**WHATEVER
HAPPENED
in 1985**

**QL MEGA GRAPHICS
FROM TALENT**

**HUGO CORNWALL
BLOWS THE LID
OFF HACKING**

Now you can create new dimensions in Computer Graphics.

Create superb colour pictures on your QL with TALENT's outstanding new graphics package. It's supplied on two microdrives – the first holds the master program and a printer dump utility, the second, three demonstration pictures. Backup copies can be made. GRAPHIQL comes with a detailed, clearly-written 60 page instruction manual, outlining the program's many facilities.

- Freehand drawing, 8 colours, optional flash
- Rubber banding, rubber boxes, even rubber circles and ellipses
- Variable size texture definition
- Doodle pad
- Colour and texture fill of any shaped area

- User definable paint brush – any colour or width
- Colour list for full control
- Re-colour facility
- Magnification with panning
- Mirroring and rotation of blocks of screen
- Air-brush effect
- On-line 'help' facility
- Full file-store access
- Printer dump utility.

Text can be included in pictures. The characters can be single or double height with flash and underline. GRAPHIQL pictures can be put into BASIC or assembler programs with the sample routines provided.

Available from selected branches of
Boots & WH Smiths.
£34.95 + 50p

Sinclair User Annual is published by
EMAP Business & Computer Publications

If you would like to contribute to
Sinclair User please send
programs or articles to:
Sinclair User,
EMAP Business & Computer Publications,
Priory Court,
30-32 Farringdon Lane,
London EC1R 3AU.

Original programs should be on cassette and
articles should be typed. We cannot
undertake to return them unless a
stamped-addressed envelope is
included.

We pay £20 for each program
printed and £50 for star programs.

Typeset by Saffron Graphics Ltd,
London EC1.
Printed by Peterboro' Web,
Woodstone, Peterborough.
Distributed by EMAP Publications Ltd. ©
Copyright 1985 *Sinclair User*
ISSN No 0262-5458

INTRODUCTION 5

The home computer industry has undergone drastic changes during the past year. How do those changes affect the future of Sinclair computers and their users?

WHATEVER HAPPENED 6

A pictorial parade of the events which shaped 1985.

SINCLAIR SIMON 9

The comic cult hero who makes a hack of computing.

GREMLIN 11

The terror from the gossip jungle is unleashed again to bring you the events of 1986.

COMMUNICATIONS 13

Hugo Cornwall reveals the secrets of a hacker and William John shows how to set up your own communications legally. Gary Price explains how to tie your computer up to a printer.

ARCHIVE 24

Sandra Essex shows how to plug into the hidden powers of the Psion QL database.

TALENT GRAPHICS TOOLKIT 31

A professional QL program written specially for you by the standard setting Talent programming team.

ADVENTURE 35

A specially commissioned map of the worlds of Gordo Greatbelly with a key which will provide you with clues for some top selling adventures. Richard Price reflects on the best adventures of 1985.

SOFTWARE SCENE 45

The best and the worst of 1985's software. We provide an indepth analysis of the arcade, strategy, education, business and utility scene.

AT THE SIGN OF THE DANCING OGRE 79

An adventure game starring Gordo Greatbelly. Become bartender at The Dancing Ogre inn in a bid to rescue your love Marion.

HELPLINE 85

Andrew Hewson answers questions concerning user-defined graphics on the Spectrum and shows how you can produce sprites.

BOOKS 91

John Gilbert assesses the book market and looks at some of the titles from the shelf of 1985.

MYSTERIES OF THE OPERATING SYSTEM 101

Marcus Jeffrey shows how you can use QDOS traps in your programs and John Lambert explains the entry points of the Spectrum ZX ROM.

REFERENCE 109

A comprehensive software and hardware guide. We provide all you need to make the most of your Sinclair Spectrum or QL.

CALL 0267 231246 FOR PERSONAL ASSISTANCE

NEW LOW QL PRICE – JUST £199

MICRO MANAGER BY LOGISTIC SOFTWARE JUST £99.95

- ☆ **SALES AND PURCHASE LEDGERS** Up to 12 sales types with full reporting on each type. Running totals of sales and purchases.
- ☆ **NOMINAL LEDGER** Integrates with sales and purchase ledgers with up to 70 categories. VAT and profit and loss and end of year balance sheet.
- ☆ **INVOICE GENERATOR** Produces invoices, orders and credit notes in three different formats.
- ☆ **CUSTOMER AND SUPPLIER FILES** Complete reports on what is owed for one month, two month and over three month basis.
- ☆ **BANK MANAGER** Records all monies paid in and out and reports on debit and credit balance produced.
- ☆ **UNPROTECTED SOFTWARE** Transfer to disk or cartridge as required.
- ☆ **OPERATION** Menu-driven with helpful user manual.

NEW QCAD GRAPHIC DESIGN PROGRAM FOR JUST £39.95 ENABLES YOU TO EASILY DESIGN HIGH RESOLUTION GRAPHICS ON THE SCREEN

- ☆ SUPPLIED COMPLETE WITH USER MANUAL
- ☆ EXTENDED ELECTRONIC SYMBOL SET
- ☆ HIGH RESOLUTION SCREEN DUMPS TO MOST PRINTERS
- ☆ SET AND MANIPULATE SYMBOLS – MOVE – COPY, ETC
- ☆ SAVE AND LOAD DIAGRAMS
- ☆ BACK-UP SERVICE INCLUDED
- ☆ UNPROTECTED SOFTWARE TO TRANSFER TO ANY MEDIA
- ☆ DESIGN YOUR OWN SYMBOL SET

STRONG COMPUTER SYSTEMS

Bryn Cottage, Peniel, Carmarthen, Dyfed SA32 7DJ

Tel: (0267) 231246

SURVIVAL was the name of the game in 1985 and, despite the occasional shock, the players were successful.

In the big name league Acorn was the first to suffer from financial problems. Its share price fell, eventually being suspended, it owed creditors, including the BBC and AB Electronics, large amounts of money, and its machines were regarded as being too expensive.

Fortunately, Italian computer manufacturer Olivetti stepped in to save the business. After several months of negotiation the creditors extended the period of their loans to the company, and the BBC wrote off large sums which were due to them in royalties.

Sinclair Research, however, was a different proposition when it started to flounder in mid-1985. The company has a history of risk taking which does not inspire the sort of City money which is required to bail out a company with large debts. It needed a pioneer who was willing to take risks, and who would mix them with good business acumen, to take control.

Robert Maxwell was the ideal saviour. He had pulled the *Mirror* out of the doldrums, he evoked a strong nationalistic character — despite being Czechoslovakian — and had a liking for Sir Clive.

Unfortunately it was not to be and others, including creditors and the big London business institutions, were also unwilling to play ball. Sinclair did not have the respectability of Acorn with its BBC contract, and Timex, along with others, was not willing to extend credit over a long period of time.

To be fair big business was not very helpful to either Acorn or Sinclair and confidence in the computer industry from the stock market flagged dangerously during 1985.

The situation was ridiculous for three reasons. Firstly, computers rank among the top consumer products. They are now regarded on a par with washing machines, videos and hi-fi systems. Exports are also good and liable to double next year with the expansion of Spanish, French, Russian and US markets.

Large amounts of research into high technology areas are being carried out by such companies as Sinclair Research, yet support is hard to find from investors. Businesses may fall over each other to use the newest in

communications technology but they are a little more reluctant to invest in the industry which is creating it.

That leaves the question of who is principally to blame. Sinclair and Acorn both carry the can of mismanagement but other institutions are also indirectly responsible.

The Government carries some of the blame. Although it projects the image that it carries the torch of high technology facts show otherwise. It has invested a paltry sum of money in new microchip technology in Scotland and has shut down the Micros in Schools scheme which was introduced in 1976.

CoCom, the organisation which polices high technology imports and exports between allied and non-allied

Survival of the fittest

John Gilbert looks
back at a year
of doom and gloom

countries, has not helped to cultivate the interests of the British computer industry either.

CoCom, the organisation in charge of the import and export of technology between aligned and non-aligned nations, has not been helpful in the growth of the computer industry either. Its restrictions on the export of magnetic materials is a case in point.

The organisation has restricted the movement of certain types of magnetic material between countries. The higher the magnetic density of a product the more difficult it is to export. If a software house wants to ship programs or microdrive cartridge to the United States it has to complete a mass of red tape for each shipment.

If that was not enough to contend with the manufacturer must fill in all the forms supplied by CoCom and send them to London to be vetted. That can take weeks and cost the distributor or software house dearly. The red tape has recently been wound tighter with restrictions being imposed on floppy discs.

The industry also suffers from

being fragmented and, unlike those companies situated in the USA's Silicon Valley, it is not located in one area. If it was centralised then communication between software houses and machine manufacturers would be easier and perhaps more constructive.

Self interest groups such as The Guild of Software Houses, while laudable, are not doing the industry much good either. The companies which belong to them bicker about how much power they each should have and those who have not been invited to join write off such groups as useless.

GOSH should take a leaf out of the books of the retail trade. Bring down fees and more people will be willing to join. The more people who willing to join the more money the group will accumulate. Such a move would not only benefit software houses but users would see the benefits as companies learn to get on with each other and form common policies on prices and products.

Next year is important if the industry is to stave off attacks from the United States and Japan. Those companies have been friendly trade rivals as far as computers are concerned. While we have been quietly patting ourselves on the back, however the competition has been quietly creating such machines as the Amiga, ST and a new generation of 16-bit MSX machines.

During the next few months software will become even more important and the experience of companies who work within the Sinclair industry will pay dividends. Soon computers are going to be just little black boxes and it is then that such companies as Commodore will wish they had major personalities to head their operations.

Sir Clive Sinclair, and the industry which has been built up around his name, will continue to succeed because of his high profile. His company has one figurehead, something which few others have, and for that reason everyone can easily identify with his products.

If you are an old Sinclair hand you will know the benefits to be reaped from his machines. If you are a beginner the Spectrum Plus and QL are the best machines to show you the way ahead. Either way you will find *Sinclair User*, and this Annual, will provide all the help and advice you need for computing in 1986.

John Gilbert

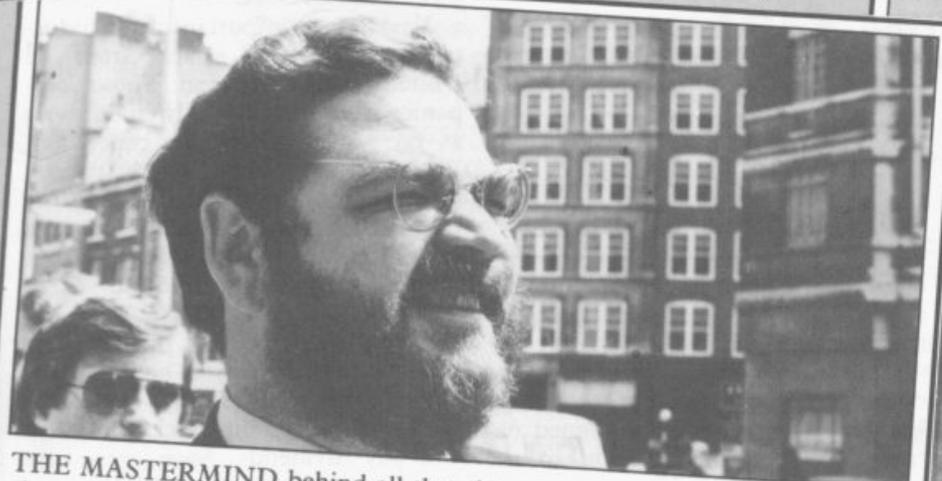

SIR CLIVE'S electric trike was launched in January and has probably inspired more jokes than any other vehicle in history. Hopes of flogging 100,000 in a year were swiftly dashed

and production cut right back. This particular photo appears to be aimed at residents of Greenham Common or Sellafield.

ONE WAY of selling a game is to tie it in with some famous personality or TV show. Elite's **Grand National** was an example from 1985, and here we see commentator Richard Pitman perched above the course at Aintree pretending to play the game.

