First CD Roms out this autumn

MICRO USERS could soon be accessing databases the size of the *Encyclopedia Britannica* - from one 12 centimetre laser-read compact disc.

Atari hopes to be the first to launch a CD Rom player - its device, based on a Philips drive unit and shown at June's CES, will be launched in December or January at around \$600 (£450).

Both Sony in the UK and Philips have prototype compact disc Rom players, and a number of other electronics companies, including Amstrad, are looking at simi-

lar devices.

The Philips CD Rom player is a new version of its audio CD player, leaving out digital to analogue conversion.

A spokesman further confirmed that Philips will also be introducing a controller, connecting the CD Rom player to a personal computer this year.

"Maybe not for every personal computer, but we will be offering the drive to the hardware companies to incorporate into their units."

Amstrad has already been in discussions with Philips

about its CD Rom drive, according to one source at Philips. William Poel of Amstrad confirmed that he had seen the Atari drive at CES, and was "very interested".

In North America, drive units have been available to OEMs (original equipment manufacturers) since early this year, according to a newsletter from 3M, the disc and tape company, which was involved in the development of the system with North American Philips.

Nigel Murphy, 3M UK's

picture courtesy of Bicycle magazine

ACTIVISION'S latest program is a topical one - a Tour de France cycle race simulation.

Tour de France, the game, takes the player on a 2,500 mile circuit through France following the 22 stages of the real life cycling marathon - probably the world's best known cycling event.

This year's race began on June 29 with the cyclists racing one stage each day until July 21. British hopes are pinned on Robert Millar, who last week was maintaining his place in the top quarter of the 180 riders.

Activision's computer game title, unusual in that it has been developed in the UK, costs £9.95 and is available on Commodore and Spectrum.

MSX prices slashed by Dixons

MSX MICRO costs look set to plunge as Dixon's, the high street chain store, announced it has cut prices by more than half.

The Toshiba HX-10 model is now selling at £99 and the Sony Hit Bit is priced at £149.99. This compares with suggested retail prices of £239 for the HX-10 and £299 on the Hit Bit.

"We don't have any control over retailers' prices, so

Pastfinder. For serious arcade players.

WHAT THE CRITICS SAY

"Very original game that mixes arcade action with exploration and adventure... from the company that gave you Ghostbusters."

EAGLE & TIGER

"An action packed science fiction shoot-'em-up which raises the standards of 64 graphics yet again."

PERSONAL COMPUTER NEWS

"A very worthy addition to the growing Activision range."

ZZAP 64

"There is plenty in this game to keep the hardened player going for hours."

ZZAP 64

"Strange semi-abstract, beautifully animated, this game should keep all arcade enthusiasts enthralled for weeks."

BRISTOL EVENING POST

It is 8878 AD. Exploration has become a thing of the past.

Everything there is to know about our universe is known.

So it is natural to look backwards.

An elite group of interstellar explorers have been given the critical task of journeying back through time to unearth the mysteries and adventures of the past.

The Pastfinders.

To join their ranks, one must possess a

rare combination of qualities.

The stamina to search carefully through hundreds of uncharted lands. The ability to dissect complex maps.

The perception to select only the proper tools for survival. And the unending desire to live dangerously. Pastfinder stretches all your game-playing skills to a new level.

It is truly three-dimensional.

It insists that you use your brain at least as much as your co-ordination of hand and eye.

AVAILABLE ON COMMODORE C64 CASSETTE AND DISK.

EDITORIAL

The row Amstrad has got itself into over its twin cassette unit capable of tape-to-tape copying – described last week by one Amsoft employee as a 'fiasco' – at least serves to highlight the extent of the home taping problem.

Anyone can copy material recorded on an ordinary compact cassette. You don't need a twin player unit – that just makes it more convenient. And the result if you pass it to a friend is technically a crime. Not a very big one some would say – like dropping your sweet wrapper on the pavement.

Ever since the introduction of the compact cassette the home piracy problem has been treated by the software and music industries as insurmountable. The crime is widespread, untraceable and, worst of all as far as they are concerned, it is socially 'acceptable'. They have had to learn to live with it.

Now, a solution to their dilemma has emerged: the compact disc. These laser player discs are 'read only' devices: they cannot be

rerecorded and, best of all for the record industry, they offer a quantum leap in terms of quality of reproduction. Consequently, demand is high, and people are prepared to trade off ease of duplication for quality.

Now, compact disc players look set to make a significant impact in the micro world. Micros being technology personified, though, the compact disc player has miraculously been transformed into the CD Rom player. A metamorphosis largely comprising a new case.

They can store staggering volumes of data and access times are very short. The market for micro compact discs is forecast to reach \$1bn by 1990 and why not? They *do* represent a quantum leap in terms of data storage capacity – bytes per buck if you like.

Yet the reason why every micro manufacturer – all the MSX companies, Philips, Atari, Amstrad – will push CD Roms so hard is because, being non-magnetic media, they are secure.

Which equates to money in their banks and just rewards for software authors.

Computer Trade Association Magazine of the Year

Acorn projects stalled

ACORN'S failure to resolve its deepening financial crisis has begun to affect progress on a number of new development projects and last week resulted in the postponement of the launch of a new range of business micros.

Cautious moves were made last week in talks to try to resolve the company's problems between Acorn, its creditors and Olivetti, the Italian company which spent £10.4 million in an earlier rescue bid in February.

A plan has been proposed under which Olivetti would inject more cash as part of a second rescue package worth up to £20 million.

Olivetti has however issued a statement claiming that no such package has yet been officially agreed. First, Close Brothers, Acorn's merchant bank has to submit detailed plans for further restructuring.

The strain of the uncertainty at Acorn is beginning to show. Work on the Alvey-funded speech recognition program has already been dropped and research - again in speech - backed by Esprit and proposed by Olivetti has not yet begun.

Two weeks ago, Acorn was due to launch a series of powerful work stations based on National Semiconductor's

16032 32-bit chip and priced between £3,500 and £8,000. The launch has been delayed, apparently, because it was feared that attention would focus at the launch on Acorn's current financial problems and not on the new machines. However, the machines have not been made available, with or without a formal launch.

Its ABC range too, announced a year ago and previewed at the *Personal Com-*

puter World Show last September, has yet to appear. After the first Olivetti rescue, the well-received IBM-compatible machines based on the Intel 80286 chip were dropped altogether, and Acorn announced that the other micros in the series would become available as OEM products only.

However, since then, no ABCs have appeared in any form.

CD Rom players

◀ continued from page 1

Product Manager, Diskettes, believes that CD data storage is "the technology that will substitute for all forms of recording media in 10 to 15 years time." 3M's corporate view suggests that optical memory systems will take off within "the next few years, with yearly 'consumption' of optical discs expected to reach half a billion by 1990."

"CD Rom falls under the optical memory heading, all being researched in the States at the moment," said Nigel Murphy.

3M in the US is offering its major customers two types of CD memory storage system - either Rom or 'Write Once'. The latter are "user recordable, non-erasable discs".

3M earlier this year purchased from Philips a system for mastering CD Rom discs, and has joined with Philips in an attempt to impose their system as an industry standard.

Meanwhile, Sony has shown a CD Rom drive at the Micro Computer Show '85, in Tokyo and a version of that drive has recently been undergoing evaluation trials at Sony UK's offices in Staines, Middlesex.

John Whitehead, in charge of the Sony UK team looking at the CD Rom player, said "We have a sample disc drive, linked to an IBM PC AT, with a

Sinclair seeks independent returns test

SINCLAIR Research has agreed to an independent survey on the level of returns for its products being carried out, in the hope that past allegations of the unreliability of Sinclair machines will be shown to be unfounded.

The scheme has been drawn up jointly by Sinclair and trade newspaper *Computer Trade Weekly*.

"The idea is that the box for each Sinclair product, starting with the Spectrum Plus, but expanding later to the QL and pocket TV, will contain a card. If the machine is faulty, the customer should fill in details on the card and send it

couple of data discs and we are looking at it to work out interfacing problems."

"The pressing program used for manufacturing CD Rom discs is the same as for CD audio discs," he added. "You do need some additional coding information on the disc, but that presents no problem as there is of the order of 540 megabytes of storage capacity on a disc."

"We could be looking at it to sell to other computer manufacturers so they could build it into their machines, or as an own brand product," he said.

"You can put whatever you

Beeping Rom solves lost key problems

THE KEY TRACER is a new device to help you find your keys if you lose them.

It is a special keyfob which attaches to a key ring containing a bubble memory Rom, powered by two hearing-

aid type batteries, pre-programmed to respond to the noise of handclapping.

The Tracer will respond to the sound of three handclaps by 'beeping'. The device has a range of around 12 feet,

to *Computer Trade Weekly*," explained the newspaper's editor Greg Ingham. The paper would then be able to monitor the level and seriousness of the complaints.

"Commodore has also agreed to the idea in principle and we are hoping to interest other companies such as Amstrad and Enterprise to make it a fully representative survey," Greg continued.

"Sinclair is looking for a truly independent source to carry out and interpret research. The card idea, while in early stages, is an option," said a Sinclair spokesman.

sufficient to react in an ordinary room.

The Key Tracer is available now, price £6.95, from Dudley Langmead Enterprises, 16 Bedford Street, Hitchin, Herts (0462 35928).

Maplin announces fallen hero

MAPLIN Electronic Supplies has announced price cuts for its leading robotic products, Hero Jr and Zero 2.

Hero Jr now costs £549.95 in kit-form and £749.95 fully assembled. Zero 2, available in kit form only, is £79.95.

Maplin is currently developing interfaces for Hero Jr for the Spectrum, Commodore 64 and BBC. It is also planning a software aerobics program for Hero Jr called *Herobics*.

want to on the discs - it could be computer data, graphics data, digitised TV pictures or audio."

"We are working on 'Write Once' devices, and also Read/Write using either magneto optical or amorphous metals," he added.

According to 3M, most of the world's largest electronics companies are now working on optical memory systems, including Canon, Hitachi, NEC, Optical Peripherals Laboratory, Panasonic, Philips, RCA, Sanyo, Sharp, Sony, Storage Technology and Toshiba.

Atari's range to include 260XE?

ATARI is now strongly rumoured to be considering a 256K Ram capacity addition to its 8-bit XE range of micros, following the announcement of its new 256K 16-bit 260ST and 260STD models (see *Popular Computing Weekly*, July 4).

The 260XE, like the 260STD is expected to include a built-in disc drive. The micro is aimed at the top end of the games market, and will sell for just under \$200 (around £155).

Atari UK's technical manag-

er Les Player declined to comment on plans for a 260XE machine. "It's certainly technically possible, and that price would be Tramiel-y possible," he said. "But we are not prepared to comment on products that may not be out until some months ahead." A spokesman for Atari US, however, hinted at an autumn announcement.

Currently the range consists of the 128K 130XE, available here, in Europe, and in North America, and the 64K 65XE, sold in Canada.

selling the machines at a loss."

Steve Dowdle, product manager at Sony, said, "We're not the retailer, and we cannot tell Dixon's what to do."

Dixon's, apart from confirming the discounts, declined to comment further on the offer.

Honeywell's fastest chip in the west

HONEYWELL, the American business computer giant, claims to have achieved a breakthrough in semi-conductor technology.

At its physical sciences centre in Minnesota, researchers reckon they have developed the fastest transistor yet. Using gallium arsenide rather than silicon as a semi-conductor, electrical signals travel across the device in just over 11 trillionths of a second. The signal moved nearly twice as fast when the device was cooled to the temperature of liquid nitrogen.

Gallium arsenide is tipped to take over from silicon as the material used in chips. It is faster and more resistant to radiation, which makes it much more suitable for some work.

Seymour Cray, the company which makes the world's most powerful computer, the Cray 2, is developing gallium arsenide chip for use in the Cray 3, and Honeywell itself is working on a prototype production line to manufacture gallium arsenide chips, funded by a grant from the US department of defense.

MSX prices slashed

◀continued from page 1

there's not a great deal we can do, although obviously we don't like it," said Chris Greet, Toshiba UK's home computer product manager. "We don't really understand their action as they will be

C is for Commodore

DYNAMITE SOFTWARE has introduced a full C language compiler for the Commodore 64.

Called *C Power*, the compiler follows closely the C language as defined in

Kernighan and Ritchie's definitive book *The C Programming Language*.

The package is available on disc, and comes with a hefty 531-page manual.

C Power costs £122.45, including postage and packing. Details from Dynamite Software, BCM 8713, London WC1N 3XX.

Mass produced

May I remind the population that a dongle is not a device for plugging into the back of a computer to hold part of the operating system – see *Hackers*, June 27 – but a device to discourage copying, without which certain programs refuse to run.

Its main advantage is that it is difficult to produce in one-off quantities, yet fairly simple for mass production to cope with. Thus the dongle acts as a successful deterrent to would-be home copiers.

Peter Bevin
62 St Denis Road
Selly Oak
Birmingham

Strictly speaking this is so, but with the QL, for example, 'dongle' came to mean – no doubt by way of humour – a device without which the whole micro fails to run.

Correct facts

In your review of *Elite* for the CBM 64 in the 20-28 June issue, the reviewer, Martin Croft, devoted one third of the review to state that the docking computer is far superior to that on the BBC version. If Mr Croft had taken the time to play the disc version of *Elite* for the BBC, which has more ships, he would have noticed that it too has a docking computer that automatically guides your ship in while you watch. Admittedly, no music plays while you dock.

Mr Croft also states that a new command is available to turn off the lines indicating polar ice caps. This command is superfluous to the experi-

enced BBC player as he just switches to the rear or side screens where no sun or planet is being displayed. The reviewer also says that *Elite* on the 64 loads in the amazing time of 30 seconds. Wow! CBM 64 users will therefore be astounded to learn that the BBC version loads in under 10 seconds. Other games on the BBC load in an equally "speedy" time WITHOUT fast loaders for disc.

