Acorn contract shoot-out

SINCLAIR Research has announced its intention to challenge Acorn for the BBC computer contract when it comes up for renewal next summer.

"We would be most interested in competing for that contract if it is feasible for us to do so," said a Sinclair spokesman.

As a first step, Sinclair has written to the BBC to discover if the contract is to be offered on open tender. "We want to state our interest openly, well in advance and find out how the BBC wants to handle it.

"So far they have acknowledged our letter and confirmed that they are looking into it," added the Sinclair spokesman.

Acorn remains unruffled by the Sinclair action. "Acorn is not at all worried — there is no reason why it should be — Sinclair tendered for the original contract and lost," explained an Acorn spokesman.

"We would be surprised if

Ted revealed at Las Vegas

COMMODORE is expected to show a prototype of its new computer, the Commodore 444, for the first time at the Consumer Electronics Show in Las Vegas in January.

The machine will be the first to use Commodore's new TED chip. The TED is a multi-purpose device, designed to reduce the number of components on the circuit board and thereby reduce manufacturing costs. The TED combines the functions of system controller, video controller, display processor

and voice generator all in one chip. The Commodore 444 will also be the first Commodore machine to use a new updated 6500-family central processor with optimised access to external memory.

The Commodore 444 will be a more advanced machine than the existing Commodore 64 computer with sophisticated cursor control and built-in word processing.

Commodore is also considering a new low-cost machine. Commodore (UK)

How to submit articles

Articles which are submitted for publication should not be more than 3,000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted.

All submissions should be typed and a double space should be left between each line. Please leave wide margins.

Programs should, whenever possible, be computer printed.

We cannot guarantee to return every submitted article or program, so please keep a copy. If you want to have your own program returned you must include a stamped, addressed envelope.

Accuracy

Popular Computing Weekly cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

Acorn's contract to produce the BBC micro comes up for renewal next year.

Although there is little likelihood of the BBC taking the contract away from Acorn — despite initial production problems, the BBC micro has lived up to most expectations — other micro manufacturers, notably Sinclair, Dragon, Oric and Computers, are itching to tender for the contract. Sinclair, in particular, is eager to prove that the BBC made the wrong decision in selecting Acorn for the original contract.

Whatever the outcome of the BBC contract, there is also the intriguing possibility of a rival micro being launched by the independent television companies. The ITV networks are all too well aware of the lucrative spin-offs which the BBC has derived from its association with micros. It would be a natural move, though there is a lot of leeway to be made up, for the ITV companies to launch their own computer.

The ITV micro is not a new idea — Commodore has already had informal talks with at least one commercial station on the feasibility of producing just such a machine. However, any ITV micro would face problems unbeknownst to its BBC sibling.

For an ITV micro to have any hope of success, it would need to be embraced by all the independent tv companies, not just a proportion of them. This, in turn, would necessitate all the companies agreeing to common specifications for the micro.

COMMODORE CASSETTE INTERFACE

Our Interface has been designed to allow low cost cassette tape recorders to operate with either the Commodore 64 or Vic20 in exactly the same way as the Commodore C2N.

As each type of tape recorder is different, our unit is equipped with a switch system which enables it to be made compatible with most tape recorders.

Included with each unit is a comprehensive instruction manual.

Priced at only £16.99 (inc VAT and P&P)

LOGIC-PLAN

PROGRAMMING AIDS FOR THE MICRO-COMPUTER

GRAPHIC PLANNING GRIDS. Each grid is designed for use with specified micro-computers, and is a lost cost aid to programmers wishing to develop their skills in designing high resolution graphic displays. Grids are marked on all four sides with pixel co-ordinates, appropriate to each computer for which they are available (Atari, BBC, Commodore 64, Dragon 32, Oric, Spectrum, Tandy and Texas). An ideal aid for beginner and expert alike, and cost **£2.99 each (inc VAT and P&P).**

AUDIO BOXES

Strongly constructed PVC "Book type" Audio Boxes hold 1 or 2 cassettes, including the plastic case. Gives dust-free storage, avoids light contamination of tapes and will enable you to build up a library of your favourite programs. Sold in packs of 3.

Single size (holds 1 cassette) £1.99 per pack

Double size (holds 2 cassettes) £2.99 per pack

cable software

GREAT GAMES FOR THE DRAGON

TRACE RACE

Race your Light Cycle around the Games Grid. Force your opponent into a Power Trace or into the Grid wall to win. A game for two players with joysticks, or can be played by a single player as TRACE RACE (SOLO) — one joystick required.

BACCARAT

Bring Casino quality gambling into your living room with BACCARAT, the game played by the rich and famous. See if you can break the bank at Monte Carlo!

CAVE FIGHTER

At last a superb 100 per cent machine code 'Scramble' type arcade game, complete with fast scrolling, high-resolution colour graphics and sound.

DRAGRUNNER

Frogger type game with a difference. Help our hero Super Sleuth Sidney make as many safe journeys across the conveyors as he can, using his Smith & Wesson MK 12 to shoot the patrolling Laser Droids.

DRONE

A graphic 3D simulation game, taking place inside your Dragon. Equipped with your MK Type Datatank, you must search out and destroy the evil Rom Guardian. At your disposal are Logic Cannons, Pulse Laser, Proximity Detectors, Thrusters, Brakes and on-screen sighting system.

All Games cost £8.75 (inc P&P and VAT)

SPECIAL CHRISTMAS PROMOTION FOR DRAGON AND ORIC OWNERS EXTRA VALUE SOFTWARE PACK WITH TWO GREAT GAMES FOR ONLY £9.99 (inc VAT and P&P)

For the Dragon 32 (Super ACTION Pack)

DRAGON RACER is a game which brings the excitement found in Formula One racing into your home.

As Star Driver for Team Micro, you must clock up as many miles as you can without crashing or blowing up your engine.

Your four-gear race-tuned engine is capable of great speeds — but watch your revs... over 12,000 rpm and your race will be prematurely ended.

WASP INVASION is a 100% machine code 'Arcade Style' game demanding quick thought and actions. As you defend your planet against the multi-wave Wasp attackers, who will drop bombs and suicide dive on to your outposts!

At your disposal is a joystick controlled Laser Base, which is used to thwart the attacks by moving and firing skyward.

For the Oric 48K (Great ADVENTURE Pack)

TEVROG'S KINGDOM II. A real time adventure for the Oric which uses virtually all available memory of the computer due to its complexity. Your task is to identify, find and acquire the Magic Talisman of King Tevrog. To do this you will need to search throughout the kingdom to locate the Talisman, avoiding all the dangers to find the clues necessary to make your search successful.

You can travel through caves and buildings, meet enemies and allies, find clues and cast spells, but although the layout of the kingdom and its buildings is fixed, little else is.

A unique concept in an Adventure Game which makes Tevrog's Kingdom II a compulsive challenge for all adventure fans.

QUEST FOR POWER. Explore the cave system inhabited by Trolls, Ogres and Balrogs. Avoid these creatures whilst acquiring magic charms and weapons to improve your chance of survival.

Once you have collected sufficient objects, you must attack and destroy the weaker creatures (Trolls and Ogres, in that order) before you can tackle the dreaded Balrogs to capture the Ring of Power.

EACH PACK CONTAINS TWO CASSETTES IN DOUBLE SIZE BOOK TYPE PACKAGE
MAKING AN IDEAL PRESENT. GREAT VALUE AT ONLY £9.99 (inc VAT and P&P)

TROJAN LIGHT PENS

The Trojan Light Pens have received great reviews throughout the computer trade and are undoubtedly the finest light pens available for Spectrum and Dragon owners.

The advanced software enables you to draw pictures on to your TV screen, create your own designs and save and reload from tape. No experience of programming is necessary as the Trojan Pen comes complete with a new advanced program cassette and comprehensive instructions.

Each Trojan Light Pen gives the user the following facilities in HI-RES:

* DRAW PICTURES FREEHAND; * DRAW BOX; * DRAW CIRCLE; * DRAW LINE; * COLOUR FILL DESIGNATED AREAS.

ALL FUNCTIONS IN FOUR COLOURS FOR THE DRAGON. ALL FUNCTIONS IN EIGHT COLOURS ON THE SPECTRUM.

Available in text: * DATA ENTRY AND PROCESSING; * MENU SELECTION AND CONTROL; * GAMES PLAYING.

Also programming hints and tips.

The Spectrum 48K Light Pen is only £17.25 (inc VAT and P&P). The Dragon 32 Light Pen is only £11.50 (inc VAT and P&P).

The Trojan Light Pen can be obtained direct from PSL Marketing or from the manufacturers:

Rival Oric disc drive from ITL

ITL, in Chatham, hopes to do for Oric what Premier Microsystems did for Dragon.

This week the company will launch a rival disc drive system to Oric's own, before the official Oric product has even appeared.

Like the Oric Products disc unit, the ITL system — called the Byte Drive 500 — is based on the Hitachi 3 inch drive. It is a 40-track single unit giving a formatted memory capacity of about 440K. A double-sided 80-track version is also on the way.

The Byte Drive 500 comes with its own power supply, capable of handling up to two disc units. The interface to connect the system to the Oric 1 computer takes the form of a custom chip that has been built into the connecting cable linking the disc drive and computer.

ITL's own disc operating

system is supplied on disc and works as an extension to the existing Oric Basic. Connecting the drive simply adds a number of new commands to the Basic vocabulary.

Peter Halford

The system has been designed for ITL by Tyrell Computer Systems. The design work of the ULA custom chip and DOS has been undertaken for Tyrell by Peter Halford, one of the original team of four which designed the Oric

1. He left Oric earlier this year.

The ULA for the disc system is being manufactured for ITL by California Devices, the Company which manufactures the ULA in the Oric 1.

The Byte Drive 500, plus power lead, is priced at £167.28. The power supply unit is £25.93 and the connecting cable, interface and operating system disc are £86.45.

ITL is currently looking for high-street distribution for the Byte Drive 500.

The first systems should go on sale by mail-order in early December. More details from ITL, The Old Courthouse, New Road, Chatham, Kent.

● The first batch of Oric's own 3 inch disc drives, originally planned for delivery in the summer, are not expected until mid-December. Bulk deliveries are not scheduled until 1984.

Magic Desk delayed

COMMODORE'S *Magic Desk* software for the Commodore 64 computer has been delayed again. The first package is not expected to go on sale in the UK until early next year.

When Apple first announced its Lisa machine in January this year, complete with 'mouse' graphics, Commodore was one of the first companies to announce software packages offering similar

facilities.

Commodore announced *Magic Desk*, a series of 32K Rom software cartridges for the Commodore 64.

Magic Desk provides, on-screen, a pictorial representation of an office. Using a joystick, a screen cursor can

be directed around the picture. By pointing at different parts of the office display and pressing the joystick 'fire' button, different options can be selected: pointing to the filing cabinet gives file handling, pointing to the typewriter gives word-processing.

The first *Magic Desk* cartridge, *Magic Desk 1 - Type and File* has recently gone on sale in the US, priced under \$100. It contains the word-processing and information filing software.

However, *Magic Desk 1* has

1981, its turnover has increased more than 30-fold. In the year ended June, 1981, turnover amounted to £1.36m., considerably less than the £42.355m. recorded in the year ended June, 1983.

not been greeted very enthusiastically by Commodore UK.

"We will probably go ahead with *Magic Desk 2* rather than *Magic Desk 1* — it's a better program," explained Commodore UK's marketing manager John Baxter.

Magic Desk 2 is similar to *Magic Desk 1* except it offers additional calculator and home budget software facilities. *Magic Desk 2* is unlikely to appear in the UK until early in 1984.

Software incompatibility

ALTHOUGH IBM claims that the majority of programs available for the PC will run directly on its new low-cost PCjr, only a small proportion will run directly on the entry model (\$669) version of the machine.

Most of the programs for the PCjr require the more advanced operating system offered by the 2.1 disc operating system of the expanded model (\$1,269).

Of the programs that will run on the entry model, a

Keyboard for 64

A NEW company, Silynn, has announced a full-size music keyboard for the Commodore 64 which will be priced under £150.

Called the Microsound 64, it is a four-octave keyboard which simply plugs into the cartridge port on the Commodore 64. Software, initially available only on disc, then converts keys depressed on the Microsound 64 into musical notes played through the tv loudspeaker.

The device also features two slider controls which operate a simple music synthesiser. Using these it is possible to alter not just the pitch of a note, but also its character.

Notes played on the unit can be stored in the memory of the computer, or saved out either to tape or disc, and recalled.

The software which accompanies the Microsound 64 — on disc — is the first of a series of programs to be produced by Silynn. Future packages will allow more complex musical effects, such as a sequencer using the different voices of the 64 and a hardware/software combination capable of digital sampling.

The Silynn Microsound 64 will be available in mid-December, priced at £125. Details from Autographics, 3a Reading Road, Henley-on-Thames.

proportion will only work in conjunction with a Basic extension cartridge which itself costs \$75. The so-called Cassette Basic in Rom on the entry model is not sufficient.

IBM itself suggests that the enhanced discette version of the PCjr will prove the more popular option. A configuration including the expanded model, tv connector, DOS 2.1 and cartridge Basic will cost over \$1,400. Of the five new software programs announced by IBM specifically for the PCjr, only one will work directly on the entry model, and two of the others require the Basic cartridge to work on the expanded model.

The PCjr. is only on sale at present in the US and Canada. No European launch date is yet available.

Ted

Antescher rescue

Just a note to put in my claim for the title of 'First person to rescue all 10 victims from Antescher'.

I bought *3D Ant Attack* on 12 November and had completed it by 13 November. Rescuing each victim becomes harder as the game progresses, and as you are up against time as well as the guardian ants, each life saved is a great relief as well as a step nearer to your goal.

My score on completion was 33,106, as well as the gold medal I was presented with at the end of the game. I now throw out the challenge for someone to rescue the 10 prisoners in Antescher in a shorter time than it took me and with a higher score.

I hope Sandy White produces more software of this quality and originality.

Well, must go now as Ant Attack has just finished loading.

D Claypole
6 Hespion Road
Glington
Peterborough PE6 7JT

Strategy column

I read your magazine regularly and find it quite entertaining. I have therefore noted with interest the idea of an 'arcade corner'.

I would like to propose something different. A strategy/simulation column. I realise many disillusioned Neanderthal alien zappers turn to quests and gold for their entertainment — hence the success of Tony Bridge's page — but another medium from brain to computer is the 'you are in control' idea, ie, strategy/simulation.

The format of such a column would be much the same as Tony's corner — a review, comments and miscellaneous items. Although a subdivision of mind game, software houses do cater for us not-so-rare breed — DK Tronics, Lothlorien, Psion, Severn, CCS and Hewson, to name but a few. Please think about it.

D Mitchell
36 The Moorlands
Hanley Road

Malvern Wells
Worcestershire WR14 4PS
PS. Is New Releases a review or not? If not, then kindly refrain from making criticisms.

As with adventure games, there seems to be a growing interest in strategy and simulation games of all types. Flight simulation programs are particularly popular at the moment.

We would be very interested to hear the views of other strategist/simulators towards such a column.

As for New Releases, it is not intended as a review so much as a round-up of some of the software produced each week (the remainder you can find in our This Week column). But if a program has a feature which is particularly praise/blame-worthy, obviously we will mention it.

Commodore roasting

Can you explain why reviewers such as Andy Pennell need to abuse their position by making snide remarks about other computers whilst reviewing? I don't think that his remarks about the Commodore machines were complementary to a review on the Memotech micro.

So the Commodore needs add-ons, so do a lot of micros.

Fascinating patterns

Re Pete Gerrard's item on RCBM 64 (Vol 2, No 44, page 35). Herewith a small alteration, producing fascinating patterns.

Muck about with Z increments (line 70) and FNA (line

You need about £60+ spent on the hallowed Spectrum to bring it anywhere near the Vic for keyboard and sound. Leave off, Mr P — the beloved ZX81 had to go through a roasting, now it looks as though it's the turn of Commodore.

One fed-up ZX81 and Vic owner.

Ego booster

I would like to reply to Craig Mitchell's 'Waste of space' letter (PCW 10-16 November).