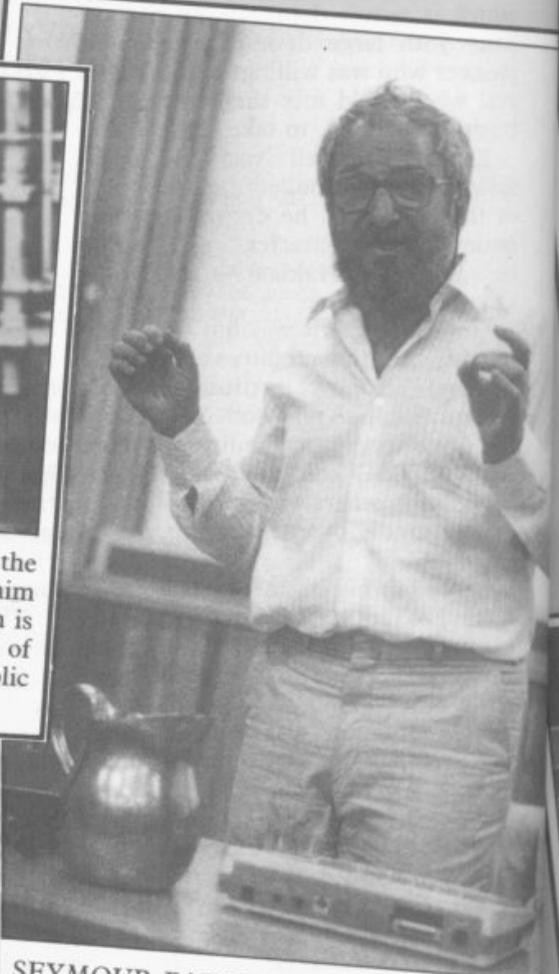

Somebody really should have remembered to switch the telly on before the photo-session started.

THE MASTERMIND behind all the chaos and clutter of the infamous ZX Microfair is Mike Johnston. Mike finances the whole thing out of his own pocket, and amazingly manages to keep the trestle tables groaning four

times a year without winding up in the dock as a bankrupt. Here we see him attempting to find the show, which is always held in some remote part of London out of concern for public health and sanity.

WHEN Cap'n Bob Maxwell announced he was buying Sinclair, one major problem was how to get rid of the vast stocks of computers in the warehouse which were not selling. One idea was to stitch up a deal in Eastern Europe, but with the Russians going for MSX, that did not look easy. We reckon the old 'send 25 box tops and a postal order for ten quid' routine was probably just as good . . .

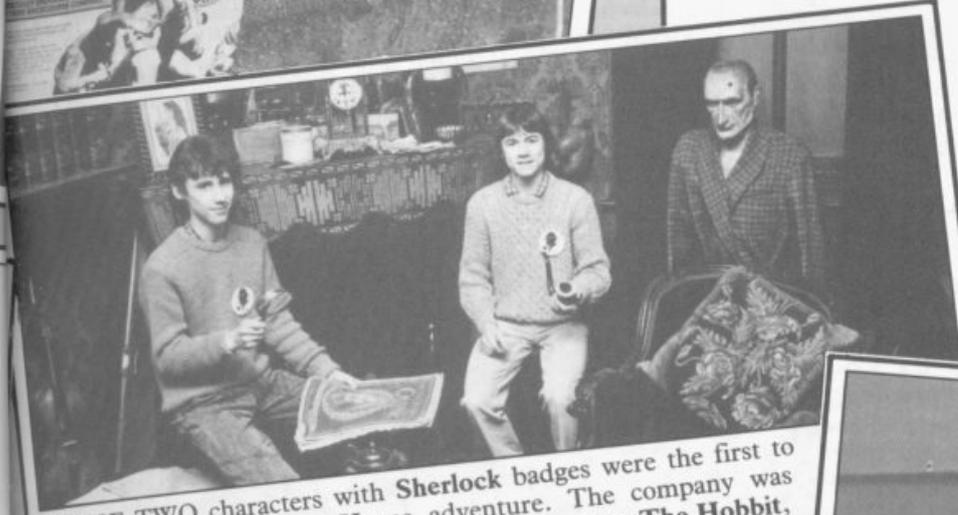

SEYMOUR PAPERT is much beloved of educationalists because he invented Logo, the language used mainly for drawing hexagons all over the screen. If you have a robot to do the drawing it's not called a robot but a turtle. The pic shows Papert about to demonstrate the little-known fact that Logo also makes all micros completely waterproof. Hence the word turtle . . .

ONE NEW development in games software has been the appearance of creative teams who design and write programs which are then sold to the software house. Denton Designs is one such, formed from the residue of Imagine after it went bust. Here the lads are begging David Ward of Ocean to take **Gift from the Gods**, their first program.

Ward's reaction is said to have been "Where's the high score table?" but he took the game away and Denton has gone from strength to strength ever since.

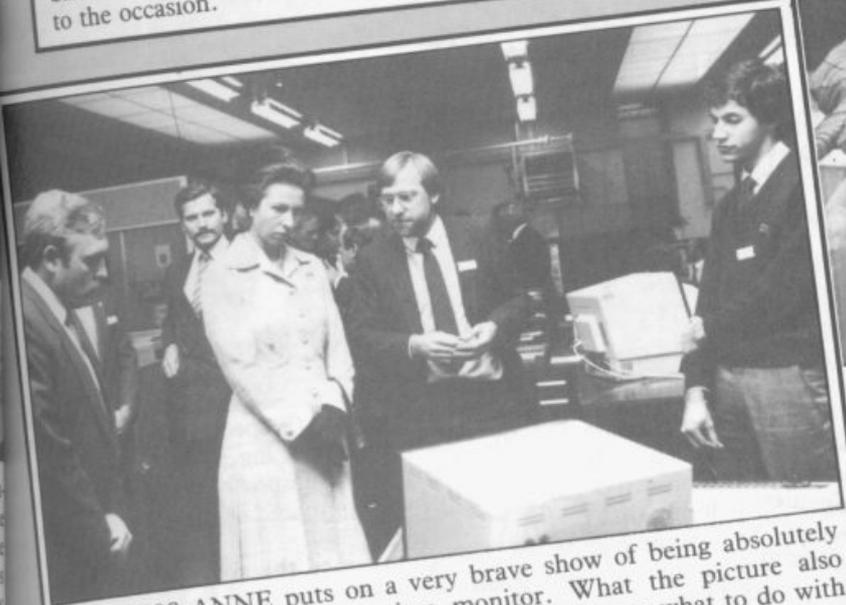

THESE TWO characters with **Sherlock** badges were the first to complete the Melbourne House adventure. The company was looking for a similar success to their legendary game **The Hobbit**, but Sherlock never made it. **The Lord of The Rings** seems much more likely to re-establish the Australian software house at the forefront of the adventure market.

To judge from his joyful expression, the guy on the right is a Sinclair Research accountant dragged along to add respectability to the occasion.

JUST when it really did look as if Sinclair was on the point of collapse, in stepped entrepreneur Robert Maxwell waving a cheque for £12m. Maxwell is never less than charming in public, but he is said to be a tough customer to deal with in the boardroom. Here is how the deal was announced after the two tycoons spent nine hours closeted in Cap'n Bob Maxwell's Oxford lair . . .

PRINCESS ANNE puts on a very brave show of being absolutely fascinated by a new Microvitec monitor. What the picture also demonstrates is how computer people do not know what to do with their hands after five minutes away from a joystick.

JUST WHEN everybody thought Cap 'n Bob had sorted the whole Sinclair deal out, he announced he wasn't going through with it. The board of Hollis, the Maxwell-owned company surprised everybody by refusing to okay the deal. Everybody but Maxwell, we presume. "Perhaps he hasn't got any money left," quipped Clive, announcing a £10m deal with Dixons.

SIR CLIVE'S happiest moment of the year is probably the one pictured above — the announcement of the waferchip. The round slice of silicon can hold vast quantities of information. The technology wasn't that new, the theory had been around for some years. Trouble was, nobody could find a way of producing the things cheaply and with reliability. Now Sinclair reckons he's cracked it. Can the waferchip be his route back to glory and new conquests?

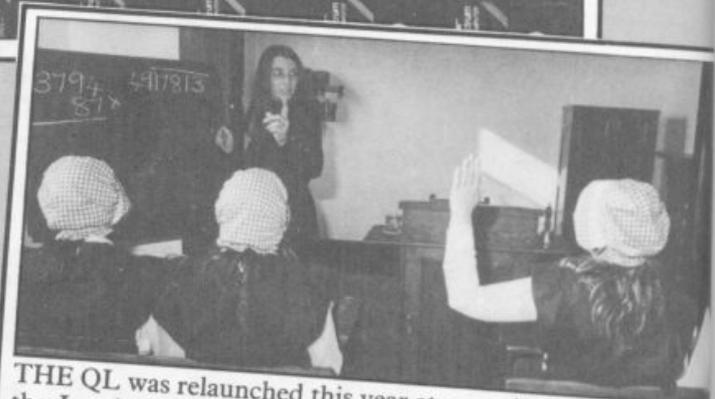

BY MARCH it was becoming clear that Sinclair had produced far too many computers before Christmas and was consequently stuck with thousands of machines it could not sell.

Here is a shot of the notorious Camberley Warehouse where Spectrums are being packed. Camberley is also where you phone for technical help, if you can get through to someone who understands what you are talking about.

Camberley is also that strange part of Britain where 28 days last three times as long as anywhere else . . .

SINCLAIR RESEARCH headquarters are up in Camberley, along with a whole army of other hi-tech companies. It used to be a bottling factory, but the architects evidently had the bright idea of melting down the bottles and building a greenhouse instead. People in glass houses, and all that . . .

THE QL was relaunched this year at a special mini-fair held at the London Hilton. One problem facing the QL has been a lack of software. That is partly because of the high cost of microdrive cartridges when compared with cassettes and floppy disks.

Some companies have complained that Sinclair does not do enough to help them duplicate programs onto microdrive. That is quite unfair. The picture clearly demonstrates Sinclair's willingness to help dealers and programmers with any problems they might have . . .

January

FRESH FROM the annual Christmas punch-up at the Baron of Beef in Cambridge, Sir Clive invites the world's press to the London Hilton for a quick glass of Perrier and a glimpse of his new Pandora portable computer. The small black box is dwarfed by huge placards indicating the awesome potential of the machine.

So impressive are the placards – 5Mb RAM, built-in pocket TV, microdrives – that Gremlin completely fails to notice the gaping hole in Pandora's rear.

'Everything is in hand' says Slugger, applying raw liver to his left eye.

Two weeks later Acorn announces a new version of the BBC with a built-in telephone, at £799 . . .

February

AUTOMATA wins the Computer Trade Association's Game of the Year award for the third time. Christian Penfold expresses surprise on receiving the coveted trophy. It appears that not one copy was ordered by distributors nor did a single review appear in the computer press. Even more strangely, explains an embittered Christian, "there was no £\$%!!× game because you have \$\$%@£×/s put us out of business months ago."

The new Acorn computer is universally condemned by the Press . . .

March

COMPLAINTS begin to filter through about the new Pandora.

Meanwhile, 34 Liverpool software houses go bust in the same week, but fortunately for their directors 33 new ones are formed immediately . . .

April

BRAZEN Backslappers of the Year Award goes to Elite for announcing that the average age at the Kindergarten is finally over 21.

Unfortunately the figure goes down to 15 again, after ageing sales manager Steve Wilcox is caught sheltering in an old tyre factory and is torn limb from limb by disgruntled distributors after the catastrophic sales of **Le Mans 24hr Spin-off** . . .

May

THE FIRST Pandoras are received by

long-suffering customers who ordered in January. Although the microdrives are a bit dodgy, they work well enough if you switch the pocket TV off. The real breakthrough is the revolutionary battery which you strap to your thigh. Leads – £14.95 extra – run up through your underwear and plug in to the power socket. Fears over safety are met by Slugger's comment: "I've had wires up mine for

A year in the life of . . .

The new BBC school computer . . .

years."

The whole business is universally condemned by *The Observer*, which rants on about financial markets and bores everybody witless . . .

June

THE NEW managing director of Sinclair Research is none other than Mr Micro-Arts himself, Geoff Davis. The high priest of pretension reckons the Pandora is a great example of 'bio-degradable text-synthesis' . . .

July

MIDSUMMER has now become the traditional freebie season as software houses launch all their games early to

avoid being overwhelmed by some dire American import at Christmas.