There are only a few good games on the BBC at the moment; *Elite*, *Castle Quest*, *Knightlore*, *Atic Atac* and *Alien 8* (other software houses may disagree). So Mr Croft, kindly resist the temptation to have a dig and a sneer at a computer which is not thought of very highly in the computer games world, mainly because of its small memory, until you have got your facts correct.

Russell Jefford
143 West Close
Medmenham
Marlow
Bucks

At no point in the review does the reviewer state that the Commodore version of *Elite* is better than the BBC original.

You appear to feel that the review was an attack on the BBC – it certainly wasn't intended as such.

Rather, it was an attempt to tell Commodore owners about a new game for their computers.

The fact that Commodore 64 *Elite* on disc loads in 30 seconds is included because most Commodore discs take a very long time – not as any comparison with the BBC.

Older and wiser

I am sick to death of reading that the computer boom is over, and the industry is dying.

The computer industry is growing up, that's all. There are still thousands of home computer owners who are just as dedicated as they ever were, but now they too have grown with the industry and are far wiser, and refuse to buy rubbish.

The present problems, during this transition, result from the beginning, when anyone could set up in business and sell software, to the fast approaching time when only the best will be good enough.

During this transition, the home user is simply being cautious, but we are equally aware that brilliant products are now appearing.

Brian Waltham
69 Livingstone Road
Birmingham

A biased view?

As one of the companies mentioned by Mr Sleight in his letter about alignment kits, you may think we have a biased view about the need for such lists. However, Tony Kendle's review showed the need for such a system. We have run extensive electronic tests on our product and have discovered that when cassette decks are properly set up with our system, their output is about as good as it is possible to obtain.

Interestingly, when we ran a number of blind tests using a technique similar to the one described by Mr Sleight, great variations in signal output were evident. Where a computer is even relatively sensitive about its cassette operation, such a test can lead to real problems in loading further programs. A read data routine is really the safest method, because the results can be easily quantified.

Mike Daniels
Managing Director
Global Software
PO Box 67
London SW11

While it is possible to carry out tape head alignment yourself quite easily, an

"Now your key tracer's located them, should I phone the AA?"

alignment software test program certainly makes the job easier.

Summer Freeze

Angus Ross writes in *Peek and Poke* of his problems with his QL 'freezing'.

I too had this problem with a version AH machine and wrote to Sinclair. They advised me that there was probably a fault and I duly returned said machine for repair – three times! Eventually I took the machine back to John Lewis where I had bought it and they took the matter up with Sinclair. My QL 'froze' annoyingly often in all applications and while using various different software. Sinclair apparently told John Lewis that this was impossible since the machine had been repaired. Fortunately I could prove to the manager that the 'freezing' did take place and without argument they replaced the machine for a new JM version. Needless to say I have had no more problems to date.

Apparently 'freezing' was a problem with early machines so my advice to Angus Ross is – brook no argument, get a replacement.

The QL is a great machine and there is nothing to compete at the price. It is just a pity that the promised software doesn't seem to be materialising in any quantity and even titles apparently 'out' are almost impossible to locate – even in central London.

Reviews

Knightmare

Program *The Chess Game* **Price** £7.95 **Micro** Commodore 64 **Supplier** Micro Classic, Priory Road, Forest Row, Sussex RH18 5JD.

All is quiet and peaceful. It is late at night and you are slowly dozing off to sleep. Only a faint murmur penetrates your world of tranquility. But what is happening? A huge chessboard is slowly forming.

The Chess Game is no ordinary Chess simulation. Instead, it simulates one of your worst nightmares. You are the pawn on a gigantic chessboard, and all the other pieces are after you.

The title screen for the *Chess Game* is pretty impressive. It shows a small girl lying in bed asleep, with a chessboard on her bedside table. When the game starts, the screen is transformed into a sort of gladiatorial arena, with the chessboard situated in the middle. The crowds shout and wave, waiting for the contest to commence. One criticism I must make is of the appalling instructions. Anyone not familiar with the basic rules of proper chess would be rather bewildered.

After working out how to play, however, you find that the actual game makes up for the bad instructions.

Tom Hussey

High power

Program *Devpac 80* **Price** £39.99 **Micro** Amstrad PC + disc/Tatung Einstein **Supplier** HiSoft, 180 High Street North, Dunstable, LU6 1AT.

There are plenty of reasons to regard HiSoft's *Devpac* assembler package with respect – it is perhaps the most sophisticated and powerful of the various such utilities available for the Amstrad range.

Devpac 80 is the CP/M version of this program and as such there are several important differences.

For a start, although you can use an ordinary assembler to produce CP/M compatible code, and vice versa, there are some disadvantages in doing so. If nothing

else it is far better if you can test the code simply from within the operating system to which it applies.

Perhaps more important, however, is that the CP/M version of *Devpac* has been written to fully exploit the strengths of the medium. Disc handling from the assembler in particular is absolutely superb.

There are three modules to the package – *Ed80* is a full screen editor which has excellent block *Cut* and *Paste* commands, auto indentation, good *Search*, *Replace* and *Insert* modes but, as is so common with such things, relatively poor printer control. The control sequence for cursor movement, deletion etc have all been defined as compatible with the equivalent *Wordstar* sequences – a remarkably sensible move for a CP/M editor, although

Wording

Program *Superscript* **Price** £69.99 **Micro** Commodore 64 **Supplier** Precision Software, 6 Park Terrace, Worcester Park, Surrey.

Superscript from Precision Software is both a powerful word processor in its own right and also an upgraded version of *Easy Script*. If *Easy Script* users want to shell out £69.99 to get the full works, *Superscript*, it will automatically convert most *Easy Script* files.

The basic differences between the two are terminology ('fill file' becomes 'mail merge', for example) and power. *Superscript* is bewilderingly powerful. wordwrap, justification, choice of column width, block moves, numeric tabs, spelling checkers, letter merge, all this is peanuts to it.

For those who don't know *Easy Script*, *Superscript* works on a menu within menu basis, you bash away in Edit mode, then use Command mode to tidy up the document. Within Command mode there are lots of short cuts (erasing words, paragraphs etc, either with cursors, or

Inst/Del, or *Fl Erase*, which ever seems simplest at the time) and the emphasis is placed much on final revision and checking, rather than doing it as you go along.

Having done the tidying and parameter setting for the printer, the document as it will appear on paper as a final check.

It also (three cheers) pays an enormous amount of attention in the manual to printers, largely, 'troubleshooting with the printer' which means it isn't printing anything except lines of DDDDDDDDDs. In my experience, getting a document to print out usually takes twice as long as it did to write it, so I'm grateful for more than a cursory few lines.

What does take an eternity (about 20 minutes) on *Superscript* is the initial formatting of your work discs. Still, hopefully the one disc will take a fair few files, and you won't have to go through the procedure too often.

At £69.99 it is not cheap, and thus not for the casual user. But it could be the answer to a prayer for someone who word processes a lot and wants a really powerful game.

Christina Erskine

you can easily redefine them to use the same keys as a different utility such as *Am sword* if you would rather. *Help* menus are available at a keypress which summarise the commands.

Gen80 is the assembler module which includes the following special features: macros that are called by their label name with the appropriate parameters; direct keyboard input of text to be assembled as though it was part of a file. Files which can be called from disc and assembled within other files by the powerful *include* command – these can be nested and recursive and almost provide a high-level function in that programs can be written as small 'procedures'. Virtual discing, which allows owners of only one drive to code as though they had several; direct control over symbol table size or the number of significant characters in a label, as well as many more options that are usually fixed

in most assemblers. Many arithmetic and logical operators; conditional assembly which can produce different results if coding for different machines for example; assembly to disc and production of symbol files for debugging purposes – the list goes on.

Mon80 is the disassembler/monitor module. On screen you have provided at the same time the disassembled memory, the hex values of the memory itself and the corresponding ascii codes.

The documentation reflects the quality of the package. It is helpful, if advanced, and even goes so far as to give details on patching your own code to change the modules.

There is also a very good tutorial at the back that goes some way to teaching the rudiments of CP/M programming as well as how to use *Devpac*.

Tony Kendle

Look see

Program Ancient Quests Micro Spectrum 48K Price £7.95 Supplier Mirrorsoft, Holborn Circus, London EC1P 1DQ.

There's been a spate of excellent releases from Mirrorsoft recently, and here we have, back-to-back, two educational arcade games for five to eleven year olds which are best seen as under-age versions of *Sabre Wulf* and *Atic Atac*.

King Tut's Treasure involves steering an archaeologist, armed only with a metal detector, round a desert inhabited by prowling nasties, in search of various treasures. These can be as simple as shapes that must be matched or as complex as fractions to link to their decimal equivalents. The detector's rising pitch indicates a 'find' and all that remains is to dig it up and, if it's what you're seeking, return it to

the start.

The Count is perhaps not surprisingly concerned with a combination of simple arithmetic and Dracula. Search the castle room by room, solve the maths problems and watch the Count crumble to dust. It's an attractive looking game with amusing spooky ghosts, rats, and assorted nasties.

Both of these are a great advance on previous educational arcade games, which have all too often turned out to be space invaders with sums. In addition to their more obvious benefits they both call for some mapping. A joystick is almost obligatory for *Tut* owing to the use of the inconvenient cursor keys. I have slight doubts about their addictive qualities, though both cater for a wide range of abilities, and with both on one tape they're a pleasing attempt to reach a young audience.

John Minson

3D Tanks

Program Tankbusters Price £7.95 Micro CPC 464 Supplier Design-Design Software, 125 Smedley Road, Cheetham Hill, Manchester M8 7RS.

Doubtless there are many readers who will find the very concept of this game tedious in the extreme – unless you like zapping, read no further. But for those brave souls who remember coming home, weak kneed, shaking and penniless after two hours on a

Battlezone machine it is a release of some import.

The cover of the cassette and, not surprisingly, the graphics both owe a lot to Design-Design/Crystal's earlier Spectrum attempt at this game – the slow *Rommel's Revenge*. In the blurb it puts a lot of emphasis that the vector graphic programming techniques owe a lot to their more recent *Dark Star* – but the end result is, in my opinion, much better than both of them. For once we have a conversion of the game where chasing the enemy tanks, particularly the very mean ones that appear some way into the game, is

Inoffensive

Program Cryptomania Price £6.50 Micro BBC B Supplier Black Knight Computers, PO Box 132, Chislehurst, Kent, BR7 6JX.

Cryptomania is an inoffensive sort of game. The plot, though not startlingly original, is OK – you are a gun-toting explorer trapped in a pyramid, and must collect four coloured keys (while avoiding and zapping nasties) before proceeding from one level to another (faster) level. The programming is competent, with adequate graphics, good scrolling and Pause, plus Mu-

sic on/off functions. However, at the end of the day, the result is a pretty run of the mill arcade game.

This is no arcade adventure – no puzzles to solve or conundrums to ponder over here – just straight moving and zapping in a fairly uninspired fashion. Acceptable at the level of a £1.99 cheapie – slightly less so at £6.50 I think.

At this price, you almost start competing with the likes of *Ultimate* or the best of Acornsoft. And up against that sort of competition, the majority of the present generation of BBC games software looks pretty silly indeed.

Charles Hall

Familiar

Program War Machine Price £1.99 Micro Commodore 64 Supplier Pocket Money Software, St Austell, Cornwall.

Alone, at a distant outpost of the Empire, you have been assigned the task of guarding the world's remaining

stant attack from the enemy saucers above. With the aid of a vertical missile launcher and a bit of deft timing, you must dodge the explosions and return fire. Also, from time to time, it is necessary to blast the odd, stray, mining vehicle out of the way.

Standards of budget-priced software are improving rapidly, and I'm afraid that *War Machine* doesn't live up to the high expectations

neutronium deposits. Right now, however, your only concern is staying alive.

Sounds familiar? Well, it's *Moon Buggy* time again.

While patrolling the lunar surface you are under con-

created by companies like Mastertronic or Firebird.

My advice – leave your cash in the piggy bank.

Tom Hussey

the sort of fast breathless panic it is supposed to be.

There is also the, now traditional, much enjoyed, high score table that answers back.

One for enthusiasts only,

but I'm sure that they will have few complaints, beyond the lack of the flying saucers to provide some variation.

Tony Kendle

Paralytic

Program Happy Hour Price
£1.99 **Micro Spectrum 48K**
Supplier Scorpio
Gamesworld, 307 Corn Exchange Buildings, Cathedral Street, Manchester.

Have you ever suffered one of those bores who bends your ear

about how in his day beer was so cheap you could get paralytic for a pound?

Nowadays, particularly after forking out for your Spectrum, you can't even afford for attain the lowest levels of alcoholic poisoning. Now into the gap steps Scorpio with a program based on Wobbly Wilf's pub crawl.

Like any good drinking bout you have to wander round town, collecting pound coins from pavements, avoiding tripping into invisible gut-

ters, and searching for hostels before returning home to face the wrath of 'her indoors'. Unluckily you don't know where the ale houses are located but the innate radar of the inebriate indicated if one is in the surrounding spaces, though only at a cost.

There have been boozing games before (Automata went through an alcoholic spell) and as they're less likely to damage the liver, if not

the brain, than the real thing, I suppose they should be praised. But despite its competent if uninspired programming this one is no alternative to the demon drink. Unless you're already nissed as a pewt it's likely to prove so random, so pointless that even at this low price the money would be better spent on a couple of pints of Scruttock's Old Emetic.

