## News Desk

### Thorn-EMI plans software on cable

THORN EMI is planning to offer its computer software on a cable tv channel.

At present the company has a cable franchise in Swindon and is looking for a second in Leicester. The cable networks will offer a selection of cable tv channels, including one which is planned to be exclusively for software. If the pilot schemes are a success, then cable software could be distributed

nationally.

The software channel would run a rotating top-20 computer games and a selection of home business and education packages.

Said Thorn EMI's Peter Chandler: "It is an obvious development for us — we have interests in cable, film and music and we also have a computer software division."

### Electron add-ons from Sir

SIR Computers, the Cardiff-based Acorn dealer, plans to get out a range of add-on expansion units for the Electron computer well before Acorn's own.

The first of Sir's units, a Centronics and joystick port is planned for the end of September. The unit will cost less than £40 and be compatible for use with BBC joystick controllers. The equivalent Acorn module is not now expected until late autumn.

Sir follows its first unit with four others — an RS423 port and a Rom board both scheduled for mid-October. In November, a Teletext adapter is planned giving the Electron Mode 7.

Prototypes of the Sir computers Electron add-ons will be on show at the Acorn User Show, held at the Cunard International Hotel, London on August 25-28.

Add-on details from Sir Computers, 91 Whitchurch Road, Cardiff.

# Action games that will grab you.

## BBC 32K

### PAINTER £8 ARCADE GAME \*

One of the best. Paint your grids and score before the fizzers get you.

### PLANES £8 ARCADE GAME \*

Fast or slow, skill and speed are needed to beat the enemy aircraft attack.

### FROGGER £8 ARCADE GAME

It's tough going to get FROG across road and river. Snakes and crocodiles too, but there's a lady FROG!

### PHARAOHS TOMB

**£8 ADVENTURE GAME** Pick up the gold but don't be scared penniless by the mummy. Be quick, it's in real time, so work out those magic words.

### SHRINKING PROFESSOR

**£8 ADVENTURE GAME** You're only an inch high how are you going to survive in the garden with all those monstrous spiders, ants and other giant horrors. The crystals do it.

### HORROR CASTLE £8

**ADVENTURE GAME** A beautiful princess waits for you to save her. But how can you get into the castle? The clues lead you to the hidden guarded prison.

### HOWSZAT £6.90 1-2 PLAYER

**CRICKET** Be a cricket star and enjoy all the hazards of cricket to beat your equally keen opponent.

### BOUNCER £8 ARCADE GAME

Thank your lucky stars for the anti matter scoop to catch the BEEBOIDS before they drain the universe into oblivion.

## SPECTRUM

### PAINTER 48K £5.75 ARCADE

**GAME** Patrick's a keen painter but old rollers don't like spray cans and vengefully set out to crush him.

### CRAZY BALLOONS £5.75

**ARCADE GAME** It's a great balloon but ice crystal clouds are the menace. Narrow passages and high winds too before home base safety.

### JUNGLE FEVER £6.90 ARCADE

**GAME** It's got everything, with an exotic horror array of nasty natives, man-eating spiders and crocodiles too.

## ORIC

### ZODIAC £6.90 ADVENTURE

**GAME** An intricate game with pit falls to surprise, frustrate and kill you before you find your successful way. But you can be resurrected.

### DEATH SATELLITE £6.90

**ADVENTURE GAME** You've run out of fuel on an orbiting satellite near a forbidding robotic planet with mutant monsters guarding your vital fuel supply. Can your wits help you to survive?

### PAINTER £6.90 ARCADE GAME \*

One of the best. Paint your grids and score before the fizzers get you.

## DRAGON 32K

### DEADWOOD £6.90 1-4 PLAYER

**ADVENTURE GAME** An ideal family game for everyone who can decide where to invest their bank roll in the long slog to millions.

### SWASHBUCKLERS £6.90 1-4

**PLAYER ADVENTURE GAME** Up to four pirate ships laden with treasure that you want. Scurvy knaves and smallpox too don't help. And is Leper Island the best place to go?

AVAILABLE FROM YOUR LOCAL DEALER  
AND AT MOST COMPUTER BOOK SHOPS.

### How to submit articles

Articles which are submitted for publication should not be more than 3,000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted.

All submissions should be typed and a double space should be left between each line. Please leave wide margins.

Programs should, whenever possible, be computer printed.

We cannot guarantee to return every submitted article or program, so please keep a copy. If you want to have your own program returned you must include a stamped, addressed envelope.

### Accuracy

*Popular Computing Weekly* cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

## Editorial

Chess is a game which has fascinated men for centuries. For some reason this two player game has an ability to capture people's imaginations in a way that no other game has matched.

The origins of chess are hard to pin down, though it is believed to be descended from a board game played in ancient Persia.

Chess is basically a war game simulation, designed to encourage the use of tactics that can be applied to the battlefield. The strengths and weaknesses of each piece are assessed, as are the strategic values of controlling the centre ground and defending your base. Swords are not so much beaten into ploughshares as sublimated into knights and pawns.

Programming a computer to play chess is an extraordinarily difficult business. Each possible move must be evaluated and compared with every other possible move. Illegal moves must be discarded, as must moves which leave the computer defenceless. Looking ahead more than a few moves is very time consuming and slows the game down to a point where boredom sets in.

But, chess computers are getting better all the time. Human Grandmasters may find that their supremacy is being challenged sooner than they think. Perhaps the programmers will inherit the earth after all.

## PROGRAMMABLE JOYSTICK INTERFACE

for  
**Spectrum**  
or **ZX81**

### ABOUT OUR PROGRAMMABLE INTERFACE

Surpassing the outstanding specification of our Interface Module II which still offers the best software support at its price, a Joystick Interface that is compatible with ALL SOFTWARE through its unique hardware programmable design.

The Interface plugs on to the rear connector of your ZX81 or ZX Spectrum.

Quick clip-on connections, which are configured from a reference card supplied, allow you to define which of the forty keys are simulated by which action of the Joystick. A pack of ten Quick Reference Programming Cards makes setting for your favourite games even easier. These can be filled in to show at a glance the configuration required and stored in the cassette case of the particular game. When you change to a game using different keys the module is re-programmed in a few seconds.

As with our Interface Module II the Programmable Interface accepts all standard switch Joysticks that are Atari-compatible. Two sockets are available which are connected together for two player games which use the same keys for both players.

The Interface resides in the keyboard address space and does not affect its operation or interfere with any other add-ons. A rear extension edge connector will accommodate expansion of your system.

The unique AGF key simulation principle makes it extremely easy to incorporate Joystick action in your own programs. All eight directions and fire are read by simple BASIC.

With every order comes a free demonstration program called 'Video Graffiti' plus a full set of instructions.

### KEY FEATURES

- ★ Programmable design gives TOTAL software support.
- ★ Accepts Atari, Competition Pro, Wico, Starfighter, Quick Shot, Le Stick etc.
- ★ Rear extension connector for all other add-ons.
- ★ Free demo program and instructions.

### PACKAGE CONTENTS SUPPLIED

- Programmable Interface Module as illustrated, complete with clip-on programming leads.
- Self adhesive programming chart detailing how to define which key is simulated by UP, DOWN, LEFT, RIGHT, and FIRE. This can be fixed on to the case of your computer or if preferred the protective backing can be left on. The chart is made of a very durable reverse printed plastic and is extremely easy to read.
- One pack of ten Quick Reference Programming Cards for at-a-glance setting to your games requirements. The card allows you to mark the configuration in an easy to read fashion with space to record the software title and company name.
- Video Graffiti demonstration program which is written totally in BASIC to illustrate how all eight directions and fire can be read. This is also a useful high resolution drawing program.
- 12 months guarantee and full written instructions.

## JOYSTICKS

### ATARI CONTROLLERS

## Thorn-EMI

Continued from page 1

At the moment Thorn EMI is looking at one-way transmission of software, although interactive systems with dynamic pages could be a future possibility.

An experimental cable software system, using an Atari computer and software, was demonstrated by Thorn earlier this year at the Cable '83 show. The display used a teletext-type arrangement of branching pages to list a menu and download a choice of games software via cable. A similar system, capable of broadcasting software either by cable or satellite, will be shown by Thorn at the Cable and Satellite Technology exhibition, to be held at the NEC, Birmingham, in September.

According to Peter, a viable cable telesoftware system has to be compatible with all the current computer systems and distribute current top-selling commercial quality material.

"Submarine Commander is one title we might put on cable — it is a top-selling title, and has been written across a range of popular machines," he says.

To use the system, a special Rom cartridge would be plugged into the user's micro and act as a kind of software filter — making sure that only software available for the user's particular type of machine can be downloaded.

"The system is now entirely possible," commented Peter, "all we are waiting for is the second generation of teletext chips that will make the system much faster to use."

Thorn EMI is already well advanced with plans for a music cable channel and is now looking at satellite distribution for its material — including the software channel — to Europe.

## Eighth ZX fair at Ally Pally

THE eighth ZX Microfair is being held this weekend.

The venue is again Alexandra Pavilion, Alexandra Palace, London, and the cost to get in is £1 and 50p.

The one-day show on Saturday, August 20 will be open from 10 am to 6 pm.

# Phoenix rises from the ashes

ONE of the two founders of Romik Software — the predominantly Vic20 and Dragon games house — has left to form his own company, Phoenix Software.

Gerry Rose

The split between Romik's Gerry Rose and Mike Barton comes as a shock, since the company is still less than a year old. Formed last September, Romik achieved a turnover of more than £100,000 in its first six months trading.

"Mike Barton and I had an acrimonious falling-out in, which he used his casting vote as chairman of the company to try to get me out," explained Gerry Rose. "He failed, and eventually we agreed an out-of-court settlement."

## Apocalypse is here

APOCALYPSE software appears to be the first independent software house to write for the Aquarius computer.

Aqua Paks 1 and 2 are compilations with a number of games on each tape.

Other titles still in the pipeline include Aquamarine (a Scramble variant), Aquaman (a Pac-man game), Aquasplat (a Blitz-type game) and Grandprix (a driving game).

All titles will cost £9.95 and be available from the new company, Apocalypse Software, 5-7 Stert Street, Abingdon, Oxon.

## The Dragon goes Forth

FOR £14 it will soon be possible to buy a disc-based version of Forth for the Dragon.

M and J Software plan the product, which is compatible with the Premier Microsystems Delta disc system, for the beginning of September. The language is a fig-Forth implementation and contains its own macroassembler.

Forths seem to be about in

Mike Barton tells his side: "I bought Gerry out for quite a large sum — a very large sum. It has always been my company and I wanted the business back."

Now Gerry Rose has set up a new software house — Phoenix — which will be launched at this year's Personal Computer World show in September.

Says Gerry: "Phoenix is the bird which rose from the ashes — that's why I chose the name." To start off with Gerry plans software for the Vic20 and Spectrum based on what he describes as a completely new idea. "Some people enjoy arcade games, others prefer adventures," he says; "the

## Discs for 480Z

RESEARCH Machines has announced the launch of its disc drive system for the Link 480Z machine.

The units, either single or double drives, can operate in either a single- or double-density disc mode.

In double-density mode the single disc system has a capacity of 328K. Like the 380Z system, the units are compatible with the CP/M 2.2 operating system.

Prices are £616 for the single disc drive and £924 for the double. Educational establishments should, however, be eligible for around a 20 per cent discount on these costs.

Phoenix idea is to give people the best of both worlds."

Mike Barton remains undaunted by the split. He plans to release 16 new titles under the Romik banner in the next three weeks: included are Atom Smasher (BBC), Sessaw Scramble (Atari), Power Blaster, 3D Monster Craze and Atom Smasher (all Lynx), Zogon's Kingdom and Golden Apple of Zeus (Vic20), Dickies Diamond and Tomb of Xeiops (Commodore 64) and White Crystal (Dragon 32).

## An ideal party game

THIS curious-looking device costs £15.95 and is an electro-mechanical game based on the arcade favourite Donkey Kong.

Kong Man stands 15in tall and is, apparently, an ideal party game. The object of the exercise is to negotiate a steel ball from the bottom of the structure to the top, avoiding a variety of obstacles.

The toy is made by Tomy and should appear in the shops for Christmas.

## Latest microdrive news

IN this series of bulletins we hope to keep you informed about delivery schedules for the Sinclair ZX Microdrive.

Here is what has happened so far: Popular Computing Weekly received its microdrive order form on July 29. Order form completed and returned to Sinclair, July 29. Cheque not yet cashed. No acknowledgement received. Days since order: 21.

# It's time to S-T-R-E-T-C-H your Micro with new books and software from McGraw-Hill

☐ **Information Handling for the ZX Spectrum**  
**C.A. Street**

This book explains how file handling programs are designed, used, developed, and written. Details of the accompanying software are given below.