Grand Sultan of Ocean, David Ward, steals a march on the competition by buying the entire McCormick stable of overrated athletes. This ensures a steady flow of tacky games such as **Boris Becker's Big Serve** and **Tony Knowles' Strip Snooker** . . .

August

THE WALLIES at Mikro-Gen announce a new line of games commencing with **We're all Berks**. Apparently you have to guess which one of 4096 flickering sprites you are actually moving with the joystick.

As far as Gremlin is concerned, it is even more silly than the new BBC Micro, with built-in CB radio . . .

September

ULTIMATE'S **Camra Obscura** is unseated from number one spot by **Arnold Schwarzenegger's Biceps** from Ocean.

Elite, Alligata, Argus and DK'tronics immediately bring out body-building games. The graphics are awful, but pumping the joystick does wonders for the physique . . .

October

NOBODY tells the BBC about Acorn, so Chris Curry and his Italian masters win the contract yet again. With no computer available, the machine actually put into schools is the Olivetti Lettera 22 portable typewriter . . .

November

SLUGGER is furious about the Acorn business but since the Pandora is still undergoing "teething troubles" he can do nothing about it, except keep a date at the Baron of Beef and hope someone from Acorn turns up.

December

AMID horror stories of a totally unforeseeable slump in demand at Christmas, 87 software companies go bust as Mastertronic sweeps the charts with **Stupid Steve's Sticky Thumbs** given away with Bubble-gum. "It's the end of quality software" moans David Ward, as **Zola Budd's Tragic Trip** flops out at number 107.

The new BBC typewriter is universally praised by the press . . .

BETA BASIC 3.0

SINCLAIR USER, JAN. 85 (ABOUT RELEASE 1.8): "HAS ESTABLISHED ITSELF AS THE STANDARD EXTENDED BASIC FOR THE SPECTRUM.....TURNS SINCLAIR BASIC FROM A GOOD VERSION OF THE LANGUAGE TO A FANTASTIC ONE..." NOW, WITH RELEASE 3.0, BETA BASIC BECOMES PROBABLY THE MOST POWERFUL BASIC AVAILABLE ON ANY 8-BIT MICRO.

- **PROCEDURES** - a very full implementation that lets you extend Basic easily. With parameter passing by value or by reference (including arrays), LOCAL variables, recursion, DEFAULT parameter values, and the ability to handle parameter LISTS of any length. No PROC keyword is needed; e.g. you can use things like: swop a,b or draw_box 10,20,5 or addup b1,sum.
- **GRAPHICS** - up to 128 WINDOWS, each with its own character size (giving 1-64 chars/line!) and attributes. ROLL and SCROLL any part of the screen by any number of pixels in any direction! Use GET to store parts of the screen, then put them back anywhere at different magnifications. Fast FILL, ALTER attributes, PLOT strings, DRAW TO a point, change scale and origin.
- **TOOLKIT** features: Rename with block move or copy; block DELETE, search and/or change (e.g. ALTER applies TO al. 36 User-defined keys. List the variables, list a procedure, list DEF KEYS.
- **EDITOR** - lets you move the cursor around the screen 10 times faster! And you can move the cursor up and down within edited lines. AUTO, EDIT, JOIN and SPLIT commands.
- **LISTINGS** with optional automatic indentation of loops, IF, procedures etc. Works on existing programs e.g. you can choose to list:
10 FOR n=1 TO 10: PRINT n: NEXT n
or: 10 FOR n=1 TO 10
PRINT n
NEXT n
- **KEYWORDS** can all be entered by typing them in full, or by the "single entry" method, or both in the same line; e.g. the line:
10print"hello";if x=1 THEN goto 100 will be recognised and listed normally.
- **Upgrades** to Release 1.8 customers: If you bought direct from us, there is no need to return your cassette - just quote the (approximate) original purchase date with your order; otherwise return your cassette and name your supplier. The upgrade price of £6.95 (£7.50 overseas) includes a new manual.
- **ARRAY** and string handling features include fast INSTRING (100,000 chars/sec) and INARRAY search functions. You can JOIN arrays together, delete, transfer and insert sections, change dimensions without data loss. LENGTH function gives dimensions. Ultra-fast array SORT - e.g. a\$(500,30) will sort in about 3 seconds!
- **MICRODRIVE** commands let you use simple forms, or exactly the same commands you normally use for tape - just enter DEFAULT =m1 or m2. Some possible Microdrive commands: SAVE "name", ERASE "name", LOAD l, "name", SAVE 10 TO 100; "part prog"; SAVE a "slice"; or just the variables. MOVE programs, CODE, arrays, MERGE auto-running programs. End-Of-File function.
- **OTHER FEATURES**, new or improved, are too many to describe: DO - LOOP structure with WHILE, UNTIL and EXIT IF; BREAK, CLEAR, CLOCK, CONTROL, CODES, EDIT variables, ELSE, GET, KEYIN (programs can write themselves!) MULTILET, (L)LIST a "slice", ON (works with line nos, procs, etc.) ON ERROR, OVER 2, POKE strings, POP, READ LINE, TRACE, USING, DPOKE. Faster GOTOS, GOSUBS and FOR-NEXT loops.
- **26 FUNCTIONS**: AND, OR, XOR, DEC, HEX\$, BIN\$, fast SINE, COS, RND%, CHAR\$, NUMBER, DPEEK, EOF, FILLED, INARRAY, INSTRING, ITEM LENGTH, MEMORY\$, MEM, MOD, SCREEN\$, SHIFT\$, STRINGS, TIMES, USING\$.
- **Spectrum Basic compatible** - you can run existing programs. Transferable to Microdrive. Syntax check on entry. Extra error messages. Compatible with most printer interfaces (please specify). Waft-drive version available.
- **Comprehensive A5-size manual**. More than 80 pages, with many examples.
- **To show you the power of Beta Basic's procedures**, we include a FREE TURTLE GRAPHICS package!
- **Release 1.8 remains available**, at a lower price of £4.95 (£5.50 overseas). You can upgrade later to Release 3.0 for £6.95 (£7.50 overseas).
- **TRANSFORM your Spectrum with BETA BASIC 3.0** for just £14.95 inclusive! (£15.50 overseas).

(TICK AS APPROPRIATE.) PLEASE SEND ME:
 [] BETA BASIC 3.0. PAYMENT OF £14.95 (OR £15.50 OVERSEAS) IS ENCLOSED.
 [] BETA BASIC 3.0 UPGRADE. PAYMENT OF £6.95 (£7.50) IS ENCLOSED.
 [] BETA BASIC 1.8. PAYMENT OF £4.95 (£5.50) IS ENCLOSED.
 [] MORE INFORMATION ON I HAVE/DO NOT HAVE RELEASE 1.8 ALREADY.
 A STAMPED ADDRESSED ENVELOPE IS ENCLOSED.

ZX SPECTRUM PRINTER INTERFACE

"One of the most comprehensive printer interfaces available for the Spectrum. With a choice of both Centronics and RS232 in the one interface it will satisfy most." (SINCLAIR USER MAGAZINE).
 "A remarkable device which packs considerable ingenuity into a small box. Should be almost irresistible." (COMPUTING TODAY)
 "I will keep looking for the perfect interface but in the meantime I'll use the next best thing - ZXLprint III." (ZX COMPUTING)

£34.95
cable £9.95
inc. VAT

ZXLprint III interface enables your Spectrum computer (16 or 48K) to print on almost any dot matrix or daisy wheel printer with RS232 or Centronics input. Just plug in ZXLprint III and LPRINT and LLIST commands will work. COPY works without any software on Epson, Star Delta, Brother HR5 & 1009, Gemini, Walters WM80, Mannesman MT80, Kaga Taxan, Cannon, Shinwa, Seikosha 100, 250 & 500. Plus Seikosha GP700 in FULL COLOUR. Also available is optional COPY in 4 colours on CGP115, MCP40 & 80 and SCP80.
 No additional software needed - RAM is free to take Tasword 2, Masterfile, OCP +80 software, Kemp Business Accounts etc.

- WORD PROCESSING • PLUG IN FOR LLIST, LPRINT & COPY
- PRINTS SPECTRUM GRAPHICS & UDG's • HIGH RESOLUTION SCREEN DUMPS • TWO COPY SIZES ON EPSON & COMPATIBLES
- PRINTS PRESTEL FRAMES WITH SUITABLE MODEM
- COMPATIBLE WITH MICRODRIVES & INTERFACE 1

POOLSWINNER

THE ULTIMATE POOLS PREDICTION PROGRAM

- **MASSIVE DATABASE** Poolswinner is a sophisticated Pools prediction aid. It comes complete with the largest database available - 22000 matches over 10 years. The database updates automatically as results come in.
- **PREDICTS** Not just SCOREDRAWS, but ALWAYS, HOMES and NO SCORES.
- **SUCCESSFUL SELEC** guarantee that Poolswinner performs significantly better than chance.
- **ADAPTABLE** Probabilities are given on every fixture - choose as many selections as you need for your bet. The precise prediction formula can be set by the user - you can develop and test your own unique method.
- **SIMPLE DATA ENTRY** All team names are in the program. Simply type in the reference numbers from the screen. Or use FIXGEN to produce fixture list automatically (see below).
- **DISC/MICRODRIVE COMPATIBLE** Tapes supplied with conversion instructions.
- **PRINTER SUPPORT** Full hard copy printout of data if you have a printer.

AVAILABLE FOR Spectrum (48K), Commodore 64, VIC 20 (+16K), AMSTRAD, BBC B, Atari (48K), ZX81 (16K), Dragon, Apple II, ELECTRON

PRICE £15.00 (all inclusive)

Boxed, with detailed instruction booklet

NOW AVAILABLE

FIXGEN 85/6

AT LAST! No more struggling for hours to get the fixture list into the computer. FIXGEN has been programmed with all English and Scottish fixtures for 1985/6. Simply type in the date, and the full fixture list is generated in seconds. Fully compatible with Poolswinner.

POOLSWINNER with FIXGEN £16.50 (all inclusive)

COURSEWINNER v3 THE PUNTERS COMPUTER PROGRAM

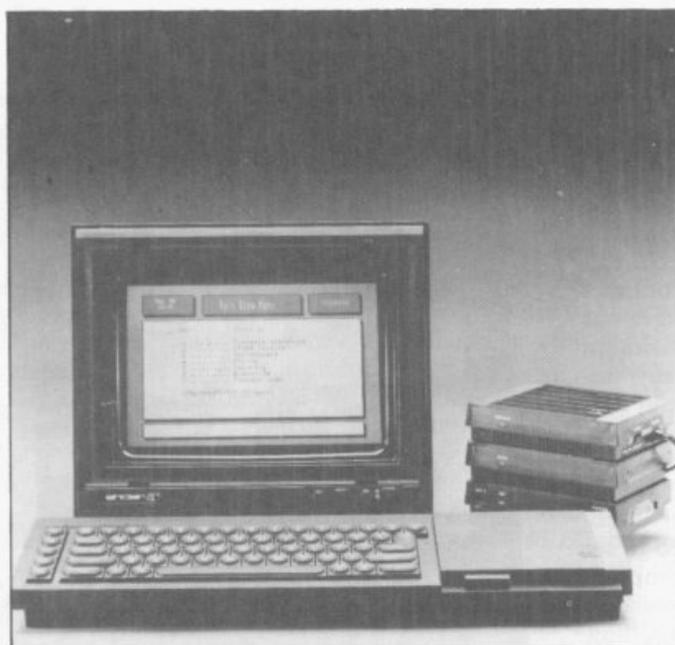

You can develop and test your own unique winning system by adjusting the analysis formula, or use the program in simple mode. Coursewinner V3 uses statistical analysis of major factors including past form, speed ratings, course statistics, prize money, weight, going, trainer and jockey form etc. etc. It outputs most likely winners, good long odds bets, forecasts, tricasts etc. The database includes vital course statistics for all British courses. You can update the database - never goes out of date.

AVAILABLE FOR Spectrum (48K), Commodore 64, BBC (B), AMSTRAD, Atari (48K), Apple II
 PRICE £15.00 (all inclusive) includes Flat AND National Hunt versions.