John Minson

Colour code

Program Supertype Micro
Commodore 64 **Price** £19.95
Supplier Precision Software,
6 Park Terrace, Worcester
Park, Surrey

Something of a departure for Precision from its business software is *Supertype*, which aims to teach fast (around 30 words per minute) touch typing in eight-10 hours.

The whole package is very carefully thought out and well-designed. The method of teaching revolves round the use of coloured circular

tabs to stick on the keys - each colour denoting that a certain finger must be used for that key. Precision supplies a lot of these stickers - much more than needed for the keyboard. I can think of some companies which would make you buy your own.

While the colour association (blue - index finger, green - little finger, etc) certainly works, the stickers have a very high nuisance rating; there are the ones which fall off, and the fact that, I imagine most serious users will want to practice the typing, say, once a day, and use the computer for other functions in between, they could

well become irritating.

So the stickers are a mixed blessing, but the documentation and gradual progression of the exercises is very clear and well-planned.

Each exercise concentrates on a certain combination of fingers, beginning with the letters, going on to words then sentences. A full assessment of your performance is given at the end which times your wpm rate, tells you which keys to practice, and which fingers to pay attention to.

There are three exercises for the letters, one for numerals, and then a consolidation exercise using whole pieces

of text. *Supertype* suggests you don't move from one exercise to the next until you've achieved a rating of 'good'.

Obviously, anything like this needs the user to have a certain amount of self-discipline - I have to admit it was far more satisfying to get a 'very good' rating with two fingers than 'not good' with all eight - and eight-10 hours may be optimistic.

Having said that, I reckon anyone who seriously wants to learn touch typing can do so without tears with this package.

Christina Erskine

On the beach

Program Beach Head Price
£9.95 **Micro CPC 464 Supplier**
US Gold, Unit 10, Parkway
Industrial Centre, Heneage
Street, Birmingham B7 4LY.

This conversion of what was a smash hit war-based arcade game on the Commodore and a similar great success on the Spectrum, has doubtless been

torpedo laden waters, a simple stop-start, left right exercise; blasting away at the enemy aircraft and battleships - up, down, left, right, fire; guiding your tanks through the 3D view obstacle course - left, right etc. Really it has to be put into that pile of games that bewitched people by the original quality of the graphics and sound, never mind the plot, and considering the outrageous price it could be a case of 'Yankee Go Home'.

Still, the Amstrad conver-

long awaited by many Amstrad owners. However it must be pointed out that the retrospective opinion of many people who own those machines is that the game, although initially entertaining, soon palls and becomes rather boring - a feeling that I must go along with after just an evening of playing this version.

Doubtless you are familiar with the various screens of the game - guiding your flotilla of battleships through

sion is competent. It shows a promising ability to exploit the hardware but lacks many of the super little touches that characterised the earlier releases - the animated figures of the Spectrum version for example. Doubtless it will do well on the basis of its reputation, but I'm sure that there must be a lot of more worthwhile stuff to be seen from the US Gold stable.

Tony Kendle

A Day At The Races

Place your bets on this game for the Atari by Tom Wharton

As you might expect, this game is a horse racing simulation game – simple but fun to play. Although it is an all text game, good use is made of colour and sound. It is written in Atari Basic and uses just under 8K.

It can easily be converted for other

micros, there are only a few Atari specific commands used which can easily be substituted and only two pokes in it – 752,1 removes the cursor and 756,204 accesses the international character set so that the '£' sign (CHR\$(8)) can be used. On a few of the lines there are some

characters in heavy type; this indicates that they (and spaces in between) should be entered in inverse video. The program is written in such a way that should make it extremely easy to type in and understand.

A great NEW game from A&F.

Our intrepid hero "Hen House Harry" of "Chuckie Egg" fame has been called in to help a "Chocolate Egg" manufacturer sort out his automated factory, which has gone haywire. Harry, using all the skills he acquired working in the Hen House must get the wheels of industry moving.

Not only does Harry have to collect the ingredients to mix the eggs, but he will also have to collect the parts for the toys that go inside the eggs.

As if all these problems were not enough there are a number of other items that Harry will need to find and use to be able to complete the task. Things like ladders, bits of girders, keys and many more.

Chuckie Egg 2 contains 120 screens, plenty of surprises, and it is a true Arcade / Adventure game - you don't just find things, you actually move them and use them.

Getting in on the ACT

Top-down approach. **Andrew Pennell** reviews ACT's home business micro – the F1e

Shortly after the release of the BBC B Plus, ACT – best known for its Apricot range of business micros – took great delight in announcing a price cut of their F1e micro, to just £225 above Acorn's price. For that you get a built-in disc drive, 256K Ram (rather than 64K) and a 16- rather than 8-bit processor.

The package seems ideal at first sight for either the small businessman or the keen hobbyist – a similar market to Acorn's – offering an impressive hardware specification and bundled software for £685.

Hardware

The hardware part of the F1e package consists of two main components – the systems unit, and the keyboard.

The systems unit contains the main processor board, using the 16-bit 8086, processor, 256K of Ram, parallel and serial ports, and a built-in 315K 3.5inch floppy disc drive. It is housed in a long thin box, which has a lower section towards the front on which a monitor can rest. The size of this area is such that the ACT monitors are the only ones small enough to fit, thanks to their small footprint. All the connectors and the on/off switch are on the back of the unit, the only control on the front being a disc eject button.

Incidentally, some of the photos of the F1e in adverts give a false impression of how big it is, as the monitor is positioned to obscure the length of the main unit.

The keyboard is as wide as the case is long, containing some 90 keys. It is quite thin, so to give it a suitable typing angle there are some hinged feet on the back that spring down at the press of a button.

The keys themselves are not stepped, presumably because the keyboard is a membrane type. However – never fear – as it bears no further resemblance to the dreaded QL or Spectrum+ keyboards, and is quite nice to type on.

In addition to the usual keys, there is a numeric pad, nine function keys and a few miscellaneous keys. Above the keyboard on the right are four buttons, labelled *Reset*, *Repeat Rate*, *Set Time* and *Keyboard Lock*. The *Reset* key has to be held down for some time to reset the machine, as a safety feature, while the repeat button allows the rate to be varied at any time. *Set Time* is for the internal clock, though I couldn't get it to work, and the *Lock* button is a way of disabling the keyboard, which I am sure will be useful for someone, only I can't think who.

The keyboard follows the latest craze, being linked to the main unit via an infra-red link. This is supposed to remove the

need for interconnecting cables, but all it does is make the positioning of the keyboard relative to the system unit very critical.

I found it necessary to use the light pipe supplied if I wanted to be able to use the keyboard where I felt like. There is a mouse available, and it also uses an infra-red link. I am dubious of the infra-red connection on a keyboard, but on a mouse, which by definition is moved around constantly, I would think that the pipe is a necessity.

For this review I was supplied with an ACT monochrome monitor, which is colour co-ordinated with the rest of the F1e, and its 9inch screen means it rests happily on the system unit. Connection seemed to be a doddle, just plug in the mains cable to the system unit, connect the monitor to its socket, and switch on – but no picture.

The manual is so vague it didn't describe why the black and white monitor could only plug into the colour monitor socket, or the fact that the monitor should come with its own power supply that plugs into the back of the system unit – a fact that wasn't immediately realised.

Instead, I used the composite video output from the back into my own monitor, until I discovered the reason for my lack of display.

Output from the F1e is normally high-resolution with 80-column text. A 40-column mode is available – pressing F3 switches to 40-column mode, F1 returns to 80-column. The 40-column mode means that it is possible to use the F1e with an ordinary domestic television although you will need to buy a modulator adaptor which costs around £35. Not all software available for the F1e is configured to adapt to the 40-column display and where software is only 80-column for-

mat the screen will overwrite on the same line with the second 40 columns of each line.

If this doesn't sound too terrific it may still be necessary to consider the domestic TV display option since ACT's range of monitors for the F1e is fairly pricey. The 9inch monochrome monitor supplied with the machine costs a hefty £230, although it did give a very clear stable picture. Scrolling text quickly did sometimes give blurred results, though, because of the persistence of the screen.

Other monitor options offered by ACT are a 12inch monochrome screen for £287.50 and a colour monitor at £464.25 – two-thirds of the cost of the F1e to start off with.

It is possible to get some colour monitors for other machines for less although it does not seem possible to easily connect any other type of colour monitor to the F1e.

ACT also offers a number of Ram expansion boards for the F1e which are necessary for running some of the bigger Apricot software packages. They are steep – bringing the machine up to 512K costs half as much again as the whole micro/keyboard/disc drive package. The Ram boards are easy to install.

continued over the page

Hardware

The rear cover on the Fle can be unscrewed to reveal a socket for the boards.

If you want a 10M hard disc unit for the Fle it'll cost you as much as two more Fles!

Software

There is quite a considerable amount of software supplied with the Fle, all running under MS-DOS.

Although, in principle, this means the Fle will run IBM software, in practice only data files are compatible, and as the Apricot uses 3.5inch discs while IBM uses 5.25inch discs some comms software and access to an IBM will be required for transferring any files.

The bigger brothers in the Apricot range have a wide variety of business software and languages available, and the Fle will run some of them, though not all.

Most of the more powerful programs, assuming they will actually run, require more Ram - at least 384K and often 512K, and upgrading an Fle is expensive. An extra 128K - bringing the spec up to 384K - costs £201.25. The 256K Ram board - making 512K in all - costs £339.25 and a 512K board costs only £50 less than the Fle itself.

Lotus 123, one of the most popular programs, is not yet available for the Fle, and when it is it is bound to require

and programs executed by selecting items with a cursor, driven around the screen with the numeric pad, or the mouse. In fact this *Activity* user interface is quite a good front end, allowing most MS-DOS actions to be carried out fairly easily.

In all five system discs are supplied,

ating systems and Basic language in Rom.

There are several supplied utilities for changing fonts, program icons, keyboard layout, and various system parameters such as the printer port configuration. One disadvantage is that the B1 operating system for MS-DOS, that controls the discs, screen and keyboard takes up 128K of the Ram, and other parts of the system take a fair bit of the rest, leaving only around 100K free for programs. Screen resolution is 640 x 256 in black and white, and 320 x 256 in 16 colours, and the graphic programs can be configured for one or the other, to suit your monitor.

The first of the supplied programs is *ACT Diary*. It is an electronic version of the desk diary, with a neat screen display, and fairly easy to use. Given the time it takes to load, and the fact you obviously have to stop what you're doing on the machine to load it, I think it would be easier to use the paper version, unless you have a particularly busy and complex lifestyle though the use of a mouse would speed things up.

Next up is *ACT Sketch*, a drawing program. This looks to be a very neat utility which, according to the manual, will work on keyboard or mouse. What it doesn't tell you is how to get it to use the keyboard - on loading without a mouse, you get the cursor in the middle of the screen, and that's it.

You can't even quit the program, as that requires the cursor to be moved to the appropriate menu. Which you can't do of course!

For programmers there is GW Basic (which stands for Gee Whiz - honest), a standard Microsoft implementation. As ACT are pitching this machine straight at Acorn's BBC market, a useful utility *B-Tran* is supplied to convert BBC Basic

add-on memory.

MS-DOS, though it is one of the most widely accepted disc operating systems, can be daunting to the beginner. To help get around this, a 'front end' interface called *Activity* is supplied with the Fle, giving a graphics-based environment in which to use MS-DOS. A sort of poor man's Macintosh.

After switch-on, the machine does a self test, and invites you to insert a disc or set the date and time. This step is not documented anywhere, and I could not persuade the machine that I wanted to change the date. After inserting a system disc, control normally passes to *Activity*, though inserting a non-system disc results in a large 'X' being shown, next to a number. This too is undocumented.

Once in *Activity*, discs are controlled

and a certain amount of disc swapping is required for most actions.

After initially loading it, a special *Tutor* program is run, showing graphically the important features of *Activity* in a step by step process. When you have finished with *Tutor*, you find that none of the functions actually work, all producing a 'disc overlay not found' error. To the casual user with little technical knowledge, the program seems pointless at this stage. What the manual fails to tell you is that disc No2 is required to be inserted for any functions to be carried out.

The Fle is a 'soft' machine. That is, it loads in any required operating system into Ram, and is also re-configurable. This is in contrast with machines like the Spectrum or C64 which have their oper-

programs into GW Basic ones, though a better option would have been to have put a proper Beeb Basic interpreter on it, as the conversion process is slow as you have to load a separate program. The converter is sophisticated, turning the elegant structures of BBC Basic into the Goto-ridden lines of GW-Basic. The manual is good by ACT standards and seems accurate and useful. A cable and software is supplied for up-loading programs directly from a BBC micro to the FLE.

Exactly which BBC commands and functions can be handled by the FLE and B-Tran are shown in Tables 1-3.

Throughout my time with the FLE, I battled with the documentation, either the lack of it or its inadequacies, and ACT Communications was another case

in point. I could load it, and it immediately gave me an error message, returning to MS-DOS. I had neither instructions nor the time necessary to work out what was going on. I have since discovered that it is used for asynchronous up- and down-loading files between the FLE and other machines, with the FLE acting like a terminal. For that you will need an RS232 cable, not supplied by ACT.

Additionally two modem packages are available for the FLE. They both use the same modem but with different software. For £339.95 you get the modem and software to access BT Gold; for £454.25 you get the modem and an Apricot networking package.

As well as the review machine and its accompanying software, ACT supplied a few other discs of software that do not

come as standard, to show what the FLE can do.

The three utilities *SuperWriter*, *SuperPlanner* and *SuperCalc* are being bundled together for £109.25, specially for the FLE, although they are apparently not configured to work in 40-column mode. You will need a monitor.