My first point is that he himself wasted space by trying to boost his ego with his amazing high scores. 'Hey man, I've survived 5.3 centillion waves and saved the world's population after consuming a cruise missile, while playing Warfare.'

Point two is that it's *Tranzam* — note the weird shape after the n.

My last point is that if he understood what *Vetpac* and *Trantam* were, why did he bother to complain? If he understood, then everybody will be able to work it out.

PS. Please keep a few mistakes

in the clasifide pages and perhaps put sum in on purpos. Well done, Diane.

Lance Rock
(address withheld by request)

Competitive urge

Arcade games are certainly the most popular use of home computers, but is it really necessary to fill the valuable space of your letters page with claims of highest scores?

These claims seem particularly futile when you have also published letters describing bugs in some of the games which enable high scores to be achieved easily.

Recently, there was a letter describing the bug in *Jetpac* where, by standing on the middle platform on the fourth screen, the Jetman can, given time, achieve infinitely high scores without being shot. This week (10-16 November) you published a letter describing a *Jetpac* score of over a million which can be achieved by anyone capable of reaching the fourth screen.

The printer dump or photograph method of validating high scores is easily forged. I enclose a photograph (of poor quality) showing a high score of 999760 on *Jetpac*. In fact, I simply wrote a program to produce the screen display (about 10 minutes work) and could have inserted any value for the high score.

Perhaps the arcade fans could organise some events where the competitive urge could be satisfied. Hire a hall, set up a couple of Spectrums, load them with a popular program and let the alien zappers fight it out live. By charging an entry fee, the organisers could probably make a reasonable profit. This would leave the letters page free for some more thoughtful letters.

ATTENTION AUTHORS-COMING SOON

ARCADE FORTH is the most complete games language ever written.

Complete implementation of Fig Forth extended to contain Sinclair's graphics and sound commands.

For the newcomer, lines of BASIC can be executed from within Forth so no previous knowledge is required.

A complete sprite language with more than forty commands. Sprites can be any size you choose and the only limit on the number is memory size.

Programs written in ARCADE FORTH will run independantly of the compiler.

Comprehensive manual and demonstration tape which covers the sprite commands one at a time.

Faster and more flexible than any other program around, ARCADE FORTH is not a games generator it is a complete language.

Amoeba's Playtime

A new game for 48K Spectrum by Terry Wiley

Down at the Microscopic Zoo, Fang the Killer Amoeba is happily squishing around the deserted Bacteria Compound. But playtime is over, and it's time to put the bacteria back.

Fang is annoyed at this interruption, and will eat the bacteria if they are left unprotected, so you must attempt to enclose bits of the compound with amoeba-proof fences, where the bacteria can be safely re-introduced.

The fence-layer (a little blue block at the bottom of the screen) can be moved around the edges of existing fences with the cursor keys 5 to 8, and can draw new fences by also pressing CAPS SHIFT. However, be warned that uncompleted (red) fences are vulnerable to Fang, and if he hits one you become his next meal and the game will end.

To safely complete a fence, join it to the compound wall or to another completed region, and the empty pen will fill with bacteria. One point is obtained for every bacterium introduced, and if you manage to introduce more than 6,000 bacteria, Fang will give up and go back to his cage. Each bacterium above this threshold scores 2 points; note that you need 100 extra bacteria each screen to subdue Fang.

To enter the program, do the following:

- (1) Produce, as line one, a REM followed by 230 'x's
- (2) Edit the REM line number to 2 to make another REM-ful of 'x's
- (3) Type in this machine code loader:
3 INPUT A,B: FOR N = A TO B: INPUT;" "Z:

POKE N,Z: PRINT N,Z: NEXT N

(4) Run the program twice with the following INPUT:

- (i) 23762, 23987, then the code in fig. 1
- (ii) 24000, 24203, then fig. 2

Save the program if you wish to test the code; *Usr 24000* should turn the screen black; *Plot 100,0 : Draw 255,0 : Plot 120,0 : Draw 255,0 : Randomize 28270 : Let Z = Usr 23762* should produce a band of bacteria (dots).

There are two other routines, *Usr 24024* and *Usr 23954*, which require numerous Pokes and don't have a fixed effect (one moves Fang, the other creeps around boundaries looking for a specified point) which are best tested by the program itself, so check the code carefully and Save the whole program (lines 3 to 4010 from the listing, plus the two REM's) before running it.

Budding superstars

Graham Taylor looks at the growing links between electronic keyboards and micros

What costs between £40 and £500, has a memory, is programmable, and can be used with add-ons like light pens? It's a Casio keyboard.

Just as microcomputers have moved out of the specialist shops and now flourish in toy stores, book shops and supermarkets, so electronic keyboards have moved out from the specialist music shops.

A Casio electronic keyboard is a bit like an organ, but is capable of very unorgan-like sounds. It's a bit like a synthesizer, but is very easy to program. In some respects, it's even a bit like a computer...

Casio Electronics is a Japanese company whose pre-tax profits rose by 13.4 percent to around £20m (£7bn) in the half year ending in September. Although Casio is involved in a number of electrical products, all of which have grown in sales, the really startling growth is found in their office computers and their electronic musical instruments — up by an enormous 50 per cent.

Britain has taken the Casio keyboard to its heart; the basic model, the VL-1, has sold nearly half a million since its release in May 1981.

Dave Caulfield is the National Sales Manager for Casiotone UK. Even he is surprised by their success: "We've tried to do an analysis of our market, but it's really impossible to come to any specific conclusions — there seems to be almost no type of consumer who couldn't be a prospective purchaser."

"Britain has always been full of weekend musicians — people who play for their own amusement at the weekend — no musical instrument manufacturers could manage on the sales to the big name groups, but Casio has gone beyond that."

As with computers, the technology is getting relatively cheaper and much more widely available. "With a four-track cassette machine and a mid-range Casio, you have about as much equipment in your home as the Beatles had for their early records," explained Dave.

The instruments are, inevitably, the result of microchip technology. The internal workings, complete with sound and rhythm chips, memory, and input/output ports would be familiar territory to computer buffs.

Just as computers have an international standard for connecting one to the other — RS232 — so the latest generation of electronic keyboards have a similar standard interface called MIDI, or musical instrument digital interface. This enables one keyboard to be played from another set to different sound styles; eg, brass on one and strings on another. "You could also slightly de-tune one of the keyboards to get a very full, spacey sound," explained Dave.

To complement the new Casio keyboards, the company will be selling interfaces for the best selling micros — this will almost certainly include Commodore, Acorn and Sinclair.

Surprisingly, perhaps, Dave does not see the computer adding much to the quality and range of sounds available from the micro: "If that were the only point of the interface, why bother? Even the VL-1 has more sound facilities than most of the micros — certainly for practical musical purposes."

The real point of the computer link Dave sees as educational: "As much as anything else, we're trying to make it easy to learn music and it's important to give people visual references — it's something we've tried to do using the LEDs that light up each note as it's played, but obviously with a tv screen we could do much better."

To this end, Casio are starting to look at software houses as potential independent suppliers of educational material. "I see us consulting with a software house in terms of technical information, but it's the visual display that will be really important — there are so many different ways the two things could be tied together."

Whatever the future of the keyboard/micro linkup, one thing seems clear from even a cursory glance at the latest machines — some fundamental computing concepts are being incorporated. Perhaps the most interesting of these is the idea of Rom and Ram cartridges.

Two machines, the MT 800 and the PT 50, include cartridge slots very much like those on computers.

Rom cartridges contain groups of popular pieces of music which the Casio will play automatically. Budding superstars and egomaniacs everywhere can even connect a microphone to the machine and mix in their voice to sing along with the music.

The PT 50 can also accept Ram cartridges, which is perhaps the most important new development. The Ram cartridges are used, rather like a tape recorder with computers, to store your own creations for retrieval at a later stage.

The idea of Ram is likely to be extended further, using it to store actual sound types for example. "If you wanted, you could have no sounds built into the keyboards at all — just cartridges containing various sound building blocks whose parameters you can change using the instrument."

A similar idea is already found in some of the Casios including the VL-1 using the ADSR function which stands for attack, decay, sustain, release. This gives the main features of the preset sounds a numerical code consisting of feet, envelope and modulation. These can then be mixed in any combination to give a wide range of sounds different to, but derived from, the presets.

In principle, this idea could be extended to give virtually limitless ranges of sounds. The Casio 1000P, for example, is capable of most things an expensive synthesizer can produce, merely by manipulating 10 presets in exactly this way.

Casio has plenty of competitors, including Seiko and the mighty Yamaha, but Dave is confident. "Casio won't produce anything unless we are sure there is a big market for it. We've been aware of the computer market for a long time, but basically we've made a decision not to get involved either with the keyboards or by, say, issuing our own home computer."

Next year will see the demise of many well-known computer companies, predicts Dave. "It's a good job we've kept on the sidelines. Look at the big names who are in trouble — the shakeout has already started."

"By the middle of next year, we'll have keyboards with interfaces built in and we'll cover the major micros by providing appropriate connectors. But, with the Casio keyboard I think we've discovered a genuine consumer product — something that appeals to all sorts of people for all sorts of reasons. I sometimes wonder if that's really true of home computers."

The expanding Dragon

Keith and Steven Brain take a look at the range of enhancements now on the market for the Dragon

No home micro is initially capable of everything the user might want to do with it and therefore it is usual for a range of enhancements to come on to the market from independent suppliers. The Dragon is well supported by the independents who offer a wide range of products on cassette, cartridge, and now disc.

These offer a wide range of facilities, but it is often difficult to compare their capabilities with the advertising claims. This review takes a look at many of the products now available and evaluates the potential benefits to the user.

One of the main criticisms of the Dragon centres on the text display. Many people feel that 32 columns is not enough, and that true lower case characters are really essential. There are several ways of remedying this problem by generating high-resolution characters within a Basic program, but several companies are now offering machine code programs providing text on the hi-res screen. Below are details of four of these which differ somewhat in their capabilities and price; two of these are "Hybrid" products offering "high-res text" and "tool kit" functions at the same time.

Scribe (Premier Software) is available on tape and the Delta disc system. It produces upper and lower case on a 42*24 display in *Pmode 4* only. The size matrix was apparently selected as the largest which can be guaranteed to be clearly legible on most domestic tv's and it

numbers, although this procedure is clearly explained and instructions are given for saving your redefined character set.

Scribe is compatible with the other Premier utilities and will often be used in conjunction with them. At £13.95 on cassette or £14.95 on disc, *Scribe* offers reasonable value for money, if you only want to produce a relatively straightforward 'true text' display.

Rainbow-Writer (Microdeal) was originally written for the Tandy CoCo by Rainbow Connection Software and it is the only commercial software we have seen so far on a Dragon Disc, although apparently Microdeal plan to sell discs configured for the Premier/Cumana Delta system.

There are two versions of *Rainbow-Writer* provided, which give 32/42 characters a line or 50/64 characters a line. In each case you can alter the distance between each character by specifying a low-density (32 or 50) or a high-density (42 or 64) mode. You can also enlarge characters up to a massive 16*8 which is good for titles and educational purposes.

The character sets can be redefined and if you want to save memory you can load in only a partial set. The program locates itself at the top of memory and it therefore does not interfere with many other enhancements. You can produce legible text in any *Pmode* as well as different size, width and colour characters, subscripts, superscripts, inverse video and underlining.

You can also produce artefactual colours in *Pmode 4*, protect parts of the screen from scrolling, and mix the facilities on the screen at the same time. At any point you can call up a *Help* screen which tells you the current settings of the program. A demonstration program showing the

command sequences you will be using frequently as strings.

This is the most flexible of the high-resolution text enhancements and even though the price is around £20, it is good value if you are going to use the versatile facilities. It is interesting to note that encouragement and a 'limited licence' is given to the incorporation of the program into commercial software, rather than the usual dire (and ineffective!) threats.

Edit+ (including *Hi-res*) (Compusense) is a cartridge so it uses very little of the Dragon memory, but of course it effectively blocks the expansion port so that you cannot add anything else. Two instruction booklets are included, one for *Hi-res* and one for *Edit+*, and since *Hi-res* is also sold separately we will consider the facilities of that first.

The program produces a 51*24 character display, but only operates in *Pmode 4*, which becomes the default mode whenever you use *Print* or a prompt appears. There are four *Print* commands: *Print* uses the whole 51*24 matrix, but *Print @* uses a 32*16 window so that it is compatible with the normal Dragon display and you can test normal-mode programs. *Print 1* is similar to the standard *Print @*, but works on the 51*24 matrix, and *Print %* prints 'sprites' which are specified by X and Y coordinates.

These sprites are actually characters which are put on the screen with exclusive-OR logic, and the sprite mode is rather irritating to use as the prompts, cursor, and *Print* command become distorted. Nine character sets are included (although many of the 'different' characters are the same) and characters can be redefined, although this must be done by calculating binary numbers and the definition must be saved as a separate program.

The *Cls* command is extended to provide a number of functions and control codes are also used to provide some extra features. Auto-repeat is included, but there is a very long delay before it is activated.

The *Edit+* "full screen editor and programmers tool kit" is only activated when you type *Edit*. It displays the program on the 51*24 screen and has editing features of the type usually found on word processors. Reading programs formatted to 51 characters was rather difficult and the screen refresh was very slow so that it took a long time to work through a program.

The editing and "tool kit" facilities were not very impressive especially when compared to the competition, and at £25 for *Hi-res* and £34 for *Hi-res* with *Edit+*, rather over-priced. The cartridge approach is not the most logical way to provide these facilities.

Picture Writer (Rampage) is more than just a text on hi-res screen program as it includes some useful extensions to Basic. It is supplied on a tape which auto-starts, and it sits at the bottom of memory. The

THIS IS SCRIBE IN UPPER CASE
THIS IS SCRIBE IN UPPER and lower case
PRINT CHR\$(1)

THIS IS SCRIBE underlined
PRINT CHR\$(1);CHR\$(2)

THIS IS SCRIBE inverse

was certainly very clear on the three sets tried.

Automatic underlining and inverse characters are available using *Print chr\$(n)* and the *Print @* command uses the 42*24 grid. Another extremely useful command is *Put @ X,Y,n* which allows you to place a character anywhere on the screen to within one screen point, allowing you to produce subscripts, superscripts and 'sprites'. The *Print 1* command allows you to redefine characters, but you have to calculate these as a series of binary

advanced features of *Rainbow-Writer* and a good on-screen character generator are included.

John Symes says that the Dragon distributor in Greece is giving away a copy of *Rainbow-Writer* with the Greek character set with every machine! The only real winge is that the display commands must be called by Escape sequences, rather than new Basic commands, so that you have to type *Print CHR\$(27) "★★★"* each time (where ★★★ is one of many commands). Of course you could predefine the

display is only 32*16 but it has true upper and lower case, a full screen cursor, commands to program the cursor through *Print* statements, and it is a great improvement over the standard display.

A major difference to the other text on high-res programs is that you have separate control over text and graphics where these are mixed. There are three types of screen clear. *Pcls* or *Cls* just clears any graphics on the screen and leaves the text, *Clst* clears the text and leaves the graphics, and *Cls* clears both.

You can specify scroll protected areas or *Freeze* the screen completely, and scroll the text over static graphics. Characters can be redefined using either binary codes or a proper screen-based character generator which is activated by the *Char* command, and *Csavec* saves character sets without the need to remember addresses, and allows you to save only parts of the character set.

If you type *Graf Off* you go back to the normal Dragon display but the additional Basic commands are still available, including the full screen cursor. The keyboard is redefined so that the graphic characters can be accessed directly from the keyboard, and use abbreviated keyword entry. You can set the keyboard back to normal with *Key Off* and auto-repeat and a bell are included which can be turned on and off by *Rep On/Off* and *Bell On/Off*.

An *Old* command is provided which will normally resurrect a program which was accidentally *Newed*, and you can switch between *Fast* and *Slow* mode.

This program offers a useful extension to the facilities of the Dragon and at £10 it is excellent value for money.

Although the Basic commands for handling sound in the Microsoft Extended Colour Basic used on the Dragon are very easy to use, only one sound channel is available which is rather limiting, and the

'speech' produced by *Computavoice* and programs like *Talking Android Attack* is pretty unintelligible.

