other Spectrums, and other micros, also suffer from it.

CLASSIFIED

Semi-display — £5 per single cc
Trade lineage — 20p per word
Private lineage — 10p per word

EXTEND SPECTRUM BASIC

WITH THE MACHINE CODE ROUTINES OF

WHITE NOISE AND GRAPHICS £5.95

Add over 20 new commands to Spectrum Basic using named user calls and normal variables. No Pokes required.

Includes the following:

WHITE NOISE. A truly amazing routine allowing synthesis of sounds, eg Escaping Gas, Explosions, Machine Guns, etc, not previously possible with BEEP.

WINDOW GRAPHICS. This system allows any area of the screen to be defined as a window. This section can then be cleared, shaded, scrolled in eight directions, inverted and bordered. This can happen to either the main character screen or the attribute (colour) screen file or both, under your control. The system also includes Pixel scrolling and character identification, true press any key to continue routine etc. All this in less than 1½K of Machine Code on cassette containing both 16K and 48K versions, with extensive instruction manual.

From **Gilsoft, 30 Hawthorn Road, Barry, South Glamorgan CF6 8LE**

BEST OF

POPULAR

Computing WEEKLY

Four of the top Spectrum and ZX81 games from *Popular Computing Weekly* on sale on one cassette at a special Christmas price of only **£4.45** inc p&p.

Laserchase, by Simon Lane. This top game for the 16K Spectrum now has the added feature of a Bomb facility.

Kong's Revenge, by Jonathan Flint. This Kong game for the 16K Spectrum is one of the best you will see.

Robot Control, by Simon Lane. This 16K game for the ZX81 uses machine code routines to make your flight from the robots even more deadly.

Alien Attack, by Jeff Naylor. This machine code Space Invaders type program fits into 1K on the ZX81.

You will not find better value for money Spectrum and ZX81 software. Order now from:

**Popular Computing Weekly, Hobhouse Court
19 Whitcomb Street, London WC2 7HF**

Please make cheques/postal orders for **£4.45** payable to Sunshine Publications. We can normally deliver within four to five days.

THE WORKING SPECTRUM

A LIBRARY OF PRACTICAL SUBROUTINES AND PROGRAMS

DAVID LAWRENCE

The **Working Spectrum** is the first well-documented collection of serious programs for the ZX Spectrum.

The programs include a Basic Renumber which can handle Gotos and Gosubs. You will read in other books that this can't be done. We prove it can.

With some of the other programs you can define your own characters, store them in a dictionary, design geometric shapes without using maths, draw pictures for use in other programs and recall them at will, draw different graphs from the same subroutines, create a file-handling program for up to 28,000 characters, create a data-base handling program, learn how to sort your data, learn how to touch-type, handle your accounts and play sophisticated games such as Missile and Tracker.

Each program is explained in detail, line by line. And each of the programs is built up out of general purpose subroutines which, once understood, can form the basis of any other programs you need to write.

Advanced programming techniques spring out of the discussions explaining each subroutine. The result is not only to advance your programming skills but also to leave you with a wide range of practical application programs which might otherwise only be available to those prepared to buy cassettes or those capable of writing substantial programs for themselves.

Expert or novice — whatever your experience, you will find this the most useful and valuable book for the Spectrum.

228 pages. Over 150 separate subroutines and programs.

Also available through your local computer bookshop

Please send me a copy of The Working Spectrum.

I enclose a cheque/postal order for £5.95.

Ziggurat

The nth generation

At times I feel like that famous pioneer of psychoanalysis, Dr Helmholtz. Dr Helmholtz, you may recall, was a marvellous amateur violinist, although he could not read music, and could only play one note (*Getting Even* by Woody Allen).

If we have a fifth generation of computers, we must have had four previous generations. So, "What is a generation?" Given that faculty, hindsight, it is possible to make sense of history, to see patterns, to see generations.

Marvin Harris (*Cannibals & Kings*, 1977) points out that "Retrospectively, scientists can readily reconstruct the causal chain of adaptations that led from fish to reptiles to birds. But what biologist looking at a primitive shark could have foreseen a pigeon?"

Computers have certainly changed. They have become smaller, faster, cheaper, and internally more capacious. This is obvious. When observers look back, they discern differences in style of computers and many find four different styles — the so-called four generations of computers.