ISBN 07 084707 X

£6.95

☐ **Spectrum Information Handling Routines**  
**C.A. Street**

Contains thirty programs and program segments with machine code routines for sorting. Saves hours of keying!

ISBN 07 084726 6

£6.95 inc VAT

☐ **PROFILE 1**

**C.A. Street**

A spreadsheet file handling system for the hobbyist or small business needing a cataloguing, mailing or stock control system. Handles both numeric and alphabetic information, selects, prints, processes, calculates and manipulates words and numbers.

ISBN 07 084706 1

£9.95 inc VAT

☐ **The Spectrum Workshop: Word Processing and Beyond**  
**Randle Hurley**

The Spectrum can be used as a wordprocessor! The programs in this book are as comprehensive as a dedicated commercial package, and are fully described, line by line.

ISBN 07 084704 5

£6.95

☐ **Spectrum Interfacing and Projects**  
**G.D. Bishop**

This book shows how to use the Spectrum to control the outside world and contains many examples, programs and circuits, including a DAC, ADC and latch. Hardware kits are available for projects.

ISBN 07 084702 9

£6.95

☐ **Spectrum Interfacing Programs**  
**G.D. Bishop**

This support software provides all the necessary programs to drive the projects in the above book.

ISBN 07 084709 6

£6.95 inc VAT

☐ **ZX81/TS1000 Programming for Young Programmers**  
**Linda Hurley**

A book intended to teach children aged 9 upwards how to program in BASIC, through games and movements, calculated to hold a child's interest.

ISBN 07 084595 6

£4.95

☐ **ZX81/TS1000 Programs for Young Programmers**  
**Linda Hurley**

Consists of three games programs not included in the above book and provides many extensions and improvements in the book.

ISBN 07 084700 2

£5.95 inc VAT

☐ **Learn and Use Assembly Language on the ZX Spectrum**

**Tony Woods**

This book provides a detailed step-by-step introduction to Assembly Language Programming.

ISBN 07 084703 7

£6.95

☐ **ZX Spectrum Machine Code Assembler**  
**ACS**

A full-function machine code assembler which enables the Spectrum to 'speak' Z80 Assembly Language. A must for arcade enthusiasts.

ISBN 07 084717 7

£7.95 inc VAT

☐ **Invent and Write Games for the ZX Spectrum**

**Noel Williams**

This book teaches you how to write your own graphic and adventure games programs. See below for accompanying software.

ISBN 07 084719 3

£6.95

☐ **Write Spectrum Games Programs**  
**Noel Williams**

This book teaches you how to write your own graphic and adventure games programs. See below for accompanying software.

ISBN 07 084719 3

£6.95

☐ **Write Spectrum Games Programs**  
**Noel Williams**

Three games are included along with additional programs not in the book. The programs are listable and can be examined and modified.

ISBN 07 084720 7

£6.95 inc VAT

☐ **Programming the Dragon for Games and Graphics**  
**Geoff Phillips**

Programming techniques in BASIC – including a stock control (freezer contents) program, an Adventure game, and Star Battle. See accompanying software.

ISBN 07 084703 7

£5.95

☐ **Dragon Games and Graphics**  
**Geoff Phillips**

All the major programs in the book – Breakout, Clock, Freezer, Adventure, Cards and Star Battle. All in BASIC, can be listed, to save a lot of keying.

ISBN 07 084715 0

£7.95 inc VAT

☐ **Structured Programming: A First Course for Students and Hobbyists**  
**Peter Gosling**

The merits and techniques of structured programming are explained in this book, with examples of the way real-life programs are designed and written.

ISBN 07 084701 0

£5.95

☐ Please send me further details about the above series.

## Easy to learn

I hope I can claim the highest score on Bug-Byte's *Another Vic in the Wall* of 83,170. Until this high score I had only managed a mere 11,000 (or thereabouts).

Ever since this mammoth score, I have regularly scored more than 60,000. The secret to the high scores is a rather simple and easy to learn method, which I am sure many Vic users will already have picked up. But, for those who haven't:

(1) Make sure that you get the ball on as much of an angle as possible, with quite a bit of speed.

(2) Try to keep directly underneath, so that you can easily intercept the ball when it reaches your bat.

(3) Just keep repeating steps one and two and success should come in time.

Also, I would like to know if anybody has beaten my highest score.

Philip Bidwell  
20 Hough Lane  
Leyland  
Lancs PR5 1SD

## Object of the game

I would like to make a comment on the letter from Steven Wilson (PCW 4-10 August) regarding his conceptions about Melbourne House's excellent *Penetrator* program. "Pooh!"

He says that there is a fifth level in which you encounter an impassable mountain which always destroys your ship. He believes this sheet to be a bug. He is wrong, this sheet is not a bug at all, but is in fact the whole object of the game. If he were to read his cassette inlay he would discover that the idea of the game is to "Penetrate" (hence the program title *Penetrator*) through four defence rings and blow up an illegal cache of neutron bombs.

The bomb store is on the fifth sheet. As you enter the fifth sheet, a small and narrow vertical shaft comes into sight in the lower region of the screen. You have to launch one of your bombs down this shaft where, at the bottom,

there are two neutron bomb stores. Miss even one of them and it's "Goodnight from him!", because, as Steven Wilson correctly reveals, the tunnel narrows to a point and the ship crashes helplessly into a mountain.

However, if you do succeed in dropping a bomb down the shaft, the screen goes into a brief spasm of pyrotechnics and a nice little tune is played for you. You then receive 1000 points (this score increases by 1000 every time a neutron bomb store is destroyed) and the danger level is reduced to zero. Having done this, you then have to work your way back through the stages and back to the first sheet, whereupon the danger level is reduced to zero again and the mission starts all over again.

Just for the record, my high score on *Penetrator* stands at 98,000 points (I made it to the neutron bomb store and back five times).

May I also offer a tip to *Penetrator* owners who are dozing off at their consoles as the *Penetrator* handwriting is being drawn? Press *Enter* and all the handwriting will appear on the screen at once.

PS. Your magazine is the only one that I actually look forward to buying every week. Keep up the good work.

S Ryatt  
13 Laburnham Road  
Hayes  
Middlesex

## Beltman bug

Thank you for an excellent game. I am, of course, talking about *Beltman* (PCW 21-27 July) which I entered and have been playing ever since.

However, there is a bug in the program which only becomes apparent after two screens have been cleared. The 'time' statement moves down one line for no obvious reason and the program crashes, giving an 'out of screen' error report. This is remedied by slightly amending program line 29. Instead of using 'Tab 13,' substitute 'A 1,13,'.

I have included a printout of the amended line and also a couple of other changes which your readers may find of interest. I have added a 'screen

no' report, to remind hectic beltmen how many levels of play they have completed. Also, I have changed the seemingly meaningless numbers at the top of the screen to graphics which resemble fuses (after all, that is what they are supposed to be).

We ran a mammoth machine code series last year by Ian Stewart and Robin Jones, starting in PCW 23 September, 1982. It may be a little soon to start another series machine code — please write in and let us know your views.

## Full 3-D view

While reading PCW Vol 2 No 30, I noticed a letter from N Webber of Middlesex. I have a BBC B and I purchased a 747 flight simulator from Doctor Soft, but I was disappointed with it. There are various points which make this Basic program unbearable. There is no fuel limit, it takes place at night, you are able to reach 200,000 ft, etc.

In the 747 advertisement it states 'full 3D view of runway'. I do not call a horizon line and an outline of a triangle a 'full 3D view of a runway'.

But, I would like to recommend another flight simulator — *F for Freddie* — a machine code program from Kansas City Systems.

## Green on black

My thanks to Dave Vaughan (PCW letters, 4-10 August) for his comments about my "Green on Black" article (PCW Dragon page, 14-20 July). The problem he is having with the *Get* command is caused by the fact that not only does *CIs* call routine 416, so does *Get*.

The way round this problem is to check that the return address is going to *CIs*. Unfortunately, I have not left enough memory free to add this, without moving the whole program down in memory and consequently rewriting the whole thing. The simplest solution is this: whenever you are going to use a *Get* command type: *Poke 416, 57* first and *Poke 416, 126* afterwards, for example:

```
100 POKE 416, 57: GET(X,Y) -
(W,Z):A: POKE 416, 126
```

## A few points

Many thanks for the ZX Microdrive review published last week (PCW, 28 July-3 August). However, I must bring a few clarifying points to your attention. These were forwarded to me by one of our design engineers.

Printers and terminals use the *Tab* character in a way which is inconsistent with each other and in a way which is inconsistent with the Basic use of *Tab*. Control code sequences appropriate to a specific printer or terminal may be printed on the "b" file to achieve the desired effect.

There is "handshaking" on the Net ... data cannot be lost even if the receiver is not waiting for it.

The *Move* command cannot be used to pirate software ... it will be "impossible" to pirate programs that are protected.

There is no problem with the RS232 interface. It is as flexible as any RS232 interface on any other computer.

# WALLER

#### THE BAD NEWS

VALHALLA is late.

#### THE GOOD NEWS

Popular Computing Weekly said, " VALHALLA's undisguised intention is to steal the title, " best adventure game bar none" ".  
It will.

#### INFORMATION

VALHALLA will be available to distributors, retailers and by direct mail.

Further details will be published in this and other magazines early in September.

It is now anticipated that VALHALLA will be available in the week commencing September 18.

A new game for the Vic20 by I Shambrook

This program was written for a Vic with an additional 3K Ram. The object of the game is to destroy the opposition's navy, before your own fleet is sent to the sea-bed.

First, you are asked to plot the locations on the ocean map grid of the individual units under your command (the *Return* key, must be hit after each location has been specified). These units are shown in a key which is illustrated as part of the program. The opposition navy is plotted using random numbers generated by the computer.

You are then required to input your first guess as to where you think the opposition's fleet is situated (there is no need to hit *Return* after specifying the row number and column letter). If you miss, then the letter *M* will be *Poked* up on to the screen, while a hit will be greeted with a black square on the screen.

The computer then has its turn in guessing. As its moves are the results of calculations using random numbers, the computer is allowed two goes compared to your one. If you find that this is still not enough to prevent you from winning every time, then it is easy to change the game so that the computer has three or even four guesses. To do this change line 854 to:

```
FOR J = 1 TO 3
```

If you manage to score a hit then, as the computer is only permitted to plot certain shapes to represent its navy, it should be fairly easy to work out what it is that you have hit — thus you can quickly hit any adjacent parts of the target before moving on to another unit. If a hit is scored, you will be given an extra guess.

The game continues with the player and computer moving in turn, until one of the navies has been completely destroyed. Once this has happened, the game finishes and the user is asked if he would like another game.

The main variables used in the program are:

PG%	Two-dimensional integer array storing contents of player's grid
CG%	Two-dimensional integer array storing contents of computer's grid
DE, J, C	Counters
AS, BS, CS, DS, ES, FS	Used to hold characters input via the keyboard
VP	Vertical position in grid
LP	Horizontal position in grid
QW	Holds the ASCII value of B\$
ER	Stores the numerical value of A\$
SC	Number of squares the player has plotted when inputting the positions of his naval units.
S1	Poke value of speaker 1
S2	Poke value of speaker 2
S3	Poke value of speaker 3
S4	Poke value of speaker 4
QWS	Used to empty keyboard buffer
K	Holds the ASCII value of E\$
L	Stores the numerical value of D\$
PS	Number of hits player has scored
CS	Number of hits scored by computer
HS	Used to see if player wants another game

## Program notes

30	Puts poke values of each speaker into variables S1, S2, S3, S4 respectively
45	Dimensions the arrays storing the player's and computer's map grids
49	Changes screen and border colours
60-135	Prints instructions
96-115	Keyboard bleeps
165	"Sea" noise
170-190	Pokes grids on to screen
200-213	Prints co-ordinates for each grid
220	Stops "sea" noise.
249-280	Plots two aeroplanes on to computer grid
255	Generates two random numbers to represent vertical and horizontal starting positions of plane.
259	Prevents planes being plotted outside the grid area.
260-265	Prevents two naval units from being plotted in the same square
270	Sets elements of array in which plane has been plotted to 1
290-322	Plots ammunition dump
330-357	Plots aircraft carrier
360-390	Plots battleship

400-430	Plots cruiser
440-470	Plots submarine
479-495	Plots patrol launch
500-530	Subroutine in which two random numbers are generated. These are used in determining vertical and horizontal positions of all navy units
510	Generates random number between 1 and 21 for column letter
520	Generates random number between 1 and 10 for row number
550-680	Player inputs his navy positions
610-620	Inputs row number — number is not accepted if out of range 0-9
630-631	Inputs column letter — letter is only accepted if in range A-U
650	Checks to see that player has not made a mistake in inputting a plot
667	Keyboard bleep
670	If position has previously been specified then returns to get two new co-ordinates
671-672	Sets element in array in which plot has been specified to 1. Pokes asterisk on grid in position input.
680	If all units have not been input then returns to get more co-ordinates from keyboard.
699-821	Player's guess is input
735	Empties keyboard buffer
740-750	Inputs row number of guess
760-770	Inputs column letter of guess
795	Prevents player from guessing the same position more than once
800-801	If position is empty letter "M" is poked on to grid
811	If position is occupied player has scored a hit. Player's score is incremented by 1
820	"Hit" noise, temporarily changes screen and border colours
850-900	Computer's guess
860	Generates random numbers to determine co-ordinates of guess
870	If this position has previously been guessed then new co-ordinates are generated
880-885	If computer has scored a hit it's score is incremented by one, "hit" noise is generated
900	Sets element in array to two showing that it has already been guessed
1000	If computer has won then prints "I won".
1010	If player has won then prints "You won".
1100	Delay loop
1110	Clears screen, asks if player would like another game
1120	If player inputs "Y" then program runs again
1130	If player inputs "N" then program execution is terminated.