On the other hand *The Dragon Composer* program (Microdeal/Speech Systems) solves the music problem as it gives you four sound channels, each one with up to seven octaves. You enter tunes in a format which has some resemblance to the *Play* command, but in *Data* statements which are placed at the end of part of the composer program. For example:

3010 DATA D5G4D4B4Q

means:

Play note D in octave 5 in channel one		
G	4	two
D	4	three
B	4	four

(All the notes being quavers (Q))

Fifteen lengths from a whole note to a 1/32 note are allowed, sharps and flats are available, and the tempo and key can be changed. Comprehensive editing and saving facilities are included and when you have entered your tune you can compile it into a self-contained machine code subroutine with the *Complete Source* command.

You can *Play* this *Music* directly, but an important feature of *Composer* is that you can also use this compiled routine to add first-class sound to any other program. Although the processor is totally dedicated to producing the sound you can put the command *Basic* into the *Data* to return control to Basic during a tune, so that you can arrange to interrupt it if necessary.

This program completely transforms the sound output of the Dragon and even at £15 it is good value for money and includes very clear instructions.

You are never going to get real speech without extra hardware such as that used in the *Speech Synthesis Module* (JCB Microsystems) which is a cartridge giving very clear speech with only a slight transatlantic accent. It uses a General Instrument SP0256 Speech Processor and a custom ROM containing predefined words.

A clear manual is provided which explains in detail everything you could possibly want to know about the system. The simplest method is to use the *Say* command which allows you to easily produce any of the predefined words. For example, a polite computer might start by saying to the user:

10 SAY "HELLO" 3, GOOD, 3, MORNING, 5, 1, 2, AM
4, YOUR, 4, DRAGON, 4, COMPUTER, 5"
20 SAY "PLEASE, 4, TYPE, 4, YOUR, 4, INSTRUCTION, 4"

The *Say#* commands deals with numbers and is very impressive when you give it values like 123456789 which immediately comes out as "one hundred and twenty three million, four hundred and fifty six thousand, seven hundred and eighty nine" and if you add a zero to the end it instantly converts it to "1.23456789 exponent plus nine". Equations like *Say.120 2/3* are allowed and it automatically rounds up after eight places.

In addition you can use the 64 allophones (individual speech sounds) to create any word which is then called by the *Speak* command. Using allophones takes some practice and experimentation to get the desired result but it extends the range of the module to an infinite vocabulary. For example, you might like to add the word "master" to that request for instructions:

30 SPEAK "MM,AR,SS,TT2,ER1,4"

The *Add* command allows you to mix *Say* and *Speak* to form likes like:

40 ADD, SAY "BY, 4, DRAGON, 4; SAY# 32: SAY" GAMES, 1", SPEAK "SS, 4, MM, AR, SS, TT2, ER1, 4"; SAY "o, 3, K, 4"

You can also *Say* or *Speak* strings and *Say#* variables. As these commands do not halt the program you can mix speech and graphics very effectively and while the computer is actually speaking you can do almost anything else with it, except create sound, or use the joysticks or cassette interface.

It is obviously a great asset in education, and in producing really "user-friendly" programs. £37.95 is a fair price for this useful add-on.

End of the line

W R Masfield explains how to calculate the frequency response of 4-terminal networks

This program for the ZX Spectrum was developed to be a time-saving aid in the calculation of voltage transfer ratios and input and output impedances of simple 4-terminal electrical networks containing resistance, inductance and capacitance. It is not an exhaustive treatment and is applicable only to networks which can be reduced to a sequence of series and shunt sections of the general form shown in Figure 1.

The method of calculation is by simple A-matrices. For those not familiar with matrix algebra, the following brief account may be of help — for a fuller treatment, you should consult a textbook.

Briefly, any 4-terminal network having passive components — resistance (R), inductance (L) and Capacitance (C) — can be represented in the form of a 2×2 matrix (Figure 2). There are several ways in which the matrix can be made up. For our purposes, the one relating input vol-

tage and current to output voltage and current (the so-called A-matrix), is the one to use (Figure 3). This has the advantage that, for a sequence of sections of a network, the overall matrix is the product of the individual section matrices taken in sequential order:

$$(A) = (A_1) \times (A_2) \times (A_3) \dots$$

Matrix multiplication follows a special rule, as shown in Figure 4.

Any series of shunt section can be represented by a simple matrix of the form shown in Figure 5. These matrices are then multiplied together to give the overall matrix. Once the overall matrix has been found, it is a simple matter to derive the frequency response of the complete network, since the voltage transfer ratio is given by:

$$\frac{V_{OUT}}{V_{IN}} = \frac{1}{a_{11}} \text{ with output open-circuit,}$$

and the input and output impedances by:

$$Z_{IN} = \frac{a_{11}}{a_{21}} \text{ with output open-circuit,}$$

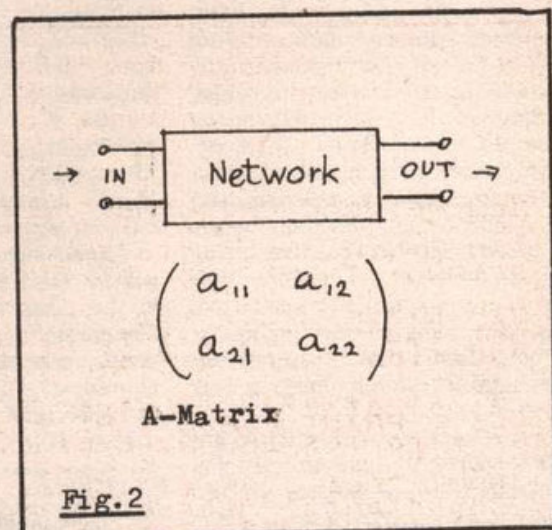

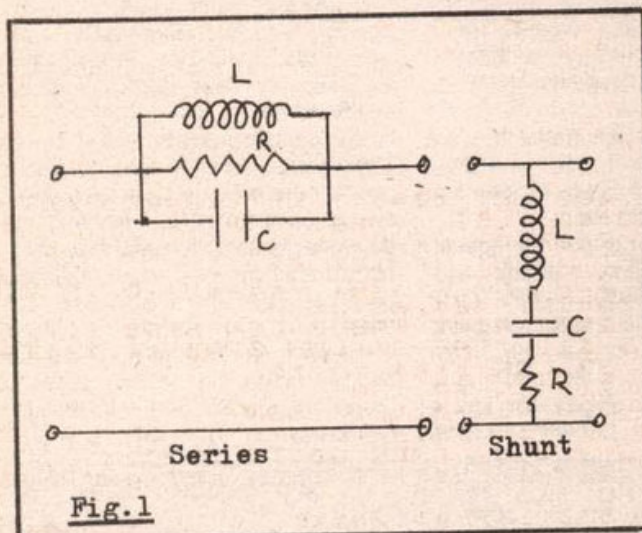

and

$$Z_{OUT} = \frac{a_{22}}{a_{21}} \text{ with input open-circuit.}$$

This program is easily adapted for other machines, as it makes no use of artful dodges. On Run, the user is asked to input the number of sections, whether they are series or shunt and all the components of the sections, in turn. Where a particular component is absent a zero is entered. For example, if a section contains resistance only, then zero is entered for inductance and capacitance. The computer recognises the zero to mean "no inductance" or "no capacitance", not as a short-circuit or open-circuit condition.

After putting in all the components, the next prompt is for frequency. As written, the maximum frequency is 9,999,999Hz (almost 10MHz) — anything larger will exceed the print format.

The program takes a few seconds to work out the answers, depending on how many sections have to be multiplied together. After display, the next frequency can be entered and so the response is gradually built up. As an example, Figure 6 shows a simple network and the printout obtained for it.

$$\begin{pmatrix} v_{IN} \\ i_{IN} \end{pmatrix} = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \begin{pmatrix} v_{OUT} \\ i_{OUT} \end{pmatrix}$$

A-Matrix Equation

Fig. 3

$$\begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \begin{pmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{pmatrix} = \begin{pmatrix} a_{11}b_{11} + a_{12}b_{21} & a_{11}b_{12} + a_{12}b_{22} \\ a_{21}b_{11} + a_{22}b_{21} & a_{21}b_{12} + a_{22}b_{22} \end{pmatrix}$$

Rudely interrupted

Alan Went unmasks some of the secrets hidden in the Spectrum interrupts

The Z80 processor used in the Spectrum has a set of connections and instructions that allow the normal running of a program to be interrupted, and a sub-routine called and Run, before returning to the main routine.

Two types of interrupt are allowed on the Z80. Firstly, the non maskable interrupt. When the signal on this pin is activated, the processor will always jump to location 66H and Run the routine there. This is not used on the Spectrum.

Secondly, the maskable interrupt. A signal on this pin will cause one of three courses of action to occur, depending on the interrupt mode selected. In mode 1, the cpu executes an instruction provided by an external device. This mode is not used on the Spectrum.

Mode 2 is the normal Spectrum mode. When an interrupt occurs, the cpu stores its current program address and jumps to location 38H (56 dec) and continues from there. The Spectrum routine here increments the Frames (Timer) variable, then reads the keyboard. The hardware is arranged such that these interrupts occur every 20mS (50 times per sec).

When the interrupt occurs, the cpu forms an address using the contents of the I register as the high part of the address and the value placed on the data bus by the interrupting device as the lower part of the address. The contents of the address so formed are used as the address to jump to. Thus, a table of subroutine start addresses can be held in memory, with the interrupting device combining with the I register to look up the appropriate address for that device. If no data byte is placed on the data bus, the cpu will read FFH (255 dec) and thus look at the address $I * 256 + 255$ (and + 1 as a 16 bit address is required), and jump to the address stored there.

When the Spectrum is running a Basic program, and during editing, the interrupts are enabled, and only disabled during time-critical routines such as Save/Load or when using the beeper. Interrupt mode 1 is selected at all times, and the I register contains 3FH (63 dec).

Listing 1 On/Off Routines. Assembler

Addr.	Code, Label	Inst.

FE62	ED47	LD I,A
FE64	ED56	IM1
FE66	C9	RET
FE67	00	NOP
FE68	00	NOP
FE69	Interrupt Routine Starts here.	

By changing the cpu into IM2, we can cause the Spectrum to call our own machine code routines 50 times per second. To do this, we need to set the I register to a value where the cpu can find a suitable address for our routine. The value of I must, in the Spectrum, stay below 3FH as it is used when outputting the display — setting I to above 40H will give 'snow' on the screen.

So, we need to find somewhere, where the memory will always contain the same value, and that value will form part of a suitable address for our routine. Looking through the Rom we find that if I = 9, then locations 09FF H/0A00 H (2559/2560) contain the address FE69 H (65129) which is a suitable address for a routine in a 48K Spectrum. For a 16K version I = 28H produces a jump to 7E5C H (32348).

Therefore, by changing the value of I to

9 or 40, we can make the cpu call our own routines. The routines in listing 1 show the method used to change/restore the I register and set the interrupt mode, so switching the interrupt routines on and off.

Listing 2 is the Basic program we will be using to Load our routines into place. Type it in and Save it, then Run. To check the switching routine, line 100 causes a jump back to the normal interrupt routine. Try switching it on and off — the machine should not crash and no effect should be noticed.

Note: the first figure in the line 100 always equals the number of bytes to be poked into place:

RAND USR 65110 (16K — 32330) turns ON RAND USR 65120 (16K 32340) — turns OFF.

Border. Add listing 3 to your base program and Save it, as with all routines before Running. This short routine sets the Border to be always the same as the permanent Paper colour — the demo program starting at line 200 shows this in action. Enter as a direct command Poke 65131, 120 (16K 32350) and the Border will now flash as the contents of the timer (23672) is sent to the Border.

Sound. We can make the Spectrum beep continuously, even when Running a program. Reload listing 2 and add listing 4, Save and Run, then Run line 200 (change values for 16K) and your Spectrum will sing to you!

If locations 65134 and 65137 (16K 32353 and 32356) are Poked with other values as shown, the tone can be changed. The higher the number, the purer the tone, but the less time allowed to spend running the program and it runs very slowly.

Break disable. One disadvantage of Basic programs, at times, is that they can be stopped, by pressing Caps Shift/Space.

The next interrupt routine will disable that function. This works by checking the system variable *Errnr* for error code *L Break* into program. When this is detected, the code for *Cont* is entered into the editing area and then, having ensured that the system variables *Oldppc* and *Ospcc* (see p175 Spectrum manual) are correct, a jump is made to the Rom routine that runs a direct command. This has the same effect as pressing *Cont* and *Enter* after a break. Thus, the program continues with the next statement.

To use this in your own programs, add listing 5 to the base program and merge into your program or, after running Save

"break" Code 65110,77 (16K 32330,77), Load into your program after Clear 65109 (32329) : Load "break" Code. Adding the line *Rand Usr 65110* (32330) to your program will then turn the routine on.

Moving display. This routine is designed to show how the screen can be manipulated with an interrupt routine. The chosen lines of the display are moved one pixel to the left on each interrupt. This could be used, for example, to produce a moving landscape, with a game taking place overhead. The part of the screen that moves is a block, up to eight lines deep, starting from the top, middle or bottom of the screen.

When listing 6 has been added, Saved and Run, Poke 65137,(32353) with the number of lines to be moved and Poke 65135 (32351) with:

64 for top third of screen.
72 for middle third,
80 for bottom third.

The program at line 200 (listing 6) gives some examples of this in action.

Trace/Memory Free. This last and longest routine gives the Spectrum a trace command. This places on screen the line and statement number as the program is Run — also the amount of unused memory. The speed that the program runs can be adjusted from 75 percent normal speed to very slow.

One line of the screen is cleared and used as the status line. The first number shown is the memory report. Direct commands are checked for and shown as line 0000:01. The routine contains its own print routine, so that it will always function even with the printer running.

To use, Poke 65199 (32418) with the required speed (not above 40 approx), then turn the routine on. The speed can be changed when trace is on. After use in debugging, etc, it could be replaced in your final program with the break/disable routine previously described.

Note, to save code only; Save "trace" Code 65110,176 (32330,176) and reload as in the break/disable example.

In this article I have shown some of the ways in which interrupts can be used within programs — it is now up to you to improve them and write your own. When doing this, the following points must be borne in mind:

- (1) Always Save the contents of any register that you use and restore it again before turning to the main routine.
- (2) When an interrupt occurs, the cpu disables any further interrupt to prevent an interrupt service routine from being interrupted, thus forming an unbreakable loop. Therefore, always ensure that the *EI* (interrupt enable) command is used before returning to the main routine.
- (3) If you require the Spectrum to read the keyboard and your routine does not do so, end with a *JP 0038H* — this will read the keys, etc — and then return to the main routine. Otherwise, end service routine with a *Return* instruction. ■

GIANT'S CASTLE £5.95

by MIKE MEINECK

A Junior Graphics Adventure

Explore the castle, fight the wicked Guardians and rescue the fair Damsel to gain a hero's reward!
Suitable for ages 7 to 11 (younger if assisted). Editing instructions supplied (to customise general knowledge questioning).

DRAGON
STICKS

The ultimate Dragon/CoCo analogue sticks, with guaranteed fire button. £19.95 per pair, post free.

TEMPLE OF ZOREN £7.95

by MIKE MEINECK

An Intermediate Level S.F. Adventure

Previous agents didn't make it, but Terran Security rely on you to survive this espionage mission long enough to bring back the Golden Orb, a map of Zoren and a sample of the latest Zoreen Laser Gun. Out of fuel on landing, you'll also have to solve the problem of getting off the planet!

MATHS-TREK £5.95

by ANDREW JONES

An Educational Odyssey

To bring the "Enterprise" back to base, through the Black Holes, Asteroids and Klingon Gunships, you'll have to prove that a Space Captain can handle his maths.
Fifty skill levels and six branches of maths selectable. Suitable for ages 6 to 16.

Dragon Dungeon

QUALITY SOFTWARE FOR THE DRAGON 32

BUGGED! £5.95

By ANDREW JEAVONS

The Tactical Arcade Game

Wave after wave of killer BUGS, deadly BUG NESTS, crafty and homicidal INDY-BUGS and MASS MUTATION from Screen 21 onwards! Survival impossible, but can you make the BUG-BASHER HALL OF FAME? The only way to destroy the little blighters is to roll the EGGS on to them and squash 'em! On-screen Scoring, Wave Data and Lives Left. BE WARNED! Intelligent manoeuvring and lightning tactical decisions count for more in this game than pure arcade reflexes.