Communications

Expand the power of your Spectrum Plus or QL. Hugo Cornwall, author of the best selling *Hackers' Handbook* explains how he became a hacker and why he thinks his part time profession has such an appeal to teenagers.

John Williams continues the hacking theme with an introduction to communication networks such as Micronet 800 and Prestel. He provides all the information you will need to reach bulletin message boards.

On a different tack Gary Evans shows you how to interface your computer with a printer. He explains the differences between RS-232 and Centronics standards and how to set a baud rate.

Code Busters

Hugo Cornwall, author of the best-selling *Hacker's Handbook* explains the myths of hacking, and why so many are addicted to that most peculiar of pursuits

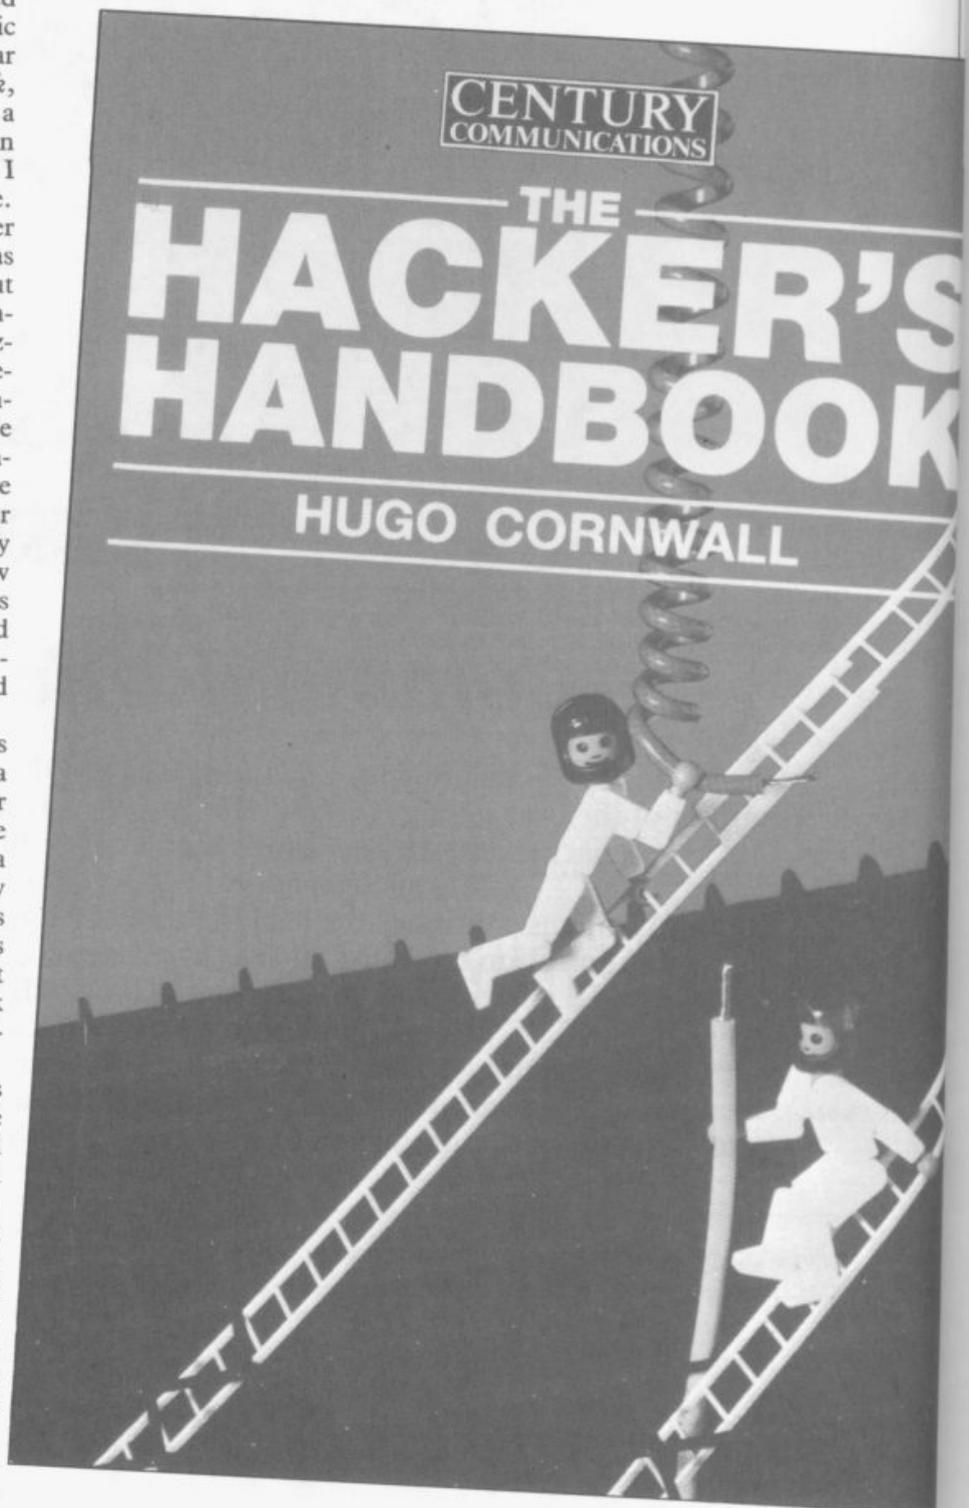

I HAVE become somewhat bemused by the extent of interest in the eclectic pastime of hacking. Earlier this year my book, *The Hacker's Handbook*, which was expected to stimulate a lively but modest interest, spent seven giddy weeks in the best-seller lists. I have been wondering why ever since.

I have been a hacker for a number of years. My original basic motive was to look at remote databases without have a salesperson to guide my fingers. A skilled demonstrator can dazzle you with flashy features and prevent you seeing how limited, or clumsy the service really is. Many people would have thought my level of interest rather technical. I wanted to see how quickly the remote computer responded to my requests, how easy the instructions were to follow, how complete the information and facilities offered. I have always been seduced by the vision of the universal electronic information service, and I wanted to be among the first to use it.

I began to collect 'phone numbers and passwords — when I didn't have a legitimate password, I invented or discovered one. I thought of those episodes as country walks across a landscape of computer networks. By and large, the owners of those services were anxious to acquire customers and, rather like farmers who don't mind careful rambblers, polite network adventurers like myself were tolerated.

In the early days of computer clubs — the sort that met after hours in the local polytechnic — I began to find people who had similarly acquired lists of interesting phone numbers. Only their preoccupations were not always the same as mine. There were those who sought facilities for playing with advanced languages of the type that could not be placed on micros, or those who wanted to locate the big games that were run on large machines.

As Prestel became more widely available, my attention was focused on discovering its hidden features, or

experiments in progress. My Prestel explorations were mostly carried out under my own legitimate ID; the fun and skill was to find information you were not supposed to see. A constant area of interest was the unindexed Res.D database — page 640 — which was run by the Martlesham Research and Development Laboratory.

If you persisted, you found hints about Prestel's future plans. At other times you could see experiments for what was then called Picture Prestel — dynamic frames before they had been announced, devices to render compatible French-standard videotex with that used in the UK, foreign character sets, and so on. On other pages, you could see what IPs were planning. In those early days, you could often download telesoftware free, because the IP had sent the frames but hadn't placed any charges on them. At one stage I was even able to see a demonstration of Prestel's status monitoring device — VAM-PIRE.

It wasn't until late 1982 that anyone used the word hacker in its modern context. Up until then, hackers were American computer buffs who messed around on mainframes, or built their own home computers in garages. Quite suddenly, hacker had a new and specific meaning. At about the same time, it became evident that there were network explorers whose main interest was not the remote computers themselves, but the defeat of entry validation procedures.

Then came the bulletin boards, and with them the Hacker's SIGs — Special Interest Groups. For the first time I became aware of the number of

"Up to publication our ambition was to be the best-selling computer book of 1985"

people who seemed to have acquired the same curious interests. I, and some of the other contributors to the Hacker's SIGs, were being watched to see if we would qualify to be admitted to an elite group.

There was a super-secret SIG at that time, masquerading under the name of Penzance — Pirates of . . . — where it was said to be safe to exchange really sensitive material. In my book I included some disguised Penz-

ance material under the name Erewhon, with the result that many people started to track down Erewhon or Nowhere. In fact, by the time the book was published, Penzance had already changed its name and form, and the only relic is my choice of pseudonym — Cornwall.

I still firmly believed that hacking was the recreation of a tiny minority. When Simon Dally — formerly of Century Communications and now the business mind behind MUD, Multi-User Dungeon — said he thought hacking needed a handbook, I got in touch to say, in effect, "You cannot be serious".

Right up to publication our ambitions were relatively modest — to be the best-selling computer book of 1985. We had no thought of competing with the best-sellers from the rest of the book world.

Undoubtedly, the single event which gave the book mass attention was an unwise remark by John Austen, then the recently appointed head of computer fraud at Scotland Yard. Asked by the ever-sharp Jane Bird of the *Sunday Times* what he thought of the idea of a hacker's handbook, he condemned it unread. He gave her a good story and me, unexpected publicity. The book trade was unprepared and by the end of the first day after publication, the first edition had vanished from the shelves, creating another element in the mystery. It was widely believed that the book was unavailable because it had been banned.

I had already decided that there were to be no public appearances by Hugo Cornwall, and only the most select of interviews — a strategy which made my publishers apprehensive. To secure wide attention for a book you need a body — an author who can be wheeled around the television hospitality suites and into pubs where the press hangs out. Deny the media a body and human interest vanishes. Hugo Cornwall was the exception. His very elusiveness added to his attraction. In fact, two uncomplimentary biographies were deliberately released to add to media confusion.

There are very definite reasons for my insistence on anonymity. In the first place, my job in the real, non-hacking world, has some considerable responsibility attached to it. I have never betrayed a confidence — I really do believe in a hacker's code of ethics — but it could alarm some of my

colleagues to think I might. Secondly, I have noticed the willingness of public figures to condemn loudly that which they have not read or seen. While I don't mind being criticised for what I say and do, it seems a bit much to be victimised for what some MP or

"Hackerdom is not worth the martyrdom of arrest and conviction"

other opinion-moulder thinks I have said.

Shortly after publication, two men were arrested on alleged hacking charges, thought to be in connection with the Great Prince Philip Prestel Hack. Many newspapers seemed to think I was one of them. Several claimed that *The Hacker's Handbook* had been referred to the Director of Public Prosecutions.

By contrast, serious hackers who had read the book were polite about the writing, but disappointed with the content. The book claims to be an introduction to those who know very little, not the last word for those who already know a lot. Besides, hackerdom is not worth the martyrdom of arrest and possible conviction.

Hugo Cornwall has become a full-blown media-myth. Those who have interviewed me felt, I think, a little short-changed. I do not resemble the hero of the film *Wargames* or any other stereotypes of hackers. I am quite a bit older, not particularly obsessive about computers and relatively well socially adjusted. But I don't think too many people are interested in the reality — they want the myth to be completely real.

A folk-myth is not something that is utterly untrue. It starts from a basis of truth and then takes on a life of its own, as those who repeat it find it so compellingly attractive that they invest, in each retelling, some of their own most important feelings.

Two good examples from British history are King Arthur and Robin Hood. King Arthur was probably a Celtic warlord. He became, for the Celts, a symbol of their lost independence and identity as other European tribes invaded Britain westwards. So he was dubbed the Once and Future King. Robin Hood was a nobleman, dispossessed of his lands, who

apparently showed more care for the common people than did most of his class at that time. So he became the man who robbed the rich to give to the poor.

The only way in which I can solve the conundrum of the success of my guide to hacking is by turning to the idea of the folk-myth. Don't get me wrong. Of course hackers exist, and the methods and events described in the book are all, as far as I can determine, true.

The real attraction of the book is that it represents an idea of hackerdom, rather than reality. Lots of computer owners want to be hackers — though many of them, if I read my post-bag correctly, aren't prepared to put in the necessary work. Lots of non-owners are filled with a sort of admiration that they almost dare not express, because hacking is, after all, semi-legal, isn't it? And it's not only the general public who find the idea of the hacker attractive.