# The gang of four

David Kelly writes the *Ultimate Street Life*

The people behind Ultimate Play the Game think their company produces the best software. And they are certainly not shy about telling people.

They may be right. At least they are a contender. Their first game for the Spectrum — *Jet Pac* — released in May caused quite a stir among rival software houses. With a strongly arcade theme, the emphasis was on on-screen visual presentation and fine, smooth graphics. Yet the thing that really surprised people was that the game was very economical on memory, seeming to cram a very great deal into only 16K. Since May the program has become a best-seller, reaching the top of the WH Smith top ten at the beginning of this month. Other games have also been released — *Psst*, *Cookie* and *Tranz Am* — and a lot of people are asking, "Who are these newcomers, Ultimate?"

The company comprises four equal partners — Tim Stamper, Carole Ward, John Lathbury and Chris Stamper.

All four, prior to Ultimate, worked as a development team for the arcade industry. Before that Carole was trained as a graphic designer and the other three all have backgrounds in various aspects of electrical and electronic engineering.

They began working as the design team of a major US arcade machine manufacturer — either Sega or Atari, Tim would not say which — over three years ago. He says: "We were all in right at the beginning of the arcade boom." He feels that the market has changed since then — with the arcades giving way to home computers as the quality of micro games has improved. "Why spend 20p to play when you can pay £5.50 to have the game whenever you want it," agrees Carole.

In 1982 the four decided to go solo and Ultimate came into being. "We went our own way — we are still developing for the arcade industry, but the Spectrum market attracted us because in the UK the machine had a phenomenal growth rate." Thus, Ultimate became the first independent company to make the cross-over from coin-ops to micros. "As a small company we decided we couldn't compete in the arcade industry," explains Chris. "Sega,

for example, has just spent \$1.5m on developing its computer/laser disc system, so we had a choice: carry on producing conventional arcade titles or move into a different arena."

Home computer software required a completely different approach. Developing for the arcades, the idea for the game comes first and then *both* the hardware and software are designed together to implement it. As a result, Tim, Chris and John have experience of both hardware design and program writing on a range of different processors: Z80, 6502, 6510, 8086, 68000 and 1802.

The difference with the home computer market is that everyone has the same machines to work with. "With the Spectrum everyone is on an equal footing," says John. "We looked at the competition at the end of last year and, to be honest, we didn't think much of the standard of software being sold."

Tim: "The Spectrum is Z80 — a nice processor — and we know what it does. There are a few strange things in the Spectrum hardware which perhaps our design team wouldn't have done — but all in all it's not a bad machine."

"Our background means we can produce a top quality game and we have years more experience than most of our competitors."

Ultimate do not use freelance programmers. "People will buy an Ultimate game because they know it will be good," says Carole. "We have to guarantee a high standard of programming — and we do that by writing all the programs ourselves." Tim again: "We chose to write 16K Spectrum games because they can run on more machines. We could produce a tremendous game in 48K — but our development time would go up. We could either do one 48K program a month or two 16K — and we chose to do two 16K."

"Besides, programming in 16K is a very good exercise — it keeps the code tight." The idea for an Ultimate game is well planned before fingers ever type on keyboards. The game and its flow are first planned on a storyboard. Then a series of

screen displays are programmed. Ultimate use a development system to program on — a variation on the tools they used to design for the arcades. Chris reckons the 32-bit multi-user system they use is as good as any of the custom-made systems in use by the big software development com-

panies in the US. A program under development is run simultaneously on the development system and the Spectrum.

The gang of four always work together on each project — and the ideas for the games so far released have been kicking around in their collective heads for three years. Says Tim: "We know what we will do now all the way up to Christmas. Different people have different preferences and we like variety in our programming diet."

Ultimate tries to stick with a set way of approaching a program, but it does not, as some houses do, use standard routines in its programs. "If we did that we would have 32K programs, not 16K programs," explains Tim. In each case the routines are optimised for each game. An arcade machine may have 256 sprites on a moving background and a bit-mapped screen. The Spectrum only has a foreground and background colour.

"Our graphics do look like the arcades," grins John, "but that is only through careful game-flow design."

Not using standard routines has another advantage. "If anybody disassembled one of our programs they will only see what we were doing a couple of months ago!"

Now Ultimate is branching out and will be producing material for the Vic20, Atari and Commodore 64, plus, of course, more for the Spectrum. *Jet-Pac* will go on to the 8K-expanded Vic20 this month and three other programs are at an advanced stage of production — including an arcade/adventure hybrid and a new arcade game, both for the 48K Spectrum. The second of these should be ready within the next four weeks. "There is now an awful lot of software out for the Spectrum, but ours will always sell because it's better. What other people get into 48K we can put in 16," claims Tim.

Ultimate has been approached by other software houses to write for them, but the answer has always been "No".

"We are doing this for ourselves — not to work for another company," explains Carole.

"We have worried a lot of our competitors. Suddenly *Jet Pac* came out from nowhere but, in fact, we have more experience than all of them. I think we have raised the user's expectation of what the Spectrum can do and software houses have been forced to raise their standards in line with us," says Tim.

"Just like the arcades, the market is becoming very selective and the next few months will see a filtering-out of the companies not up to scratch."

"What we are waiting for now is a home micro with a fast 16-bit processor — something like the 8086 or 68000. We have the equipment to produce software for it very quickly and I don't know if other houses can do that. When such a machine comes out we will manufacture software for it — and that will sell the computer."

It makes you wonder how Clive managed without them. ■

## Play the game...

David Lawrence fights off the mutant camels in this review of Commodore 64 software

Now that the price of the Commodore 64 has been slashed to what must be a more realistic figure for the home micro market, we can look forward to a flood of games and personal software. That can only be for the good since, up to now, the 64 software available has been severely limited compared to some other machines on the market. Hopefully, the period in the price wilderness will also have given some of the software houses a chance to get used to the facilities that the 64 has to offer to the commercial programmer.

The danger is that the 64, more than any other recent micro, will produce more than its fair share of superb software and also of absolute disasters. The reason is that with three-channel sound, the sprite facility and an outstanding colour capability, it is possible to make almost any game, no matter how trivial and boring, seem exciting on first sight. On most other machines, the presence of high quality sound and moving graphics are a fair indication that the programmer is of some quality. On the 64, it may simply mean that he or she has read the manual.

If what follows, therefore, sounds a little harsher than the average review, it is only because the 64 really demands a higher quality of game than machines like the Spectrum and consumers have the right to make that demand clear from the beginning.

*Mangrove* by Supersoft is a moderately interesting adaptation of the widely used "Game of Life". In this version, you begin with a stable grid of 32 cells in the centre of the screen. You can now move a flashing cursor around the screen, leaving a trail of cells behind you. If you can place the cells

you create so that they each have four neighbours, then they will survive — otherwise, they will quickly perish.

The catch is that "cancerous" cells appear from random directions. Whenever they touch one of your cells, it is destroyed and the grid disrupted. The only solution is to repair the damage, or catch and destroy the cancerous enemies before they do too much harm.

The game is difficult to play and addictive in the short term, but I suspect that the lack of variety would quickly pall, especially the monotonous graphics.

*Tank Atak*, also by Supersoft and written by B Cotton, is a simple implementation of the arcade tank warfare games. Most of the graphics are low resolution, but they are cleverly used and quite satisfying in practice, with one or two flying saucer sprites darting about the simple mountain backdrop to liven things up a little. For those who are addicted to the arcade game itself, it will come as a disappointment that it is not possible to actually move your own tank across the ground, only to turn it in the direction indicated by the crude direction finder. The use of colour and sound is good, if not spectacular.

I found *Tank Atak* far more enjoyable to play than *Mangrove*, if only because it's the kind of game that you can get the hang of very quickly and yet never completely master.

### A fast accurate varied game

*Centropods*, by Rabbit and written by B and D Houck, is a fairly typical *Centipede* game, with the addition of a randomly moving fireball at the bottom of the screen which, if it touches your fire base, will destroy it.

The game represents a fairly disappointing use of the graphical abilities of the 64. The controls are leaden and seem relatively inaccurate. There are none of the touches which lift a game out of the ordinary. Indeed, so lacklustre is the presentation, that even when your fire base is destroyed, there is hardly any indication of what has happened.

Because the original *Centipede* idea is a good one, the game has its attractions, but all in all it's a pretty sad effort for a commercial game.

If *Centropods* is an example of how not to present a commercial game, *Gridrunner* stands as overwhelming proof that it is still the skill and flair of the programmer which creates a great game. The idea behind *Gridrunner* is, once again, the basic *Centipede* game, but there all comparison ends. This is a fast, accurate, varied game, with a host of touches which make it at

least as good as most of the games being played in arcades around the country.

In *Gridrunner*, written by Jeff Minter of Llamasoft, the *Centipede* idea is dressed up in a science fiction scenario that has you controlling a nifty little spaceship in a quest to rid Earth's solar power grids of invading alien droids (who just happen to join together and progress like a *Centipede*). The threats are numerous and constantly changing — the sound and graphics are quite superb. I've played it for hours and I'm still only learning, but boredom is months away.

If I have a reservation, it's simply that I question whether anyone has to charge £9 in order to make a good return on a game like this.

*Attack of the Mutant Camels*, also by Jeff Minter, is completely new to me. The basic theme is an attack by a convoy of armoured and mutated camels, under the control of alien invaders. Your job is to take your incredibly manoeuvrable scout ship and pick them off, one by one, avoiding their cannons and "smart" missiles. If you're too slow, then they will overrun the defences of your main base. If you succeed... well, you get some more camels.

When I first played this game, I found it one of the best I had ever come across, far more exciting than *Gridrunner*, for instance. Although I still admire the presentation of the game, it has palled on me a little, simply because it lacks a certain variety. That shouldn't detract, however, from a brilliant job of programming and presentation.

The game controls are superb, with a sense of motion in the control of your ship that I have seldom seen equalled. The graphics and sound are excellent, including a trip through hyperspace (in between frames of camels) which contributes nothing to the actual game but is a joy to behold. This is all-action arcade stuff of the best quality, not strong on tactics but then not everyone is looking for tactical games.

*Motor Mania*, by Software 64 and written by John A Fitzpatrick, is a prime example of a good game that could have been made even better on the 64.

The theme of the game is a simple driving test. You steer your car along a changing road, sometimes speeding along a three-lane highway, sometimes edging along a dirt track. There are a number of very nice touches to the game, including an occasional police car which speeds across an intersection with its siren wailing, just as you try to cross at full speed.

Obstacles come in the form of other cars, oil slicks, logs, broken glass and even avalanches. There are a variety of instruments, the car can be refuelled, tyres can be changed and there is a generator which will only keep the battery charged if you keep up a fair speed over the circuit as a whole. The circuit itself, though clearly built up out of a limited number of units, is nevertheless varied enough to keep your interest the whole time — and if it doesn't, that's another car mangled.

Though I enjoyed playing it, my basic objection is that too little use is made of the 64's graphical abilities. Your own car (and the others which appear from time to time) is a single colour sprite, shaped roughly like a racing car. Some of the obstacles are also sprites and fairly neatly done. Apart from that, however, the whole game relies on the 64's low resolution graphics

set, a fact which becomes painfully obvious when you look at the instrument panel. A high resolution display throughout would have required more work, but I think the overall quality of the game would have merited the effort.

As simple *Pacman* type games go, *Pakakuda*, from Rabbit Software, is quite competent. The theme is one of a fish which has to clear a grid by eating smaller fish, all the while evading the octopus pursuers. When an electric eel is eaten, the pursuers can be attacked for a short time. Having cleared the grid of fish, another grid presents itself.