TREASURE TOMBE £7.95

By MIKE MEINECK

A Real-Time Graphics Adventure

Don your chain-mail and crawl down into Merlin's 90-chamber tomb complex to search for Arthur's treasure. Wizards, Warlocks, Goblins, Vampires and a host of other dungeon-spawn await!

OSCAR THE OWL'S
MATHS TEST £4.95

by R. WESTWOOD

Maths testing for Primary School Children. Complete the sum on Oscar's blackboard before Lennie the Looper Caterpillar reaches his mushroom. Selectable type of sum, difficulty and timing.

THE CRYSTAL CHALICE £7.95

By MIKE MEINECK

An Advanced Level Swords and Sorcery Adventure

The Klarz smashed the Chalice and scattered the shards to the four corners of the doomed Kingdom of Quorum. Darkness and evil now hold sway and a thorn-spiked Tanglewood has overgrown the Meadowplain.

Your Quest will take you from the Black Lagoon, through the dungeons of the Klarz itself to the rambling Farlands. Brute strength and cunning will both be required.
(Clue sheet available on request.)

MIDAS MAZE £5.95

by MIKE MEINECK

A Movement Game for the Younger Player

All that glitters is not gold! Don't fall into the Devil's Kitchen where escape demands the eating of Power Pies and keep your fingers crossed that the Good Fairy helps you.

*CASH-FLOW £8.75

by A. S. CLARK

Money Management for Home and Small Businesses.

*CATALOGUE, SORT AND MAIL £8.75
A Filing System, with Sorting and Mailing List facilities. Print-out control and address label facilities.

*THE MANAGER £14.95

Both of the above utilities presented as a double cassette package. 2r-friendly Manuals provided and Menu-driven.
(*Available October 1983)

GEM SOFTWARE NEW RELEASES FOR CHRISTMAS

OH MUMMY!! Your party of archaeologists enter the pyramid in search of the mummies of the pharaoh's household. There are five burial chambers containing treasure, secret scrolls, keys, royal mummies and some nasty surprises. To pass from one chamber to the next, you must find the key and royal mummy, but beware, you may uncover a guardian, who will chase your group to avenge your desecration!! A Machine Code game for those with nerves of steel and great courage.

Price (LYNX) £7.95
Price (ZX81 and SPECTRUM) £4.95

TANK ATTACK. A machine code game for 1/2 players, defending supplies against computer controlled tanks. This game will stretch your reflexes to the limit as you battle with the enemy tanks. They won't be able to shoot back until they have supplies, but when they do, look out!! Joysticks required.

Price (BBC-B OS 1.0+) £7.95

SPANNERMAN. Pete the Plumber has his work cut out! He's stuck in the boiler room and the pipes are leaking! Unless he can fix the leaks and stop the water rising he'll meet with a watery doom. To make matters worse, all sorts of nasties keep coming out of the woodwork!! A fantastic machine code game, that stretches you and your Lynx to the limit!!

Price (LYNX) £7.95

UTIL 1. Two very useful programs for your BBC-B. Both tested on OS 1.0 and above. **Character Define** gives you a very comprehensive and simple way to quickly create all manner of user defined characters. **Envelope Editor** will enable you to unravel the complexities of the Sound and Envelope commands, so that you can produce exactly the sound you require. The ship!! In SUB CHASE you must depth charge the wolf pack.

Price (BBC-B OS 1.0+) £9.95

CHRISTMAS SPECIAL OFFER (mail order only for DRAGON 32). Choose any three of the following titles for £15.90. A saving of £7.95

GAMES PACK I
ALIEN BLITZ

GAMES PACK II
GOLF

GAMES PACK III
SPACE MISSION

All prices include postage and packing. All cassettes despatched within 48 hours of receipt of order. Access orders welcome.

A cosmic experience

Michael Pearce presents a *Cosmic Lander* program written on OS 1.2 for model B or 32K A

With a minimum amount of fuel left, your space-craft is orbiting the planet below. Gravity and strong cross-winds are pulling your craft quickly down — the only hope you have of saving your ship is by landing it on one of the pressure pads.

But, this task will not be easy. The slightest movement or too fast landing will lead to your ship being blown up. Also, cosmic stars float above the surface and on some occasions will cause an explosion. On some screens, landing pads do not appear, so death is imminent no matter what happens. The more screens you clear, the more intense the winds become.

The program has full instructions and a signature tune. The landing screen is drawn in hi-res colour graphics, with stars and a 3D perspective graphics landscape. Landing pads are randomly placed. The ship is two characters high. Fuel readout is at the top of the screen.

Keys for the game are:

Z... Left

C... Right
M... Thrust

It is unwise to keep your hand on a key for too long. Once the craft starts drifting too fast, it will be hard to stop. If you crash into the top, or sides, of the screen, your craft will explode.

If the screen set-up is not to your liking, add this line:

```
655 IF A$="P" THEN GOTO 340
```

On the press of P, the screen will be redrawn, though the variables will stay the same.

Variables

CA	Craft position across screen
CB	Craft position down screen
DRIFT	Wind force
DEC	Descent rate
CAB	Ships step of movement across screen
SN	Ships to go
SC	Score

Notes

10-230 Instructions and signature tune

240-330	User defined graphics and sound effects
350-560	Set up screen display
570-680	Prints craft and waits for keyboard input
690-730	Deletes ship
740-830	Checks for crash or land
830-900	Crashes, checks for end of game
910-950	Lands, adds up score
960-1000	Updates instruments
1010-1060	End of game, wait for new start

Proc statements

PROCscreen	Sets up screen
PROCcraft	Print craft waits for instructions
PROCmoving	Blacks out craft
PROCpos	Checks for crash or land
PROCcrash	Crashes craft
PROClend	Lands craft
PROCinst	Updates instruments
PROCend	Ends game

PROGRAMMING AIDS AND LANGUAGES FROM ...

Audiogenic LTD

FOR COMMODORE VIC-20 AND 64!

VP052 BUTI PLUS - £39.95 - Basic Programming Aid Commands PLUS Machine Code Monitor PLUS 3K Expansion! Basic aids include - APPEND, AUTO, DELETE, DUMP, EDIT, FIND, HELP, RENUMBER, REPEAT, STEP, TRACE, UNNEW, VIC, and DEC to HEX. Monitor Commands - ASSEMBLE, DISASSEMBLE, CENTRONICS, FILL, GO, MEMORY, HUNT, REGISTER, PRINTED DISASSEMBLE, LOAD, QUICK EXECUTE, WALK CODE, SAVE, TRANSFER, EXIT.

VP074 MONITOR VIC - £19.95 - Monitor on its own. Commands as above.

SS074 MONITOR 64 - £29.95 - 64 version. Commands as above.

VP078 MIKRO ASSEMBLER - £48.95 - Cartridge Assembler program for the VIC - Includes 3K extra memory. Write your machine language source code on Basic Lines which can be manipulated using the included toolkit commands. MIKRO uses standard MOS mnemonics, and features ASSEMBLER and DISASSEMBLER, plus TIM monitor commands, and special hi-res, sound, and joystick extensions.

SS076 FORTH 64 - £29.95 - Audiogenic Forth is very fast because it compiles right down to machine code, and very compact because it uses special screen compression routines. Audiogenic Forth contains a dictionary of over 200 Forth words, but the great thing about Forth is that you can define your own commands! Audiogenic Forth gives you full error messages (instead of codes), a full scrolling screen editor, and a comprehensive manual.

VP076 FORTH VIC - £24.95 - As above, but includes special VIC colour and sound commands. This version must be used in a motherboard with 8K+ expansion.

VP076/M FORTH VIC (with memory) - £39.95 - As VP076, but includes 3K expansion built-in so that you don't need a motherboard and expansion.

ADVENTURE

GAMES

48K SINCLAIR ZX SPECTRUM

You are a Knight of Camelot, searching for Merlin's lost treasure. On your way you will discover the Witches' Tower, rescue a Princess held by the wicked Wizard of Trill. **£5.95**

You discover the entrance to an ancient pyramid blocked by a rock. Once inside, you discover fire rooms, ice rooms and other traps set by the builders to protect the Pharaoh. **£4.95**

A rope above a rock fissure is the only way into this Magic Mountain, or is it? Legends tell of vast stores of treasure but also of poisonous spiders, lizards and magic at work. **£4.95**

You are Spectrasses, battling in the arena with Gorgon, whose stare can turn you to stone. To recover the lost chalice, you must also win a swordfight with Grang, inside his cave. **£4.95**

To find the Black Planet you need 7 pieces of the key each hidden on different planets, and requiring different puzzles to be solved. On the journey, you fight off the pirates who get steadily more desperate. **£5.95**

Send SAE for full list.

Bernice Hennessy explains how to obtain machine code access to Basic functions

In his article "A Routine Matter" (PCW 120-26 October), Peter Whittaker describes a very useful technique for calling Basic Rom routines from a machine code program. In a similar manner, you can access the functions of Basic and also any additional Basic commands provided, for example by disc operating systems or some hardware add-on modules.

To do this, you need to know that the Basic system uses a list of reserved commands and functions, together with their corresponding addresses. During Basic initialisation, pointers to these are set up in Ram as follows:

\$120 Number of normal reserved words

\$121 Address of normal reserved words list
\$123 Address of statement despatch table
\$125 Number of function reserved words
\$126 Address of function reserved words list
\$128 Address of function despatch table

Listings 1 and 1a are generalisations of Peter Whittaker's program which display both normal reserved words and Basic functions. You will see that the statement despatch table only contains Exec addresses for tokens up to 186 Renum, because later tokens are always used in conjunction with an earlier one. Functions are represented by a pair of tokens, the first always being \$FF.

The lists of reserved words and the addresses of the subroutines to implement

them are normally stored in the Basic Rom. The way in which extra commands are added to Basic (or existing commands given new meanings) is to move the reserved word list and despatch table (ie, list of addresses) into either protected Ram or the cartridge Rom area. It is then possible to redefine commands and their meanings as required. Listing 2 shows an example of this where the function reserved word list and function despatch table have been moved into Ram and the following modifications made:

The INT and MEM functions no longer exist.
Token 255 129 has been redefined as QNT and points to \$8C31 (the old MEM routine).
Token 255 155 has been redefined as % and points to \$7CE5 in Ram where a machine code routine gives the function its meaning.

Using this technique, it is possible to redefine Basic words at will (although you change the meaning of existing words at your peril!) and to define meanings for extra Basic commands which you can add to your Dragon's repertoire.

TURN YOUR PROGRAMME UPSIDE DOWN

Now you can add another dimension to your games.
Swap direction, swap functions, confuse your friends.
In fact you can add almost any twist to your games with
Stonechip's Programmable Joystick Interface.

You can also listen to them
with **Stonechip's Echo Amplifier.**

Programmable Joystick Interface. This also enables any Spectrum software to be used with a joystick, irrespective of which keyboard keys have been chosen for function.

Programming is easy using only a single switch. Switch one way to program and another way to play. No tapes to load or links to worry about — all programming is achieved by hardware. Used with Atari-compatible joysticks. Simply plugs into rear expansion port of ZX-Spectrum. No other connections to make, no additional power supply required.

Echo Amplifier. How would you like to listen to the sound output from your ZX-Spectrum without ear strain? The Stonechip Echo amplifier can do this for you as well as easing the tedium of saving or loading of tapes and enlarging the range of tape recorder compatibility with the computer. The amplifier has volume control over a range adequate for most uses, and a tone control for harsh or mellow sounds. A switched interface removes the need to swap leads during 'SAVE'ing or 'LOAD'ing. Leads are left connected all the time and the desired function is selected on the three position switch by the user. Use of the 'CUE' facility enables an audio cue to precede the program being 'SAVE'd on tape, a decided advantage when searching through a multi-program tape. The Echo simply plugs into the Ear, Mic and Power sockets of the computer and does not require an additional power supply. The expansion port at the rear of the computer is left free for use with other peripherals and the unit is housed in an attractive case custom designed to complement the ZX-Spectrum.

SCOPE

Computer Graphics Language

- ★ A VERY POWERFUL, TRUE MULTITASK LANGUAGE
- ★ AS FAST AS MACHINE CODE
- ★ SIMPLER THAN BASIC

Write Machine Code in a fraction of the time currently required

SCOPE is available from most good quality dealers and selected branches of

WHSMITH

For details of how to get your games published commercially contact ISP Marketing

TECHNICAL DETAILS

SCOPE is a fully structured multitask language specifically for writing *graphics, animation and sound*. Being fully compatible with BASIC it is ideal for writing both arcade and adventure style games. Additionally, with SCOPE present in high memory it can be used as an assembler with SCOPE words as plain language mnemonics. Therefore no knowledge of machine code is required. The language is extremely easy to comprehend and is very powerful indeed providing many features not available from BASIC.

SCOPE HAS TO BE USED TO BE BELIEVED

Dealer Enquiries Welcome

A registered connection

Pete Gerrard takes a look at some of the registers connected with the Sid chip

Last week I gave you some of the fundamental information regarding the use of the 6581 Sid chip in your Commodore 64.

While space precludes an in-depth look at everything connected with the chip, this week we're going to take a detailed look at just some of the more interesting registers, starting with register 54276.

At this point it would be useful to dig out last week's copy, and have the Sid memory map in front of you.

Control Register

This is the most important register of them all, containing eight control bits with the following functions:

Gate — Bit 0

This controls the envelope generator for voice 1, and when this bit is set to a '1' the envelope generator is triggered and the Attack/Decay/Sustain (or ADS) cycle is begun.

When this bit is reset to a zero, then the release part of the cycle begins.

This envelope generator controls the amplitude of voice 1 as it appears at the audio output, and must therefore be triggered in order for the selected output of voice 1 to be audible.

Sync — Bit 1

When set to a '1' this synchronizes the fundamental frequency of voice 1 with the fundamental frequency of voice 3, producing what are known as 'hard sync' effects.

Varying the frequency of voice 1 with respect to voice 3 produces a wide range of complex harmonic structures from voice 1 at the frequency of voice 3.

In order for this to take place, obviously voice 3 must be set to some frequency or other, preferably lower than that of voice 1, but naturally higher than zero. Nothing else connected with voice 3 has any effect on Sync.

Ring Mod — Bit 2

When set to a '1' this bit replaces the triangle waveform of voice 1 with a ring modulation combination of voices 1 and 3: obviously, one must previously have selected the waveform of voice 1 to be a triangle one!

Varying the frequency of voice 1 with respect to voice 3 produces a wide range of non-harmonic overtone structures. Again, nothing else connected with voice 3 has any effect on Ring Mod.

Test — Bit 3

This bit, when set to a '1', resets and holds voice 1 at zero, until the bit is cleared.

The noise waveform of voice 1 is also reset, and if a pulse wave has been selected this is held at a DC level.

Triangle — Bit 4

When this is set to a '1', the triangle waveform is selected for voice 1. This is low in harmonics, and thus produces a mellow, reed-like note.

Sawtooth — Bit 5

When this is set to a '1', the sawtooth waveform is selected for voice 1. This is rich in harmonics, and thus produces a brassy, trumpet-like note.

Pulse — Bit 6

When this is set to a '1' the pulse waveform is selected for voice 1. The harmonic content of this waveform can be varied by altering the pulse width registers, producing a wide variety of different musical (and not so musical) sounds.

Sweeping through the pulse widths can produce some dynamic effects, and add a sense of motion to the sound. Also worthy of experiment is a rapid altering of pulse widths.

Noise — Bit 7

When set to a '1', the noise waveform is selected for voice 1. This is a totally random signal which changes at the frequency of voice 1, and thus is of most use in generating purely sound 'effects', like missiles taking off, engines revving, or explosions.

One of the above waveforms must be selected in order for voice 1 to produce any audible sound, although that sound can be turned off without un-selecting a waveform, as the voice at the end is a function of the envelope generator only.

You cannot add more than one waveform together to produce something totally different from the above four, although you're welcome to try!

Filtering techniques

This concerns memory locations 54293 and 54294, known as Freq Lo/Freq Hi — registers \$15 and \$16.