The hacker is a convenient scapegoat for the owner of a large, vulnerable computer. It is easier to think of criminals as outsiders, rather than your own staff, although all statistics collected on computer frauds state that unauthorised access by outsiders accounts for far less than the five per cent of the actual threat.

For those selling computer security systems, the hacker is a wonderful sales-aid. "Buy my hacker-cracker gismo", they cry. Most large computers and associated software already contain security devices quite sufficient to deter unauthorised outside access, provided system managers and legitimate users are prepared to adopt the necessary procedures. It is through slackness that hackers are successful — over 95 per cent of all hacks rely on simple password acquisition — reading passwords that have been left carelessly disclosed, or guessing the ludicrously simple choices that are still widely adopted.

The hacker is immensely attractive to the authorities. The detection of fraud is one of the most intellectually demanding tasks that is asked of a police force. In terms of the time and effort taken in order to prepare a particular case, it is extremely unrewarding. And when the court comes to consider, there is a real danger, as the persistent lobbying tells us, that an ordinary jury will lack the intelligence and knowledge to enable it to convict. The policing problems with computer

fraud are even greater. The value of the hacker, in those circumstances, is that chasing after him gives everyone a sense of justice being done.

For the general public, whose view has been moulded by newspaper reports of sensational hacker successes, as well as movies like *Wargames* and its TV derivative *Whiskids*, the appeal must be powerful indeed, to gauge by viewing figures. *Wargames* was not great cinema; it is accurate in its representation of what hackers do in the same sense that *The A Team* and *Streethawk* are documentaries on US law enforcement.

I think the hacker-myth boils down

to the belief that even the biggest computer, and all the control that it implies, is vulnerable. Ever since the 1960s, when the sociologist Jacques Ellul wrote about the forces of technology taking over from the decisions of mere man — progress forcing the pace of change without human kind having too much control over direction — we have been scared of the computer as an entity in itself. We have been scared also of the organisations that run the largest databases, and most powerful machines, because they hold part of our privacy. It is the hacker who appears to demonstrate that it may be possible to fight back.

Subj: US PHONE FREAKING
USA Phone Freaking is done with a 2 out of 5 Code. The tones must be with 30
Hz, and have less than 1 % Distortion.
```

```
Master Tone Frequency = 2600 Hz.
>1 = 700 & 900 Hz
>2 = 700 & 1100 Hz
>3 = 900 & 1100 Hz
>4 = 700 & 1300 Hz
>5 = 900 & 1300 Hz
>6 = 1100 & 1300 Hz
>7 = 700 & 1500 Hz
>8 = 900 & 1500 Hz
>9 = 1100 & 1500 Hz
>0 = 1300 & 1500 Hz
>Start Key Signal = 1100 & 1700 Hz
>End Key Signal = 1300 & 1700 Hz
> Military Priority Keys 11=700 & 1700 ; 12=900 & 1700 - I don't recommend
using these.
The method of use will be explained in a separate note. DO NOT DISCLOSE WHERE
YOU GOT THESE FREQUENCIES TO ANYONE!
```

Subj: UK PHONE FREAKING
```

The UK system also uses a 2 out of 5 tone pattern.

```
The Master Frequency is 2280 Hz
>1 = 1380 & 1500 Hz
>2 = 1380 & 1620 Hz
>3 = 1500 & 1620 Hz
>4 = 1380 & 1740 Hz
>5 = 1500 & 1740 Hz
>6 = 1620 & 1740 Hz
>7 = 1380 & 1860 Hz
>8 = 1500 & 1860 Hz
>9 = 1620 & 1860 Hz
>0 = 1740 & 1860 Hz
>Start Key = 1740 & 1980 ; End Keying = 1860 & 1980 Hz
>Unused I think 11 = 1380 & 1980 ; 12 = 1500 & 1980 Hz
This is from the CCITT White Book Vol. 6 and is known as SSF No. 3 to some
B.T. Personnel.
```

The 2280 Hz tone is being filtered out at many exchanges so you may need quite a high level for it to work.

Mr. Software

FREE GAMES!

YES....place an order for our Spectrum Magazine and we will send you one of the above games absolutely free. We will also enrol you in our Discount Software Club enabling you to purchase software at huge savings over shop prices. We offer all the latest titles at substantial discounts such as, **Frank Bruno's Boxing** at £3.95 (saving £3.00), **Frankie Goes To Hollywood** at £6.95 (saving another £3.00) or **Spy Versus Spy II** at £6.95 (saving yet another £3.00). We also have a number of older titles at even bigger discounts, such as, **Alchemist**, **Zoom** or **Cosmic Cruiser** all at just 95p each. In all we have over 200 titles available for your computer.

SIX MAGAZINES A YEAR

A subscription of just £5.00 will bring you six magazines a year through the post. Each magazine is packed with reviews of all the latest software, reader's game playing tips, competitions to enter, our reviewer's personal choices and a summary of how the other magazines rate the new releases.

HARDWARE AND UTILITIES SUPPLEMENT

Every new subscriber to the magazine gets a 32-page review of some of the more popular utilities — such as word processing software — and hardware including joysticks and Spectrum interfaces.

HOTLINE KEEPS YOU UP TO DATE

Subscribers to the magazine can phone our 24 hour Hotline for up to the minute news of the latest releases. A three minute recording, updated weekly, details the new titles and their prices. Club members may order by phone too!

EASY ORDERING

You can order from our substantial range as and when you like. There are no minimum order requirements — you don't *have* to buy anything at all. When you do order we do our best to despatch your goods within a week — often quicker.

DON'T TAKE OUR WORD.....

Here's what some of our subscribers say:

"I am very pleased at your quick response. I know that the enclosed order will be dealt with quickly and efficiently as always."
J. Mann, Wallsend, Staffs.

"I think your Club is sensational, terrific — who else could offer such bargains."
David Barrows, Northampton.

Tap the network

THE MOST IMPORTANT fact about computer communications is that it is not expensive.

Dialling into Prestel — Britain's largest database — costs around 40 pence an hour. The necessary Spectrum hardware will set you back only £50, plus £24 a year for the subscription fee.

For that modest sum you get 350,000 screenfuls of information — everything from train timetables to up-to-the-minute world news — and an electronic mail service guaranteed to enhance your social life.

Pay a little more, and you can have home banking, the hottest Stock Market information, or a 35,000 page computer magazine.

Behind the screens

Telecommunications — or comms — involves linking your micro down the 'phone line to another computer. Sometimes that remote machine is identical to your own, and the practice is referred to as user-to-user comms, but usually the distant computer is

William John shows how to connect your computer to a database and receive information down the telephone line

agement — so that it doesn't give you screenfuls of garbage — to sophisticated messaging services and keyword search.

The information stored on those remote databases falls into two categories.

The first is aimed at those for whom knowledge is money. Stockbrokers desperate for a ten second lead on the competition, researchers weary of endless treks around libraries and newspaper vaults, and lawyers glad of an alternative to shelves full of vastly expensive reference books. They all need access to huge pools of rapidly-changing information and are willing to pay premium rates to get it.

Secondly, there are databases in-

with features for the human side of computer buffs; lonely hearts areas, advertisements for professional services, agony aunts, gay contacts, and a screen version of CB radio.

Equipment

As an interface between your micro and the 'phone line you need a black box called a modem. A similar modem sits between the 'phone line and the remote computer you are dialling up.

Modems are necessary because a computer moves data around, inside itself, on the equivalent of multi-lane highways — the electrical impulses travelling down parallel wires are like cars travelling side by side down a motorway.

If there are eight impulses travelling in line abreast, then your machine is an 8-bit computer; 16 impulses signify a 16-bit computer — and so on.

For most purposes, though, 'phone lines can only carry one electrical pulse at once — the signals travelling in single file down the telephone wire. So the modem has to convert the parallel impulses inside our computer into serial impulses suitable for the 'phone system — and vice versa.

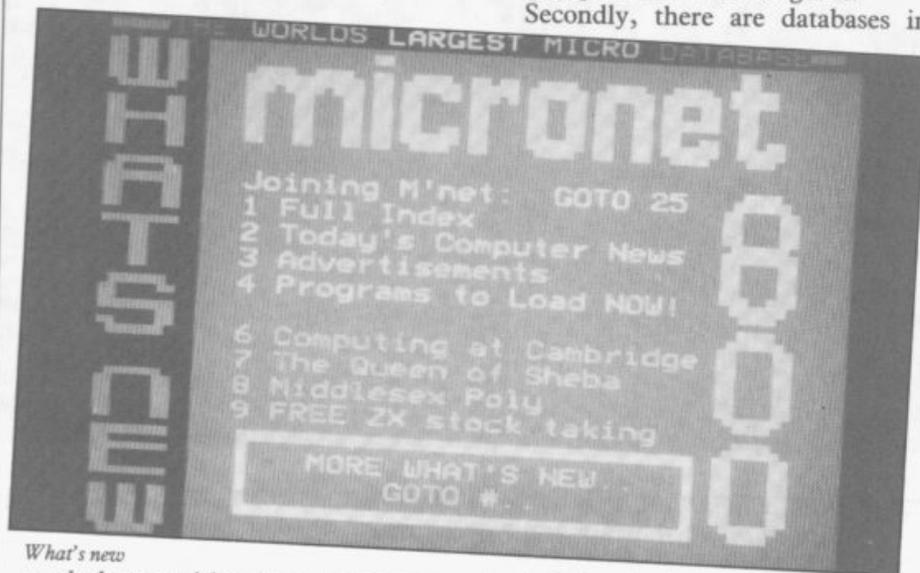

The modem must also ensure that its output is at an appropriate voltage or frequency. The two computers it interfaces must be readied in their respective send and receive modes before data begins to flow.

It must also conform with the terminal software in your micro which governs how incoming data will be handled — how it will be stored in memory, displayed on-screen, and so on.

The job of the modem is further complicated by the differing speeds at which remote computers send data to your micro. Data speed is measured in baud — a unit indicating the number of modulations per second occurring on the 'phone line.

The Prestel database sends out data to its 60,000 subscribers at 1200 baud, and receives data back from them at 75 baud. The vast difference in speed reflects the fact that Prestel was built to send out much more data than it receives.

Although the Prestel standard of

What's new

vastly larger with a huge data storage facility, often on hard disc.

Put simply, you are paying to use someone else's disc storage facilities, and for information which other users or commercial companies have left on those discs.

The remote computer also has a degree of processing power, ranging from the bare minimum of disc man-

tended for the domestic market. Not surprisingly, most of those have a strong slant towards computer hobbyists who comprise the bulk of their users, concentrating on computer news and features, and software you can pull down the 'phone line into your machine.

The wisest of consumer-orientated databases are broadening their appeal

1200/75 is widely adhered to, and will gain you access to most of the large international databases, many smaller databases run on a 300/300 baud protocol. Your modem should be able to operate at lots of different baud

fell into the hands of comms specialists, Modem House, which sells the device for £49.95 and throws in an £8.00 voucher towards your Micronet membership.

Those remarkably low prices are doubtless spoiling the pitch for other

livery is complemented by a sophisticated range of features, including auto-dial, auto-answer and the automatic sensing of baud rates.

My chief reservation about QCOM is that the supplied modem unit is limited to 1200/75 and 1200/1200 operation, and that its sleek good looks would be compromised by the use of a more versatile device. At £219.65 it is also more expensive than its main rival, the £180 Bright Star modem from Modem House.

The latter device is a single box unit built around the 7910 modem on a chip, and should offer a range of facilities similar to QCOM's.

The QL modem from Medic has a similar one-chip modem at its heart, but the device will only appeal to owners buying other units in the company's range: the modem is priced at a competitive £150, but demands investment in the £99 Medic motherboard before connection can be made to the QL.