With *SuperWriter*, the word processor, I found one snag immediately – the backspace key didn't, as the configuration was not complete for the machine. It was configured for the bigger Apricots, and some functions were assigned to the microscreen keys, which do not exist on the FLE.

This apart, it seems a powerful wordprocessor, with built in (British) spelling checker, and useful *Help* screens, though it is not a what-you-see-is-what-you-get program. It comes with its own font, which is thicker than the usual one, and with the long persistence monitor I was using it produces ghosting effects.

I had a brief look at *SuperCalc*, a spreadsheet, and *SuperPlanner*, an electronic notebook. These are in the same family as *SuperWriter*, and used to be bundled free with the bigger Apricots.

I also had Dr Logo, which uses the CP/M 86 operating system, rather than MS-DOS. Sensibly, the disc formats are similar, though you can only load programs on the correct operating system. For £34.50 – ACT's educational pack – you get Dr Logo, the CP/M 86 system disc and a tutorial disc. The documentation is up to the usual Apricot standards – the first instruction, how to load the program, is actually wrong! There is a separate booklet containing corrections

continued over the page

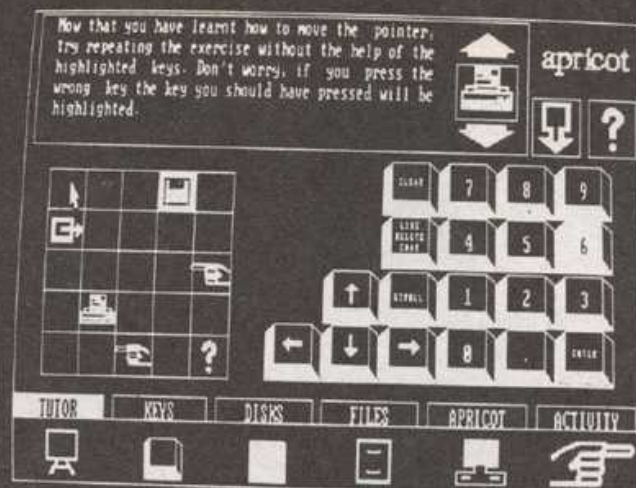

for the Logo manual, but that one didn't get a mention. It is a standard Logo, with the usual turtle graphics and list processing features.

Conclusions

Generally the hardware performed well, with one exception - the keyboard. The more I used it, the worse it became, ignoring key presses. It got so bad at one point that each key had to be pressed three times to register. Hopefully this fault is limited to just my particular model.

The main rivals in the price range are the BBC B Plus, the Amstrad CPC664 and

GW Basic's interpreter offers 174 statements, commands and functions in its vocabulary, compared with 114 in BBC Basic. Extra facilities include: circle and line drawing, random disc access, data handling, error trapping, event trapping, direct cursor control, program merging, directory management, variables exchange and keyboard reprogramming.

Most BBC Basic statements and structures can be either used directly or are translated automatically for use under GW Basic.

the Sinclair QL.

The Fle has a hardware spec that outperforms them all, with 256K Ram and a built-in disc drive, though the Amstrad does have a monitor.

It runs the industry standard MS-DOS, compared to CP/M on the Amstrad, and the non-standard operating systems of the BBC and QL.

The software supplied, when configured properly for the Fle, is a neat and necessary front end to MS-DOS, though the manuals are all appalling and should be re-written completely.

The Fle is also a proper 16-bit machine - another plus - and should have the technical support of a large, respected company, though actually tracking one down in the shops is very difficult at the present.

In contrast with some of its competing machines the Fle is a proper business machine capable of use by smaller businesses that can't afford more up-market micros. For the home market it loses out to the Amstrad and BBC in the games area, as there are no games at all to my knowledge.

Compared to even the forthcoming Atari STs the basic Fle package is very keenly priced.

The biggest problem the machine faces is the high price of software and peripherals. Because of the machine's lineage - being the lowest priced of a family of full-blown business micros - unless ACT is offering a special deal (such as with the three Super packages) all software and hardware additions appear to the seasoned home user to be very overpriced. Come back Tasword, all is forgiven.

When considering buying an Fle, the high price of additions to your micro must definitely be taken into account.

Micro Apricot Fle Price £685 Accessories Monochrome monitor (9inch) £230 (12inch) £287.50; Colour monitor £464.25; Domestic TV modulator adaptor £34.50; Mouse £109.25; Ram memory expansion boards (128K) £201.25 (256K) £339.25 (512K) £625.75; MX10 Hard disc (10M) £1,374.25; Modem £339.95-£454.25

THE ARTIST

The ultimate?

"I can only label [The Artist] with that often misapplied adjective, 'ultimate'."

B. Knight, Mortimer, Berks

"Saturday. Just received 'The Artist'. It's now Monday, where did the weekend go?...truly superb."

J. Hughes, Winterslow, Wilts

Your Spectrum reviewed the best graphics packages for the Spectrum; Paintplus, Light Magic, Leonardo, and The Artist. The Artist won hands down with a 5/5 rating. It was judged the best in every category of testing: best UGD creator, fastest to use (2½ times faster than its closest rival Paintplus, and 6 times faster than Leonardo), easiest to use, outstanding airbrush effect and astounding facility to paint with patterns.

"Only The Artist has got it right."

"An amazingly complex screen took only half an hour to produce..."

"The FILL commands are wonderfully versatile..."

"...it has so many goodies that you're bound to find one that'll help you do exactly what you want."

"...advanced colour editor."

"Who needs a Macintosh when you've got a Spectrum and this program? All it needs is a mouse and you've saved yourself two grand!"

Your Spectrum, June 1985 issue.

The Artist is compatible with the Wafadrive, Microdrive and can be obtained for use with some disk drives (write for details). Equally ideal whether you simply wish to 'doodle', or whether you're an expert looking for a 'serious' graphics package on a home computer.

Quite simply, the ultimate graphics package for your Sinclair Spectrum.

Minter Mania

Llamasoft Software, 49 Mount Pleasant, Tadley, Hants.

The release of a Llamasoft game is always an occasion of universe-shattering celebration. Notorious for endless whackiness, graphic genius and inventive gameplay, Jeff Minter's games often stretch the 64 to its limits. The time was bound to come, though, when such is the great man's inventiveness that he would develop a game so far out that it was quite impossible for humans to play. This, *Mama Llama*, is it.

You control a family of three llamas and a telepathically-directed killer droid. The droid is used to neutralise attacking baddies which supposedly come in all shapes and sizes.

Since you can apparently select which order you want to play through the phases, *Mama Llama* is more than just a straightforward zapper. But in fact it's so devilishly complicated that it will take a three-headed Vegan slime-octopus to work it all out. I'm not even going to try to give this a rating for gameplay — if you want a real challenge, just go out and buy it.

Program: *Mama Llama*, 64 Supplier: Llamasoft Price: £7.50

Graphics: ★★★★★★ Sonics: ★★★★★★ Gameplay: Glurk!

Commodore Horizons

MAMA LLAMA (Llamasoft) for Commodore 64: Another one from the Jeff Minter stable, and, if your brain works on the same wavelength as his, you will love this game.

Nobody could accuse Llamasoft of skimping on the instructions; there are "acres" of them and trying to absorb them all and loading the tape takes a very steady nerve.

The trouble is my brain refuses to accept all these instructions but nevertheless I got the tape programmed in the computer. What I saw looked good — the graphics were superb — but I did not understand any of it, I think I would rather try to remember word for word the complete works of William Shakespeare in Norwegian.

Sorry, Jeff, this is not my game, but I am sure that your fans will adore it. If you do decide to buy it (don't let me put you off) you will need, as you will with all Llamasoft games, a joystick. That I did discover.

Thetford & Watton Times, Norwich

Llamasoft Jeff Minter's latest game is called *Mama Llama* and is one of the most colourful games I have ever seen. It has over a 100 different levels and involves both skillful play and strategy if it is to be mastered.

An excellent game that should do very well once the distributors latch onto it.

Computer Games & Systems Retailer

Camel Ye Faithful and knuckle down to a session of JEFF MINTER'S newest smasherooni—and a continuation of the Ungulant Saga, TONY TAKOUSHI reports...

JEFF MINTER's pilgrimage to Peru last October was the inspiration for his latest game called *Mama Llama*. It features a (surprise!) mother Llama and her two babies, all of whom are being attacked, in the best Minter tradition, by aliens.

The game follows the Minter style of a good shoot 'em up but uses smooth scrolling backdrops to good effect. The scrolling backdrops are a first in that they are very colourful (unlike Tony Crowther who sticks firmly to four background colours).

The overall aim is to survive and protect the baby llamas, who mimic their mothers every action so as she leaps and spits at the aliens so do they! You have many sectors to patrol, with scanners within each section to help you locate any approaching nasties.

Following on from *Sheep in Space* and *Ancipital*, Minter has further evolved his gravity routines to allow incredible permutations on the alien attack patterns and on the movement of the llama. If you manage to clear a sector a warp gate will open to another sector, but you can choose to stay where you are a little longer.

Other sectors include the Inca City, Egyptian City, Space City, Rock City and Inca Homeworld — the gravity and viciousness of the aliens being suitable altered for each.

One of the most outstanding features of Minter games is his increasing ability to make the game feel good to play. When you pick up the joystick it feels true. Real gamers will know what I mean (the rest of you will just have to work at it!).

At the time of review the game was only half complete and had to be reviewed as such due to print deadlines but even semi-complete its quality stood out and I look forward to seeing the finished item.

Big K, London

A shoot 'em up with no bullets

ONCE upon a time computer games either derived from amusement arcades — which meant they consisted of shooting up aliens — or were adventures, which involved reading a lot of text and reacting to it.

But now, how do you classify *Mama Llama* (Llamasoft, £7.50), Jeff Minter's latest opus for the Commodore 64?

It is an arcade game — of sorts. But it's not like other shoot 'em ups. There's none of the usual approach of "make one mistake and you're dead." You don't even work your way through waves in the time-honoured way.

Ever since his first speedy variations on Centipede — Laserzone and the like — Minter has been rethinking computer games. He even altered the playing area, as in *Sheep In Space* with its planetary surfaces at the top and bottom of the screen.

Minter, who coined the phrase "mega-game" to describe his programs, understatedly calls his latest "rather unusual".

Mama Llama may be his masterpiece — a whacky, surrealist piece of lateral programming. It's a shoot 'em up with no bullets. And the player can choose at what point he or she even enters the game, and can even move on when the going gets too tough — which happens when Rory the savage guinea pig makes his biting entrance.

You control a mother llama and her two children, protecting them from danger by means of a kildroid which removes obstacles by touching them.

Well animated with good baroque and roll musical accompaniment and excellent, varied backgrounds for you to walk through, the game will especially appeal to fans of *Revenge Of The Mutant Camels* — a great game now also available for the Atari at £7.50. Keyboard by John Walker

North Western Evening Mail, Barrow-In-Furness

LLAMA MIA

There comes a time where every reviewer has to own up — after reading through the many lines explaining the plot of *Mama Llama* several times, I am still baffled. This is what I've got so far: the plot, incomprehensible, involves simulated video games on a planet called Led-Zepp IV (was that the one with *Stairway to Heaven* on it?), first part of game is a grid in which you choose what planet and how many aliens you want to fight. Part two sends you to the planet where you defend your Llama offspring from attack from various kinds of alien, one of which looks like a buffalo. However, there are things called Antigenesis devices, and Retrogenesis devices, which seem to be the Minter equivalents of smart bombs in that they reduce the number of aliens in certain ways. There appears to be all kinds of strategic elements to the way the game is played and it zaps like crazy. Beyond this, I don't dare to comment.

Program *Mama Llama* Price £7.50 Micro Commodore 64

Popular Computing Weekly

Watch out — this guinea pig bites!

John Walker

MAMA LLAMA

From the wagging ears and tail and nodding heads and curtsies of llamas on the opening screen, *Mama Llama* may look like just another tame beast with her two babes. But not Jeff Minter behind it.

Rather, the plaster on one of the babe's cheek in the cover group shot is more an indication of this hazardous, fast-paced trauma. And then there's the small but threatening Kildroid that hovers overhead to protect this cozy family. To do any good, however, you have to master it's inertia-controlled movement — no easy feat if it's possible at all.

As usual, instructions are very involved even not considering the detailed account of what inspired Minter to produce his latest ungulates. Your choice of playing modes, difficulty, scenes, etc, are numerous since you pick from a grid. Minter calls it a "totally amorphous wave select system."

The harrowing pace of *Mama Llama* is daunting even in the beginner phase but substantial practice sharpens your skills. Meanwhile the changing scenery, situations and attackers keep the player occupied. This is a toughie probably best conquered by dedicated Llamasoft fans rather than those just seeking an introduction to Minter's mind.

Considering that, the action is good and *Mama* and the player could become rather attached to *Mama* and her babies. All around, it's off-the-wall enough to keep the experts amused and glued to their joysticks.

Commodore Computing

All sorted out

Try this simple filing program on Spectrum from the keyboard of **Brian Lyle**

This program, which can maintain a file of record or program titles, birthdays or telephone numbers, was one of those programs born out of a typical 'I wonder if' exercise, when I was tinkering with the computer's ability to compare string values, and hence produce an alphabetical sequence.

From the simple compares, I was able to produce an array of records in alphabetical order, writing new records in their correct order and shoving everything else up a bit to make room! The next step was obviously to be able to reverse the process, and delete unwanted records. Everything else just seemed to fall naturally into place.

The program is menu driven, and all

routines flow through good old fashioned *Goto* statements. Desperately unstructured, it would probably give professional programmers nightmares, but it works - honest!

The options provided are as follows: Adding new records to the file (25 characters each), deleting unwanted records, displaying the file, page by page from the beginning, or starting with a given initial letter, and saving the program (and verifying) to tape, together with the updated file.