As bits 3 to 7 of register \$15 are not used, these two combine together to form an 11-bit number which linearly controls the cut-off, or centre frequency of the programmable filter. The approximate cut-off frequency is obtained from:

$$FC_{out} = ((6.6E - 8 + FC_n * 1.28E - 8) / C) \text{ Hz}$$

where FC_n is the 11-bit number in the above two registers and C is the value of the two filter capacitors connected to pins 1 to 4, or in our case 2200 picoFarads.

This gives an approximate filter range of 30 Hz to 12 KHz, according to:

$$FC_{out} = (30 + FC_n * 5.8) \text{ Hz}$$

Res/Filter — Register \$17 (54295)

Bits 4 to 7 of this register control the

resonance of the filter, where resonance emphasises components of the frequency at the cut-off frequency of the filter, thus causing a sharper sound.

There are 16 resonance settings, ranging linearly from no resonance, when this is set to zero, or maximum resonance, when it is set to 15.

Bits 0 to 3 determine which signals will be routed through the filter:

Bit 0: When this is set to zero, voice 1 appears directly at the audio output, and there is no filtering effect. When set to 1, voice 1 is processed through the filter, and the harmonic content of voice 1 is altered according to the selected filter parameters.

Bit 1: Ditto for voice 2.

Bit 2: Ditto for voice 3.

Bit 3: Ditto for external audio input on pin 26.

Mode/Vol — Register \$18 (54296)

Usually referred to as the master volume control, this actually does a whole lot more.

Bits 0 to 3 are the actual volume settings, and allow you to select an overall volume ranging from 0 (silence) to 15 (maximum).

Bits 4 to 7 select various filter modes and output options:

Bit 4: When set to a '1', the low pass output of the filter is selected and sent to the audio output. For a given filter input signal, all components of the frequency below the filter cut-off are passed through unaltered, whilst all those above the cut-off are attenuated at a rate of 12 decibels per octave.

Bit 5: As above for band pass output, but attenuation above and below the cut-off is at a rate of 6 decibels per octave.

Bit 6: As above for high pass output, and attenuation below the cut-off is back to 12 decibels per octave.

Bit 7: When this is set to '1' the output of voice 3 is disconnected from the direct audio path, so setting voice 3 to bypass the filter and setting 3 OFF to a '1' stops voice 3 from reaching the audio output. Thus voice 3 can be used for modulation purposes without any extraneous noises coming out.

These filter modes are additive, in that one can combine a number of different modes at the same time. Playing with, and understanding, these frequency alterations is the key to getting the most out of the 6581.

I have not given you any concrete examples here, so you'll just have to sit down and do it for yourself. But, armed with the above information about how the important registers can be altered for filtering, synchronisation, and other techniques, the 6581 Sid chip should begin to reveal just a few of its secrets to you. ■

Cuthbert Goes Walkabout

Cuthbert is on the Lunar Landing Pad, waiting for the Federal Chief's State Visit. He must turn the lights on by walking across the switches, located at the corners of the squares, before the invading Moronians get him. Watch him do his Victory Dance before he tackles the next "Pad" and another, larger, set of Moronian Invaders. Can you get your name in the Hall of Fame?

Superb full colour graphics with accompanying music.

WHEN YOU BUY FORTH MAKE IT THE BEST!

“Forth is closer to machine code and more than 10 times faster than BASIC. A game of Space Invaders written using it would be almost as if it is written in machine code.” Sinclair User. ● “Abersoft Forth has no known bugs, gives you more Forth words, and because it allows 12 screens in memory at once it is easier to load and save programs.” Personal Computer News. ● “Abersoft Forth is a complete version of the language with added colour, attribute and graphics instructions. It is also possible to define your own characters just as you can in Spectrum BASIC.” S.U. ● “Forth is an easy language to use, and the graphics commands in Abersoft Forth allow you to do anything in Forth that you can do in BASIC.” P.C.N. ● “Abersoft Forth is the only Spectrum package which has been endorsed by the Forth Interest Group.” S.U. ● “Its features make it well worth the price.” P.C.N. ●

AGF

PROGRAMMABLE JOYSTICK INTERFACE for Spectrum or ZX81

MICRODRIVE
COMPATIBLE

ABOUT OUR INTERFACE

The AGF Programmable Joystick Interface is a unique design offering the use of any Atari-compatible joystick with absolutely all software, whether it is cassette or ROM cartridge, with the Sinclair Spectrum or ZX81.

The hardware programmable interface requires no additional software and accurately replicates the keys of the computer in a manner which is responsive to absolutely ALL key reading methods, both BASIC and Machine Code.

The interface does not interfere with key operation and can therefore be used simultaneously with the keyboard.

There is no need to remove the interface once fitted as the rear extension connector will accommodate further expansion, i.e. printers or RAM packs etc. This important feature avoids excessive wear to the expansion port.

The key replication principle pioneered by AGF means that your own programs can use eight directional joystick movement by utilising simple key reading BASIC.

Two joystick sockets are provided which share the same keys, for use with the majority of two player games. Several interfaces may be used on the same computer for multiple joystick applications.

The interface is programmed by a two digit code, which is looked up on a programming chart supplied, for each direction and firing button. The two numbers are then selected on a pair of leads which are clipped onto appropriately numbered strips on the interface.

Once configured this can be marked on a Quick Reference Programming Card for storing with the game. As the programming is not power dependent the interface retains the last configuration made and can be immediately used when next switched on.

KEY FEATURES

- ★ Programmable design gives TOTAL software support.
- ★ Accepts Atari, Competition Pro, Wico, Starfighter, Quick Shot, Le Stick etc.
- ★ Rear extension connector for all other add-ons.
- ★ Free demo program and instructions.

PACKAGE CONTENTS SUPPLIED

- Programmable Interface Module as illustrated, complete with clip-on programming leads.
- Self adhesive programming chart detailing how to define which key is simulated by UP, DOWN, LEFT, RIGHT, and FIRE. This can be fixed on to the case of your computer or if preferred the protective backing can be left on. The chart is made of a very durable reverse printed plastic and is extremely easy to read.
- One pack of ten Quick Reference Programming Cards for at-a-glance setting to your games requirements. The card allows you to mark the configuration in an easy to read fashion with space to record the software title and company name.
- Video Graffiti demonstration program which is written totally in BASIC to illustrate how all eight directions and fire can be read. This is also a useful high resolution drawing program.
- 12 months guarantee and full written instructions.

A crowded market

Andrew Pennell takes his Sord in both hands and enters the cut and thrust world of the under-£200 computer market

The CGL M5 is yet another contender in the crowded sub-£200 computer market. It is manufactured by Sord in Japan and sold in this country by CGL, known for their *Game & Match* toys.

The standard M5 machine costs £149.95, and comes with 20K Ram and 16K Rom. This is not as attractive as it first seems as 16K of the Ram is dedicated to the video display, leaving only 4K for the user. Of the Rom, 8K is contained in the machine as the operating system, while a further 8K is supplied in the Basic-I plug-in cartridge. Supplying the main language on a detachable cartridge is a very good idea, as it can be changed or upgraded. Something which may be rather necessary on the M5.

The main unit is little larger than the Spectrum, though rather heavier. It is in pleasant two-tone colours, with a detachable flap that occupies the rear third of the top. The flap has to be removed when the machine is in use, as it covers the cartridge slot. The cartridges themselves are exactly the same size as cassette boxes, and they fitted into my cassette rack perfectly. The keyboard is one of the popular (with manufacturers anyway) moving-rubber key types, but is much nicer to type on than the Spectrum. Each key is shaped as a square with a corner removed, for some inexplicable reason, and there are even 55 keys, removing the need for the complicated shifts required on the Spectrum's 40 keys. Unfortunately there is no space bar, and the space key is just under the *Return* key, which is not really a good place for it. It also has two *Shift* keys, a *Ctrl* key, a *Func* key (for single-key entry) and a *Reset* key, which sensibly also requires *Ctrl* to be pressed. Each key has the main symbol in white, any keywords in yellow, and graphic symbols in blue. As the keys themselves are also blue, it makes the graphics all but invisible under

concealed under a considerable weight of metal shielding which really does cut down on radio interference — Sinclair please note. Among the components are the Z80A microprocessor, the Texas 9929 video chip, a Z80 CTC timer chip, a 76489 sound chip, and an 8K *Rom*. The CGL M5 uses the same video chip as that in the now defunct TI 99/4A, the new Memotech MTX500 (see *Popular Computing Weekly*, November 17), and the forthcoming MSX-standard series machines. The sound chip is the same as that used by the BBC micro and the Memotech.

Because of its apparent similarities with the Memotech, I was very interested in the display quality on the M5. The machine initialises to white letters on a black background, and appears twice on the tv dial — there was no discernible difference between the two. Unlike the Memotech, all the characters were visible on the screen, but it was similar in the way the picture distorts 'CinemaScope' fashion, so that circles are oval in shape. Colour stability was better than the Memotech, and the sound quality very much better.

The M5 is supplied with the Basic-I Rom cartridge which CGL say is Easy BASIC for Beginners. I can only presume that the I in the name means in fact Basic for Idiots!

The first thing I did with the computer was to type in a three-line program to print the character set and it would not run. After Listing it I found that the word *Let* had been inserted before each statement. After examining the manual I discovered that if a space is not entered after each line number then *Let* is inserted — it is claimed that this is done so that you do not have to type *Let*, but it seems ridiculous to me. Spaces are also required to separate commands, else they are not accepted. Normally commands have to be typed in letter by letter, but if the *Func* key is held down with

characters can be accessed direct from the keyboard, though the manual has to be referred to as half the legends are missing and the other half are illegible due to the colour clash of the keys and keyboard already mentioned. Control codes can also be entered in listings, by holding *Shift*, *Ctrl* and the appropriate key, and they get listed as inverse characters. The codes are important since they control the different screen modes.

The Basic itself is rather unusual in that it is integer-only. This means that no decimals are allowed, and numbers are limited to the range ± 32767 . The last micro I can remember that was integer-only was the Acorn Atom some years ago. After thinking about it though, for a beginner, integer-only is probably sufficient. The best part of Basic-I is its speed — it is incredibly fast. Simple tests showed it to be at least four times faster than the Spectrum, and marginally faster than the BBC! Its speed is obviously due to the integer limitation. The commands are fairly standard, with some additions for graphics.

The M5 has four graphics modes. The simplest is Text, which is 40×24 characters in two colours. Graphics Mode 1 has a resolution of 256×192 pixels, but only a maximum of 256 characters can be displayed, each with a foreground and background colour chosen from a palette of 16 colours. Graphics Mode 2, the most useful, has the same resolution, but the screen is fully bit-mapped in colour giving a colour resolution of 64×192 . Finally, multi-colour mode, in which each pixel can be any of 16 colours, has a resolution of only 64×48 and is really not at all useful.

The best feature of the Texas 9929 chip, and thus the M5, is its ability to display and control large graphics shapes — Sprites. All of the above modes, except Text, can support up to 32 Sprites each of size up to 32×32 pixels which are independent of the graphics screen, and can be one of 16 colours.

Basic-I has only a few commands for accessing the graphics, and none are explained in detail or at all clearly in the manual. To switch between graphic modes, certain control codes have to be printed, and this is certain to confuse the beginner. If for some reason an error occurs in some of the modes, the error message will be invisible, and the computer appears not to be working. This is particularly a problem in Multi-colour or Graphics 2 modes, as characters are not printed sensibly in either. The manual unwisely advises that the power be removed if the screen displays meaningless characters, but this is simply not so. Eventually, after pressing complicated *Ctrl* sequences, control can be regained.

Once in a particular graphic mode there are a handful of commands to define the shape, colour, size and position of the Sprites, but their use is poorly explained in the manual's Appendix. There are no

normal light.

Along the back of the case are the power and cassette sockets, a Centronics printer socket, two joystick sockets, tv output, and video and audio outputs. Regrettably, the joystick sockets are non-standard, so only the CGL 'joypads' will fit. This is a problem since they are not very good.

The power supply is a huge black slab that has to sit next to the main unit because of its short lead — aesthetically pleasing it is not, but, thankfully, it is silent.

Inside the case there is only one circuit board containing the electronics. It is well

certain letters a whole keyword is generated. This single-keyword entry is optional but, again, if you don't press *Space* after each keyword the line will not run.

Lines are edited using a fairly standard screen editor, using the cursor keys in conjunction with *Ctrl*. Insert mode can be entered with *Ctrl P*, and left with *Ctrl O*. Delete works — in the opposite way to the norm — removing the character to the right of the cursor — but this seems to be getting more popular and one soon gets used to it. Program lines can be entered in either upper or lower-case and are listed in upper-case. A wide range of graphics

commands to plot points or draw lines, or to use the sound chip.

This would not be a great problem if CGL provided sufficient technical information to allow access by *Pokes*, *VPokes* (for the video Ram) and *Outs*, like Commodore do, but no mention is made. I was most unimpressed with the CGL M5 until I typed in a demonstration program from the back of the manual. It produced a rather impressive game in colour with Sprites and background characters. The listing was full of *Pokes* and other such commands, but no explanation of them was given. It also showed how to use the sound chip using an *Out* instruction but, again, no details

For *Next* loops. There is a limitation, not mentioned in the manual — only four Sprites can be on a given horizontal line. That information I discovered in the Memotech manual. The *Joint* statement allows Sprites to be joined together to make bigger shapes. To detect collisions between Sprites, there is a command *On Coinc Gosub xxx*, and if any two Sprites touch each other then routine *xxx* is executed. These graphic commands make it simple to write complicated games and they run fast, too.

As well as the extra graphics commands, Basic-G also supports the sound chip. On the M5 the sound output is through the tv speaker and it is nice and

clear. The commands for using it are *Play*, for music, and *Sg*, for sound effects. The M5 has three tone channels and one noise channel — all easily used Basic-G. The *Play* command is used in a similar way to that on the Dragon 32, but can address all three channels. It is not just the note that can be controlled. So can the octave, duration, volume, tempo and envelope. The control commands are all clearly ex-

matrix printer that has a bit-mode with 8 dots, such as the Epson machines. It would appear, however, to rule out the popular Seikosha GP100.

Although Basic-G has a large number of good features, it still has the idiosyncrasies of Basic-I. Spaces are still required in lines (except after line numbers), error messages are still just numbers and, incredibly, it is still integer-only.

Just before writing this review, I received the M5 Technical Manual, which I hoped would cover all the omissions from the Basic manuals. Unfortunately 'Technical Manual' is not really accurate — most of it is just the Appendix from the Basic-G manual. There are a couple of pages devoted to I/O locations, a vague memory map and a circuit diagram, but actual details of the graphics and sound chips are almost non-existent.

In fact, M5 owners who want to know more should try and get a Memotech manual, as it contains all they should need. There is little mention of machine-code in any M5 document, and information is particularly lacking on the system variables and where to put the code in memory. For independent support a machine needs to have certain technical information available, as Texas found to their cost, and CGL don't seem able to supply nearly enough.

The standard M5 machine with Basic-I and 4K user-Ram seems expensive at £150. I thought only Commodore could get away with omitting the extra commands to use machines (eg, the Commodore 64 and Simons' Basic), but CGL obviously seem to think that they can too.

There is a paragraph in the technical manual that says: 'Basic-I is not designed to bring out all the M5 capabilities. The built-in synthesiser requires much time to produce sounds and the fine colour graphics are difficult to produce on the screen.' I wholeheartedly agree. No such statement appears in CGL's adverts though. With Basic-G and 8K user-Ram it should really be compared with the 16K Spectrum, but costs £185, making the CGL less attractive. However, Basic-G is a brilliant games-writing language (except for the inexcusable lack of floating-point numbers), even though writing similar programs from machine-code is almost impossible with the current level of technical data.

There is supposed to be a 32K Ram pack coming shortly. If CGL were to sell the 32K Ram pack together with Basic-G and the M5 Console at a discount it could make an attractive package.

My feeling is that there are already too many machines competing for the sub-£200 market. CGL will have to change their current tactics if they wish to start the long-heralded Japanese invasion by supplying Basic-G as standard. And that's just for starters. Independent support will be slow in coming without more technical information being easily available. ■

were given. At this stage I realised the CGL had a lot of potential, but I could not get to it.