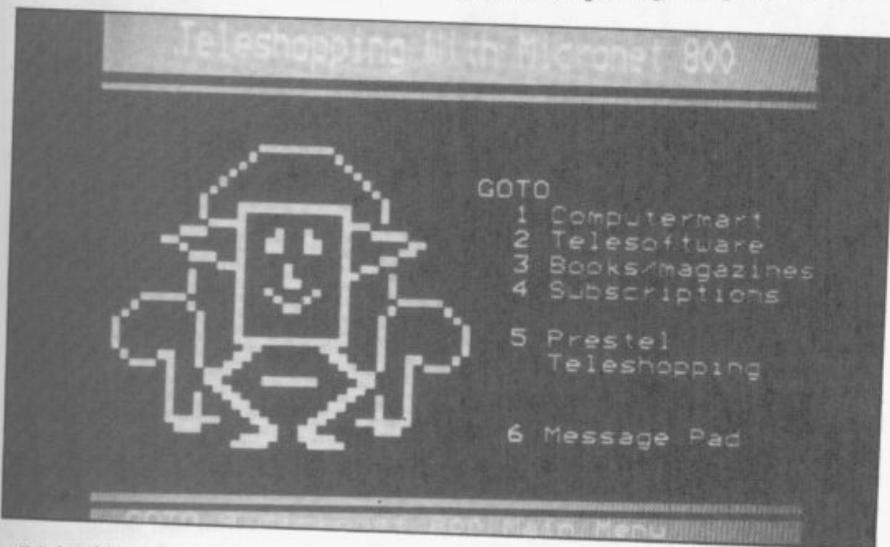

Inevitably, Miracle Technology has launched a modem interface for the QL, too. The £40 device should allow the computer to access any conventional modem.

A conventional modem would not, of course, include the Spectrum's VTX5000, but the interface does offer the prospect of cheap QL comms to existing modem owners, or to users prepared to shop around for cheap modems on the second-hand market.

Choosing a database

The largest UK database is British Telecom's Prestel system. Stored on hard disc in a series of GEC mini-computers, Prestel is organised to the viewdata format of information distribution.

Viewdata looks just like the BBC's

Teleshopping

rates, giving you access to as many on-line databases as possible.

Spoilt for choice

Modems are generally built to plug into the RS232 port on their host computers. But neither the Spectrum's Interface 1, nor the QL's two serial ports provide that standard RS232 output. Therefore, the two machines have to rely on specially-customised modems — although interfaces providing standard outputs are about to be launched and should give access to a vastly wider range of modem hardware.

Spectrum owners needn't worry about any of those technicalities — they should buy the VTX5000 modem. Inexpensive, tried and tested, the VTX offers baud rates suitable for Prestel and user-to-user comms. It can also download a software patch from Micronet enabling it to access scrolling databases such as the giant US systems, and British Telecom's Telecom Gold.

The VTX's main limitation is that it cannot access those amateur bulletin board databases which operate only at 300/300 baud rates. It nevertheless remains the standard modem for Spectrum owners, and offers more than enough scope for the comms newcomer.

Due to the receivership of manufacturers OE Ltd and of distributors Prism, a large number of cheap VTXs

would-be Spectrum modem manufacturers. Waiting in the wings is well established modem maker, Miracle Technology — who promise a £45.95 modem interface for the Spectrum. That will allow the computer to link to more sophisticated modems such as Miracle's own £130 WS2000.

Modems for the QL have been advertised since late last year, but at the time of writing none are available for purchase or, therefore, for recommendation.

The computer's best-known comms system is the QCOM package originally developed by OE Ltd, and acquired by Tandata after the former's receivership.

QCOM has acquired semi-official status following its appearance in numerous Sinclair Research advertisements, and its QL-compatible black

Ceefax service — brightly coloured pages of text and crude graphics — but it is sent down the 'phone line instead of being broadcast via the TV signal. And unlike Ceefax, Prestel's hard disc system ensures that an unlimited number of pages can be stored and almost instantly accessed.

Thanks to the BT connection, Prestel can offer local call charges to 92 per cent of 'phone users. Comms hobbyists can also avoid the computer time-charge, which ceases to be levied outside office hours — hence the figure of 40pence an hour.

Prestel was the world's first public-access database, and its pages still contain much dross from the years when nobody had much idea what users might want from such a system. However, one corner of the database will be of immediate interest to computer buffs.

Micronet is a 35,000 page computer magazine stored on an area of the system called Prestel Microcomputing. It is one of the few successful electronic publications in Britain, and the best place to experience comms in action.

Indeed, right after buying the VTX5000 modem, every budding Spectrum comms enthusiast should shell out the £66 annual subscription to join Micronet 800. Access to the rest of Prestel is included in that price.

Micronet is best regarded as a daily newspaper for Spectrum, BBC and Commodore 64 users — except that its news section, updated every day, has an even shorter print lead-time.

What makes Micronet so interesting is its 16,000 other subscribers, and the network of electronic pen-pals which they generate.

An electronic letter costs nothing to

send — except the local call rate to dial into Prestel — and arrives at its destination anywhere in Britain, in two seconds flat. Unlike a conventional letter, it avoids the paraphernalia of paper, envelope, stamp and letter box because it is sent and received from your computer screen. And unlike a 'phone call, it does not require its recipients to be at home, and allows them to respond in their own time.

Its main disadvantage is that recipients have to log on before they can read their mail, which, I suppose, brings us back to where we started — the addictiveness of the medium.

Micronet members have access to the rest of Prestel, and many users have been drawn to the system's other main facility — that of home banking.

Schemes run by the Bank of Scotland and the Nottingham Building Society provide bank statements, account transfers and bill paying via your Prestel terminal. Of the two, the Bank of Scotland is more attractive, requiring no minimum deposit — though neither service can avoid the fact that cash withdrawals and cheque

deposits still require a trip to the High Street.

Beyond Prestel

Besides Prestel and that other BT giant, the message-orientated Telecom Gold service, there are dozens of other databases in the UK.

Those range from commercial organisations such as the One-to-One telex relaying service and the BLAISE on-line index of British Library stock, to tiny operations run by private enthusiasts using a personal computer and a domestic 'phone.

Of those one-man databases, the two most worthy of a long distance call are The Gnome at Home — 01-888 8894 — and London Underground — 01-863 0198.

But there is no reason for limiting your comms experience to Britain. Equipped with any of the modems recommended above, you can access databases all around the world.

A word of warning, though. Even if you subscribe to BT's PSS service — a low cost system for sending data down a shared 'phone line — 'phone charges may still be prohibitive, and foreign databases generally charge much higher subscription fees than Prestel.

Bearing that in mind, most comms users will probably limit themselves to a brief dabble in one or other of the major US databases.

Their scrolling, monochrome text-only display may look monotonous after Prestel, but their stark appearance is indicative of a more hard nosed technical approach. US services are more advanced than Prestel in their provision of features, such as keyword search and user-editing.

The first US databases to try are CompuServe, 5000 Arlington Centre Boulevard, Columbus, Ohio 43220, USA, and The Source, 1616 Anderson Road, McLean, Virginia 22120, USA.

A QUALITY LIGHTPEN
for the SPECTRUM computer

- Incorporates features not provided with other pens. • Push button operation on pen - no need to use keyboard. • Works under any lighting conditions. • Plots to pixel accuracy. • 20 pre-defined commands allow plotting of geometric shapes, including triangles, lines, circles, etc., text, or user-defined characters. • Uses all paper and ink colours. • A screen grid may be turned on and off, at will, to assist drawing. • Flexible erase capability. • All drawings can be saved to tape for further use. • Plugs in direct - no batteries, additional components, or adjustments needed. • Handbook, plus printout of routines for use in your own programs.

PLUS: 3 SOFTWARE PROGRAMS

- Routines and ideas for your own programs. (Menus, games, music, etc.)
- User-defined graphics creation program.
- Superb full colour drawing program as illustrated in these actual screen photographs.

Send cheque or P.O. for £29.00 to: Dept.

DATAPEN MICROTECHNOLOGY LIMITED,

Kingsclere Road, OVERTON, Hants. RG25 3JB 0256 770488
or ask at your local computer shop. Send S.A.E. for details.

Lightpens and software are also available for BBC B, Dragon, CBM-64 and VIC-20.

SINCLAIR REPAIRS BY THE SPECIALIST

Walkers will repair your computer at a realistic price.

You send a cheque not to exceed £30.00 your computer will be repaired and returned the same day or send for a free quotation. Most repairs will be in the range £15.00-£30.00 subject to machine.

INFINITE SOFTWARE CLUB NEWS

INFINITE SOFTWARE CLUB is a user group set up by us to help people of all ages to share KNOWLEDGE of the SPECTRUM and programming and an OPPORTUNITY to have your very own programs published and allow others to learn from your talent. We are now in our third year and have many services to offer you - the Spectrum owner.

Send S.A.E. for more details...

INFINITE SOFTWARE CLUB NEWS

An interface is an important and necessary add-on for printing. Gary Evans describes its uses and the way in which it operates

SO YOU want to see your name in print? How do you go about achieving that ambition? Well, you could enter into negotiations with Cap'n Bob Maxwell to arrange for a look in at the *Mirror* but, quite frankly, your chances are about as great as Ronnie Reagan running a sub-four minute mile. Fortunately, if you own a Spectrum there is an alternative approach to the problem.

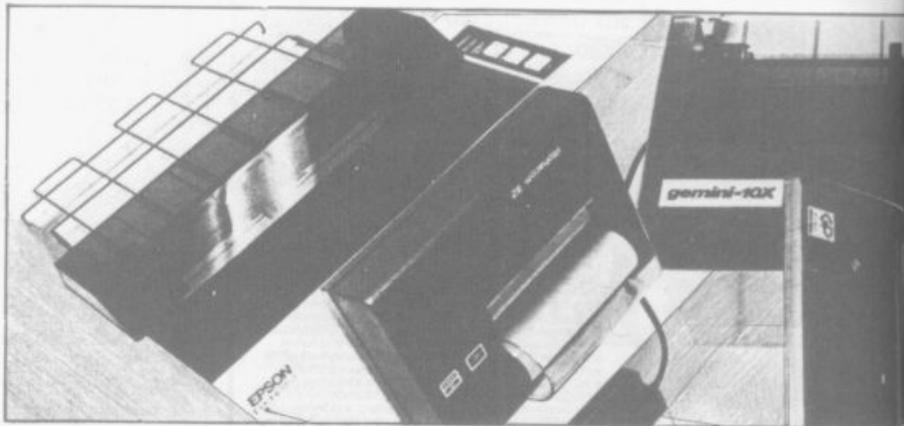

The first thing you are going to need is a printer. That is likely to set you back in excess of £100, more like £200 for a printer capable of producing decent hard copy. In order to get your printer dumping out your program listings with your name writ bold along the top you are going to need a printer interface, which will add another £30-£40 to the bill. We will return to the reason why the Spectrum requires an interface in a moment, but at this stage will address the obvious question — why spend 250 notes to add a printer to the Spectrum?

The initial reason for wanting a printer will vary from user to user, but once you have connected one to your computer you will wonder how you got on without it. Have you ever tried to copy a program from a magazine into the Spectrum? They never seem to work first time; it is usually a simple keying error. Trying to debug a long listing on the screen is a nightmare. Imagine being able to print out your errant piece of software and compare it with the published listing, away from the computer.

A printer can be of benefit if you are hooked on adventure games — it will allow you to keep a record of the correct moves and help to avoid repeating past mistakes. Buy a word processor such as **Tasword** and the printer will allow you to produce faultless items of prose.

Having convinced you that a printer is a must, just a few words about the selection of a suitable model. If you want to produce printouts which are legible, try to save up for either a

Connection

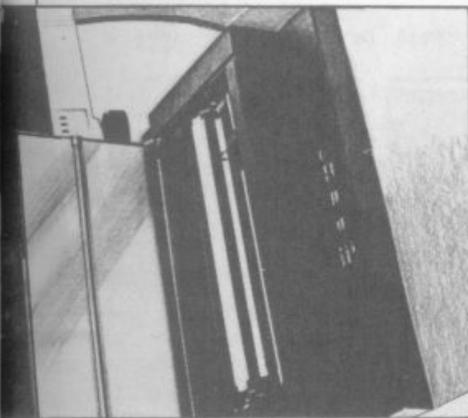

thermal or dot matrix printer — electrostatic printers work, but only just. The choice of thermal and dot matrix printers is vast, and shopping around should reveal a printer that will be within your budget. One thing to make sure of is that any printer you buy for the Spectrum has a Centronics parallel computer interface. Some thermal typewriters have an RS232 interface that is not, in general, suit-

able for use with the standard Spectrum, although if you have Interface 1 fitted to the machine that will connect directly to an RS232 printer.