Unfortunately, the grid and the moving objects are all frankly boring, making very little use of the 64's capabilities. No doubt there are *Pacman* addicts who will relish another addition to the family, but I doubt if many other buyers will play it more than a couple of times.

The idea on which Supersoft's *Kaktus* is based sounds fairly original to me. You are a gopher, defending a cactus plant from a swarm of marauding wasps and hornets who are trying to eat it. Threats consist of a deadly acid rain released by the swarm, a buzzard which bombs you with its eggs and a mole which tries to fill in your hole and trap you.

## Boredom mixed with amazement

Unfortunately, the graphics are extremely dull, the controls are slow and one or two attempts at the game were sufficient, in my case at least, to bring on an acute case of boredom mixed with amazement that anyone should try and charge £9.20 for this.

For all those who are bored with arcade-style games but are fascinated by intelligent board games, *Renaissance* from Software 64 and distributed by Audiogenic is going to be a good buy. In reality it's a version of *Othello*, the simplified version of *Go* which became popular around 10 years ago.

This is an attractively put-together package, colourful, easy to use and providing a

wide range of options such as setting up problems, changing colours in mid-game, withdrawing one or more moves and suggested moves if you're stuck. There are eight levels of play and the standard is high. *Othello* has always fascinated me, but I never realised how badly I must play until this program took me to the cleaners.

My only reservations about the game are that there are one or two careless touches, like a flashing cursor which alternates between white and pale yellow and so hardly catches the eye on the board. The other problem is that of speed on the higher levels. In complex situations, it can be a matter of sitting back and having a cup of coffee before a move is decided upon and a game at the highest levels is likely to take a considerable time. Even so, this is a game that is likely to be on your list of favourites long after the average arcade game has been consigned to a box in the attic.

If *Othello* is fun, chess for many micro owners is the ultimate in games. Of the many chess programs around at the moment, *Grandmaster*, from Software 64, appears to be one of the strongest (the strongest micro version according to the handbook).

Not being a chess professional I find that claim difficult to assess, but the program certainly appears to be stronger than Artic's *Spectrum Chess* which was my previous favourite. The display is clear, although the graphics are not the best I have seen. Moves, the level of analysis and a chess clock are displayed on the right of the screen.

Surprisingly, for what seems such a well-put-together package, there are one or two fairly standard features missing. It is not possible, for instance, to set *Grandmaster* up to analyse a chess problem or to swap colours in mid-game. Since the 64 is going to be around for some time, it is to be hoped that these features will be added in the not too distant future, especially if people are being expected to pay £18 for the package.

## On the move with Vic

*Peter Bartley shows how to move objects about the screen in the first of a six-part series for the Vic20*

OK, so you've bought your Vic20, taken it home, been suitably impressed with its "powerful sound and graphics capabilities", suitably unimpressed by the demonstration programs in the back of the manual, then sat back and thought: "What now?" Perhaps you bought a few magazines, tapped their programs in, and zapped a few more meanies. Satisfied? I hope not.

Writing your own games is a very powerful way of improving your programming capabilities (believe it or not!) and can be an informative and enjoyable way to learn new techniques, commands, and tricks, even, on your micro. This series of articles introduces the newcomer to the "ins and outs" of Vic computing, with a few tips to keep the "old hands" on their toes! For the moment we'll be concentrating on "arcade-type" games only (that is, those concerning objects moving about the screen).

With the Vic, there are two ways to get objects on to the screen: *Print* and *Poke*. The Vic owner's manual states that for more sophisticated animation, *Poke* is the more suitable. True. But the ever-faithful *Print* can have its useful points. Try the program in Figure 1 to enhance your text presentation.

A quick explanation: line 40 is probably causing a bit of headscratching. Quite simply, all this is doing is setting register *B* to the number of characters in *A*, minus the current value of the loop. If *B* is greater than the number of spaces on the screen (22), then *B* is made equal to 22 (neatens up the display!).

So, for each step in the loop, it produces a successively shorter string length. When these strings are printed over each other, in line 50, it produces the effect of movement.

This simple program can have useful games applications. If the loop was continuous and consisted of graphic logs and turtles, you'd have little further to go to produce a working version of *Frogger*!

Another useful *Print* routine, producing a futuristic display, is contained in Figure 2.

Line 40 in Figure 2 chops up *A\$* into single characters and checks to see if the

characters are spaces or not. If the characters are not spaces, lines 60 and 70 make a noise and print the character. If they are spaces, the characters are printed without the noise.

Line 40 can also be used to filter out cursor commands as well as spaces: How?

By the way, line 50 simply prints a cursor (\*) over the current print position. This novel routine would certainly liven up a bland "adventure" program, and generally illustrates the Vic's ability to chop up and mangle strings.

On with the games! Presuming you have read the owners manual, you will have some idea of how to *Poke* objects on to the screen. I personally like to view the screen as two grids superimposed on each other — then one grid represents the shape of the character, and the other its colour.

In this respect there are two "magic numbers" to remember (inscribe them on the tablets of your heart — they'll serve you well!). They are: 7680 and 30720. The first you may recognise as the first screen location; the second will probably be unfamiliar. You will notice that the first colour location is 38400 — and what's 38400 minus 7680? Yes, you've guessed it! — 30720.

So, when you're moving objects about,

you can colour them by simply adding 30720 to their screen character codes (7680-8185).

Suppose you want to move an object randomly about the screen, representing say, a dodging aircraft or spaceship. Obviously this involves use of the random

number generator. Being on a flat screen, our ship can only move in four directions (possibly eight, if you include diagonals). From any given position, it can move up (-22 blocks on the Vic screen), down (+22), left (-1), or right (+1).

At first sight, it looks impossible to produce just those numbers using *Rnd(1)*. The easiest way to overcome this is:

```
10 A(1) = 22: A(2) = -22: A(3) = 1: A(4) = -1
20 B = INT(RND(1) * 4) + 1: PRINT A(B): GOTO 20
```

See? Much easier and neater than a series of *If...Then*s. Delete line 20 and add the following:

```
20 B = 7933: POKE 36879,8: PRINT "[CLR SCR]"
30 POKE B,32: B = B + A(INT(RND(1) * 4) + 1):
   POKE B,81: FOR C = 1 TO 100: NEXT
40 GOTO 30
```

Well, there's a start. We're moving at last! Next week, we'll be dealing with how to get your ship on the screen reacting to your inputs, and fully exploring the realms of *Peek* and *Poke*. Later still, we'll be seeing how to vastly improve Vic standard graphics and play around a little with the sound generators.

Meanwhile, try to figure out a way to stop our friendly "blob" in the program above from disappearing off the top and bottom of the screen.

VICTRICK No. 1: Type in "SYS64802" and see what happens!

Figure 1

```
10 A$ = "PRINT YOUR MESSAGE
   HERE [SPACE]"
20 FOR A = 1 TO LEN(A$)

# ORIC MCP 40 COLOUR PRINTER

**ORIC**  
MCP 40 COLOUR PRINTER

**£169.95** incl.VAT

It's here, the exciting new ORIC MCP 40, Colour-Printer. Packed with quality ORIC features to start building your ORIC system.

Superbly styled and quality engineered to provide 4 colour hard copy, for home and business use.

Just look at these leading features:

- **Quality hard copy on plain paper**
- **Superb graphics and text capability**
- **Prints 4 colours – Red, Green, Blue and Black**
- **Designed to match the futuristic style of ORIC 1**
- **Plugs straight into your ORIC – printer lead supplied**

# A flash of light

*Peter Vincent explains how to invert the screen and switch both Flash and Bright on or off*

The three machine code routines presented here operate on the attribute file of the ZX Spectrum and hence alter the display instantly by a simple *Usr* call.

The first two routines, given in Figures 1 and 2, alter the *Flash* and *Brightness* attributes respectively. This means that, if the relevant attribute was set to 1, it is changed to a 0 (ie, ON to OFF), and if set to 0, then it is changed to 1. Consequently, if the *Flash* routine is called, then whatever was not *Flashing* now starts to *Flash*, and anything that was *Flashing* now stops. The *Brightness* routine works in exactly the same way.

If you examine the detail of each routine, you will see that the start of the attribute file is loaded into the *HL* register pair, which is then incremented to examine each byte

of the file in turn. Then the *Flash* bit (bit 7) or the *Brightness* bit (bit 6) of each byte is tested and reset if set, or set if previously reset.

On each of the three routines given here, the count is organised in the same way. The *B* register is initially set to 194 and this is decremented to 0, then reset to 255 (twice) by reference to the number stored in the *C* register. This gives the 704 (194 + 255 + 255) items needed to make up the screen display.

The third routine in Figure 3 performs a screen invert by exchanging all the *Paper* and *Ink* attributes, the other attributes are not affected. The routine works in a similar way to the earlier two, but finds the relevant bits in the attribute file by masking each byte in turn with the instructions *And*

7, *And* 56, *And* 192 (binary 00000111 (0h), 00111000 (38h), and 11000000 (C0h)). The attributes are then moved either left or right into the positions of the *Ink* or *Paper* they are about to become, and then stored in the *D* and *E* registers. Finally, all the attribute byte is put together using the instructions *Or D* and *Or E* and replaced into the attribute file.

The program in Figure 4 allows all three routines to be *Loaded* into memory, after storing the Hex data in a string. Be sure to enter this string in the *Caps* mode, so that the *Hex Load* program given in lines 50 to 90 works correctly.

When entered, each routine can be called using the appropriate *Usr* call, with the routines stored as follows: the screen invert routine at address 32480, the flash routine at 32525, and the brightness routine at 32554. The program gives a demonstration of all three routines, but they do not all have to be used together and any individual routine can easily be added when required to any machine code program.

## CALIFORNIA

## GOLD RUSH

### HOWDE DO PARDNERS

This here's Prospector Jake, I sure am havin' one helluva time tryin' to peg ma claim with those damned Injuns a hootin' an a hollerin' all over this territory. Ma job gets harder as I move from one Gold Field to another. I know, that is me an' ma stubborn hornery ol' Mule here know of 24 rich an' I mean rich seams of pure Gold. All it needs to make this here ol' critter happy is that you help me peg every doggone last one of them claims.

Can YOU help Jake become rich, help him peg his claim, dodge the arrows, avoid the tomahawks, and plant the Dynamite in just the right place? . . . YOU CAN!!!

YIPPEE . . . Git yer Picks an' Shovels and join the CALIFORNIA GOLD RUSH . . . NOW

Amazing Arcade Action . . . Stunning Sound and Graphics  
Available NOW for Commodore 64, Spectrum 48, and Dragon

**£ 7.95** including P&P

# Get the message

Brian Cadge provides an alternative set of error messages

Error messages given by the Dragon are somewhat terse, to say the least. A question mark, followed by two letters, can be somewhat confusing and send you scurrying for your quick reference guide. What is worse, not all of the error codes are explained — ?DN and ?UF are two examples. For the less experienced user, for whom error messages need to be especially clear, all this can be very confusing.

The accompanying program will, when entered and Run, replace the two letter codes with full text messages such as "Out of string space" instead of ?OS. There are 26 possible error messages that

the Dragon can produce and the new versions are held in the Data statements from lines 200 onwards. The order of these is very important to ensure that the correct message is displayed. However, the messages can say anything you like — they are as clear as possible, but you may like to alter the Data statements to give customised or comical messages instead (how about "Major Cockup" instead of "Syntax error").

The assembly language listing of the machine code shows how the program works with each line explained. When an error occurs, the Dragon jumps to location 401, which usually contains a Rts instruc-

tion. The program changes this to jump to the special error routine. The number of the error (from 0 to 25) is held in the B register, which must be divided by two to get the actual number — this is done in line 100 of the assembly language listing.

All of the Rom calls are explained in the listing, the most useful being the call to location 37093. This will print the text starting at the address one after that in the X register, until a zero byte is encountered — this is why after each message a zero is Poked in line 120 of the Basic listing.

The machine code in the Data statements is checked in line 60 by means of a check sum and will not run if any errors are present — this avoids the machine crashing. To return to the normal Dragon error codes at any time, type: *Poke 401, 57* and to get full messages type: *Poke 401, 126*.

GREAT VALUE FOR MONEY WITH OUR

# SPECTRUM

SOFTWARE

GAMES FOR THE 16K or 48K SPECTRUM

**MONGOOSE (m/c) and BEAR ISLAND** £4.95

Fast and furious arcade action with these colourful high speed games.

**REVERSI (m/c) and POKER DICE** £4.95

Classic strategy and addictive gambling games.

**TIME-LINE (m/c) and TASKS** £4.95

A superb 16K text adventure and a collection of mind stimulating puzzles.

**MAGIC CASTLE (m/c 48K only)** £4.95

A gripping adventure. Rescue the princess, but beware of booby traps and vampires.

**3D MAZE OF GOLD (m/c)** £5.95

Amazing full colour, high resolution views as you walk around a large labyrinth.

## EXTEND SPECTRUM BASIC (16K or 48K)

WITH WHITE NOISE AND GRAPHICS (m/c)

£5.95

Adds many useful commands to BASIC including a window system and true explosion type sound effects. Extensive manual supplied.

## EDUCATIONAL PROGRAMS

**CESIL** £5.95

A widely used O-level teaching language available for 16K or 48K Spectrum Dragon 32 and 16K ZX81. Supplied with a comprehensive manual.

**HAL** £5.95

Another popular O-level teaching language for the 16K or 48K Spectrum.

**VISUAL PROCESSOR** £5.95

Provides an 'on screen' display of a simple Micro-processor illustrating its internal operation as it runs your programs. With comprehensive manual. For the 16K or 48K Spectrum.

Our Software is now available from many computer shops nationwide, or direct from us by post or phone. SAE for details. Dealer enquiries welcome.

# Assembled — part five

Jeremy Ruston concludes his introduction to assembly language programming

The *Php* instruction pushes the status register on to the stack. Apart from pushing it, this instruction does not affect the status register. This instruction is often used in the same way as the *Pha* instruction above.

The *Pla* instruction pulls the accumulator off the stack. Thus, it complements the *Pha* instruction.

The *Plp* instruction pulls a byte from the stack, then moves it into the status register. The flags are inherently affected. This instruction is usually paired with a *Php* instruction, to conserve the status register whilst a subroutine is executing.

The *Rol* instruction is similar to the *Asl* instruction. The difference is that when the byte is shifted left, bit zero is not set to zero — rather, it is set to the previous value of the carry flag. The instruction thus rotates the byte, and assumes that the carry flag is the 9th bit of the byte. The addressing modes allowed are:

Accumulator, eg. *ROL A*  
Zero page, eg. *ROL &83*  
Absolute, eg. *ROL &8300*  
Zero page indexed with X, eg. *ROL &83,X*  
Absolute indexed with X, eg. *ROL &8300,X*

The idea of this instruction, in part, is to allow the shifting of numbers that are more than eight bits long. For example, if a 32 bit number is stored in *&80–&83*, the following sequence of instructions will shift the whole lot one position to the left:

```
ASL &80
ROL &81
ROL &82
ROL &83
```

In addition to the action of the carry flag mentioned earlier, the sign and zero flags are affected in the normal way.

The *Ror* instruction is similar to the *Rol* instruction, except that the rotation is carried out to the right. Exactly the same addressing options can be used.

The *Rti* instruction is like the Basic keyword *Return*, except that it is not used to return from a normal subroutine. Rather, it is used to exit from a subroutine designed to deal with interrupts. Thus, you'll almost certainly never have to use this instruction.

Internally, it pulls the status register off the stack, then pulls the new program counter contents off the stack. Thus, it pulls off the stack exactly what the *Brk* instruction put there. You could use the *Rti* instruction to effect return from a normal subroutine as follows:

```
<main program>
JSR <label>
<rest of program>

<label>
PHP
<subroutine code>
RTI
```

In this case, you are substituting *Rti* for the code *Plp*, *Rts*.

The *Rts* instruction is used like the *Return* keyword of Basic. It pulls the program counter off the stack, where it was placed by the *Jsr* instruction. Subroutines are described under the description of the *Jsr* instruction.

The *Sbc* instruction subtracts the contents of the indicated memory location from the accumulator. However, like the *Adc* instruction, it also takes the contents of the carry flag into account. If the carry flag is set, it is ignored, otherwise 1 is subtracted from the final answer.

Thus, the *Sbc* instruction is often preceded by an *Sec* instruction (SET Carry flag), to ensure that the carry flag does not muck up the result. Like the *Adc* instruction, bit 8 of the accumulator is assumed to be the carry flag, so if a borrow is necessary (as in 3-5) the carry flag is set.

In keeping with the way the carry flag is treated at the start of the instruction, it is inverted after the instruction. This means that the carry flag will be unset if a borrow was required, and set if it was not.

The *Sbc* instruction can use the same addressing modes as the *Adc* instruction.

can use all the *Adc* addressing modes, except the immediate addressing mode — which wouldn't make any sense in this instruction anyway. Thus, *Sta &2000* stores the value in the accumulator to location *&2000*.

The *Stx* instruction does the same thing as the *Sta* instruction, except it stores the value in the X register. The addressing modes allowed are:

Zero page, eg. *STX &80*  
Absolute, eg. *STX &7C00*  
Zero page indexed with Y, eg. *STX &80,Y*

Naturally, no flags are affected by this instruction.

The *Sty* instruction stores the value of the Y register to a specified memory location. The addressing modes allowed are:

Zero page, eg. *STY &75*  
Absolute, eg. *STY &7500*  
Zero page indexed with X, eg. *STY &75,X*

The *Tax* instruction transfers the value in the accumulator to the X register. In the process, the sign and zero flags are affected.

The *Tay* instruction transfers the value in the accumulator to the Y register. In the process, the sign and zero flags are affected in the normal way.

The *Tsx* instruction transfers the current value of the stack pointer to the X register. It is the only way to examine the contents of the stack pointer. This instruction is

Multiple *Sbc* instructions can be concatenated in the same way as multiple *Adc* instructions. Besides the carry flag, the sign and zero flags are affected in the normal way by this instruction.

The *Sec* instruction sets the carry flag, while the *Sed* instruction sets the decimal mode flag. This makes the computer carry out decimal arithmetic until the next *Cld* instruction.

The *Sei* instruction sets the interrupt disable flag, so disabling interrupts. You can use this instruction in particularly crucial bits of code, to ensure that the processor is not interrupted. If you do, you should push the old status value before hand, and retrieve it afterwards. This ensures that interrupts are treated the same before and after the routine executes.

The *Sta* instruction stores that value of the accumulator to the indicated location. It

used by the operating system to access information passed on the stack, but normal programming rarely uses it. The sign and zero flags are affected in the normal way.

The *Txa* instruction transfers the contents of the X register to the accumulator, affecting the sign and zero flags as it does so.

The *Txs* instruction copies the X register to the stack pointer, without affecting any flags. It is the normal way to set the stack pointer when the computer is reset. Otherwise, it is rarely used.

The *Tya* instruction copies the value held in the Y register to the accumulator, affecting the sign and zero flags in the normal way as it does so.

This is an extract from *The BBC Micro Compendium*, available from 1 August, from Interface Publications, 44-46 Earls Court Road, London W8 6EJ.

# Wizard Software

## ARCADE GAMES FOR THE DRAGON

**SMASH** £7.00  
A super "break out" type game in high resolution graphics. Features include a demonstration mode, 9 bat angles and walls of increasing difficulty from a single wall up to a full three walls. Continuous display of score, best score and balls remaining. **RECOMMENDED BY THE MICROCOMPUTER SOFTWARE CLUB.**

**EVICTOR** £7.00  
A reactive game with machine code for extra zip. Evict the aliens from their self re-generating and defended base. Features lasers, phasers and bombs. 5 skill levels. Also features a demonstration mode.

**ALIENS+** £7.95  
A machine coded Arcade game presented in high resolution graphics. Features 48 invaders, mother ship, 4 defenders per wave, 4 shields + bonus shields. Continuous display of score during game.

Still available:

WIZARD £6.50  
SIRIUS IV £6.50  
GALLEONS £5.00

FRUITA £6.50

## Modules 5 - 9

### Module 1.5

Although it is more sensible to input numbers in hexadecimal, working in Basic does mean that they have to be translated into ordinary decimal for use by the program. This is accomplished by the current module.

#### Commentary

Throughout the program the variable *Err* (error) will be used to indicate that an error has been discovered. The normal value of *Err* will be 0, which is the value assigned to the variable *False* in the initialisation routine. Whenever an error is detected, *Err* is reset to the value of *True*, which is minus one.

The point behind using these truth values is that it also allows *Err* to be set by a statement such as *Err=(A>50)*. The expression in brackets has a value according to whether it is true or false. If false, it will take the value 0, if true it will have the value -1. By this means, *Err* can be set to show that something is wrong much more economically than using statements such as *If A>50 Then Err=-1*.

Examining each character of the string *H\$* in turn, this loop 11980-12020 extracts the decimal value of the hexadecimal character using the user-defined function *Fndec* (line 10050). Since the loop works from the left, the result obtained so far must be multiplied by 16 for each subsequent hexadecimal digit. If a character outside the range 0-F is input, the *Err* variable is set to -1 as a warning to subsequent modules.

### Module 1.6

When printing the contents of an area of memory to the screen, it is necessary to specify the start point in memory. This is done in hexadecimal, and the input is then translated into decimal by the previous module.

### Module 1.7

When an area of memory is dumped to the screen, this module is called to inquire whether the user wishes to continue with another.

### Module 1.8

This module does the actual work of taking a value from a location in the memory specified by the Variable *AD*. Module 2 is then called to transform the value into hexadecimal form — single figure hexadecimal numbers are padded out with a leading zero, in order to ensure a standardised format of two digits per byte of memory. Finally, the hexadecimal number is added to *O2\$*, which will be used to display the contents of the memory to the screen.

### Module 1.9

We have now entered all the modules which are necessary to define a start address and pick up data from the memory. We can now proceed to the part of the program which actually does something. Having defined the start point, this module prints out the contents of an area of memory to the screen.

### Commentary

The *X1* loop will be used to print out 18 lines, each with eight values taken from the memory, starting at the address now stored in *AD*.

The hexadecimal values returned by the previous modules are stored in the string *O2\$*. If the value contained in the particular memory location is the code of an Ascii letter or digit, that character is stored in the string *O3\$*, for display next to the values concerned. In most cases, the characters displayed will make no sense, since the fact that the code is that of a printable character will be purely chance. However, when examining areas of memory such as the variables area of the 64, or the structure of the Basic program itself, or a machine code program which contains strings, this facility will be indispensable in getting a picture of what an area of memory contains.

### Review

Having entered this section, you have the working basis of the program as a whole. In the sections which follow you will find that many of the modules employed have already been entered, since functions such as translating into hexadecimal are common to them all.

Before moving on to enter the rest of the program, familiarise yourself with the operation of the program so far. Examine the area of memory which contains the start of the program itself (starting at 801 hex) and the variables area.

This is an extract from *Commodore 64 Machine Code Master* by David Lawrence and Mark England, published by Sunshine Books.

## NEW FOOD FOR YOUR BEEB!

Looking for something a bit different? Fed up with evaporating aliens? Tired of chasing monsters? Are endless missions in deep space proving a strain?

Then you need **THIRD PROGRAM**, a new source of RAM-fodder for your ever-hungry Beeb.

**HOROSCOPES** is a fun program which gives you personal character readings — terrific for parties, or, with a printer, a lucrative fund-raiser at fetes, etc. It may even convince your sceptical family and friends that the computer's not so bad after all!

**WHAT MAKES YOU TICK?** is another original concept from Third Program — a personality test program — find out about yourself the fun way!

**HOROSCOPES** and **WHAT MAKES YOU TICK?** are for the BBC Computer with 32K, O.S. 0.1/1.2, and cost just £5.95 inc p&p each on cassette, or both for £10.90.

### STOP PRESS!

#### ELECTRON VERSIONS NOW AVAILABLE!

State "Electron" clearly when ordering

# ZX MICROFAIR

Where else can you see so much  
for Sinclair Computers?

ONCE AGAIN AT ALLY PALLY  
THE BIGGEST SHOW OF ITS KIND  
ANYWHERE IN THE GALAXY!

What Computer Exhibition gives you the opportunity of finding everything (and we mean everything) for ZX Computers?

Where can you find more than 150 exhibitors dedicated to Sinclair enthusiasts?

Where on Earth can you discover new and original products — hardware, software, books peripherals, programs, add-ons — many additions launched at the show?

Where can you find plenty of space to move, eat, drink, relax and, of course, buy?

Where will you discover that special 'show offer' on the equipment you have been promising yourself?

Where will you find an exhibition hall with so much parking space — and in parkland too?

And what other exhibition offers you all this for only £1 entrance fee (50p for kids under 14)? There's only one answer:

**THE 8th ZX MICROFAIR AT ALEXANDRA PAVILION, SATURDAY 20th AUGUST 1983.**

Make a note of it now . . . and come along for a good day out!

### The big show for a quid (or less)!

**CUT OUT AND KEEP!**

#### By British Rail

From London (Kings Cross or Moorgate) — about every 10 minutes to Alexandra Palace station — free shuttle bus or short walk from there!

From any part of the U.K. enquire from Kings Cross Travel Centre, London N1 9AP (phone 01-278 2477) about special day trips to the ZX MICROFAIR!

#### By Road

Follow signs from the A1 (Links with M1 and North Circular). Plenty of parking space available! Variety of routes from Central London.

#### By London Transport

Underground: Victoria Line from Victoria (also Oxford Circus, Kings Cross/St Pancras) to Highbury and Islington — change (cross platform) to BR Suburban Service to Alexandra Palace — free shuttle bus or 5 minute walk from there!

Alternative: Piccadilly Line (from Heathrow etc) to Finsbury Park or Wood Green — Link with W3 bus service to the fair.

**8th**  
**ZX MICROFAIR**  
**ALEXANDRA PALACE**  
**SATURDAY 20th AUGUST 1983**

**SATURDAY 20th AUGUST 1983 AT ALEXANDRA PAVILION, ALEXANDRA PALACE, WOOD GREEN, LONDON N22. FROM 10am TO 6pm.** Advance tickets available from: Mike Johnston, (PCW) 71 Park Lane, Tottenham, London N17 0HG, Adults £1.00, Kids (under 14) 50p. Parties of 10 or more at 20% discount! Please make cheques/P.O.s payable to ZX MICROFAIR and enclose S.A.E.

EXHIBITORS! Call Mike Johnston now on 01-801 9172 for details of space at this and future shows!

## OPEN FORUM

**Open Forum** is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

## Function

## on Dragon

This program has been written on a Dragon 32 but can easily be modified for use on any micro. The program solves the function in line 60 which is entered as, for an example:

```
60 DEF FN F(X) = X*X-(1-X) ^ 5
```

The program expects exactly one root to be located between the lower and upper limits supplied by the user, with the function having opposite signs at each limit. The user should also supply the accuracy required (1E-8 is suitable) and can see the interval A to B being diminished as the

```

## Chopper

### on BBC Micro

Chopper is a game where you, the tree feller, have to rid the forest of dead trees. You score one point for each of the trees felled — but beware, you must avoid hitting the live trees as you will lose one of your five lives.

The program has many sound effects including a "reward" tune if you beat the high score, two colour user defined characters, a sound on or off routine and fill instructions.

The higher your score the faster the game goes — utilising the negative inkey function means you can move either up and down, left and right or, if two keys are pressed together, diagonally.

### Program notes

## Atomic Collision

on Vic20

The program is an Atomic collision simulation and displays a radioactive source which gives off radiation. Other atoms are

shown randomly scattered throughout the screen and should a stray particle hit one of these it splits into two smaller particles which scatter in different directions.

The program features sound as the radioactive source emits particles and when a collision occurs.

### Variables

PO = position of emitted particle.  
PX and PY = positions of scattered particles.  
SY = shape of scattered particles.

Finally, PS, X, Y, SX are random controls for positioning, sound frequency, etc.

```

## Extra Colours

### on Dragon

The high resolution screen of the Dragon is normally restricted to four colours per mode.

Here are two short listings that will produce a multitude of colours and shades. By poking a value between 0-225 into each screen location, colours not

obtainable by normal methods are revealed.

Each pixel is composed of four parts. With the exception of 0 (which will only produce the mode background colour), between 1 and 4 parts of the pixel will be turned on in a mixture of colours (see Table 1).

Certain values will set all four parts of the pixel to the same colour (see Table 2). With a little skill these extra colours and

pixels can be incorporated into your programs.

The two listings take some one-and-a-half hours to run through completely. You may wish to speed it up by adding *Poke* 65495,0 at the beginning of the listing.

Listing 1 will produce a wide variety of deckchair-striped patterns.

Listing 2 produces an endlessly changing mosaic pattern.

#### Listing 1

```
10 P MODE 1 : SCREEN 1,0 : PCLS
20 A = 0
30 FOR I = 1536 to 4607
40 POKE I, A
50 NEXT I
60 A = A + 1
70 IF A > 255 THEN 90
80 GO TO 30
90 A = 0
100 P MODE 1 : SCREEN 1,1 : PCLS
110 GO TO 30
```

#### Listing 2

```
10 A = 0
20 B = 16
30 P MODE 1 : SCREEN 1,1 : PCLS
40 FOR I = 1536 to 4607
50 POKE I, A + B
60 A = A + 16
70 IF A > 239 THEN A = B
80 NEXT I
90 B = B + 1
100 IF B > 16 THEN B = 0
110 GO TO 40
```

## WIN A LYNX!

This competition is designed just for young people — you must be aged under 18 on September 1, 1983, in order to enter.

The competition itself is simple, just write a 1,000-word essay describing your ideal computer and the different features it should contain. For example, you may think that your ideal computer should be able to speak, or think for itself, or even move about under its own power. The essay should also explain how

these additional features help you to do things which are difficult or impossible on the current range of micros.

To enter the competition, simply fill out the accompanying form and send it, together with your essay, to:

Popular Computing Weekly  
Lynx Competition  
12-13 Little Newport Street  
London WC2R 3LD

### Rules

- (1) Each entry must consist of a 1,000-word essay, preferably typed double spaced on one side of the paper only, together with a completed entry form.
- (2) All entrants must be aged under 18 on September 1, 1983.
- (3) Closing date for competition entries is September 1, 1983.
- (4) The judges' decision is final.
- (5) No employees of Sunshine Publications Ltd, or their families, will be eligible to enter.

games and books

At Last's place we make  
you offers you can't refuse...

We're worth a visit because:

- ★ We've probably the best range of software in the North — and we're improving all the time.
- ★ We've a growing range of computers, peripherals, upgrades and books.
- ★ We've the biggest range of Citadel figures for leagues around.
- ★ We've board and adventure games for all ages from TSR, Games Workshop, Avalon Hill, Victory Games, GDW, Yaquinto, etc, etc.

**PROGRAMMERS — Assassin Software needs your marketable programs. Give us a call**

## SINCLAIR OWNERS READ THIS FROM

You've probably heard about MACHINE CODED PROGRAMS and thought: 'so what? How can they help me?' Well now you can find out and taste the very real difference by purchasing our latest MACHINE CODED programs. These emulate features of the most modern professional computers (12 years' writing machine coded programs for IBM, ICL, UNIVAC and Sinclair means we know what we're talking about). Just read the specification and you'll see what we mean.

### MACHINE CODE TEST TOOL

The ultimate professional tutor and de-bug program, we wrote this to help us write our own programs.

- **TEST** and display machine code instructions as they're written
- **IDEAL** for both the novice and the expert
- **FULLY** documented with a 32 page tutorial
- **HEXDECIMAL** conversion as standard
- **CHARACTER GENERATOR** — of unbelievable quality

Available for the 16K ZX81 and 16/48K Spectrum

### SPECTRUM CHESS — Dare you face The Turk

The original Turk was an eighteenth century automaton, a life-size mechanical figure resplendent in Turkish costume and seated behind a wooden cabinet on which a chess board and pieces were placed.

DCP now offer you the twentieth century equivalent of that Turk — a chess-playing computer program.

The Turk challenges you to a game of chess!

#### MANY OPTIONS INCLUDE:

- 6 LEVELS OF DIFFICULTY
- DEMONSTRATION MODE
- BOARD EDITOR
- GAMES PRINTOUT FACILITY
- BUTZ CHESS AGAINST THE CLOCK
- TWO PLAYER MODE
- UNFINISHED GAMES CAN BE STORED
- RECOMMENDED MOVE

#### FULL INSTRUCTIONS PROVIDED

### ADDRESS MANAGER.....

Works on the 16K and 48K Spectrum, in 48K it will store, file, select and retrieve over 400 full addresses (over 1500 individual names). Dynamic Memory Management and compression techniques makes all this possible and there's a lot more.

- **FULL SCREEN INPUT and EDITING** — see it as a page as it happens with insert, delete and TAB Commands
- **MULTIPLE INDEXING** — 3 way user-defined index enables you to define, catalogue, select and print entries as needed. (essential for the more sophisticated applications.)
- **INSTANT RESPONSE** — yes, this program is very very fast
- **SUPER FRIENDLY** — crash-proof, extremely easy to use and efficient in a way that BASIC can never be.

#### MANY USES

- **AT HOME** — (storing addresses, printing out Xmas Card lists etc.)
- **AT WORK** — for mail-order work, internal telephone directory, sorting customers into types, areas, size you choose
- **CLUBS** — print-out members list, sort different categories etc.

### MACHINE CODE.. IT MAKES ALL THE DIFFERENCE.....

Post order to: Oxford Computer Publishing Ltd., P.O. Box 99, Oxford.

Please rush me: **Address Manager** at £8.95 each. Spectrum only.

**Chess The Turk** at £8.95 each. Spectrum only.

**Machine Code Test Tool** at £8.95 each. Spectrum only.

### The White Barrows

Self-confessed adventure junkie Nigel Morse is having some problems with Level 9's *Colossal Adventure*, Carnell Software's *Black Crystal* and Automata's *Pimania*. Nigel used his free clue in *Colossal Adventure* to find out how to get into the plover room with the lamp. Now Nigel wants to know how to get batteries for the lamp and to find out where the colossal cavern is located.

Well, Nigel, I have to confess to my ignorance. Perhaps one of our readers can help.

Nick Darlow, of Ilfracombe, has a tip for anyone playing Acornsoft's *Sphinx*. There is a point in the adventure where you need to get past an elephant. The usual solution is to find a mouse and then drop it near the elephant, scaring it off. However, Nick thinks that he has discovered a flaw — just type 'drop mouse' whether you have a mouse or not, and you will be able to get past the elephant.

But, Nick has a problem further on in the adventure. A gang of goblins keeps leaping on him and tearing him limb from limb. He has tried killing them, feeding them, paying them and throwing all sorts of objects at them, but to no avail. Any clues would be gratefully received.

Now, Andrew Pennell has kindly provided the following review of *The White Barrows* by ASP:

Long ago, in the Dark Ages (ie, before there were Sinclair Spectrums) a game called *Hunt the Wumpus* was very popular on micros and mainframes. It was ideally suited to teletype terminals as it was text only, but, in its day, it was well liked.

The plot for *Wumpus* went something like this: deep underground there was a network of caves, interconnected by dark tunnels. The main inhabitant of these

caves was a monster called a *Wumpus*, with sucker feet and heavy breathing, who did not like intruders invading his privacy. He built into some of his caves bottomless pits to catch the unwary, and trained his pet bats to lift intruders and transport them randomly in the network. The player was given a limited number of arrows with which to shoot the *Wumpus* if he should see him.

If you replace *Wumpus* with *Evil Sorcerer*, arrows with magic units, bats with magic spots and caves with chambers and put the program on a 48K Spectrum, you end up with *White Barrows* by ASP Software. Originally published as a listing for the Acorn Atom (remember them!) in a magazine, this version of *Wumpus* does have a few improvements over the old classic.

When you are in a chamber, you may get messages such as "I can hear a dragon", and then, for example "You are in chamber 24 — tunnels lead to 8,41". You then have four options — *Create a Wall*, which seems to do nothing, *Move*, which lets you pass along a tunnel to another chamber, *View*, which lets you look into an adjacent chamber, and *Plan*, which draws a map (a luxury that old *Wumpus* players never had). As no instructions were provided on my copy, I

cannot say what *Create a Wall* should do, apart from using up precious magic units.

Also in the chambers are various monsters such as Dragons who you must fight, and a corrupt dwarf who will tell you where the Sorcerer is, if you pay him enough.

When you eventually get adjacent to the Sorcerer, the message "The Chalice is near" appears. However, if you move into the chamber where the Sorcerer was, you get "The Sorcerer has run away". You can chase him as much as you like, but you never seem to catch him.

The *White Barrows* should have been good — the old *Wumpus* game could be made very sophisticated on the new generation of high-res colour micros, but ASP seem to have missed the opportunity. ■

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further, write to: Tony Bridge, Adventure Corner, *Popular Computing Weekly*, 12-13 Little Newport Street, London WC2R 3LD.

Are you stuck in an adventure? Are you faced by a problem that seems insurmountable? *Adventure Helpline* may be the answer.

*Adventure Helpline* is, quite simply, designed to put adventurers in touch with one another. Where you may be stumped by a baffling puzzle, a fellow adventurer may be able to help. By the same token, you may be able to help other people with their problems.

If you are having difficulties with an adventure, fill in the accompanying coupon and send it to:

*Adventure Helpline*  
Popular Computing Weekly  
Hobhouse Court  
19 Whitcomb Street  
London WC2

We shall publish *Adventure Helpline* entries each week in their own special column.

## CAMEL PRODUCTS

### BLOPROM-81

A uniquely sophisti-  
cated EPROM PROG-  
RAMMER as used by  
various labs including  
Sinclair Research. Resi-  
dent 8K software.  
Eprom types 2716 to  
27128. Hobbyist and  
Professional modes.  
ZX81 and 16K only re-  
quired — NO EX-  
TRAS. See printout

£79.95

**PROMER-81.** At last! A low cost reliable programmer for  
2516/32, 2716/32 EPROMS. This is the solution to using  
EPROMs instead of tape. Requires 4 x PP3 batteries for a  
regulated 25 volts. Remarkably priced at **£19.95**

**ROM-81.** Provides two 24 pin sockets for up to 8K of  
EPROM memory in the 8-16K area. Eproms are perman-  
ent memory which require programmers to write to them.  
Can use 2516/32 or 2716/32 **£14.95**

**MEMIC-81.2.** Faster than a Floppy. Easier than an  
EPROM. A 4K CMOS memory and Lithium battery unit.  
Saves programs up to 10 years without external power.  
Plug it into the ZX81 and flick a switch and your program  
is ready for retrieval. A simple PRINT USR... entry  
loads your program into RAM. Resides in 8-12K but can  
be moved to 12-16K. Comprehensive notes + example **£29.95**

## OHIO GAMES

M Golzar, of Cayman House, Gill Street, London E14, writes:

**Q** Could you please give me any details of games to suit my computer which is an Ohio Challenger 1P with 8K Rom in Basic and monitor. If you cannot help me, can you tell me where I can get help?

**A** I must be honest and admit that I have not tracked down any software houses advertising games for the Challenger 1P. If any readers can help, perhaps they will write in and tell us.

The only people who might be able to help you whose address I have is 'The Ohio Scientific Users Group' which can be found at 19a West End, Street, Somerset.

## CLONED COPY

Terry Stygall of Pinewood Close, Westbury-on-Trym, Bristol, writes:

**Q** I have what is possibly a difficult question. There are a number of pieces of software on the market, which, despite the let-out clause, will allow people to pirate other people's software, without having to resort to tape to tape copying. As a writer of software this does irritate me.

I recently bought copies of *Zap* and *Clone*, in order to try and find a way of beating them. I'm afraid that I haven't succeeded, but I know that a method *does* exist. If, for example, you try to copy *Zap* using either *Zap* or *Clone*, the system crashes. Attempts to copy *Clone*, using either *Clone* or *Zap*, meets with a refusal to Load.

The manufacturers of these copiers seem to be happy about

people copying any software other than their own. Have you any idea how these copiers work? If so, have you any idea about how to stop them working?

**A** This is probably the most contentious subject in the business today, and such copiers as you mention are in the forefront of the battle. In deed, as any regular attender of microfairs will tell you, *Zap* points out that 'Certain uses of Spectrum *Zap* can infringe the copyright law'. Copying for private use is not illegal, and given the quality of some tapes that are being sold it is a positive aid.

A copier works by replacing the operating system in the Rom. Thus, in effect, any Rom based command simply does not exist, and so of course can have no effect. The real problem comes when trying to find out where these machine code routines are stored.

Because they are transparent to the system, at least as far as the user is concerned, the copier when *Loaded* cannot be in the user Ram area as that is all available. Logically, therefore, the copier is stored between *Prog* and 16384. I doubt if it is above Ramtop, though in all honesty I don't know. I would also guess that the systems variables are left clear as they are almost always used, as they stand, and I doubt that they could be copied and moved.

I am surprised that no one has yet found a way to beat the copiers, but I would be interested to hear from any reader who has actually failed to make a back-up copy of any tape. *Zap* has been around since before last Christmas, and I would expect someone to get some way into it sooner or later.

Remember, programs are written in different ways, and people storing machine code will do so in different places. Sooner or later, someone is going to try and store code in an area used by a copier. The copier goes in first, and then the program after. If the program was to overwrite the area where the copier was stored, then the copier would not work.

I am afraid that the only help I can give is a theory of how to beat the copiers. It

would mean that any tape you supply must fill up the *entire* Ram. This is easier said than done, but it would ensure that whenever the copier was stored, it would be overwritten.

## DISABLED STOP

T L Beckham of Eleanor Road, Bowes Park, London N11, writes:

**Q** Could you help me with the following problem. I would like to disable the *Stop* key on my latest version Pet, ie, the 96K version. *Poke 144, 49* does not work. Can you suggest an alternative?

**A** The *Poke* commands you want on the 8096 are still at the same address, only the numbers have changed. If you want to disable the *Stop* key then use *Poke 144, 88*. If you want to later reinstate it, then you need the command *Poke 144, 85*.

## GRAPHIC SHAPES

James Sanderson of Learway Drive, Milton, Glasgow G22, writes:

**Q** Since getting my Spectrum I have become an avid computer user. While there is still a lot I do not understand, I am making progress.

However, there is one thing that still leaves me bewildered and that is references in magazines to graphic A and others like it, for example *Balloons* (PCW, 7-13 April), I can understand how that applies to the little characters at the top, but when I use graphics with the letter A all I get is capital letters. Obviously, I am doing something wrong. Can you help me understand how to get these graphics?

**A** The Spectrum, along with many other computers, allows you to define your own graphic shapes and use them in programs. You are

given certain basic shapes on the top row of the keyboard — squares, half squares, etc, but you can create your own shapes and assign them to some of the other keys on the Spectrum (A to U).

You should consult the manual to see how to use user defined graphics — the important point to note is that the capital A you mention is an A got by pressing the key after you have gone into graphics mode; ie, it is not just the ordinary capital. Somewhere else in the program a shape will have been designed and assigned to the A key.

## STOP, PAUSE

A Morris of Tonbridge Avenue, Portsmouth, Hants, writes:

**Q** I am writing several maths programs for my ZX Spectrum (48K) and I would like them to *Pause* for an answer, for a couple of seconds. Then, if the answer is not entered in that time, it would be counted as wrong. The normal *Pause* will not allow an entry and *Input* has no time limit. Could you tell me how I can do this on my Spectrum?

**A** A simple routine for entering answers has been around a long time for the ZX81 and it should transfer directly to the Spectrum. The length of the pause is determined by line 10 and the value of Z. The more times the computer has to execute the loop, the longer it will take.