Then I managed to get hold of a copy of the Basic-G cartridge.

Basic-G, at £34.95, is a cartridge that comes in a huge plastic box, with foam padding to fill it, and a massive 280-page manual. Noticeably heavier than Basic-I, it contains 16K of Rom and an extra 4K of Ram. On the front of the manual are the words 'Easy Basic for Games' and, after examining the contents, it certainly seemed like it.

As well as all the Basic-I commands, Basic-G adds over 50 new ones, mainly for graphics. The graphics modes (except the useless Multi-colour mode) are very well supported, with easy colour commands, pixel plots, line drawings, circles, ovals and even polygons. There is a powerful *Paint* command which is extremely fast and fills in any irregular shape with solid colour. The commands *Bar* and *Box* are given for drawing line and solid rectangles. For controlling the Sprites there are a wealth of commands, the most impressive of which is *Move*: it allows movement to a given point, at a given speed, or movement in a given direction, at a given speed. A maximum of twelve Sprites can be moving together, automatically, at one time, though others can be moved using

plained, even to musical ignoramuses like myself. The *Sg* command can also be used to control the tone generators, but that requires more work.

To aid easy programming, there are several levels of 'interrupts'. Normally these are only available on other machines via machine-code. An interrupt is an occurrence that stops normal program flow for a while, while it does something else; when the extra routine has finished the normal program flow is resumed.

On the M5 there are six types of interrupts controllable from Basic-G. On *Coinc Gosub* has already been mentioned. The others are: *On Event Gosub* and *On Alarm Gosub*, which trigger on certain timed occurrences; *On Key Gosub*, used when a key is pressed; *On Joy Gosub*, when a joystick is moved; and *On Error Gosub*, when any error occurs. This type of interrupt management is a brilliant idea, and deserves to be duplicated on the next generation of home micros.

On the back of the M5 is a socket for a printer cable of the Centronics type. When a printer is connected both listings and text are available by *LList* and *LPrint* commands. Also available is the *PCopy* command which copies the hi-res screen to an attached printer, using parameters set up with the *PMode* command. From what I could see, it should work with any dot-

OPEN FORUM

Open Forum is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

Frequency

on Spectrum

This program draws frequency graphs of the sound being received at the ear socket.

First enter the small basic program and save it using the line:

Save "Sound" Line 5

New the computer then enter and Run the hex loader program. Use this program to enter the 93 bytes of hex code which constitutes the main program. The hex is the second column of figures starting 110501. When all the code has been entered input "STOP" to stop the program then save the machine code using the line:

Save "Sound" Code 65000,100. New the computer then rewind the tape and

load the basic program. When loaded it will automatically load the machine code and then stop.

The easiest way to use the program is to first record the sound you want analysed onto tape. Run the program and after the tone the computer waits for a signal at the ear socket. Connect the tape recorder as for loading, and play. The computer will store values corresponding to the frequency at location 60000 to 60254.

The program will then draw a simple time versus frequency graph of the values. Press enter to run the program again. Owners of Casio VL-Tones can connect the instrument directly to the ear socket for analysing the waveforms produced by the instruments *Adsr* function.

Screen Block Delete

on Spectrum

This machine code routine is designed to help you clear parts of the screen without damaging another part which you may

want to leave on.

The program will clear any line(s) or column(s) the user specifies. To use the routine do the following *Pokes*

27004 With the first column to clear - 1
27008 With no. of columns to clear
27014 With no. of lines to clear
27016 With specified paper colour

As the programme stands it will *Poke* in the machine code and then *List* the program three times and delete the top left-hand corner of the screen.

This program can be used when, for example, some instructions need to stay on the screen whilst others need not.

OPEN FORUM

Cavern Runner

on Vic20

The idea of the game is to dodge the meteors as you travel down the cavern. You have 25 missiles in case of an emergency. Use them carefully. As a last resort there is a hyperspace function to get

you out of trouble. Controls are:

Z = Left
C = Right Or use a joystick, down for hyperspace
M = Fire
Space = Hyperspace

The game consists of two routines, the game and the death section. Each one calls the other routines as it needs them.

The game includes music and hi-score table.

Program notes

10-59 Sets up User Defined Graphics
66-68 Tune
69-119 Instructions
154-230 Main loop
800-910 Death routine and another game

SOFTWARE FOR SPECTRUM AND ZX81

OUR POLICY

We aim to create programs which you will keep on using until your computer wears out. You won't find our programs in the top ten and you will look in vain for colour adverts and fancy packaging. Nevertheless we have built up a solid following of discerning users in all parts of the world. Read the reviews of our programs if you can find them. We have been consistently praised for quality, originality and value for money.

WHAT DO YOU GET?

The bulk of our cassettes are now made by the factory which produced the Horizons tape. Programs are recorded twice and carry on the reverse side an audio narrative to supplement the operating instructions. Where appropriate, cassettes are accompanied by a comprehensive and clearly written instruction manual.

48K SPECTRUM

"Day of the Match" £5.00

Fascinating and realistic simulation of an entire football season. Name your own teams if you wish (English league provided on cassette). Rate each team from one to nine in various success categories such as attack, defence, manager, etc. Watch the season unfold. Includes knock-out cup option.

"Ball by Ball" £5.00

Simulates a test match series or one day international series. Set up your own teams and pool of players (England v Australia provided). Rate each player's capabilities as batsman and bowler on a one to nine scale for qualities such as talent, effort, etc. Pick your teams and play the match. Electronic scoreboard shows progress of a match. Full supporting score card and series averages.

"Superplan Generator" £12.00

Spreadsheet type program with variable column width and variable number of columns. Lets you sacrifice columns you don't need to get more lines.

"Superplan Pack 1". Business Applications £7.00

Ready made applications programs for sales day book, purchase day book, cash book and petty cash book.

"Superplan Pack 2". Home computing £7.00

Ready made applications programs for home budgeting, nutrition tables, car running costs and bank statements.

"Superview" £5.00

Simple but effective information display. Up to 42 pages of text and low-res graphics. Access pages on demand or run in perpetual 'slide-show' mode. Full facilities to create your own pages and build up an information library on cassette.

16K SPECTRUM

"Superdraw" £5.00

Create full colour high-res pictures and store them on cassette for use as titles or background screens in other programs. Or just have fun doodling and build up a cassette library of your creations. Slide show option allows you to review pictures stored on cassette.

16K ZX81

Here is a selection of titles still available for ZX81. Send s&e for illustrated catalogue. These are the ZX81 equivalents of the Spectrum programs described above. Although similar in concept the specifications fall short of the descriptions given for the Spectrum.

"FOOTBALL-LEAGUE" Forerunner of "Day of the Match" £4.00

"TEST-MATCH" Forerunner of "Ball by Ball" £4.00

"VIDEO-PLAN" Forerunner of "Superplan" £7.00

"VIDEO-AD" Forerunner of "Superview" £7.00

"VIDEO-SKETCH" Forerunner of "Superdraw" £7.00

Many independent computer shops now stock our products but we continue to supply by mail order on an off-the-shelf, immediate delivery basis. Prices include VAT, post and packing in UK. Add a bit for postage if you live in Outer Mongolia. (Note: "Day of the Match" not available until late October 1983.)

Video Software Ltd, Stone Lane
Kinver, Stourbridge, West Midlands

Get more out of your Dragon 32

INFOMANAGER

Provides tape-based Dragon 32 users with a tool to develop practical applications. Combining a Data Manager with a Calculator and Barchart generator, and capable of exchanging data, INFOMANAGER has the following features:

- ★ User defined file format.
- ★ Add, update, delete, record.
- ★ Powerful display functions.
- ★ Sort on any field in ascending or descending sequence.
- ★ Formatted printed output suitable for reporting, printing, making labels, etc.
- ★ Transfer of data from the data file to the Calculator and to the Barchart generator.

and more . . .

Apart from the benefit of practical applications, INFO-MANAGER will prove to be informative and interesting, especially to those users unfamiliar with information processing as distinct from games and technical programs.

INFOMANAGER is supplied with full documentation.

Priced at £9.00, inclusive of postage.

INFOMANAGER is available from:

J-SOFT
9 Tiverton Avenue
Northampton NN2 8LY

Spectrum

Oh, BLOW IT!

ZX81

PROMER-81 for the ZX81 blows 2K or 4K Eproms types 2516/2716, 2532/2732. Software on tape. A & T £19.95

PROMER-81S. The very popular low cost programmer for the ZX81 has been adapted to the Spectrum with new software on tape..... £22.95

PROMER-SP will blow 2764/27128 on the Spectrum. Delivery January '84 or earlier. Orders taken now..... £29.95

ROM-81. An EPROM reader with two 24 pin sockets for '16/32 types for up to 8K in the 8K-16K area. User notes give a small transfer routine for loading Basic programs using USR..... £14.95

ROM-SP. Ingeniously allows up to 16K (2 2764) program to be instantly loaded and RUN on the Spectrum at power-up or on request. Reset button. Cabled, yes, cabled connector. ABS case. NOTE: Sinclair ROM is not disabled by this unit. It stays completely available. Delivery January '84. Orders accepted now..... £29.95

BLOPROM-81

A uniquely sophisticated EPROM PROGRAMMER as used by various labs including Sinclair Research. Resident 8K software. Eprom types 2716 to 27128. Hobbyist and Professional modes. ZX81 and 16K only required — NO EXTRAS. See printout.

by Colin Pryke

Murder at the Manor

Death comes to a quiet country village when the Lord of the Manor is savagely murdered.

The police are baffled with no obvious clues to help them.

Your skills as an ace investigator are required to identify and apprehend the murderer. This will involve searching for clues (which could be dangerous requiring ingenious deductions), examining the scene of the crime and asking questions of the right people.

What is the mystery of the Gravediggers Hut?

What secret does the safe hold?

What lurks at the bottom of the brook?

These may be some of the questions you will ask yourself during your investigation into the murder at the manor.

The game is based on a fixed map, comprising the Manor House, the Garden, the Town, the Graveyard and many other fully described locations, inhabited by a variety of individual characters whom you are likely to meet.

It is up to you to solve the murder, the locals may know the answer — but will they tell YOU!

This original adventure fills your 48K Spectrum with over 120 locations, all of which are depicted in full colour machine-coded graphics.

Add sound effects, a full score and save game facility plus a comprehensive and easy to use command analyser (incorporating abbreviations and multi-command lines) and you are sure of many exciting and frustrating hours.

WARNING — this is a 4D adventure where night brings added difficulties.

"Highly recommended." (Popular Computing Weekly, Vol 2 No 42).

Cassette and instruction Booklet

costs £6.95 inc.

GEMTIME, 16 Ben Ledi Road, Kirkcaldy, Fife.

NEW RELEASE
"PUB CRAWL"
100% Machine Code

PUB CRAWL

£6.95

A 100% machine code, all high resolution graphics game that reaches the parts other games cannot reach. Never mind if the wife has stopped your nights on the tiles, you can crawl around the town, trying to get a drink in each pub with your Dragon 32. But beware the more drinks and nights out you have the more the police will be after you. Watch out also for the traffic on the busy roads. A hamburger occasionally will help sober you, but not for long. A great game with on-screen scoring and high score, high speed action and sound. It's ready when you are Bob!

* LUNAR LANDER AND RESCUE

£6.95

A brilliant two-part game. Part one is an arcade standard lander which trains you for part two. Here you must rescue lunar engineers in a tortuous cavern. Fuel dump landings and falling stalactites add to the perils of your heroic mission in one of the best Dragon programs available.

"The best version we've seen for the Dragon 32" ... Dragon Dungeon

"A challenging and well-written game" ... Dragon User

"Very good" ... Dragon Data

FREE PARKING

£6.95

The first full-feature version of the extremely popular board game available for the Dragon. A complete simulation including buying, selling, mortgaging, etc. etc. The program make full use of the Dragon's colour facilities and incorporates some inspired graphics and sound effects. With options for 2-6 players, continually available instructions and the Dragon as banker, the game is terrific for all the family and there will be no missing £500s!

* SUBMARINE COMMANDER

£6.95

Navigate the seas to find the enemy with this high-resolution colour simulation. Engage enemy aircraft and ships who will try to torpedo and ram you. Depth charges and under-sea mines add to your problems. You are assisted by torpedoes, periscope view, radar compass, fuel and depth gauges with on-screen displays of ammunition and score. Realistic explosions and sound effects alongside identification sheet, home-coming display, hall of fame and graphic reward for beating the high-score makes this program a masterpiece. TRY IT!

COMPUTER

OPEN FORUM

Close The Box

on Dragon 32

This program is based on the old board game for two or more players. Each player throws dice and covers the numbers indicated by the dice. He continues until no further moves are possible. The board is cleared and play passes to the next player. Any numbers remaining uncovered at the end of a player's turn are counted against

him. More than 45 points and you have lost. This continues until only one player is left.

Program notes

80 Sets up a string of green for blanking out words etc.
90-170 Ascertain the number of players and their names.
240-310 Set up board numbers.
320 Prints the score.
400-420 Set up colour strings for the board.
430-510 Draw the board.
520 Holds the input prompt at the bottom left of

the screen.
540-800 Enter players choice and prevent inadvertent entering of wrong numbers.
840 Checks for a winner.
910-940 Roll die 1.
970-1020 Print die 1 numbers.
1030 Checks for board score of six or less and deletes right die if required.
1040-1080 Roll die 2.
1110-1160 Print die 2 numbers.
1200-1280 Instructions.
1290-1350 Keeps score and notifies losers and the winner.
The players overall score (in brackets) can be deleted by removing [:"(45 - B + S(I):") in line 320.

This game requires a colour television set
and the special 3D glasses provided with each game.

OPEN FORUM

Quasimodo

on Vic20

This program uses ugd, colour and sound. Move Quasimodo across the screen to ring the bell without being killed by the fireball. You have a time limit and points awarded by how far inside the limit you are.

Once you complete a screen you get a new sheet which is faster. The abbreviation "?" should be used in the print statements at the end of the program.

Variables

Y = Your position.
X = Fireballs position.
SC = Score.
HI = Hi score.
Tm = Time.

L.S = Lives left.
F = Extra life

Program notes

1-9 Sets up user defined graphics.
11-30 Set screen layout.
40-60 Move fireball and print score.
70-140 Move Quasimodo.
300-350 Cleared screen.
400-440 Dead.
500-580 End of game.
1000-1100 Title screen (my highest score is 12,390).

The best books for the Dragon 32

The Working Dragon 32

A library of practical sub-routines and programs. ISBN: 0 946408 01 7

- "There clearly is a need for books of this kind which provide more than just games" — *Practical Computing*, Sept 1983.
- It's a good one" — *Personal Computer News*, May 20 1983

The Dragon Trainer

Written as a combined manual and beginners course on the power of Dragon Basic. It is aimed at the beginner and assumes no previous experience of computing. ISBN: 0 946408 09 2

Dragon 32 Games Master

Learn how to write your own top level games. ISBN: 0 94068 03 3

- "If you can't write a half way decent game after this then it will be down to your own lack of imagination. I would recommend the Brains book as the best of this selection." *Which Micro* — Sept 83

Advanced Sounds & Graphics for the Dragon Computer

All the major aspects of the sound and graphics capabilities of this machine are covered in extensive detail. ISBN: 0 946408 06 8

Plus Sunshine Software

Cruising

Quick thinking and dexterity are required to master this high speed chase game.

Look out for the Sunshine range in W.H. Smith's, Boots, John Menzies, other leading retail chains and through our national network of bookshops and specialist stores.

Dealer enquiries:

Microsound 64

The **FABULOUS** new music keyboard system for the **COMMODORE 64**

NEW!

Designed for the Musician by Musicians
with the following **OUTSTANDING FEATURES**

- (1) Attractive 4-octave full-size music keyboard
- (2) Making full use of the COMMODORE 64's extensive sound capabilities
- (3) Designed with expansion in mind, ie Add-ons for DIGITAL SAMPLING, LIGHT PEN attachments for waveform synthesis, etc
- (4) Range of software from a Simple Synthesizer to Advanced Sequencing Systems
- (5) Save and Recall an almost unlimited number of sounds

Alien Attack

on Spectrum

The object of this game is to shoot the invader which is coming down to earth. As your score gets higher he gets faster — the higher up the screen he is when you shoot him the more points you get. If the

invader should manage to reach earth, all his friends will join him and the game is over.