Having got yourself a printer, the next difficulty to face is how to hook it up to the Spectrum. With many computers that is no problem as the manufacturer will have built some form of printer interface into the computer. In the case of the Spec-

Pin No.	Signal	Direction	Explanation
1	RDP STROBE	Input	The strobe signal for data (RD1~RD8) read-in. Data is read in after the signal reaches a high level. Positive logic
2	RD1	Input	Shows eight bit parallel data from the first bit to eighth bit. RD1, RD8 match LSB, MSB respectively.
3	RD2	Input	
4	RD3	Input	
5	RD4	Input	
6	RD5	Input	
7	RD6	Input	
8	RD7	Input	
9	RD8	Input	
10	IRT	Input	The initial reset signal which returns the printer to READY. (Same conditions when turning on power).
11	$\overline{\text{RDA}}$ BUSY	Output	A signal to indicate whether printing is possible or not (Data can be entered or not). Negative logic and data can be entered with the signal at a low level.
12	$\overline{\text{STATUS}}$	Output	It responds with this signal, checking whether there is printing paper or not, and checking the condition of the printer mechanism in response to status demands from the host machine. It is negative logic and this signal is at a high level during correct conditions. This signal is at a low level when there is no printing paper or when trouble with the mechanism is caused. Logic GND level.
13-25	GND	—	

trum, the designers decided to keep the cost of the basic machine down by omitting such niceties as user interfaces. The grandly named Expansion Bus at the rear of the computer is just a way of getting at the inside of the computer without having to remove

during that operation, otherwise characters will be lost.

Turning now to the pin-out of the Spectrum's expansion port, shown in Figure two, while it is easy to spot data lines that look as if they could be connected to the printer, there is no sign of a STROBE or BUSY connector. The job of the interface is to whip up these lines from those provided by the Spectrum. It does that by decoding some of the control signals generated by the Z80 processor at the heart of the Spectrum. For example, when the Z80 wishes to output data, it signals the fact by taking its IORQ line to logic 0. The Z80 is capable of dealing with up to 256 different I/O lines and the interface must decide when the processor is outputting to the printer. Decoding the IORQ line and the address lines yields the STROBE signal to the printer. A similar process, but in reverse, provides the means of getting data from the printer's BUSY line into the Spectrum.

Most printer interfaces are designed around a special Integrated Circuit — IC — given the name of a PIO — Parallel Input and Output — together with a couple of other chips. The PIO, in addition to performing some of the decoding, provides another very useful function, it buffers the Spectrum from the printer. This means that the circuitry of the computer is protected from anything that may happen at the printer's input. A fault at the printer will only harm a cheap IC, not the Spectrum.

The job of the interface does not end with sorting out the electrical connections between the printer and the Spectrum. You will recall that a printer expects data to be presented to it according to the ASCII format. Unfortunately, the Spectrum does not store all data in that format. Line numbers within a program are stored in a binary representation; key words are stored as tokens rather than as an ASCII text string in order to save memory; block graphics characters must be changed before they are sent to the printer. It is obvious that some software is needed to take care of those conversions.

The way in which interfaces operate

vary from design to design — the best will be transparent in operation. That is a posh way of saying that all the user has to do is press LLIST and the printer will start to dump out a program to the printer — there will be no need for any special commands. An interface accomplishes this by making use of the printer reflection provided in the Spectrum's operating system. In an unmodified Spectrum, the commands associated with a printer will generate output in a format suitable for the long gone ZX printer. That data would be of little use to any other type of printer. The reflection byte means that it is possible to intercept data before it is passed to the ZX printer driver, and to modify it in a way suitable for driving a normal ASCII printer.

The best interfaces will have their software stored in EPROM and there will be no need to load the program from tape every time you wish to use a printer.

Printer interfaces combine clever electronics with a small section of program to interpret signals generated by the Spectrum, so that they can be understood by off-the-shelf printers. Many companies produce excellent printer interfaces that also provide other facilities such as a joystick interface. Glance through the adverts in this annual or in *Sinclair User* to get an idea of what is available, bearing in mind the various points made above.

Finally, a word for QL owners. The QL has built into it both a printer interface in the form of its RS232 ports and, within **Quill**, a range of printer drivers. Many users of the QL wish to use the computer with a parallel printer and, in this case, they too will require a printer interface. The design of that unit is very different from one designed for the Spectrum. The job of a QL interface is to take the serial data output by the computer and to assemble it as a parallel byte of data. Once again those interfaces are designed around a special IC called a UART — Universal Asynchronous receiver/Transmitter. That chip takes care of most of the work involved and the complete conversion is taken care of by hardware — there is no need for any software.

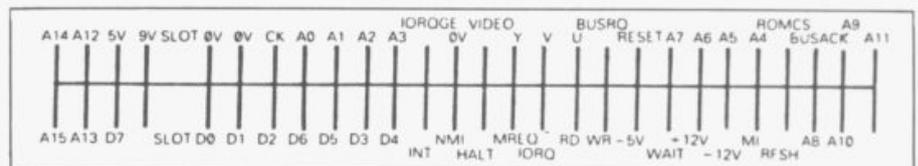

the lid.

The job of the printer interface is to take the raw information, produced by the Spectrum, and to convert it into a form that can be used by the printer to form recognisable characters. As is so often the case, that task is handled by a mixture of hardware and software.

The connections to a typical Centronics interface are shown in Figure one. The functions of the various lines can be broken down into two distinct areas. Firstly there are the data lines — eight of those, labelled RD1 to RD8. Those lines expect information as to which character is to be printed and to be presented as an eight bit ASCII character — ASCII is the agreed format in which computer information is transmitted.

The 256 unique codes that can be represented by eight bits each have a character associated with them. As the entire alphabet — upper and lower case — plus all numerics and punctuation marks can be represented in far fewer than 256 codes, it is obvious that many ASCII codes are associated with special commands that are not often encountered.

The other lines on the Centronics connector are referred to as control lines. The STROBE line expects an input from the Spectrum to indicate that the data present on lines RD1 — RD8 is a valid character and that it should be printed. The BUSY line is a signal generated by the printer to indicate that it is not ready to accept data. It could be that the print head has reached the end of a line and is moving to the start of the next, output from the computer must be halted

Archive

THE POWERFUL QL database specially commissioned from Psion by Sinclair Research has not received its due acclaim. Its facilities are equal to other databases which cost three or even four times the price of a QL but its problem has always been that it is not very user-friendly.

Sandra Essex corrects its faults, turning the program into a memory driven system which prompts enough for users at any level of ability. Her ideas bring new life to a program which every QL owner possesses.

Database diary

Running a business is time consuming, often frustrating. Sandra Essex shows how Archive can make life easier

COMPARED with expensive business database software, **Archive** can often be more easily used to produce very sophisticated applications. It only requires a little imagination and patience to learn the built-in procedural language, to achieve some remarkable results. The listings which follow provide an interrelated set of procedures which make up a salesman's calling diary, including associated expenses. It could easily be changed to suit individual needs, but working through the notes will show how to structure groups of procedures to obtain more elaborate programs.

The manual already shows how **Archive** commands and functions such as First, Next and Last can be entered directly from the keyboard. Using the procedures editor — type "edit", Enter — allows you to write complex procedures — procs — which can trap errors, do complicated maths functions, sort and alter files with just a few key presses. Those procs can be saved to a microdrive and loaded automatically when needed. This example assumes that a printer and monitor are attached. A TV can be used, but some adjustments to the program will have to be made to fit 64 characters on the screen. REM statements point to any **Archive1** differences.

First we create a database file — dbf — within a proc. That is good practice and avoids end creating too soon by mistake. It also allows the fields to be edited before calling the proc and creating the dbf. **Proc a** in listing one shows the name of the procedure. When creating a file within a proc — **proc makefl** — the command **endcreate** must be added. The **company\$** field is arranged in ascending **order** before the file is closed. The use of **first,next** is then related to the field

company\$. If you want it arranged in descending order use "**order company\$d**". **Order** only works on the first eight characters, so names such as British Telecom or British Aerospace would have to be abbreviated. You can **order** up to four fields, but the more fields ordered, the fewer files **Archive** will be able to support.

Design your screen and save it as "**recall**". Make sure you are in

entered and will later be displayed. **Archive1** allows entry outside the specified area but **Archive2** needs one extra space — dot — than the text to be entered. Limiting dots to what can be printed, say, in a mail list file, will make sure that text fits an address label. Using **sedtit** makes the screen easier to read and allows more variables to be shown. Remember that the default screen is very limiting because

Listing one

```
proc a
  rem save "filemake"
endproc
proc make
  create "callrep"
  company$:contact$:area$:day$:mon$:year$
  notel$:note2$:distance:due:day2$:mon2$:year2$
  vdate$:vdate2$
endcreate
  order company$a
  close
endproc
```

mode0 and type **sedtit**. The variables display from top to bottom and left to right should read: **company\$; contact\$; area\$; day\$; mon\$; year\$; notel\$; note2\$; distance; due — due** must be set at line: 14, col: 62; — **day2\$; mon2\$; year2\$**. The **vdate\$** and **vdate2\$** do not need to be seen and so are not displayed. The dots show the screen area where the text is

you can only use **insert,alter,sinput** on fields that are displayed.

Efficient use of memory is obviously important. Whilst all procs could be saved and then loaded together, it would have the effect of seriously reducing the available working memory. Therefore, the program can be broken into three parts by saving each separately. **Proc a** shows what each

Listing two

```
proc a
  rem save "report"
endproc
proc menu
  print at 22,56; ink 4;"FILES IN RECORD ";count()
  message;choice$
  print at 24,56; ink 4;"MEMORY LEFT ";memory()
  let opt$="": while opt$(">"e"
    let opt$=lower(getkey())
    if opt$="e"
      message;"CLOSING ALL FILES": close : mode 1,8: stop : endif
  print at 24,56;rept(" ",24)
  if opt$="i" or opt$="a" or opt$="d" or opt$="v":message;wait$
  run object "report1":rem archive(1) = run "report1"
  endif
  if opt$="p":message;wait$
  run object "report2":rem archive(1) = run "report2"
  endif
  endwhile
endproc
proc message;mess$
  print at 23,0;rept(" ",80)
  print at 23,0; ink 2;mess$
endproc
proc start
  mode 0: let wait$="*** PLEASE WAIT FOR SYSTEM TO LOAD ***"
  let choice$="Insert (i): Alter (a): View (v): Delete (d):
  Print out (p) End (e) ?"
  print at 10,15; ink 2;wait$: open "callrep": sload "recall"
  cls : screen :rem This line not required for Archive(1)
  menu
endproc
```

group of procedures is to be called when saved. The program is started by entering **run "report"**. Once working the computer will drop from memory groups of procs which are not currently called.

To run a program, each group of procedures must include one called **start**, as that will be the first to be called. **Proc start**, in listing two, includes **mode0** to remove the default prompts from the work area. When **Archive** is first loaded the mode is 1,8. The strings **wait\$** and **choice\$** are used throughout the program to provide a standard and present a professional image which is easy to use.

Proc menu prints **choice\$** and the text is displayed, asking what action is to be undertaken. The number of files in record and remaining memory are displayed using the functions **count()** and **memory()**. **Lower (getkey())** waits for a key to be pressed, then converts the letter to lower case. If 'e' is chosen the **message** is overwritten

Archive can be used to produce very sophisticated applications and changed to suit individual needs

with the new **message** while the file is being closed. If one of the other options is chosen the **message;wait\$** is displayed and that whole group of procedures is cancelled from memory. **Archive** would then run the procs required.

Proc message;mess\$ prints any text passed to it at the print-at position on screen. Any string can be displayed, for example, **message;"hello"** or **message; appropriate string variable**.

The group of procedures in listing three is saved separately as **report1**. When called it goes first to **proc start**, which includes an error trapping routine using the command **error**. The **while-endwhile** loop in **proc mistake** will trap any errors in subsequent procs and return you to the menu.

In **proc newrec** the use of **Archive's** command **append** adds a record to the file with the information received in **proc sinp**. To ensure no details from an existing file are added, **proc clear** is called and the command **sprint** makes sure that the screen is ready for new

input. Finally, before `append` takes place `proc check` is called. Note how `proc mistake` is used to return to the menu if necessary.