```
10 PRINT "ANSWER NOW"
20 FOR Z=1 TO 100
30 LET AS=INKEY$
40 IF INKEY$="" THEN NEXT Z
50 IF NOT INKEY$="" THEN GOTO 200
100 PRINT
110 PRINT "TOO LATE"
120 PRINT "YOU RAN OUT OF TIME"
150 STOP
200 PRINT
210 PRINT "WELL DONE"
220 PRINT "*****"
230 PRINT "YOU ANSWERED IN TIME"
```

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem *Peek* it to Ian Beardsmore and every week he will *Poke* back as many answers as he can. The address is *Peek & Poke*, PCW, 12-13 Little Newport Street, London WC2R 3LD.

**SOFTSPOT**

2 RECTORY GARDENS  
LONDON SW4 0EF

for LYNX, DRAGON, SPECTRUM  
and ZX81 Software

**SULTAN'S MAZE** by Christopher Hunt. Enter the 3D Maze in search of the Sultan's jewels, but beware, your strength may run out, or, you may come face to face with the Mad Guardian. A multi-difficulty game with fantastic graphics and sound. Price (LYNX & DRAGON) £7.95

**MONSTER MINE** by W. E. MacGowan. Escape from the mine with as much money as you can, but don't get closed in or caught by the prowling monsters. An addictive machine code game, with superb graphics and save facility. Price (LYNX & DRAGON) £7.95. Price (SPECTRUM & ZX81) £4.95.

**GOLF** by Pete Allen. An excellent Basic program, giving you an 18-hole course, with handicaps and choice of clubs. A golfing weakness must be specified. Amazing graphics and sound!! Price (LYNX & DRAGON) £7.95.

**CHATEAU** by Pete Allen. A new type adventure, in which you must wander the Count's old mansion in search of treasure! Of course, when the Count hid his treasure, then died, he left lots of unpleasant surprises for those brave enough to try and seek out his riches! Come face to face with Ghouls and Ghosts, Vampires and Trolls; do you run or fight? Will the mysterious Travel Agent suddenly appear and whisk you away to far off places? Where can you find the key or the lamp? Is the clock booby-trapped? Will you die a cold and lonely death, or will you win through to claim the fantastic treasures of The Chateau? Price (DRAGON) £7.95.

**GAMES PACK III** by Christopher Hunt.

**REVERSI**. Pit your wits against the Lynx with this easy to learn, yet extremely demanding board game. Five skill levels, from novice to grand master.

**SNAKE**. Guide the snake to the food, but watch out, he will grow and must not eat the wall or himself.

**PONTOON**. An excellent implementation of a favourite card game in full colour with sound. Lynx is a mean Banker. Price (LYNX) £7.95.

**GEMPACK IV** by W. E. MacGowan. Two great machine code games, with full colour graphics. In **Sea Harrier** you must land your plane on the aircraft carrier, after dispersing the clouds with chemical bombs, but don't hit the ship! In **Sub Chase** you must depth charge the wolf pack without being sunk. Both with four levels of play from easy to kamikaze! Price (LYNX & DRAGON) £7.95.

# OLTROSOFT

## WIN THE POOLS?

48k

## SPECTADRAW 2

A Pools Prediction Program for the 48K ZX Spectrum microcomputer. The program looks at the recent form of the teams playing in each week's English and Scottish football league matches and then refers to a large database to see what has happened in the past when teams with similar form met. It can then identify the matches which are likely to yield draws and output suitable predictions.

The program is supplied complete with a database tape containing data on over 7,500 matches and a comprehensive instruction manual. For £12.95 inclusive (cheques/POs payable to B. S. McAlley).

SPECTADRAW, T COWLEAZE, CHINNOR, OXFORD, OX9 4TD

# DRAGON RACER

Drive your super-charged 4-gear Racer on a grueling cross-country track. Keep your revs and engine temperature down or your engine will blow. If it rains you'll have to slow down. Dodge the other competitors and see what distance you can attain.

A fast-moving machine-code game in Hi-res with multiple levels which will test your skill as it has never been tested before. One player only. Two joysticks required.

**WASP INVASION.** A fast Invaders-type game in super fast machine code with full colour and Hi-res. One joystick required.

DRAGON RACER £6.95 or both for £10

WASP INVASION £5.95

Send cheques/POs to C. Woods, 37 Marlpit Lane  
Sutton Coldfield, West Midlands B75 5PH

# ADSOFT

★★NEW LOW PRICES★★

## PLAY SOCCER and PLAY SNOOKER

These programs are designed to improve your game and incorporate sound, colour and hi-res graphics. Each program gives advice on how to care for your equipment and how to avoid the most common mistakes. You will also find hints on how to practice the skills detailed in the programs. Each cassette contains SIX PROGRAMS covering all aspects of the sport and now costs an unbelievable £5.50 (Play Soccer and Play Snooker both run on either ZX Spectrum).

## VIC20 DATABASE

Ideal for collections of coins, postcards, programs etc, but suitable for any standard database uses. Vic20 Database incorporates machine code routines for ease of operation and speed of saving. PROBABLY THE BEST VALUE DATABASE EVER, FOR THE VIC20. Only £5 (for the Vic20 + at least 8K).

Please send cheques/POs (payable to ADSOFT) to:  
36 OLD QUARRY CLOSE, RUBERY, BIRMINGHAM B45 9TU

# NEW RELEASES

## COLOURED

VIC 20 Unexpanded

## CHAR. GENERATOR

SCORPION  
SOFTWARE

*Character Generator* is a utility program to aid Vic20 owners in designing their own Multi-Colour graphics.

Written entirely in machine code, a block of four characters can be designed at a time with commands like *Upturn*, *Invert*, *Multi-Colour*, etc.

The program comes complete with a fairly extensive leaflet, explaining how the program works, and a keyboard overlay.

**Program** *Character Generator*  
**Price** £4.95  
**Micro** Vic20  
**Supplier** Scorpion Software  
268 St Nicholas Drive  
Grimsby  
South Humberside  
DN37 9RP

## DEMI-BOLD

You may remember Cambell Systems' *Dlan* display language program that was mentioned here a while ago — it was a dedicated language for creating moving displays. That program used *Multifont* from Image to create the type faces.

*Multifont* is now available separately for the 16/48K Spectrum. The system gives six fonts, for titles, etc., to make a change from the usual Spectrum character set.

Some of the descriptions of the designs in the accompanying manual caught my eye "A stylish demi-bold face with a modern up-to-date feel that goes well with just about everything... this face has a

classical feel to it" — nearly as bad as wine buffs.

**Program** *Multifont*  
**Price** £4.95  
**Micro** Spectrum 16/48K  
**Supplier** Image  
185 Elm Road  
New Malden  
Surrey KT3 3HX

## SCALING

*Easiplot* is a program for the BBC that enables you to draw various kinds of graph. The program features automatic scaling and labelling, with five different bar types and 10 different line types.

The program comes with a 33 page manual and has been designed to work on both operating systems of the BBC and on Epson and Seikosha printers.

**Program** *Easiplot*  
**Price** £15.95  
**Micro** BBC  
**Supplier** Synergy Software  
Dept 1  
7 St Andrews Close  
Slip End  
Luton LU1 4DE

## WORLD MAP

Things to do with your Spectrum other than kill aliens number 57: Learn Geography.

Kemsoft is trying to take some of the pain out of learning towns and places and their location in the world by letting you use your Spectrum. The computer displays a map of the world and you use the cursor keys to position a dot over a specified country.

*Geography 1* asks questions on the world and Great Britain. Other programs in the series deal with Europe and England.

**Program** *Geography 1*  
**Price** £6.50  
**Micro** Spectrum 48K  
**Supplier** Kemsoft  
The Woodlands  
Kempsey  
Worcester

## CODE LINES

Lynx Basic is well suited to the incorporation of machine code, having, as it does, the ability to handle code lines.

It's rather odd, then, that

*Coder* from FSL Software is the first assembler/dissassembler I've seen for the machine.

The program works with the code lines, but also provides access to free Ram and Rom. It lacks some features of a full assembler, but is relatively cheap at £7.50.

**Program** *Coder*  
**Price** £7.50  
**Micro** Lynx  
**Supplier** FSL Software  
13 St Ronan's Avenue  
Southsea  
Hants PO4 0QE

## 3-D MAZE

*Mazemania* is a 3D maze game for the Spectrum. It comes from a new company Base Two Software which intends to specialise in ZX programs.

The idea of the game is to move around a 3D maze avoiding dangers like holes and searching for a key and other sundry goodies.

**Program** *Mazemania*  
**Price** £4.90  
**Micro** Spectrum 48K  
**Supplier** Base Two Software  
9 The Copse  
Lindfield  
Sussex RH16 2EZ

## WATER SKI

Amongst the new batch of Spectrum releases from Quicksilver is *Aquaplane* by John Hollis. For those of you who don't know, John wrote *Time Gate* which was, for its time, something of a classic.

*Aquaplane* is not intended to be a follow up to *Time Gate* — we will have to wait a while for that. The setting is the Cote d'Azur and you are

happily skiing along when you start to notice various obstacles in the water...

The game has the usual hires graphics and, interestingly, a full screen display — somehow John has managed to get the border to display more than one colour.

**Program** *Aquaplane*  
**Price** £6.95  
**Micro** Spectrum 48K  
**Supplier** Quicksilver Ltd  
13 Palmerston Road  
Southampton  
SO1 1LL

## MATHS

It seems to be spreading. At first it was only BBC parents who insisted their kids gave up playing games and forced them to do educational things with their computer — now it's the Dragon.

*Tele-Tutor 1* is a lavish folder containing two cassettes and a manual. Subjects covered include Spelling, Maths, Vocabulary, etc. All are written in machine code, which suggests that some effort has gone into it — I should hope so, it costs £25.

**Program** *Tele-Tutor 1*  
**Price** £25  
**Micro** Dragon 32  
**Supplier** Microdeal  
41 Truro Road  
St Austell  
Cornwall  
PL25 5JE

## SAVE & LOAD

Claiming to be a "business spreadsheet for home computers" *PractiCalc Plus* is said to have many more features than any comparable spreadsheet.

The 16K Vic version has 2,000 cells, a cell by cell or whole sheet formatting option, and full replication across columns and rows.

If, like me, you find yourself largely baffled by spreadsheets, I expect you'll find this last feature most important — a 65-page manual.