As with many things, it is worthwhile to try to work out for oneself what exactly are the four generations. As we are talking about the *interpretation* of history, there are no right or wrong answers — it is just that some interpretations are more convincing or persuasive than others. As the Japanese are the keenest to develop the fifth generation of machines, I will first give a Japanese opinion of what are the four generations of computers.

Susumi Aizawa, the senior managing director of Epson (producer of the new portable HX20 microcomputer), has said that Japan would be in the forefront of the "fourth evolution of computers". Mr Aizawa identified the first evolution as the big main-frame computers pioneered by IBM, the second evolution as the mini-computer (eg DEC), and the third evolution as the microcomputer (eg Apple).

He felt that each generation had managed to produce a smaller, cheaper product capable of doing the job originally designed for the previous generation. The views of Mr Aizawa, coming as they do from the managerial elite of an important firm, make interesting reading, because his views are at variance with the commonly accepted version of what are the four generations. Either the bosses do not really know what is happening, or they see it in a different way.

The usual version of the identity of the four generations — valves, then transistors, then integrated circuits, and now large-scale integrated circuits — concentrates on the technology, with the size of the computer being a *consequence* of the technology and the form of the circuitry being of prime importance. Though these are the normally accepted definitions, I find the transition between generation three and generation four to be unconvincing.

I can see that valves are a dramatically different form of technology from transistors, and that single transistors are very different from integrated circuits. Surely, however, the point at which an integrated circuit becomes a large-scale integrated circuit is less obvious. In fact, what Mr Aizawa was considering are levels and degrees of large-scale integration: that is, graduations within what others call the fourth generation.

The fifth generation, of course, is *going* to be something completely different (a pigeon from a reptile perhaps?) and the emphasis in the development of the new generation is towards a radical change in software.

In the history of computers has anything really changed other than size? I wonder.

Boris Allan

Puzzle

A golden rule of squares and infinitum

Puzzle No 36

The "golden ratio" is a value that has been known from antiquity, both as a mathematical curiosity, and as a valuable ratio in the world of art. A rectangle with sides in this ratio is considered to be the one most pleasing to the eye. If a square is cut from one end the remaining piece is also a "golden" rectangle. This procedure can be repeated *ad infinitum*.

The value of the "golden" ratio can easily be found as it is the only positive number that becomes its own reciprocal by the addition of 1. Try the following program:

```
10 INPUT X. 20 LET X = 1/X. 30 SCROLL. 40 PRINT X. 50 LET X = X + 1. 60 GOTO 20.
```

Whatever number you input, the values of X printed converge on the golden number.

The "golden number" can also be found by taking any two consecutive numbers in what is called the Fibonacci series and dividing the first by the second. The Fibonacci series starts with zero and one — each successive term is the sum of the preceeding two — 0, 1, 1, 2 ... Using the Fibonacci series, find the value of the Golden Ratio to eight decimal places and show that the value is stable to that accuracy. The larger the pair of numbers in the series used to find the golden value, the more accurate will be the result.

LOSERS

Oh dear dictation, How to get in and out of his office, past the mad accountant without getting my bum pinched?

(No 4) SEXIST BOSS.

FROM SILICA SHOP — WITH EVERY PURCHASE OF AN

ATARI 400

800

ATARI

ATARI PRICES REDUCED!

We at Silica Shop are pleased to announce some fantastic reductions in the prices of the Atari 400/800 personal computers. We believe that the Atari at its new price will become the U.K.'s most popular personal computer and have therefore set up the Silica Atari Users Club. This club already has a library of over 500 programs and with your purchase of a 400 or 800 computer we will give you the first 100 free of charge. There are also over 350 professionally written games and utility programs, some are listed below. Complete the reply coupon and we'll send you full details. Alternatively give us a ring on 01-301 1111 or 01-309 1111.

ATARI 400 with 16K	£199
ATARI 400 with 32K	£248
ATARI 800 with 16K	£449

400/800 SOFTWARE & PERIPHERALS

Don't buy a T.V. game! Buy an Atari 400 personal computer and a game cartridge and that's all you'll need. Later on you can buy the Basic Programming cartridge (£35) and try your hand at programming using the easy to learn BASIC language. Or if you are interested in business applications, you can buy the Atari 800 + Disk Drive + Printer together with a selection of business packages.

Silica Shop have put together a full catalogue and price list giving details of all the peripherals as well as the extensive range of software that is now available for the Atari 400/800. The Atari is now one of the best supported personal computers. Send NOW for Silica Shop's catalogue and price list as well as details on our users club.