It would obviously be possible to add to and enhance the program adding such features as amending existing records, outputting the file to a printer, searcher for embedded words in a title, etc.

When the program is first entered, *Run* it to set the arrays. From then on, if you break into the program, restart with *Goto 530*. *Run*, or *Goto 1* will, of course, blank out the file. Whilst this is quite useful when opening a new file, it's somewhat frustrating if you do it by accident when you've just entered 200 records!

As written it will hold 300 records - increase this if you like by changing Lines 100, 110, 520 and 8035.

Program Notes

Lines No	
100-524	Dimension and set-up arrays
529-560	Menu display and selection
600-680	Input routine for adding records
6000-6070	Routine to insert record in correct alpha sequence and shuffle higher records up one place
7000-7560	Routine to delete a record, and close gap
8000-9010	Display file on screen, with option to display from chosen initial letter

Point by point

A logarithmic graph drawing program for the QL
written by James Cunningham

The purpose of this program is to plot two variables whose graph would be a curve under normal circumstances. By using log-grids they can be plotted as a straight line type graph and shown if they obey a law.

The initial display gives a brief run-down on the use of the two log (base 10) grids available. The program is greatly simplified by the *Scale* command.

Now to revise one or two points before describing the main sections of the program.

Each cycle of the vertical axis (max four for clarity) represents $\log_{10}(a)$

where $1 < a < 10 \times 10^x$. If $a=1$ then $\log_{10}(a)+0$; if $a=10$ then $\log_{10}(a)=1$. All 'a' values must be +ve. If a is (eg) two then $\log_{10}(20)$ is $\log_{10}(a)+1$. The '1' is referred to as *comp* in program.

The Proc *lcalc* sorts the range of x and y , what is max and what is min. As neither x nor y can be zero (ie, you cannot have a log of zero), adjustment is made. The *comp* routine adjusts x_{min}, y_{min} so that they are in the first cycle (number between 1 and 10 therefore log between 0 and 1).

The range of *comps* is used to establish the scale. For *slgrid* the x-axis is decimal,

not log. Info2 is the *slgrid* Proc and contains a routine to fit the range of x of the program into the actual x scale length.

The following sets of values will introduce the use of the program:

a) use (1) log-log grid. $P+RI \wedge n$
X 1.4 4.7 6.8 9.1 11.2 13.1
Y 49 582 1186 2070 3136 1850
b) use (2) semi-log grid. $y=ab \wedge x$
X 0.7 1.4 2.1 2.9 3.7 4.3
Y 18.4 45.1 111 308 858 4290
c) use (2) semi-log grid. $y=ae \wedge bx$
X -1.2 0.38 1.2 2.5 3.4 4.2 5.3
Y 9.3 22.2 34.8 71.2 117 181 332
d) use (2) semi-log grid. $v=Ve \wedge t/b$
X 10.4 21.6 37.8 43.6 56.7 72
Y 883 347 90 55.5 18.6 5.2

The program allows the 'x' and 'y' to be changed to other letters as required. The semi-log routine could probably be adapted to plot amplifier gain against frequency.

POWERFUL UTILITIES

FOR YOUR SINCLAIR SPECTRUM

MAKE THE MOST OF YOUR MICRODRIVE WITH

INTERFACE III

THE IMPOSSIBLE HAS BEEN DONE

Yes it's true this fantastic new peripheral will transfer every program available on to microdrive. Yes every one. Yet, believe it or not, it is so easy to use that we are training our pet cat (Chiff) to use it. Any one capable of loading and saving a BASIC program can transfer really awkward programs to microdrive.

Just look at these features...

- Consists of hardware and software (software on microdrive cartridge).
- Transfers all programs available on to microdrive.
- Very, very, easy to use. (If Chiff can do it we're sure you can).
- All programs ret. LOAD and RUN once transferred.
- Makes a "negative" of any stage of a program. (Saved as a screen).
- Transfer can be actuated at any stage allowing "customised" versions.
- Will also save to tape. (Normal speed load once saved).
- Programs will ret. LOAD independently of the "Interface".

IF YOU HAVE A MICRODRIVE YOU MUST HAVE INTERFACE III

ONLY £39.95 inc. P&P

DOUBLER MULTI

After amazing success on the CBM 64 we introduced "Doublor" on the Spectrum. Now we have improved it and have a "Mark II" version which has already satisfied hundreds of users. Requires the use of two cassette decks and has proved capable of 100% success with all types of loader regardless of length and speed.

ONLY £14.95

B.S.C.

TAPE TO DISC UTILITY
The "TD BOM" is the most powerful utility of its type. It will transfer the vast majority of protected software onto your own disc. It is VERY easy to use and full screen reporting is provided.

Two versions are available, the normal Acorn DFS version plus one suitable for Opus/Softbit DDF/DOS.

ONLY £18.95

DATA RECORDER

A dedicated data recorder designed for use on the CBM 64 or Vic-20. Specification as C2N but with pause button. Model available for the PLUS4 or 16 at same price.

SATISFACTION GUARANTEED. ONLY £29.95

AMSTRAD

"SPEEDMASTER" allows you to make a fast loading back up of your software at a choice of SAVE speeds. Incorporates a header reader and protects BASIC option. Works on ALL normal Amstrad loaders.

ONLY £7.95

"DISCMASTER" allows you to transfer most protected software onto disc. The process is automatic and will work with multi part programs. Supplied on disc.

ONLY £12.95

FOR YOUR COMMODORE 64

NEW DISC DISECTOR V3.0 NEW

The NEW VERSION of "D.D." has once again proved it as the leading copy/utility package for the 1541 user. As well as general improvements, plus the addition of more useful utilities, two important new programs have been added.

"THE EVESHAM NIBBLER"

A first on the UK market. A true nibbler (byte for byte) copier. Copies ALL DOS errors automatically. This includes errors 20-29 inc. plus non standard errors like half tracks, extra tracks, non standard sync, remastered tracks, etc. No knowledge is required at all it just "nibbles away" and produces a perfect copy. Yes, a only takes 5-8 minutes. Has copied all discs tested (except trash). A disc above anything else available.

"FAST FILE COPIER"

An incredibly handy selective file copier that LOADS and SAVES at five times normal speed. Sounds useful? Too true. As well as these programs 17 other useful utilities are included. An essential purchase.

ONLY £29.95

Customers with earlier versions may return them along with £9.95 for "V3.0"

NEW QUICKDISC+ CARTRIDGE NEW

Get a "QUICKDISC+" CARTRIDGE plugged into your 64 and your 1541 will really start to perform. Unbelievable value.

Includes the following:

Fast LOAD and SAVE (four to five times normal speed) **WILL LOAD most protected software**. Uses no memory area, can be switched in and out from the keyboard.

Fast Format takes just 10 seconds.

Fast Backup copies an entire disc in four minutes (not protected software).

Fast File Copier (selective).

Improved DOS commands (DOS 5.1) makes for easy use of the disc drive, e.g. **RETRN** will LOAD and display a directory without overwriting BASIC. **SHIFT RUNSTOP** will LOAD "0" "J" etc. etc. Very useful.

Incorporates Centronics printer software (user part) with CBM graphics capability. (Works with "Commodore Connection").

A RESET switch is fitted.

Now the price. No not £49.95, it's not even half that much. Can you afford to be without "QUICKDISC+"?

ONLY £19.95

No internal connections needed and unlike most similar products it is compatible with printers and second drives.

DOUBLER

The amazing cassette port adaptor for the 64 is still keeping its 100% record. Consists

of hardware and special software. Requires the use of two data recorders. Tests have proved conclusively that "Doublor" can be 100% successful even with fast loaders. They said it couldn't be done.

ONLY £12.95

STILL POPULAR

"DISCO"

Sell the best tape to disc utility for normal speed loading tapes. Simple to use but rarely beaten.

ONLY £9.95

"FASTTRACK"

Converts most slow loading tapes to "turbo" load. Single and multi part. Very easy to use.

ONLY £9.95

"BIG MOUTH"

A superb text to speech synthesis program that is great fun to use. Unlimited vocabulary.

ONLY £7.95

"COMMODORE CONNECTION"

Software and cable for connecting any centronics type printer to the 64. Or use with "QUICKDISC+".

ONLY £17.95

"AZIMUTH 2000"

Allows you to check and realign your data recorder head alignment. Screwdriver provided.

ONLY £8.95

"THE ANATOMY OF THE 1541"

Get to grips with your 1541 with this very detailed book. Includes a full ROM disassembly.

ONLY £8.95

All prices include P&P and VAT. Send cheque. Postal Order of Credit Card No. Credit Card orders accepted by phone. Callers welcome. Wide range of goods stocked. Trade enquiries welcome. European orders send price as advertised. Outside Europe £2.00 for airmail. Mail order to Evesham Shop please.

TIPSTER SPECTRUM + /48 AMSTRAD CPC464/COMMODORE 64

The most accurate horse race predictor on the market

- ★ Tipster V2 took 18 months of trial and error before we arrived at the system that makes it the most accurate race predictor on the market.
- ★ Fully tested against other computer race predictors.
- ★ Tipster even performs better than the human tipsters from the top nine newspapers.
- ★ Many winners found at high prices.
- ★ For both flat and national racing.
- ★ The system will never go out of date.
- ★ We reveal the secrets of profitable betting.
- ★ Special tutor for the absolute beginner to racing.
- ★ Tipster also includes a program to calculate your returns for you.

If you can buy a more accurate race predictor we'll refund your money

Don't be tempted to buy cheap or inferior products.
£14.95

E. I. SYSTEMS
PO Box 171, Wolverhampton, West Midlands WV10 0PJ

Leaves all other race predictors in the paddocks.
(Please state computer)

POOLSWINNER

THE ULTIMATE POOLS PREDICTION PROGRAM

- **MASSIVE DATABASE** Poolswinner is a sophisticated Pools prediction aid. It comes complete with the largest database available - 22000 matches over 10 years. The database updates automatically as results come in.
- **PREDICTS** Not just SCOREDRAWS, but ALWAYS, HOMES and NO SCORES.
- **SUCCESSFUL** SELEC guarantee that Poolswinner performs significantly better than chance.
- **ADAPTABLE** Probabilities are given on every fixture - choose as many selections as you need for your bet. The precise prediction formula can be set by the user - you can develop and test your own unique method.
- **SIMPLE DATA ENTRY** All team names are in the program. Simply type in the reference numbers from the screen. Or use FIXGEN to produce fixture list automatically (see below).
- **DISC/MICRODRIVE COMPATIBLE** Tapes supplied with conversion instructions.
- **PRINTER SUPPORT** Full hard copy printout of data if you have a printer.

AVAILABLE FOR Spectrum (48K), Commodore 64, VIC 20 (+16K), AMSTRAD, BBC B, Atari (48K), ZX81 (16K), Dragon, Apple II, ELECTRON

PRICE £15.00 (all inclusive)

FIXGEN 85/6 AT LAST! No more struggling for hours to get the fixture list into the computer. FIXGEN has been programmed with all English and Scottish fixtures for 1985/6. Simply type in the date, and the full fixture list is generated in seconds. Fully compatible with Poolswinner.
POOLSWINNER with FIXGEN £16.50 (all inclusive)

COURSEWINNER V3

THE PUNTERS COMPUTER PROGRAM

Not just a TIPSTER PROGRAM, Coursewinner V3 can be used by experts and occasional punters alike. You can develop and test your own unique winning system by adjusting the analysis formula, or use the program in simple mode. Coursewinner V3 uses statistical analysis of major factors including past form, speed ratings, course statistics, prize money, weight, going, trainer and jockey form etc. etc. It outputs most likely winners, good long odds bets, forecasts, tricast etc. The database includes vital course statistics for all British courses. You can update the database - never goes out of date.

AVAILABLE FOR Spectrum (48K), Commodore 64, BBC B, AMSTRAD, Atari (48K), Apple II
PRICE £15.00 (all inclusive) includes Flat AND National Best versions.

Flying the flag

Chris Cattnach unravels the mysteries of the status register

Whereas the accumulator, the x and the y registers are well known to machine code enthusiasts, having addresses at 780, 781 and 782 respectively, the whereabouts of the Status Register is shrouded in mystery. This is rather strange, as references are constantly made to the flags of the status register in machine code programs. The values of these flags change according to the conditions resulting from each operation.

The object of this program is to depict the seven flags of the eight bit status register, represented by the letters shown as follows, and to show whether the various flags are set or not. The register thus displayed on the screen, is linked directly to the function of the real status register (address 783), whose actions are illustrated by running several consecutive short machine code programs.

Each time the space bar is pressed, a

Sys command runs one of these programs, (which is also shown in mnemonic form), to perform a simple mathematical operation, which changes the value of the status register at 783. Thus with a negative result, the N flag is set, with a zero result the Z flag is set, and if a carry takes place the carry flag C is set.

Once the actions of the register are understood, one can make use of them in a program. For instance, if the N flag is set, one could make a condition dependent upon this fact by, for example;

```
10 If Peek(783) and 128 = 128 Then 20
20 Print "Value is negative"
```

The actions of the status register are mentioned in the C-64 Programmer's Reference Guide, but the situation of this register is not made clear.

Go to hell

Memories are made of this

Find out how characters are stored in memory with this m/c program by **R G Bennett**

Although this program could perhaps be classed as a novelty program, there are features which could be of academic interest to some readers. Appendix III of the Amstrad handbook shows pictures depicting those characters with ASCII codes from 32 to 255 decimal, and shows them on an 8 x 8 grid. This grid is called the character matrix, and is stored in lower Rom as the 8 bytes represented by the 8 rows, or lines, of the matrix. Each byte is a number between 0 and 255 decimal, which is stored as the binary bit pattern which represents that number. The convention is that when a bit is 'one' it is said to be set, and when the bit is 'zero' it is reset. You can see quite clearly from Appendix III that it is the pattern of set bits in each byte which make up the whole character.