**Program** *PractiCalc Plus*  
**Price** £29.95  
**Micro** Vic (24K-16K has 600 cells)  
**Supplier** Computer Software Associates  
Goddard Road  
Whitehouse Ind Est  
Ipswich  
Suffolk IP1 5NP

# NEW RELEASES

## TIME CHECK

Do you want to plan your life up to two years ahead? Then the Aspic *Timeplan* could be for you.

The program is a menu driven "wall chart" which enables you to allocate time to various tasks.

The program will total up how many hours are committed to various tasks and also remind you at various points of what you are supposed to be doing.

**Program** *Timeplan*  
**Price** £11.95  
**Micro** Spectrum  
**Supplier** Aspic  
238 Warwick Road  
Solihull B92 7AE

## HORRIFIC

*Creepy Computer Games* is the title of a book from Usborne that manages to look quite unlike any other computer book I've seen.

First, the games in the book have been designed to work (with small modifications which are listed) on more or less all of the popular home micros.

More impressive is the design of the book which is

chock-full of illustrations, including a particularly horrific Spiderwoman. Although thin, at 99p it seems good value.

**Book** *Creepy Computer Games*  
**Price** 99p  
**Micro** Most popular micros  
**Supplier** Usborne Publishing  
20 Garrick Street  
London WC2E 9BJ

## METALLIC

Why is it that computer speech always ends up sounding exactly how those dreadful 50's films predicted it would — metallic and emotionless?

*Super Talk* from Abbex may

be a different kettle of fish (or kate-ill ov fee-shh in computer speak).

Unlike the hardware additions which typically cost £25 or £30 this is just a tape. The program works by you recording the words you require and telling the computer how they are spelt — it should then recognise the series of letters in the word and speak it.

This method is not only cheaper but it is claimed that it is possible to put some character into the speech.

**Program** *Super Talk*  
**Price** £5.95  
**Micro** Spectrum 48K  
**Supplier** Abbex  
Tavistock House  
34-36 Bromham Road  
Bedford MK40 2QD

## LICENCE

It would be an understatement to say that I have seen quite a few "you are the pilot ... fight off the enemy fighters"-type games, but *Strike Attack* is different.

In *Strike Attack* you appear to need a pilot's licence before you can even understand the manual (well, I may be being a little unfair, but it is at least as difficult as any other flight simulation program). Not only do you have to fly the plane, but also have to fight off various fighter attacks and drop bombs.

In short, it is definitely not an arcade type, shoot 'em up game, but if you enjoy complicated programs like Psion's *Flight Simulation* you should enjoy this.

**Program** *Strike Attack*  
**Price** £6.95  
**Micro** Spectrum 48K  
**Supplier** Micro Mart  
Micro House  
Greenhill Industrial Estate  
Kidderminster  
Worce

## STORMTROOPER

*Cygnus* is the first adventure game I've seen for the Jupiter Ace.

The adventure requires 19K — a 3K Ace with 16K expansion — and contains some graphics to illustrate the plot.

As is usual with adventures the cassette blurb doesn't give

much away so it's difficult to say anything about the game. The cover has a rather nasty stormtrooper on it so I expect the game contains the requisite amount of death and destruction.

**Program** *Cygnus*  
**Price** £6.95  
**Micro** Ace (19K)  
**Supplier** Richard Roberts  
52 Whalesmead Road  
Bishopstoke  
Eastleigh  
Hants SO5 6HL

## DEADLY DORIS

Program Power's *Killer Gorilla* must be one of the most successful BBC games ever.

The author of that program now has a game out — *Escape From Moonbase Alpha*.

As Joey you have been left for dead by your fellow crew members in a mysterious complex known as Moonbase Alpha. You have to find your way to freedom via a kindly doctor and his time machine.

Among the problems you might encounter on your way to freedom are the Green Grappler, Deadly Doris — Metal Mauler, The Demon and the less threatening sounding Marvin.

The graphics are all 3D and if things get really desperate you can take a Hulk-pill and walk through walls.

**Program** *Escape from Moonbase Alpha*  
**Price** £7.95  
**Micro** BBC B (A + 32K)  
**Supplier** Micro Power  
8/8a Regent Street  
Chapel Allerton  
Leeds LS7 4PE

## LOSERS PROGRAM.

it says, whoever is  
Dungeon Master has  
to be the Computer  
too...

DRAGONS and DUNGEONS.

New Releases is designed to let people know what software is coming on to the market. If you have a new game or utility which you are about to release send a copy and accompanying details to: New Releases, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

## Fact of factoid?

I would like to introduce you to a new word. The word came from I know not where, but I first came across it a couple of years ago. It is a good word, even though used by people in advertising, marketing, and similar areas (eg, video).

The word is "factoid".

Just as a humanoid is like a human, but only pretends to be human, so a factoid looks like a fact, but is only pretending to be a fact. The suffix "-oid" comes from the same Greek root (eidos) as "idea". Get the eidos?

Propaganda abounds in factoids. Example: the *Computer Horizons* feature in *The Times* for Tuesday, July 26, included a section entitled *Speak up, the computer will be listening* by Ian White. He writes:

"The good news is that within five years or so the keyboard will be used only for the most esoteric of commands. Voice recognition will be the norm before the decade is out."

No prizes for spotting the factoids.

The author of this mess of factoids must have reasons for making these assertions. Let us examine some of them. Before we analyse his reasoning, however, first think — how many typists are there, and how many are frightened of the keyboard they use every day?

The article starts by positing that the market in computer technology is being held back by what is described as the "techno-fear of thousands of potential computer users, who freeze at the sight of a keyboard and balk at the prospect of communicating with an inanimate object". A factoid of the purest untenability.

On the one hand, are all typists (a group in which I include myself) really special creatures who have managed to overcome a vastly

irrational fear of typewriters and keyboards? And are all those who are in love with cars, and with driving (in which I do not include myself) really outlandish and strange? (YES!)

The fear of computers is a vastly over-stated myth. I have heard real people say that they were frightened by computers, but often it seems to be a protection against over-enthusiastic selling. I have yet to find a child who is frightened of computers (though there must be some, I hate cars).

According to Ian White, in "five years or so" young people coming out of schools will have been incubated with computers at home and in the schools, and their parents will be totally at home with these beepy, pingy, wastes of time. Who actually is so full of "techno-fear" that talking to a computer is going to help?

To make the factoidal assertion that voice commands will be used for all except the most esoteric commands, within five years, is foolhardy at the very least. At most, it is confusing and misleading because it is given as a fact rather than one opinion. Computing, and especially Artificial Intelligence, often get a bad reception in many quarters — largely the result of such blatant factoids.

Whether or not the technology is actually capable of delivering the goods in the time-span specified, begs a question. How can we be sure that people will be happier talking to a computer? Will they be any more productive?

The main thrust of the fear of "techno-fear" comes from those managers and executives who were promoted beyond their level of competence, at a time when the competition for jobs was not as great as it is now. "Techno-fear" is mainly the preserve of the no longer young-in-mind (and there is no necessary correlation with chronological age).

I have — at long last — bought a watch. Not wishing to be the same as everybody else, I bought a quartz analogue watch.

There were a few real reasons — see how much time you have left. You can tell the time from almost any direction. It looks far better, is more aesthetically pleasing.

Anyway, I bought it (with a leather strap, and no figures to clutter the dial, only the date). I asked the assistant, "Sell many analogue?", and he answered, "More than we do of the digital. People find them easier to use."

I think it is easier to type than it is to talk. Enough said.

Boris Allan

## Puzzle

### A winning line

#### Puzzle No 69

Jamie has a new calculator again. It even has a key marked ! that will work out factorials.

The factorial of a number is obtained by multiplying together all the integers up to and including the number. So factorial 4 — or 4! as it is usually written — is equal to 24, ie,  $1 \times 2 \times 3 \times 4$ .

Jamie said: "It's very useful. For example, in this competition in the newspaper you have to place ten listed features in order of merit. As the number of different permutations is equal to 10! I can instantly find that to make sure I get a winning line I would have to send in 10! or 3,628,800 entries.

"I've found another interesting thing with factorials," he continued. "I've found a number, 145, which is equal to the sum of the factorials of its digits." He showed me that  $1! + 4! + 5! = 145$ , as he said, equal to 145.

Apart from the single digit examples of 1! and 2!, which also have this property and apart from 145, there is one other number with this property.

What is it?

#### Solution to Puzzle No 64

```
10 LET N = 1
20 LET T = N * N + 321
30 LET S = SORT
40 LET S = VAL STR$ S
50 IF S - INT S = 0 THEN PRINT N * N, T
60 LET N = N + 1
70 GOTO 20
```

There are four possible solutions. Squares with sides before and after the addition of 312 teachers of: 7 and 19, 23 and 29, 37 and 41, and 77 and 79. By looking at the number of pupils and the corresponding pupil/teacher ratios, the most likely solution is 77 — 5929 children giving a pupil/teacher ratio of almost 19.

#### Winner of Puzzle No 64

The winner is: Ruth Story, St Andrews School, Rochester, Kent, who receives £10.