Microradio

GW6JJN

Morse tutor

As promised, here are some reviews of amateur radio software on the market. The first tape is a morse code tutor written by two people with the name J E Price. Their call signs are G40IK and G40IL and the mail order address is 4 Housman Walk, Kidderminster, Worcs DY10 3XL: the price of the tape for the 16 or 48K Spectrum is £4.50.

The program by Messrs Price is a professional piece of software which is extremely suitable for learning morse code to the standard required by the examiner. The program opens with some nice user

defined graphics of morse keys hammering away. The program is menu driven and, by selecting the required speed and lesson, the computer patiently bleeps out morse code in groups of letters and/or figures.

You can return to the menu at any time to change the lesson and each time this happens there is a pleasing screen clear routine. A morse tutor is not a very sophisticated problem for a computer, so the routines that are added to this program give it a nice touch of professionalism that makes the tutor value for money.

The second tape received was from G4RWT Amateur Radio Software, 68 Forest Road, Paddock Wood, Tonbridge, Kent TN12 6JX. The price is £4.50 (cheques to R M Walton). This tape consists of a morse tutor for the 16K Spectrum, a morse tutor for the 48K Spectrum and a program called *Sattrack*, also for

the Spectrum. *Sattrack* is, of course, a satellite tracking program.

The first impression is that this tape is good value, two for the price of one, and this impression is confirmed by use. The morse tutor is also a good piece of software, professionally executed and perfectly adequate for learning the code. Again, graphics are used and there are instruction sheets that help in understanding the program.

The accompanying sheets also contain an interface diagram, which will help you to interface the Spectrum to the transceiver in order to send morse code from within the program. One of the menu selections is a morse keyboard, which enables you to send morse simply by pressing the relevant key on your micro.

The *Sattrack* program also has instructions about its use. This program will enable you

to track any amateur satellite, given its orbital data (available from AMSAT). Data is built into the program, but this may need updating from time to time. Since the going rate for a computer program on tape these days is about a fiver, then you must consider this good value. Both the tutor and the *Sattrack* program do what is required of them and both are user friendly in that the user is prompted for input and the instructions are clear.

If there are any other producers of radio software out there, then please let me know — there is far too little radio software about as it is for it to go unsung.

Ray Berry GW6 JJN

This series of articles is designed for radio and microcomputer enthusiasts alike. If you have any queries that you want answered, hints and tips to share, or topics that you would like to see covered, write to: Ray Berry, Microradio, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

ZX MICROFAIR

**More Sinclair Computer
games, goodies and presents
than in Santa's grotto.**

GREAT TWO DAY SHOW AT ALLY PALLY DECEMBER 3rd & 4th

There's more to see, more to play with, more to experiment with and more that's NEW for Sinclair Computers at the great **TWO DAY ZX MICROFAIR AT ALLY PALLY!**

Come along and see for yourself. It's the BIG SHOW for ZX enthusiasts, plenty of room, bars, refreshments...

in fact the ideal opportunity to pick up that last-minute Christmas present! So, whether you're looking for a Sinclair Computer, hardware, software, peripherals, books or anything that's new...

... there's everything from GAMES to GIZMOS at the BIG ZX MICROFAIR! More than there is in Santa's Grotto!

Tread The Path of Adventure with GILSOFT

FOR THE 48K SPECTRUM

MAGIC CASTLE £5.95

Try to rescue the princess from the castle, but beware of booby traps and vampires! A gripping adventure for the 48K Spectrum

THE QUILL
£14.95

THE QUILL is a major new utility written in machine code which allows even the novice programmer to produce high-speed machine code adventures of superior quality to many available at the moment without any knowledge of machine code whatsoever. Using a menu selection system you may create well over 200 locations, describe them and connect routes between them. You may then fill them with objects and problems of your choice. Having tested your adventure you may alter and experiment with any section with the greatest of ease. A part formed adventure may be saved to tape for later completion. When you have done so *THE QUILL* will allow you to produce a copy of your adventure which will run independently of the main *QUILL* editor, so that you may give copies away to your friends.

THE QUILL is provided with a detailed tutorial manual which covers every aspect of its use in writing adventures. For the 48K Spectrum

DIAMOND TRAIL £5.95

Recover the Sinclive diamond after a daring robbery. First you must overcome many problems in a city fraught with danger and intrigue. This is our latest adventure for the 48K Spectrum.

TIMELINE & TASKS £5.95

A superb 16K adventure in which you must locate your time machine to return to the present. Plus a collection of mind stimulating puzzles.

Our Software is now available from many computer shops nationwide, or direct from us by post or telephone.

SAE for full details of our range.

Dealer enquires welcome.

Tony Bridge's Adventure Corner

Dragon advice

Knight's Quest, from Phipps Associates (which I first looked at in issue 42), seems to be holding the attention of a lot of people at the moment. Playing this for the few moments that I could spare, when it first arrived, I thought — yes, a nice traditional adventure, which will pass a few hours. But recently, I have come to look upon it as very much more complex than I had originally thought. And so, it appears, do several of our regular readers.

Geoffrey Larsen, of Clifton, in Bristol, for example, reckons that *Knight's Quest* "becomes increasingly more addictive and difficult as you progress, and I preferred it to *The Hobbit*" — high praise indeed! Susan Schoen, of Cardiff, also enjoyed playing KQ, and sent me an account of her game, written entirely from memory, as her Spectrum had surrendered after giving sterling service for the duration! Thanks to both of you for a lot of very helpful advice, and thanks to Phipps, who have very kindly sent me some welcome hints to help me answer your queries.

A few weeks ago, I gave you the wrong advice to help you deal with the Dragon — at that time I said you would, eventually, need to kill the Dragon, so that you would be able to cross over the river in the ferry. Well, although the Dragon is too heavy to come in the ferry with you, and you will have to cross the river, don't kill the Dragon! I'm afraid that reviewer's short-sightedness overcame me, and I didn't realise that the adventurer would need the Dragon at a later stage (thus going against my own Golden Rule of Adventuring, *Everything has a purpose!*).

The Dragon will be extremely useful to you later in the Adventure, and in his cave, you may find something just as useful (although this will take a bit of lateral thinking, and is not an easy problem to crack). This is only the very start of the Adventure — you'll find a lot more to keep you happy. As Geoffrey Larsen says, "There are many more problems in this game than *The Hobbit*!"

Knight's Quest is an Adventure that will keep you happily frustrated for many a long hour, and is one that I can recommend without hesitation. Incidentally, Geoffrey, if you are still having problems in *Colossal Adventure*, from Level 9, all I can

say is that you are on the right track with the magic words — but you need to say them directly after climbing the beanstalk (remember the fairy story!). Have you found the Emerald yet? Once you have found the treasure that you are seeking, you must use another magic word to deposit the treasure in the building.

From one Dragon to another — I've already had an update, from Dungeon Software, of their latest large release of Adventure programs. The first of the programs is *Return of the Klarz*, the sequel to *Crystal Chalice*, which I mentioned a couple of weeks ago. Then comes *Dream Machine*, which is programmer Mike Meineck's "answer to *Pimania*!" and finally *Back Lot*, which is "an Adventure set after hours on the back lot of a Hollywood film studio".

Mike, feeling that he is not worked hard enough doing all this, is now adding Commodore 64 graphics to the whole range. I haven't actually seen any of these Adventures yet, but apparently many of you have invested in them and are already, says Peter Woods, the Dungeon-master, ringing in with pleas for help with dealing with the piranhas in the Black Lake, in *Crystal Chalice*.

His advice, which he would like me to pass on to anyone struggling with the problem, is to study how the Brazilian Indians deal with them when crossing rivers!

Sticking with the Dragon, and new releases, Salamander Software have just let loose *Lost in Space* on an unsuspecting world. The subject of this, the second in the Dan Diamond trilogy, concerns the sub-Mike Hammer private eye getting stuck on a derelict spaceship (from Sunset Strip to a trip into the Sun!). The ship is filled with chatty doors (believe me!) and bored robots. The object is to escape, and this you must do by finding your way to the bridge and taking control of the ship.

The display is the same as in Part One, *Franklin's Tomb*. Top left is a description of the current location, and anything that you may be able to see. On the right of the screen is an inventory list, which is visible throughout the game, while the bottom third of the screen contains all your command input and the computers responses. As well as the usual kind of objects found in this type of Adventure, you will also come across several coloured discs, for which you will find special uses (so I'm reliably informed!).

The program recognises a vocabulary of about 50 verbs and 80 nouns — but watch out for Red Herrings and Blue Kippers!

Following the example set by *Franklin's Tomb*, a manual is included in the package, graced by 13 pages of beautifully-drawn pictures of the locations (and these may contain vital clues).

The video-style cases that contain the Adventures seem to be getting bigger with each one — are Dan's cases also getting bigger? Anyway, *Fishy Business* is the third part of the trilogy, and I can't wait!

Gary Miller, of Peckham, in the course of a long letter containing a large gripe (write to the company concerned, Gary, and ask for a Hint sheet. I know that they produce one, and may, indeed, give help on a specific point if you ask), mentions the good old *Hobbit* problem, the Goblin's Dungeon!

This has been covered very well in previous corners, Gary, and I'm not going over it again, but if you are still stuck, and for the benefit of newcomers to *The Hobbit* (and if you are the proud owner of a BBC, Commodore, or Oric, then this program must be added to your collection — ask your favourite aunt to make it a Christmas pressy for you!), then turn to the Adventure Corner in PCW, 21-27 July, where some, if not all, should be revealed.

Gary reckons that *Sorcerer's Castle*, from Mikrogen is one of the ultimate Adventures. He is an old Dungeons and Dragon fan, and obviously enjoys all the good old-fashioned monster-bashing.

There are one or two more programs around that borrow from D&D, although a solo outing on a computer can only really be a rather pale imitation of the original. However, I like *Dungeon Master*, from Crystal Computing, and you should find that it gives you a good flavour of D&D, with Charisma, Wisdom, Intelligence, and all the other details such as Hit Points, lots of Magic Spells and plenty of potions all making an appearance.

Not only that, but *Dungeon Creator*, on the same tape, allows you to actually play *Dungeon Master* and map out and populate your own Dungeon in the privacy of your own home (see a more detailed look at the tape in Adventure Corner, PCW, 22-28 September). An excellent pair of programs which should whet the appetite of the jaded D&Der.

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further, write to: Tony Bridge, Adventure Corner, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

CONSTRUCTOR — FOR THE 48K ZX SPECTRUM AN EXTRA 77 USER GRAPHICS

Constructor is a user-friendly program that allows you to redefine your Spectrum's character set. With Constructor you can redefine any of 77 of the Spectrum's characters to be any symbol or shape, save the new code for the letter on to tape and use the code in your own programs. Constructor gives you an extra 77 user definable graphics.

ALSO FOR THE 48K SPECTRUM — CHARS 3

Chars 3 gives you three new character sets for your Spectrum — Space Age, Classical and Script. Just load the code, type in two simple commands and your Spectrum's character set is immediately converted to the new one.

Both these programs come complete with user guides, and cost £5.50 each from: Paul Phillips, 13 Mountain Road, Conway, Gwynedd.

COMPUTERS

TO ALL SPECTRUM AND ZX80/81 USERS

Put away all those untidy wires with this new unit designed by a Sinclair user. Holds your cassette player, up to 8 cassettes, printer power pack, your Sinclair and most add ons.

Made of wood, coloured black or mahogany — please state which at £23.50 including VAT and P&P.

Mail order only — please send cheque/PO to:

IN COMMAND

Michael J Lever of Lilliesfield Avenue, Barnwood, Gloucester, writes:

Q I own two 48K Spectrums, one is an Issue 1, and the other is an Issue 2. I have discovered an interesting, (and annoying) difference, between the two of them. It concerns the *In* command.

Normally the *In* command should return just one value, (255), if no key is pressed. I have used this feature in a number of games, written on my Issue 1 Spectrum. However I discovered that when I *Loaded* the games into my Issue 2, *In* returned a value of 191, and the games did not work properly.

Can you tell me how to remedy this bug, so that 255 is returned on my Issue 2 Spectrum?

A To be fair to Sinclair, the specifications never suggested that *In* would always return 255. The way to get 255 returned is to make sure that 255 is there. If you proceed the *In* with *Out* x, 255 where x is the keyboard value you are checking, then *In* will return a value equal to the *Out* value. Unless, of course, that value is changed by pressing a key.

TAPE TO DISC

David Cartwright of Bowshaw, Dronfield, Sheffield, writes:

Q At the school I attend we have a computer room with 11 computers, three of which are connected to disc drives. I use the computer room quite a lot and we have recently acquired several discs

for the disc drive machines.

However, I have found that the system for saving and loading machine code programs on tape does not work on the discs. Could you please tell me how to put machine code programs on to disc and how to calculate the address.

I know how to transfer from tape to tape but nobody at school knows how to do this on a disc. When I looked it up in the manuals under **Save* it just gave a lot of meaningless address letters, FFFF, 5555 etc. Even the teachers could not help. Please can you help as I urgently need an answer?

A A lot of people have been disappointed when, having bought discs, they find that they cannot easily transfer programs on tape to the disc. Most of the problems stem from the fact that the disc operate by using 2.5K of user RAM. Essentially what you'll have to do is relocate all the programs on tape so that they do not use any of the same space as the discs. The cassette page is at & E00 while the discs are at & 1900. Any program using the space in between will find it already occupied.

To explain in any detail how to move the programs would take an article that is beyond the scope of this page. If you try the following * OPT 1,2 then *CAT and then *Run* the program. At the end you will get the length, load address, and execute address in that order. This should be enough for you to relocate your program.

RAM PACK WOBBLE

Eileen Morris of Beechwood Drive, Woodford Green, Essex, writes:

Q Can you offer some advice to a young at heart pensioner who has just bought herself a ZX81? I bought one of those packs that have the extra 16K RAM in it, and I was doing fine until I put the extra RAM on to play chess. The screen displays the program but it waves all over the place. It's not the cassette recorder. Any advice?

A This letter firmly disproves the theory that

every computer owner is a male under the age of 20. I hope I can solve your problem. There are two likely causes. One is that your television just needs re-tuning slightly. All computers can wander off-channel sometimes, the ZX81 more than most. Adding the RAM pack might help to de-tune it. Because you actually get the program on the screen I think this is the most likely cause of your problems.

The other cause could be something to do with the timing, or the coding of the timing signal. The problem should be in the RAM pack as the computer works well enough without it fitted. Do you find that the pattern "beats" or does it seem random? The easiest thing to check here is that the RAM pack is firmly attached to the computer. RAM pack wobble is still a major cause of faults on the ZX81.

If re-tuning the television doesn't work and you're sure the RAM pack is fixed tightly, I'm afraid you'll just have to return the pack to the manufacturers.

FLAT ADAPTOR

David Jones of Haol Cefni, Ciermawr, Morriston, Swansea, writes:

Q Please can you help a down and out computer Junkie? Last week I trod the streets of Swansea looking for the six-pin flat adaptor for the Vic20 and the C2N cassette deck.

The answer I got from all the computer and audio shops was that my only hope was to contact Commodore direct, and that it would otherwise be impossible to obtain. I have now waited a week and a half but have had no reply from them. Do you know where I might write, phone, or pray to get one?

A What you need is a US standard edge connector.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem *Peek* it to Ian Beardsmore and every week he will *Poke* back as many answers as he can. The address is *Peek & Poke, PCW, 12-13 Little Newport Street, London WC2R 3LD.*

The American standard is 0.15, and you should be able to find one with the right number of connections. One place I know that does have them is Maplin Electronic Supplies, Unit A, Oats Road South, Hadleigh, Benfleet, Essex SS7 2BB.

PASS WORDS

Shane Gale of Alectus Way, Witham, Essex, writes:

Q I am writing to ask you if, when you are dialling into another computer, you have to guess the pass words? Or is there a manual available that lists them? I already have access to the code numbers of six or seven large computers, but the missing piece of the puzzle is the code words. Can you help?