When you have the program up and running you are requested to press a key, with or without *Shift*. You could even press the *Enter* key at this stage if you wished. The character represented by the keypress is then shown on the screen in a much enlarged form, followed by the binary, hexadecimal, and decimal representation of each byte of the matrix. You should have no difficulty in matching up the binary pattern on the screen with the pictures in Appendix III. After seeing the result of your first keypress, a second one will take you back to the start of the program, but pressing *Enter* here will stop the program.

Regarding the actual program, in order to gain access to a character matrix, the lower Rom has to be 'turned on' first, and turned back off again when the matrix has been found. When printing the enlarged character each of the 8 bits of the byte are checked in turn. If the bit is set then a solid square is printed, and if reset, a space is printed. Thus the solid squares pick out the shape of the character. The same method is used to print the binary representation of the character, but this time a 'one' replaces the solid square, and a zero is printed in place of the space.

Program notes

The following routines are called from within the program, with the addresses given in hexadecimal:

- BC0E - sets the computer mode. Register A holds the mode. AF,BC,DE,HL corrupted
- BB5A - print the character in register A to the screen, nothing corrupted but control characters are obeyed.
- BB18 - wait for a keypress, code returned in register A with carry set

nothing corrupted

- B906 - enable the lower Rom
- B909 - disable the lower Rom
- BB75 - set the current cursor position, ie, the next print position register H holds the column and register L the line position
- BBA5 - puts in the HL pair the start

address for the matrix-character in A

The only control code used in the program was in the *Text*, this was control code 31 which is the same as a *Print At* instruction. This is followed by a number for the column, and then the line number to printed to. Most of the control codes are ideal for embedding in message printing loops.

Once you have successfully generated the code by the Basic program, the actual machine code can be saved by *Save "name",B,30000,290,30000*. It can then be loaded back later on by either *Memory 29999: Load "name", or Memory 29999: Run*.

The Music Box

Rearranged

When, some time ago, Music Sales brought out their *Music Maker* software, complete with clip-on keyboard, my feeling was that they had produced a reasonable piece of software aimed essentially at the sort of market who might otherwise buy a small Casiotone or equivalent little electronic organ. Then, earlier this year, the company announced a whole range of apparently related software, much of which seemed to be directed at a more 'serious' market.

Well, I've recently had some time to play with the first of this range of products

and, frankly, it's a little disappointing.

The package is called *Popular Classics* and is described as a 'Music Maker Playalong Album'. The only sense in which it could be called integrated software is with regard to the fact that it, like the original *Music Maker* package, uses the tacky plastic clip-on keyboard. I'm not quite sure who is expected to buy this software because, elegantly packaged as it is, it doesn't quite seem to have developed an identity of its own.

The software, on cassette or disc, allows you to hear one of 12 well-known classical themes arranged for the 64's three parts: *Tchaikovsky's Capriccio Italian (sic)*, *Bizet's Toreador Song* and *Liszt's Hungarian Dance No 5* among them. You can hear these one at a time, or in a pre-programmed or self-programmed (Juke Box) sequence. You also get a choice of cartoon-style graphics which actually bear some relationship to the music.

Apart from this, there is a single key play mode which allows you to follow a piece one note at a time (using the graphic depiction of a musical keyboard), a rehearsal mode which shows you graphically which key to press in order to play the next note of the melody and a performance mode in which you just play the melody along with the backing.

Clearly, all this is designed primarily for education. The package is a sort of computerised 'play-in-a-day' book and, as such, it is well executed and quite cheerful to use. (You even get a music book with the melodies written down.) However, I'm not really sure how useful it actually is in teaching musical skills. The documentation is pretty basic and, by its very nature, the package itself is limited to teaching you to play along with 12 excerpts from out-of-copyright tunes rewritten for ease of use.

The most curious thing, perhaps, is the inclusion of a *Midi* facility. This allows the software to drive a synth so

that the tunes will play through it. You can also use the rehearsal feature in *Midi* mode, although not, apparently, the performance feature. Quite who is meant to use the *Midi* facility is not clear, although it is nice to know that *Midi* is being thought of by software producers.

I have to reserve judgment on the whole *Music Maker* project until I've seen some more software. At the moment, the most that can be said of it is that it may be quite a good way for an absolute beginner to enter the world of music.

Gary Herman

The *Music Box* is a weekly column with news, reviews and readers comments on all aspects of micros and music.

Any readers with experience of computer music making or companies with new product news are invited to write to drop a line explaining what they're doing to: Gary Herman, The *Music Box*, 12-13 Little Newport Street, London WC2R 3LD.

Creative Sound

on the BBC Microcomputer Model B

Book Creative Sound
Price £9.95 Micro BBC
Supplier Acornsoft, Betje-
 man House, 104
 Hills Road, Cam-
 bridge CB2 1LQ.

This book has a solid pedigree: David Ellis, a computer musician and journalist, and Chris Jordan, designer of the BBC sound software and the Music 500. As you might expect from such a team, they explore in considerable detail some of the sound and music-making possibilities of the Beeb.

Topics include sound synthesis, playing the Qwerty keyboard in real time, computer compositions and CAMI (Computer Assisted Musical Instruction). The programs, many of them quite long, make full use of BBC Basic and machine code routines are used when necessary. For this reason alone it's worth buying the programs, too.

Of special interest are the composition programs although many are geared to produce music with a mathematical base rather than an inspirational one - if you can do much better, however, let me know. One produces a machine code patch which reduces the usual 50ms minimum note duration to 10ms.

A raw newcomer to the world of computer music and sound synthesis may flounder in places, but if you are at all interested in exploring music on the Beeb and the potential of the sound chip this book is a must.

Ian Waugh

Book QL Technical Guide
Price £14.95
Supplier Sinclair Research, Stanhope Road, Camberley, Surrey, GU15 3PS.

The QL Technical Guide is billed as a complete technical guide to the

QL which includes the full specification of the QDOS operating system. It has been available for some time in draft form for producers of software and hardware, but is now officially finished.

The Guide is certainly not a beginner's introduction to QDOS or Superbasic, but is aimed very directly at those with a commercial interest in the QL. Description of the operating system itself and how it works is minimal, the bulk of the Guide giving descriptions of how to use QDOS with the emphasis always on officially approved techniques. Some interesting pointers to future QL developments are included. For example, Sinclair advise against direct manipulation of the screen Ram because the format may change. Sinclair are known to be working on enhanced window capabilities.

Most of the Guide consists of a reference description of the QDOS routines available to machine-code programs, traps and vectored routines in 68000/QDOS parlance. The

action of each routine is briefly described and the affects on the 68008 registers noted. No attempt is made to describe how the routines work or how they interact.

The last chapter in the Guide is all about doing business with Sinclair, who to approach if you have a program to sell, what sorts of contract are available, how Sinclair will market products bearing the Sinclair name, and so on. This chapter really sums up the Guide. It is strictly for second-source producers of QL products and if this is you, then you will need the Guide. If you simply want to learn more about the QL then I would advise that you get hold of a copy of Andy Pennell's *QDOS Companion*.

Arcade Avenue

The easy side

This week we have another of our special maps for you, courtesy of Andrew Hartley of Carnforth. Once again it is of a Spectrum game, *Gyron*, but I strongly advise at least Commodore and Amstrad owners to keep hold of it. Of course there are two sides to the game, the more difficult of which, *Necropolis*, has a Porsche as a prize for completion. For this reason, and also because as far as I know no one has come near mapping *Necropolis* (or if they have they sensibly are keeping quiet), our map is of the 'easy' side, the Atrium. Anyway let's let Andrew do the talking. "*Gyron* from Firebird is professional, expertly written, and very fiendish in conception - it must be one of the toughest games ever. I've been hooked on it for some time now. *Necropolis* is brain numbingly complex and the point of frustration is soon reached but I have finished Atrium. The routes of the spheres do not change in Atrium, nor do they stop moving. *Necropolis* is made even more difficult by the fact that many routes are blocked by stationary spheres that only move at certain times. I think the Porsche is safe.

"On my map the triangles represent the towers as they are at the start, the large black arrow indicates the start, the smaller arrows the routes of the spheres. From the start the first problem is to get to the top left past the four oscillating spheres to the seven yellow towers all in a line. Shooting the backs of the four nearby ones will make them all point in the same direction - it seems to be unimportant here but has a significant effect close to the end of the maze - eight towers in the bottom right are impassable otherwise.

"From the top left the next stop is the top right area

which is thick with towers. Two important techniques must be mastered here - using the spheres as shields to protect you from the tower blasts and travelling safely through the blind spot directly beneath the towers close to the trench wall.

"In the area bottom centre two spheres follow each other around an 'H' shaped trench. Navigating this had my

nerves in shreds and using the spheres as shields is essential. The central tower of the H has to be shot first, then guide the hedroid between the two spheres and go round with them. You must go around the H one and a half times, with five towers to shoot, and without touching either sphere. If you survive this traumatic experience the last bit is a cinch.

"Salvation is reached at the cross shaped section of trench immediately below the start. On the right are three towers, two pointing in to a third. Shoot the one in the middle to reach the final screen representing the entrance to *Necropolis*."

I'm sure many readers will want me to thank you for that, Andrew.

Tony Kendle

We are searching for the top UK computer games player - the best there is!

The very best of Britain's game players will get to fight it out on a number of top secret new games - scheduled for release in the autumn.

Here's how it works

Study the table below and look at the column for the machine you have - these are the games you'll need to master. Send your high scores in on the form below, making sure that your scores are authenticated by a responsible individual signing the form. Any score achieved using technical short-cuts - such as infinite lives Pokes - will not be accepted.

Between now and September Tony Kendle will be keeping you up to date on the *Arcade Avenue* page with just who has the scores to beat. Then, in September, the top three scorers on each machine will battle it out for a place in the final and the chance to be the first to play our 'top secret' games.

	Commodore	BBC	Spectrum	Amstrad

Tony Bridge's Adventure Corner

Atmospheric

Many moons ago, I was sent a tape for review - called *Funhouse*, it was from Pacific Software and has been written for the Spectrum and Amstrad. I spent a long time trying to get out of the very first location and then finally gave up as other adventures and other deadlines clamoured for attention. I've often said in this column that I wish software houses would send solutions, maps and so on with their programs - much as I love to play an adventure from the same standpoint as other players, time is too pressing to spend long hours trying to progress through new games. This, too, incidentally, is why some of the hints you may read in this column may be a little off the mark - quite often, I don't have a chance to check them personally, so don't sue me!

Anyway, as so often happens a flash of inspiration (prompted, I have to admit, by reading the cassette inlay, which practically gives the solution to this first problem in the list of vocabulary - a good rule of adventuring being, read all the information) sent me back to try again, and lo and behold, I finally managed to crack it. Once past this first location, I found a fine adventure. In a nicely designed character set, you are told that "a lifetime seems to have passed since their craft crashed into the old abandoned amusement park. They then invaded the town to hold all human life captive, but you escaped with one aim - to find and destroy their power source". Leaving aside all the unanswered questions that this introduction

poses ("Is all human life present in this one town? Who are *They*?" and so on), the scene is thus nicely set in the eerie old funfair.

It's a pretty large one too, having some 130 locations, many of them illustrated with chunky colourful pictures (although written with *The Quill* - not mentioned anywhere, incidentally - it is pre-*Illustrator*). You'll find plenty of objects to use and puzzle over (and Examine everything!). The atmosphere, however, doesn't come so much from the graphics or location descriptions, which anyway are rather basic, but rather from the feeling of 'place'. That is, the fairground gives plenty of scope for creepy situations - unusual happenings in a mundane setting, a device used in some of the best horror stories. While the location descriptions may be terse, they often manage to convey something more than just where you are; for example, things seen in one location may sometimes be seen from another, and then you often get the impression that something is watching you from the shadows! And you are there alone, or almost. . .

Most of the problems, despite what I said of the opening sequence, are not horrendously difficult, but the adventure is pretty large, and it will take you some time to finish it. Although the screen layout is occasionally messy (commas at the start of lines, pictures scrolling half-way up the screen and so on), the game is good value at £3.99 for the Spectrum, and, rather strangely, £5.95 for the Amstrad. Details from Pacific Software, Pacific House, Buttermere Grove, Beechwood, Runcorn, Cheshire.

From a *Quill'd* (in the Spectrum version) adventure that reeks with atmosphere, to another that is unfortunately sterile and non-addictive. *Operation Nightingale* comes from Softly Softly (good name that!) and with the offer of a £100 prize. The story starts with you in your office, somewhere in a Government building. You are carrying a revolver. There's a small room nearby, which yields a bullet. Aha! I thought, immediately typing Get Bullet, Load Revolver. Yes, you can see what's coming already, can't you? The Spectrum thought that I was asking it to load in a saved game! Oh well, back to the drawing board. . . On subsequent attempts, I explored quite a bit of the adventure, as

it's fairly open and easy to get around. *The Illustrator* has been used here, and the pictures are sometimes quite artistic, evoking memories of the Bauhaus school of the 1930's. Despite this, there is absolutely no atmosphere, and this is partly due to the minimal and uninspiring location descriptions, but mainly to the complete absence of involvement. You'll see this most in moving about the landscape; for example, in Leicester Square, you can go North to Soho, or South to Oxford Street.

Apart from the geographical nonsense in this state of affairs, there is no sense of being in the West End of London - you might just as well be completely alone in the middle of a desert, with a few cardboard building-fronts scattered around (I suppose this could turn out to be the dread secret!)

"Atmosphere" is, of course, a subject for a whole book, but it can be evoked not only by a vivid location description, which anyway is missing here, but also by the sense of "place". While we are all intellectually aware of how an adventure works - by keeping tabs on where the player is in a large matrix of cells - nevertheless, an atmospheric program will fool the player into believing that he/she is actually wandering around a real landscape, where one location leads naturally into another: the suspension of disbelief, in other words. In *Operational Nightingale*, the mechanics of the adventure are only too painfully obvious, and this makes for a dull game.

With a prize of £100 at stake, you can be sure that the problems are going to be tough, and that Softly Softly didn't provide me with a solution or map, though a tape of a game saved at some early position would have come in handy for a review. Well, I couldn't be bothered to flog my way through the puzzles, but the prize is obviously worth going for.

So, if you are into puzzles with good reward at the end, maybe this is for you. Incidentally, the prize is only available until 26 August 1985, so be quick. Softly Softly, 36 Broadlands Road, Bromley, Kent BR1 5DE.

Another tape that I received some time ago was from Celtic Software - it's a smashing adventure, but I can't tell you about it until I find their address again! So, Celtic Software, please let me have your address, and then I can tell everybody about *Manor Madness*.

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure you cannot progress any further write to: Tony Bridge, Adventure Corner, *Popular Computing Weekly*, 12-13 Little Newport Street, London WC2R 3LD.

Adventure Helpline

Going bananas? If you are stuck in an Adventure with nowhere to turn do not despair - help is at hand.

Fill in the coupon, explaining your prob-

lem, send it to us, and a fellow adventurer may be able to help.

Remember - the system only works if those adventurers who have solved the puzzles get in touch. Every week is Save An Adventurer Today (SAAT) week!

Peek & Poke

Addicts guide

Douglas Irons of Maidstone, Kent, writes:

Q I have just read the complete Arcade Addicts Guide, and many of the pokes and cheats have been very useful, but how do you enter them into the program if the line starts with a zero? I know there is a poke statement for this, but I cannot find it in the hundreds of back issues I have got. I have enclosed a SAE so you can't get out of

replying to me!

A The address you are looking for is 23756. If the header program contains a Line zero, it is not recognised, so cannot be edited. If you *Poke 23756, n* (where *n* is an integer) then the Line zero will now be Line *n*, and can be edited in the normal way. By the way, Douglas, I'm afraid a SAE doesn't improve your chances of getting an answer - I'm afraid I just get too many enquiries to answer individually.

Main advantage

R Diamond of Chelmsford, Essex, writes:

Q Can you explain how a microdrive and Interface would make a difference when using a database (as opposed to just using a cassette recorder). I know that a microdrive can hold about 100K but as my Spectrum has only 48K Ram, I

don't quite see the advantage.

A The main advantage is simply speed. Databases need information (a lot of it) to be available quickly. Rewinding a cassette from end to end searching for the required information can take a long time, but any information can be retrieved from a microdrive in a few seconds.

A microdrive allows for files of up to 85K, but only parts of the file are loaded into memory at any time, hence the apparent ability of fitting 100K into 48! Also the attachment of a second microdrive allows for much more data to be available without any decrease in speed.

Book of instructions

Guillaume Philraudeau of London W8, writes:

Q I have been the owner of a 48K Spectrum for two years now, and am

starting to program in machine code. I have already written small programs, but I would like to buy a book on the subject.

What I want to understand are the 'Rotate' instructions (RRA, RLCA, RLC, etc), the 'bit', 'set' and 'ses' instructions and the registers they use. Although I know what they do, I don't know how to use them.

Unfortunately, the books I've seen are either for the absolute beginner (which I'm not), or for the already proficient programmer, not my case either. Could you please help me find a book that would suit my requirements.

A I would suggest you try a recent Melbourne House publication, *Z-80 Reference Guide* written by Alan Tully, price £9.95. Their address is Castleyard House, Castleyard, Richmond, TW10 6TF.

As a much less solitary alternative, have you tried contacting a local computer club or user group?

SOFTWARE

WDSOFTWARE

For the QL:

WD Utilities (3rd ed) (base £5.50)

PRINT 60 file DIRECTORY or view it on one screen, one-key LOAD, COPY or PRINT 60 files with one key (allows for namesakes). Multiple FORMATTING to prevent corruption by stretching of tape. TOOLKIT to give dated, numbered modules in program development. PRUNE old files to release space (one key DELETES a file). Full instructions in QUILT file. Use up to 6 EXTRA MICRODRIVES (add on your Spectrum ones).

WD Utilities for CST Q-Discs (base £8)

100-file capacity, for CST/Computamate disc systems AND up to 4 extra microdrives. User-friendly timesavers.

RefQL (3rd ed) (base £3)

500 useful QL references in an ARCHIVE file (too long for one cartridge with Utilities and Morse).

For Spectrum/QL/BBC

WD Morse Tutor (base £4)

From absolute beginner to beyond RYA and Amateur Radio receiving. Adjust pitch. Set speed to your test level (4-18 wpm). Learn from single characters, via groups with wide spaces to random sentences, decrease spacing to normal. Write down what you hear, then CHECK on Screen or Printer (or speech for Spectrum with Currah Microspeech). Also own message, random figures, letters or mixed.

For Spectrum 48K

Tradewind (base £4)

Sailing/trading strategy game with graphic surprises.

Jersey Quest (base £4)

Text adventure with Bergerac and the Dragon (not disc).

PRICES (incl Europe postage — elsewhere add £1)

Spectrum/BBC Cassettes — base price only

QL or Spectrum Microdrives — £2.00 cartridge plus base price

5 1/4" Floppies, £2; 3 1/2" Floppies, £5. (please state format wanted)

Two or more programs on medium — pay medium + base, eg. WD Utilities and RefQL for £10.50, but IM-POSSIBLE to mix QL/BBC/ Spectrum programs on one medium. Send YOUR cartridge and pay base price but FORMATTED it FIRST in your DRIVE 1 for compatibility.

SERVICES

FAST COMPUTER REPAIRS

First company in all UK. to introduce while-u-wait service. Now first to offer an international repair service.

I have come across a firm that will be more than willing to advise you as to how to remedy your problem. They are called MANCOMP, and as well as repairing faulty Spectrums, are also quite willing to discuss your problems with you, and offer reasonably cheap, and (more importantly) correct cures

PHIL ROGERS 'Peek & Poke'
"POPULAR COMPUTING WEEKLY"
January 1985 (Vol IV No 1).

My Spectrum blew recently. I took it to Mancomp who fixed it in eight minutes! And for less than £10. They are local, clued up, and blindingly efficient

COMPUTER COLUMN 4 HEATONS
DIGEST Vol 1, No. 11

One firm at least can usually effect any necessary repair over the counter in forty five minutes. Based in Manchester, Mancomp can offer what is arguably the fastest turnaround in the business to personal callers

CRASH MAGAZINE, JUNE 1985

NEW TAPE TO DRIVE TRANSFER OF RECENT PROGRAMS

Yes SPECTRUM owners can even transfer many of the LATEST fast/jerky programs to their drives at **LOW COST** with our software and information sheets. You will be amazed at what can now be done and with no risk as our programs carry our **MONEY BACK GUARANTEE** (not updates).

Firstly you will need our MD1b (for m/drive) or WD1b (for Wafa or disc drive) programs that give you the tools to convert programs. Includes the ability to chop/split bytes in one go, bytes mover, "VAL" creator and REMkill, make visible etc. FULL manual (highly rated by CRASH) with example transfers. MD1b or WD1b cost £6.99. "MD1b manages more programs" - Your Spectrum.

To manage the latest programs you will also need our Tape Copier 7 program at £6.50. EXTRA program to CONVENIENTLY transfer converted bytes directly to m/drive with many other features (eg. alter program names, stop programs, etc) buy MT6 at £3. (Wafadrive version is called WAFATAPE at £4).

NEW LERM INFORMATION SHEETS

Each sheet gives you the DETAILED instructions required to transfer to your drive 8 of the more POPULAR programs. They cost £2 EACH plus SAE. Up to sheet 4 available. UPDATE SERVICE: Send old tape + large SAE to get a £2 REDUCTION. OVERSEAS: Add £1 Europe, £2 others for each product. SAE for enquiries. PL411

LERM, DEPT PCW, 10 BRUNSWICK GDNS,
CORBY, NORTHANTS NN18 9ER

KWIKLOAD FOR THE 48K SPECTRUM

KWIKLOAD allows cassette S/W to be loaded 3 times the normal speed on a standard cassette recorder. The manual explains how to convert most commercial S/W.

"Knightride loads in 115 secs"
"Jet Set Willy loads in 95 secs"
"A bit like upgrading your C5 to a 3.5 litre car"

"I'm very satisfied" - N. Mettel - France
"Thank you for the delivery of your excellent Kwikload" - A. Cupit - Switzerland
£4.95 including free Tape Header Reader or send SAE for further details (overseas customers please add 50p postage).

Forale Software
32 Gladstone Road,
Hockley, Essex SS5 4BT PL447

MULTI-CHOP PLUS BYTE-COUNTER

A suite of 6 extremely useful and easy to use programs which let you chop programs into 2 or more parts ready for transferring onto either Microdrive, Wafadrive or Discdrive or simply use to chop off screen to programs load faster.

Your programs can be split into:
1. Just the first 65512 (screen) 2. All except first 65512
3. First 4000 + remainder 4. 4000 + remainder less screen
5. Can reduce Superflop programs up to 65279 bytes down to size
Has been used to successfully put MONY-MOLE & POGO on Microdrive.
Includes a Header Reader and Byte counter which can even give the length of Headerless files.

POST £5.95 FREE
Overseas: Europe + 50p Others + £1.55
(Please order as MULTI-CHOP)

ZX-GUARANTEED (Dept PCW)

29 Chadderton Drive, Unsworth,
Bury, Lancashire BL9 8NL PL434

STOP-REVEAL

Genuinely let you:
1. STOP virtually all programs, Basic, Microcode & Headerless even if protected.
2. REVEALS hidden Basic in Microcode programs. (Could be clues in an Adventure or 10k of ANI ATTACK).

3. LISTS actual Microcode on screen.
Now you can STOP/STOP/stop/stop most Spectrum programs at leisure.

Includes a DISASSEMBLER to code even study Sinclair ROM etc. Plus the most Advanced HEADER-READER even written, plus pages of super SECRET of the TRADE explaining professional methods used to hide lines/programs, etc. EVEN STOP/REVEALS programs which are a GENUINE 48K LONG.

King's Lynn, PE30 1BX PL432

INTERFACE 007

The Ultimate Back-Up copier to Tape or Microdrive

Any program, even Hyper Loads or Headerless can be transferred at the touch of a button. Tapes can be Saved to re-load at 1,2,3,4 or 5 times normal speed. You do not need an extra tape recorder.

Simply plug INTERFACE 007 into back connector of your Spectrum. Load in your game as normal, play it first if you want. At any time press button on INTERFACE 007 and your program will freeze. Pressing key 1,2,3,4 or 5 will Save a copy to a blank tape at 1,2,3,4 or 5 times normal speed. This tape when reloaded will Load at this selected speed and recommence the game from point it was Stopped at. NOTE: Unlike our competitors, the Back-Up tape is NOT simply a dump of all the memory, but is only as long as the Data necessary for the game/program. Your Back-Up tape is transferred to a Microdrive using the special MD tape included.

INTERFACE 007 is now in production & will be ready for despatch beginning of July 1985. (Wafadrive version available in August).

INTERFACE 007 £29.95

ZX-GUARANTEED (Dept PCW)

29 Chadderton Drive, Unsworth, Bury, Lancs, BL9 8NL

MAGIC-MESSAGE PLUS

This tape lets you do remarkable things with programs. Such as:
★ Reveals and lets you change hidden basic in "machine-code" programs. (Even the basic messages in the Sinclair ROM will be revealed.) Could reveal clues in some games. Just for fun, a game was changed to say: "Written by Grim Cat!"

★ Parts headers on headerless files ready to load into magic-message or make them ready to transfer to a Disc/Wafadrive/Microdrive.
★ Makes tape headers for any programs (so will stop the unstoppable). Load magic-message, play in program and like magic messages will appear on video for you to read/change.

POST £5.95 FREE

Winning phrase No 32: "No-good thief nicks urinal" from Karen Rolph of Heaton, Tyne-and-Wear who receives £25. Others who came close included "I can't think of one!" from S G Young of Garrowhill, Glasgow.

Now voting on week 34 - £25 to win

Each week *Popular* is compiling its own special software top ten chart - compiled by YOU.

And each week we will send £25 to the person who sends in, with their chart votes, the most original (witty, neat or clever - but never rude) phrase or sentence made up from the letters (you don't have to use them all) in the titles of the top three programs in this week's chart, published above.

You can still vote in the chart without making up a slogan - but you won't be in with a chance of winning the prize.

All you have to do is fill in the form below (or copy it out if you don't want to damage your magazine) and send it off to: Top 10, *Popular Computing Weekly*, 12-13 Little Newport Street, London WC2H 7PP.

Voting for Week 34 closes at 2pm on Wednesday July 17 1985. Entries received after that time will not be eligible for inclusion in that week's voting. The judges decision is final. Only one entry per individual per week will be allowed.

DICE ROLL

Leisure Genius' *Cluedo* is a perfect example of just how to computerise a board game.

Most of the screen is taken up with a representation of the board, with all the rooms marked on it. Familiar territory this - how many childhoods were spent shuttling between the ballroom and the kitchen, or sneaking into the conservatory to use the secret passage?