A No, of course you don't have to guess the pass words, but the whole idea is that only the user knows them, and no one else. Why have a pass word to protect a system, if a list of them were readily available? I can understand the excitement, and sense of achievement, that must come from breaking into a computer system. However, what people do not seem to realise is that apart from being theft, it is also very dangerous, especially if, as has happened in the United States, people try to break nuclear and military computers. These people have now been caught by the FBI.

Remember that the government does not know that your intentions are innocent — if caught you could find yourself being treated more like a terrorist. Breaking generally, it's just likely to create problems in the long-run as companies spend more and more money preventing it. It could, for example, mean that the computer checks the source of each call — a kind of phone tapping. Would you want that?

UTILITIES

★ ★ TAPE COPIER ★ ★

The most advanced BACK-UP COPIER for ANY SPECTRUM available. MICRODRIVE COMPATIBLE. Does any other copier come near?

LOOK at only SOME of its options:

- ★ Maxcopy makes working copies of the full 16K or 48K!
 - ★ Verifies. Repeat copies. Automatic abort. STOPS programs.
 - ★ Loads CONTINUOUSLY (not just one part at a time like most copiers) even without pressing a key.
 - ★ Copies HEADERLESS and ALL programs that we are aware of!
 - ★ Very user friendly and simple to use.
- LISTEN. We are so convinced that you will be pleased with our product that we offer a **FULL MONEY BACK GUARANTEE** if you are not fully satisfied. Cost only £4.50.

NEW RELEASES

ELABORATE

GATEWAY TO THE SKIES

Gateway To The Skies is an elaborate text adventure for the BBC with 32K. It is so vast it will not fit into the machine and so has to be loaded in two parts.

The program has single key entry of all movement commands, but adopts the standard Verb/Noun format for all other instructions.

The basic point of the adventure is to search for hidden golden artefacts and take them to the palace of King Zalea. You can save the game at any stage and you'll probably need to — it sounds like a long one. A Spectrum version is also available.

Program *Gateway To The Skies*
Price £8.00 (Spectrum £6.95)

 Surrey GU15 1EW

CORRUPT

Richard Shepherd Software has been one of the most successful games houses specialising in adventures for the Spectrum.

The company has now released its first program for the Commodore 64. The game *Ship of the Line* is an adaptation of the program of the same name on the Spectrum.

You assume the role of an unashamedly corrupt, sea captain in charge of a Royal Navy warship, in the 17th century. You must fight ferocious sea battles to win treasure with

which to bribe your way to the top.

Succeeding in the game is a matter of careful planning and luck, will you have enough rations to feed your mutinous crew? Will your ammunition run out?

Program *Ship of the Line*
Price £6.50

MAGIC

Compilers are wonderful things. The biggest problem with Basic is that it is simply too slow to produce the kind of exciting games that you want to play repeatedly.

Machine code on the other hand is fiendishly difficult (well I think so anyway). A compiler though, magically turns a Basic program into machine code while you sit back and watch.

The first compiler I've seen for the BBC B has just been issued by Park Software. If it all sounds a bit too good to be true, well, as with all compilers, there are limitations.

The maximum program length is 8K and only 300 program lines are allowed. Similarly, you are limited to 26 variables and 30 procedures. Nevertheless, with care, most things are possible and you could find the compiler very useful.

Program *Compiler*
Price £14.95
Micro BBC B (1.2 OS, A with 32K)

 26 Romilly Park Road
 Barry
 South Glamorgan
 CF6 8RQ

3D SCRAMBLE

Zaxxon is the first version I've seen on the Spectrum of the impressive *Zaxxon* arcade game.

Although plot-wise the format is similar to *Scramble* — break through the enemies defences to reach and destroy some ultimate objective — the

game achieved its reputation because of the 3D presentation of the attack.

Your aircraft, complete with shadow, is seen from above and to the side. The enemy defences are seen from a similar perspective. The way the screen scrolls diagonally, adds to the sense of pace and drama in the game.

Program *Zaxxon*

FUZZY

Let me be honest. I have always thought that *Dragon* software was appalling — everything I saw was overpriced and dull, and incidentally, usually written in Basic.

However, things are looking up. After the excellent *Ugh* by Softek, we have *Pub Crawl* by B&H Software and it's another superb *Dragon* game.

The screen displays a layout of various pubs and a hamburger joint. You leave home trying to visit as many pubs as you can, downing a swift pint in each. Naturally after a while things start to get a little fuzzy and with all that traffic about you'd best grab a burger to line your stomach.

Later stages of the game bring on police cars that dash about like something from the *Sweeney* — can you drink all the pints and make it back home?

The game is entirely in machine code and it shows;

the action is very fast and the sound effects are amusing.

Program *Pub Crawl*

MS RIGHT?

Lonely? Spent too much time sitting alone in front of your tv? Looking for Miss Right (or Mr Right) — now there's no need to switch off the tv and rush madly into dozens of meaningless relationships, use your computer to plan ahead.

Matchmaker is the program you need, roughly equivalent to the systems used by professional companies, it will store 100 people's replies to a series of 25 questions and, according to their answers, match them.

Using the computer's rating system you will be able to find the person who most likes what you like, etc. But what will you have to talk about?

SKILLS

Games Graphics and Sounds is a book intended to be both a general guide to what kinds of game are available and specific information on how some of the effects are programmed.

Along with the types of game, the skills required for each are discussed and there are various colour illustrations.

Also included is a guide to what to buy for games playing and a number of programs to type in. Given the colour illustrations it looks reasonable value at £4.95.

Book *Games Graphics and Sounds*

Micro General
Supplier Francis Lincoln
 Apollo Works
 5 Charlton King's Road
 London NW5 2SB

DANGEROUS

Terminal Software whose *Pinball* achieved wonders in 3K on the Vic has entered the competitive world of Spectrum programs.

Both of its new releases are graphics adventures — *Vampire Village* and *Space Island*.

Space Island gives you an android to control — the only equipment you have been able to get down to the planet Zyro from your spaceship orbiting the planet. You must use your android to locate the origin of a dangerous time distortion on the planet.

Movement and instructions to the android are all by single key presses although there are many more options than usual. The only graphics I managed to see of the game before my android drowned was the map of the planet and this was well done. The packaging, too, is very robust and appealing. Recommended.

Program *Space Island*
Price £6.95
Micro Spectrum 48K
Supplier Terminal Software
28 Church Lane
Prestwich
Manchester M2 7LW

LADDERS

More praise for Dragon software. This time for *Castle Attack*, a multi-screen arcade game with many features.

The first section is a bit like *Apple Panic* although very well done — you must run up a number of ladders on the walls of a castle to reach three keys, but you must get them in the right order.

The problem is, various bar-

rels and arrows are hurtling across the screen — you can avoid them but your time is limited. That, though, is only part one.

In the second section you play a variant of *Mastermind* with the life of a beautiful princess as the stake. The knife suspended above her draws nearer as you fumble at the logic of a four shape code. As ever, everything gets more and more difficult as you go along. Fine stuff.

Program *Castle Attack*

SUPERB

Phoenix Software whose double package *Death Mines of Sirius I* thought very good value for money have now released their first Vic game in the double cassette arcade/adventure series.

I can say that the action part of this package called *Four Gates To Freedom* is superb. It's a sophisticated version of *Breakout* where you fire at the walls with lasers. I've seen nothing faster, noisier or more addictive outside of some of the Llamasoft games.

Mastering the action game (a seemingly impossible task) will give you the start up code to the adventure.

The task then is to release the crew of a star cruiser who are held in suspended animation somewhere in the mysterious catacombs of Xzinos. It has all the standard adventure

features and the package is highly recommended.

Program *Four Gates To Freedom*
Price £9.95

OPPRESSED

Red Shift has made the world of war-game orientated computer programs its own.

The latest addition to the range is *Nebula* for the 48K Spectrum. It has the classic scenario of expansionist emperors forcing oppressed peoples to battle it out for territory and glory.

I must admit that in the past I have expressed doubt with the manuals that accompany these sort of epic games — mainly because I can't understand them. On this occasion though, I can happily report that the manual is (a) quite short and (b) fairly easy to understand, so it may be that *Nebula* could be an introduction to the subject.

Program *Nebula*
Price £9.95
Micro Spectrum 48K
Supplier Red Shift
12c Manor Road
London N16 5SA

MYSTERY

The one place where the Spectrum (16K) has no advantage over the ZX81 16K is in running text adventures. In fact, the ZX81 has more available memory.

So it's good to see that adventures are still being issued for the machine — the most recent is *Don't Look Now*.

You explore a series of caves meeting peculiar strangers who will probably want to kill you and finding objects whose function is quite likely to remain a mystery.

There is no ultimate end to the game and you must simply use your ingenuity to get as far as you can.

WELCOME

commodore 64
mastercode assembler

The Commodore 64 is a very powerful machine, but important utilities like machine code programming tools are still relatively scarce.

At the moment there isn't much choice for the 64 owner wanting to venture into assembly language; assembler and disassembler programs are few and far between.

For this reason the *Commodore 64 Mastercode Assembler* should be welcome news, combining as it does a machine code monitor, disassembler, file editor and assembler in one package.

There's no point in trying to list all the features in a short piece like this, but I can say that the manual is clearly written and the program is very user friendly. I'd better add that it's by Sunshine (which is us) and was written by book authors David Lawrence and Mark England.

Program *Commodore 64 Mastercode Assembler*
Price £14.95
Micro Commodore 64
Supplier Sunshine Books

Book Ends

POOR ORIC

A nice, undemanding idea, to fill a small gap in a computer owner's stocking, this Christmas is *Computing: A Bug's Eye View* by Shiva.

It's a neat little book containing nothing but cartoons on a computing theme, all featuring the bizarre bugs and insects created by Cosgrove.

Most of the jokes are of the groan, groan kind — Hamlet bug looking over an Oric with a sword through it says (you can see it coming, can't you) "Alas, poor Oric". Probably not good for much more than a couple of hours read, but at £2.95 perhaps that doesn't really matter.

VIOLENCE

Games of death, destruction and other wanton violence abound in *Tim Hartnell's Giant Book of Spectrum Games*.

Programs with names like *Suicide* and *Nuclear Fallout* suggest this might not be the book to ask your aged granny to buy for you as a Christmas present.

Having said that though, I should add that most of the games look like they might actually be worth your while typing them in.

The book is published by Fontana which means it should be very widely available and at £3.95 it looks good value.

Ziggurat

Advertising Standards

When we just cannot get our arcade scores any higher, or figure out how to get past that fierce lavatory seat with one hand tied behind our back, the cares of the world on our shoulders, and that Pesky Pie-Person giving us clues all the time, computer-exhaustion finally takes hold.

We desperately want to relax, so we pull out the computer lead, push the aerial back in and think of a number between one and four. This helps to sooth our tattered nerves, until the commercial "break" arrives and a large grey elephant or a superannuated Scouse cynic appears to insult our intelligence. In desperation we grab the *Radio* and *TV Times* to look for an alternative, but once again those corny adverts leer out at us from the pages. We turn off in disgust and pick up a newspaper, but there's no getting away from it as everyone from the biggest hypermarket to the local greengrocer seems to be claiming that "you can't buy it cheaper elsewhere".

We are not sure of other people's reactions, but the current state of computer promotion certainly has us oscillating between hysterical laughter and sheer horror. We know that, to the entrepreneur, computers are "for selling, not for buying" and that all advertisers are given to hyperbole, but surely there must be a limit somewhere! If you regularly read *PCW* (and even *Ziggurat*!) you probably already have a micro of some sort (or at least have tinkered with your friend's) so you presumably have

some idea about what the important features are in a home micro.

On the other hand, it seems that computer promotion has sunk to the depths of the car industry, where the whole point seems to be to extoll the importance of trivialities and to avoid the really important issues at all costs. So, who are they fooling?

Regrettably, the answer is usually the first time buyer who thinks Ram is a male goat and that Rom wasn't built in a day.

As Christmas approaches, and the stampede intensifies, all reason seems to vanish as Mum and Dad know that little Johnny (or Jenny) will be inconsolable if Santa doesn't deliver the goods. So, how do they choose and where do they go?

The answer usually lies in the relative importance of the bank-balance, "keeping up with the Joneses", and what name has been subliminally impressed on their mind.

Although every Tom, Dick and Harry now sells computers and every store seems to contain a "computer shop", it is regrettably true, that the demand for qualified salespersons far outstrips the supply (one of the funniest sights this week was the pathetic "computer sales manager" of a local department store trying to pretend to a "real" dealer that he was a potential purchaser so that he could glean some information on the products to pass on).

Of course, Darwin might argue that natural selection will ensure the survival of the fittest; but the harsh world of reality seems to select more on the basis of brute force than technical excellence. What seems to count most in this market place is how much you can afford to spend on promotion, rather than how good your product is (or even more important, how good the back-up will be).

The last few months have seen the death-throes of a number of companies, yet more have retired in haste to lick their wounds, and the writing is on the wall for several more. After Christmas we are certain that there will be a lot of wailing and gnashing of teeth as many of the big stores wrap up their chips, get out the holiday brochures, and relegate computers to the store cupboard, leaving too many customers to find out for themselves that they have bought a pig in a poke.

Keith and Steven Brain

Puzzle

Egyptian code

Puzzle No 83

This interesting fragment of an ancient Egyptian clay tablet was recently unearthed by that eminent archaeological duo — Drs Diggett and Trowell. It is thought that it represents a multiplication sum but, unless it is shown that it is possible to satisfactorily substitute digits for the symbols shown, this theory cannot be proved. There is evidence that the sum is in decimal notation and the bird symbol was used to represent the digit '3'.

Can you make the archaeological breakthrough and confirm the theory?

Solution to Puzzle No 78

The program uses three variables, *N*, the number of the highest double of successively larger domino series, *P*, the number of pieces in the set and, *T*, the total number of spots.

Subsequent orders of sets, are calculated in the *ForiNext* loop (Lines 40 to 70), and the program stops when the total number of spots exceeds 1983, the present date.

```
10 LET N = 0 0 LET P = 0 30 LET T = 0 40 FOR A =
N TO 0 STEP - 1 50 LET T = T + A + N 60 LET P =
P + 1 70 NEXT A 80 PRINT N; " " P; " " T 90 IF T >
1983 THEN STOP 100 LET N = N + 1 110 GOTO 40
```

The program gives the solution of a set with 120 pieces — up to a double-fourteen, giving a total of 1680 spots, the year required by the puzzle. The previous set, up to a double-thirteen, can be ruled out because of the number of spots. This gives the year as 1395 and it seems too close to the date of the set itself, manufactured by "distant" ancestors in the 14th century.

Winner of Puzzle No 78

The winner is: E Oakley, South Road, Northfield, Birmingham, who receives £10.

WE CELEBRATE our cartoon strip's successful tour of the Orient by releasing the gang's new program "YAKZEE" the authoratitive user-friendly computer version of the lateral-thinking dice game. It runs on the Spectrum 48K or the Dagon 32 (keep the Chinese verbals for the comic strip, OR ELSE!) and is part of our mission to spread joy and happiness across the planet with non-violent and genuine entertainment. Pray it ... whoops! Play it.....!

CALLING ALL "PIMANIACS" who can't get enough of a good thing: "THE PIMAN'S CHRISTMAS STOCKING" is out now!!! and it only costs a Fiver!! It includes "THE PIMAN'S GREAT EST HITS" stereo L.P. cassette with vocals by our very own Lady Clair Sinclive, The PiMan Gerry and the Atrics, and even Lurch the Office Parrot ... at least we think he's a parrot?! sings a song or two. Featuring "Leader of the Pac", "Video Nasty", "Bit of a Cult!", "Computer Alphabet", "Groucho Extended", "Crummy Song" "Pompey Rock", "Angel" "PiBalled Blues", "Country Musac", "Donkey Hotay" "Pimania ... the very long one

-PLUS-

THE PIMAN'S OWN C20 COMPUTER CASSETTE, a top quality blank tape, for saving your own programs, or your PIMANIA progress. (And if you pirate anything we'll send Lurch along to sort you out!)

-PLUS-

"THE PIMAN'S 1984 KARTOON KALENDAR" the official version, A4 size, hanging book format, featuring the insane world of the PiMan and his pals, as created by our resident krummy kartoonist, the amazingly underpaid Mr. Evans....