The rest of the screen is used for status display for the particular player whose turn it is at the time. You get a menu of the various things you can do during a turn; highlight the one you want using the arrow keys, then hit enter. Above the menu is a picture of the character - these are direct copies of the cards in the game.

The options are of course those present in the board game - roll dice, look at clue cards, make accusations, and so on. When you roll the dice, a large die actually appears on the screen and rolls to the middle of the board - you then move your counter however many squares it shows.

There are also options in the game which control sound effects, how good your computer opponents are, and how quickly the game plays.

You can have up to six people playing, any or all of whom can be computer controlled. Set up all six on auto pilot, choose the quickest speed, and watch them play.

Each of the characters has their own theme tune, which is usually instantly recognisable and pretty apt - Reverend Peacock gets *Onward Christian Soldiers*, Miss

Scarlett gets the theme from *Gone With The Wind*. I can't quite work out why Prof Plum gets what sounds remarkably like the 2001 theme tune, though. Perhaps he should be investigated. All the same, you still miss out on the real thing - computerised board games just aren't as much fun as rattling the dice in a chipped mug. And the computer doesn't let you cheat either.

INGENIOUS

Sentient Software - probably most famous for the well-received *Key to Time* adventure - has gone budget. It has released a number of titles, at £2.99 (including *Key to Time*) with a Spectrum version on one side and a Commodore version on the other.

The programs are mostly adventures in the traditional text-only style. I looked at *Scoop*, since it features an intrepid reporter hunting for the scoop of the century, just like life on *Popular* in fact.

Two criticisms to begin with. First the adventure is obviously *Quilled* and yet no credit is given that I could see. Secondly, the opening section has you waking up in a bedroom described as having 'floral wallpaper... a woman's touch' - this is not only sexist and idiotic but if you are a woman playing the game immediately alienating and confusing. You could easily think that 'you' were 'at your home' rather than that 'you', being a man, were at a woman's home, which is the assumption made by the programmers. Naff thinking all round.

That said, the adventure is very ingenious and immediately compulsive. The bedroom you wake up in is chock full of interesting objects to examine and packed with puzzles - I mean I've found the suit and shoes but it won't let me put them on, so at the moment I'm wandering around naked, stuck in the bedroom.

Why don't programmers

realise that, particularly with adventures, there is a sizeable minority of women who want to take part in the game but find it hard to identify with male heroes. Don't they want to maximise their market and make as much money as possible?

INDENTED

Silas is an unusual utility for the BBC. What it does is reformat Basic listings to make them clearer and more elegant. For example, *For Next* loops are indented and nested within one another. Basic command words are highlighted and variables are always given a new line.

Once loaded the system is inaugurated via a function key. The reformatted listings can be printed out as normal and will appear in the *Silas* format with bold print replacing the colour highlighting.

For those who do a lot of Basic programming this could be a very useful utility indeed - the manual is very helpful and clear.

GOTHIC

CRL's *Rocky Horror Show* game has now been released on the Amstrad. It looks exactly like the Spectrum version but has a decent sound track à la Commodore.

The game was well reviewed for capturing the flavour of the original film surprisingly well - all the favourite characters are depicted, Brad, Janet, Magenta, Eddie the Biker with bike, Rocky Horror, Columbia and Riff Raff.

The graphics though small are also well done with an authentically gothic house and weird characters.

The music is very well arranged. The opening credits give you a rendition of the Time Warp and throughout the game it recurs deviously arranged in three channels.

The other nice touch is a facility to choose whether to be Brad or Janet - whoever you choose your will have been turned to stone. The actual game is simple - get the pieces of the demedusa spell and take them to the main stage within a time limit. The only problem is that it isn't all that difficult - I got about 75% of the way there first time.

Still, that could well turn out

to be an attraction for some people.

DEVIOUS

Dun Darach, I raved about recently on the Spectrum and I'm pleased to see it in the charts. Now the game has been converted to the Amstrad.

Like *Knight Lore* before it, *Dun Darach* shows that, with the right programmers, it is possible to convert Spectrum games to the Amstrad and have them look exactly the same - except for the fact that you don't have any colour clash problems. Thus *Dun Darach* on the Amstrad is even better looking than it was on the Spectrum.

The changes are mainly in the background - there are a few more colours here and there, a muddy brown for the city walls, a few more highlights on things like street names and so on. Other than that it's the same devious, witty, stomping boot boy, Celtic romp as the original. Another one of those games that is an essential purchase for Amstrad owners.

BUMP & GO

The Bond name may be the biggest licensing job around - a lot of software companies have wanted it for a very long time. Domark have it - for *A View to a Kill* at least.

At £10.99 it's not cheap and that, plus the fact that the name alone means it's going to sell thousands, could have indicated a chance to cash in quickly. When I saw the first of the three games that make up the package I feared the worst.

Part One is a car chase across Paris - baddie/goodie Mayday is floating around on a hang glider - you have to chase her around using a fast car and be ready to meet up with her when she floats back to earth. The screen is a mixture of top down view and three dimensional perspective. Either way it looks fairly dreadful.

The graphics are very small - so small in fact that it's almost impossible to tell which way around your car is facing. The maze of streets is also pretty characterless - simple rectangles and circles, and the 3D front of car view appears to be useless - it doesn't even show the other traffic. Not only all this but Bond appears to be driving one of those 'bump and go' toys since whenever the car hits a wall it seems to bounce

Pick of the week

HOLE IN ONE

There I was, just the other day, complaining about the fact that whilst golf simulations were a lot of fun they were almost always poorly or at least unexcitingly programmed. Lo and behold - *Nick Faldo's Open*, a golf game with all the trappings of animation, scrolling screens, and icons - and it's great.

Golf games are essentially simple - choose club type, set direction, set force of hit, and hope you end up somewhere near the flag. So it is with this game, but making the various selections is all accomplished by the use of a little hand that you shunt around between different icons. When all the parameters are set you move to a box with a golfer figure and caddie in it - assuming the club you have chosen is reasonably sensible the caddie hands it to you and the golfer swings at it. When the ball moves the top half of the screen scrolls to show its position.

The screen scroll is very well done - the view is top down on an accurate map of

the Royal St George Golf Course. The ball also travels correctly, seeming to grow as it comes 'up' towards you - such professional touches make the game. Another nice touch is the sarcastic caddie who will question some of your club choices if you get something silly - he will also mock your score if it's particularly bad.

One criticism, when you get very close to the flag it becomes very difficult indeed to see exactly where the ball is. This means it's very easy to drop a lot of shots without it really being your fault. Perhaps it looks OK on monitors but on your usual small portable it's annoying.

Nevertheless I loved it - this is definitely the golfing simulation to buy. A Commodore version is planned soon.

back in the opposite direction.

Thankfully, however, the two subsequent games are considerably better. In *City Hall*, the next section, we actually get to see James Bond himself. I was shocked - the last Bond film I saw was *Moonraker* and Roger Moore looked quite well, but on the evidence of this game the

poor spy is but a shadow of his former self, thin and rather weedy looking in fact.

Bond's walk also appears to have become a little strange. There is a lightness of step and posture of hands one would ordinarily associate with a ballet dancer. Is Bond still the man he once was or is his chasing of women merely a hollow gesture? I think we

should be told.

The City Hall game is ingenious – a kind of mini animated graphics adventure.

You are trapped in the building and must both rescue Stacey (femme fatale) from a lift and escape from the building which is slowly burning away.

The screen displays Bond and the current room he is in and a joystick controlled scrolling menu lets you search for objects, use them, drop them and so on. Finding the right objects, doing the correct things with them and doing it quickly enough will get you and Stacey away safely.

This section works well as a game and, apart from Bond's androgynous appearance, looks quite good too. The same menu system is used in the final section, called Silicon Valley Mine.

It's a very similar kind of game – move Bond around through the pits and caverns of a vast mine. A nuclear detonator is ticking away when it explodes the baddy will have destroyed Silicon Valley and will then be able to capture

the silicon chip market. (I know a lot of manufacturers who'd happily hand it to him on a plate at the moment.)

To save the Yuppies and possibly everyone else Bond, still looking disturbingly effeminate, has to rescue Mayday and stop the timber. Again it's a matter of finding objects and then figuring out what to do with them.

The main difference in this section compared to City Hall is that it's a lot more action orientated, and you get to do a lot of leaping around from rocky platform to rocky platform. Again, it works as a good game with some original touches.

The music on the Commodore version is very good indeed – particularly the main Bond theme – and even Duran Duran's rather lame hit is performed on three channels with some degree of flair.

The speech on the Commodore is also not bad – you can understand the words and it's used sparingly but effectively.

None of this is true of the Spectrum version which has awful music and is utterly unintelligible.

A View to a Kill is no mega program but if you think of it as two good games featuring everybody's favourite hero for £10.99, it isn't a rip off either.

A KNOCK OUT

There are a few boxing simulations around at the moment. Probably the best is Gremlin Graphics' *Rocco* – certainly it features the most impressive animation and graphics.

Rocco pits you against a series of fighters of growing skill – you simply try to last as long as possible. The display is unusual – you see only your top half and the face and top half of your opponent.

Controls are restricted heavily to left right defence and left right attack – this is either good or bad depending on how much you like very complicated simulations.

The graphics really are spectacular; the two boxers are drawn in great detail with shading and highlights to give them a solid 3D look. Even the crowd is impressive, throwing its arms up in the air with enthusiasm.

BAD LUCK

Atlantis has earned a good reputation as one of the first and better budget software houses. Alas, its most recent release *Pioneer* is not destined to become a budget classic.

Pioneer is *Scramble* with a helicopter instead of a space ship or jet.

The graphics aren't bad really – the helicopter is quite large and the characters are a little more than matchsticks. It's certainly difficult and in some ways challenging. Why then the complaint? It's simple really – the scrolling is appalling, among the worst I've seen with jogging, jittery movements that spoil the game.

Throw this one at a skilled machine code programmer for a couple of days and you might have a very neat budget shoot 'em up.

Untapped market

Only 10% of the potential home computer market has been tapped, we have been told.

So why is the remaining 90% not opening up, in fact doing the opposite if the stock exchange's attitude towards the home micro industry is anything to go by?

Perhaps it is because the potential purchasers are not as confused as the state of the market suggests the manufacturers are. Has any manufacturer ever tried some market research to find out what sort of product this 90% would want?

However, folk wisdom spreads fast and most of us seem to know now that small home micros are good for playing games on, can do a small amount of word processing if you have a printer and keep club records or the like. The 90% are not rushing out to buy one because they do not need what is on offer.

Thankfully the manufacturers have got the message that a 'proper' keyboard is essential now. Why we were insulted with anything else makes one wonder how seriously they took their own machines.

Other jokers in the pack have been software incompatibility and hardware that will not make standard connections to peripherals. But the home micro purchaser has just as much commonsense as a business purchaser; you are careful about buying a car where spare parts are difficult to get or service is scarce - it is no different with home micros. At least

some manufacturers are cottoning on to the simple strategy of CP/M compatibility, even MS-Dos, to tap the software base available there.

So what might attract all those potential buyers? Answer the question, "What do they want that a home micro could offer in the next few years?" and you should have the right idea.

People buy micros mainly for their functional use, unlike many other products which have an element of 'image' to attract the buyer. So what could it do that will realise (or create?) what most of us want? We like to communicate, to be entertained and to be better informed.

So far a home micro caters for a limited amount of recreation. If it could also offer us a better means of communication and becoming informed than we have at present there would be a demand for it.

In other words if a micro could give you the sports results, the news headlines, let you leave a message with someone else and at weekends give you a demonstration of how to plant tomatoes or plan your route to the seaside then of course you would want one.

However, there is a gulf between what we have now and the world imagined in the previous paragraph. The technology needed will involve a device capable of producing high resolution displays in colour as well as managing video images. It will also need to reference and display large text files, like an encyclopaedia, and manipulate them at the touch of a mouse.

All of which points to a machine with considerable processing power - 16-bit at least - linked to a compact disc Rom (for those text files), a videodisc (for the gardening demos) and a modem (to leave messages).

The operating system will need to be easy to use but sufficiently powerful to handle multi-tasking.

Will it be a British-built machine? One can hope, but at the moment most of the work done so far to link micros to videos and compact disc players has been carried out by the Japanese MSX companies.

John Mawhood

Over the pond

Puzzle No 165

In our local park there is a circular fish pond, exactly 75 feet in diameter. Paula, Quentin, Rachel, and Stanley were standing at various points on the pond's edge.

As it happened, the two girls were standing diametrically opposite one another. Also, both of the girls were an exact number of feet from both of the boys. If Quentin was closer to Paula than he was to Rachel, and Stanley was closest of all to Paula, how far apart was each boy from each girl?

(Note: The distances are direct measurements - not those around the circumference of the pond.)

Solution to Puzzle 161

A total of 35,937,000 bricks would be needed to build either one cube with 330 bricks along each edge, or 99 individual cubes with sizes ascending from order 11 to order 109.

```
10 LET L=11
20 LET T=0
30 LET M=1
40 LET C=M*M*M
50 LET T=T+L*L*L
60 IF T=C THEN PRINT L,M
70 IF T>C THEN LET M=M+1:LET C=M*M*M:
  GOTO 40
80 LET L=L+1
90 GOTO 20
```

The program works by generating the series of cubes from 11^3 upwards, keeping a note of the sum of the cubes after each step. If this total is also an exact cube, the result is printed.

Because of inaccuracies in some computers when working out cube roots, it is not necessarily accurate enough to test the cube root of any given total. Consequently, the program generates a separate series of cubes and uses these values to test the totals obtained.

Winner of Puzzle 161

The winner is Ian Watts of Middleton Cheney, Banbury, Oxon, who receives £10.

Rules

The closing date of Puzzle 165 is August 7.