With `proc sinp`, the command `sinp` provides an alternative method of adding information. Data can be added to a displayed field in any order. That differs from `insert` in which data must be entered in the file's order of creation. In our case field, `company$` is made upper case. The dates entered are checked for errors by calling `proc getdate`. Petrol expenses are calculated when the distance is entered — let `due` = distance times 20 pence per mile/100 to give number of £ and p. Using the `let` command the dates are arranged in reverse order in `vdate$` and `vdate2$` so that when they are required in `proc petrol` and `proc follup` the correct period can be calculated.

`Proc getdate` checks the entries which are passed to it, taking the name `z$` and using the `Archive` functions `len` & `code`.

1st line: If only one number has been inserted a 0 is placed in front of it.

2nd line: Checks that both numbers inserted are not noughts.

3rd line: Checks that the first character is in the range 0-9.

4th line: Checks that the second character is in the range 0-9.

5th line: Checks that no more than two characters have been inserted.

If any mistakes are found by those lines, an error message is displayed — `proc mist` — and you are returned to the menu. If all is correct the value of `z$` is given to `q$`, which can then be passed back to the calling variable. For example, 2 becomes 02 but 20 remains 20.

`Proc action;act$` takes the form of any text passed to it. The text is shown on the screen and subsequent text is displayed next to it.

`Proc bye` deletes the record obtained through `proc getrec` after the required confirmation has been received.

Data can be added to a displayed field in any order and the dates entered are checked for errors

Archive1 has a serious editing fault. If you enter edit with 18 or more procs, it will crash

vdate2\$ if all the areas are to be printed but through vdate2\$ and area\$ if only one area is to be covered. Proc foll then prints out the selected files. Function month() is used to change the month from number to words.

Proc mistake. If a mistake is detected the files will be reset and reordered because the command select may have been used. All files will be reinstated before displaying the menu.

Proc notes uses the command search, starting at the first record and continuing through the file until an exact match is found for the specified field. Smith Ltd would therefore not find Smith Limited. If a match is

continued on page 30

Proc getrec uses the command locate to find the field most similar to that ordered and displays it. When previously using proc sinp, we converted the ordered field to upper case to ensure case matching.

Proc swop is used to alter existing records and we introduce the Archive command update.

Proc view displays the records for examination and calls the procedure proc pos. The latter displays the records using next, back. Also, by using the function recnum() and the command position, we are able to jump backwards or forwards.

The procedures in listing four: action;act\$ — getdate;z\$ — menu — message — mist — pos — space — view must also appear in report2 and can be moved from report1 to save typing.

Proc pout is called via proc start and proc option. It asks which print-out is required and then calls the appropriate proc.

Proc petrol prints out total expenses due between the specified dates using the command select on the field vdate\$. If any files are found, the field vdate\$ is ordered so that the printout is in chronological order. Each file found goes through the "first: while not eof()" loop, using x to add up total expenses due. The function dec — not available to Archive — is used to line up the numeric field on the right, for example, dec — due, decimal places, width. Reset restores all the files discarded when using select. As reset

invalidated the order command, we order the company\$ field and vdate\$ field.

Proc follup selects all the follow-up calls to be made in the specified month. The files are selected through

Listing four

CLASSIC BOOK-KEEPING

By A. G. Clough F.C.A.

A fully flexible, complete Book-keeping system for the 48K Spectrum, microdrives, interface Kempston E or similar. 80 column printer. Suitable for any type of business or organisation.

Follows traditional double entry routines from prime entry to Trial Balance. All records printed as created, tangible and verifiable. Comprehensive backup. Once only entries. Written by an experienced Chartered Accountant to help those with less experience to achieve top grade work, but equally good for the professional book-keeper.

		CAPACITY	
		SERIES 500	SERIES 250
GENERAL LEDGER	Traditional	250 A/c's	250 A/c's
SALES LEDGER	open	500 A/c's	250 A/c's
BOUGHT LEDGER	A/C format	500 A/c's	250 A/c's
CASH RECEIVED	Classic cash book	550 items	300 items
BANK PAYMENTS	Running balance	550 p.m.	300 p.m.
PETTY CASH	Gross, net, analysis	No practical limit	
SALES DAY BOOK	Date, ref, a/c, code, gross, VAT, net, SR,	700 invoices 400 p.m.	
PURCHASE BOOK	ZR, separate columns	700 month 400 p.m.	
JOURNAL ENTRIES	Ref, debit, credit, analysis, narrative	No practical limit	

OTHER FEATURES

Interim listing of all prime entries — Multiple coding — Error prevention and control — Self balancing ledgers — Management auto run program governs all syntax — STATEMENTS WITH AGED BALANCES — Journal entries — Manual with demonstration printout.

PRICE (Supplied on three m/d cartridges) Series 500 **£69**
Postage Paid Series 250 **£46**

Supplied in three parts (250 Series only)

Part 1 Sales Ledger package **£19.90 Postage paid**
Part 2 Bought Ledger package **£13.90 Postage paid**
Part 3 General Ledger package **£13.90 Postage paid**

The manual, control and service programs are supplied ONLY with part 1. To be effective, parts must be purchased in number order.

FREE brief example printout available.

CASH BASIS ACCOUNTS

Based on and closely resembling the 250 Series above but excluding Sales and Purchase Ledgers, Day Books and Statements. Suitable for cash based businesses, Personal accounts, incomplete records. **£29 Postage Paid**

ANALYSIS

Designed specifically to analyse up to 1,000 items over 1,000 codes. Pre-list if required, intermediate check totals, printout optional. Designed for 32 column printers, but works on 80 column.

Price supplied on cassette, Postage Paid **£7.50**

**MANX TAPES, GAREY VEG,
GLEN AULDYN, RAMSEY,
ISLE OF MAN**

Telephone: (0624) 813071

SLOMO World Patents Pending

SLOMO SPEED CONTROLLER

SLOW MOTION AND FREEZE FRAME FOR THE SPECTRUM, CBM 64 AND BBC.

Fully variable control from normal speed down to virtual standstill + instant freeze

- ★ Higher games scores and improved skills
- ★ Invaluable programming aid for de-bugging, pin pointing problem areas etc.
- ★ Unique computing aid for education, occupational therapy, robotics, machine tool control applications, etc.

£14.95

With cable and connector for easy fitting directly into the computer. (state which model)

RESET BUTTON & EXTENDER

£4.95

Resets the system GENTLY without loss of power to the computer or peripherals. Safe recovery from microdrive crashes and easy exit from programs or games.

Allows all peripherals to be securely attached to the Spectrum + & eliminates need to solder reset connections on the + Upgrade.

JOYSTICKS

£9.95

FLIGHTLINK
Microswitched; very light positive action. Dual independent fire buttons.

QUICKSHOT II
Popular joystick with two fire buttons and Autofire.

£10.95

SLOMO PACESETTERS

TWO NEW INTERFACES FOR THE SPECTRUM, WITH NIDD VALLEY'S SLOW MOTION CONTROL BUILT IN

Both with on/off button and LED to indicate slow motion and fitted with through extender.

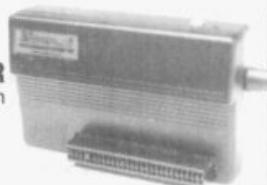

SPECTRUM PACESETTER

Kempston compatible with slow motion control built in, and through extender.

Pacesetter interface **£14.95**

SPECIAL DEAL!

Pacesetter with joystick **£21.90**

SPECTRUM PROGRAMMABLE PACESETTER

Easy to program — enables ALL games to be played with joystick and speed control by placing the control keys into the interface's 1K memory. Keeps a record of your games so you only have to program once for each game. Compatible with microdrive and all popular joysticks.

Supplied with software and instructions.

Programmable Pacesetter **£29.95**

SPECIAL DEAL!

Programmable with joystick **£34.90**

SPECTRUM KC INTERFACE

A good quality Kempston compatible interface suitable for all popular joysticks. Supplied with or without through extender

Spectrum KC with extender **£9.95**

SPECIAL DEAL!

Interface and joystick **£17.90**

Spectrum KC without extender **£8.95**

SPECIAL DEAL!

Interface and joystick **£16.90**

ORDERING INFORMATION

SLOMO — please specify for which computer required.

SPECIAL DEALS — prices apply either to Quickshot II or Flightlink. Joystick — please specify which type.

Prices include VAT and postage. To order send cheque or P.O. payable to Nidd Valley Micro Products Ltd., to the address shown below (no stamp needed). Please allow 14 days for delivery — we do not bank your cheque until day of despatch.

MONEY BACK GUARANTEE IF NOT COMPLETELY SATISFIED

NIDD VALLEY MICRO PRODUCTS LTD

Archive

Archive2 has many extras that makes it a must for serious users, and has more memory than Archive1

found the "while found() continue endwhile" loop will print out details of all the matching records.

If you break into the program, entering: **mode0: screen: mistake** will return you to the menu.

To make editing easier, try not to make your proc lines any wider than the screen. Never use **lprint** if a printer is not attached as **Archive** will then crash.

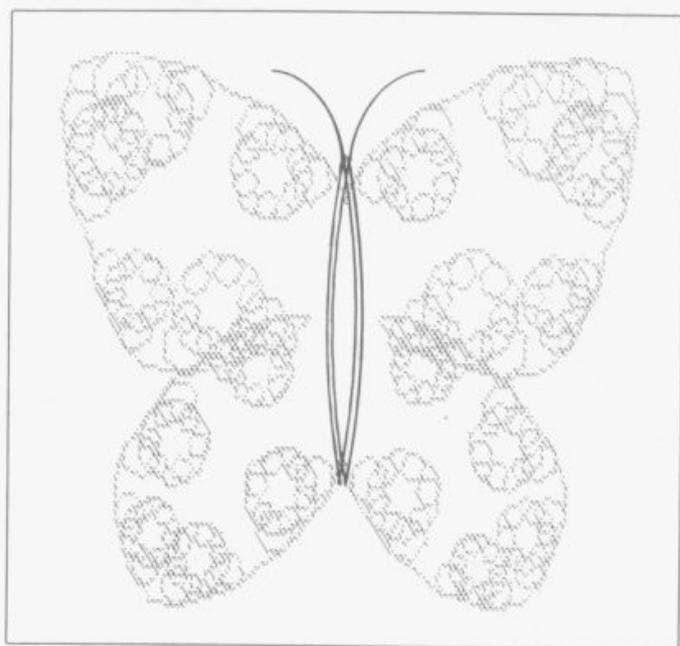

While must always be matched with **endwhile**; all with **endall**; if with **endif**. Each use of **while**, **if** or **all** moves a procedure two spaces to the right. The indentation stops when an **endwhile**, **endif** or **endall** command is added, and at the end of the procedure the **endproc** must be two spaces from the dividing line.

Archive1 has a serious editing fault in that, when no work area is displayed — mode 0 — and you enter edit with more than 18 procs, it will crash.

It is good policy to produce backup copies of all files on a separate cartridge. Do that by replacing the **Archive** cartridge and entering **backup "filename__dbf" as "mdv1__filename__dbf"**. As **Archive2** will not overwrite the same name, you must **kill** the file in **mdv1** first.

Archive2 has many extras that makes it a must for serious users. The screen editor is more versatile and two more lines are available for the screen display. The variables can be coloured using the **ink** and **paper** commands. **Archive1** procs can be run on **Archive2** but the designed screens are incompatible.

In **Archive2** the screen display determines the number of characters that can be inserted. Scrolling with **Archive1** is considerably slower than with **Archive2**. Procedures can be **Saved**, **Run**, **Merged** and **Loaded** with the option **protect**, preventing anyone from listing your procs. Files saved with the option **object** — as used in this program — are given the file extension **_pro** which makes loading faster. Many useful new functions have also been added.

Graphics Toolkit

TALENT has been setting the standard of QL software for more than a year. Its major successes include **GraphiQL**, **Cartridge Doctor**, **Akul** and **West**. In the summer of 1985 the company's talented programming team was set the task of producing a professional quality utility for the *Sinclair User Annual*.

The **Talent Graphics Toolkit** is the result of two months hard work. You can use it to experiment with the new science of Fractals, which deals with the replication of natural shapes to form landscapes, rock formations and even buildings. The techniques are similar to those used by Walt Disney Productions to create *Tron*. Enter a new world of computer generated graphics and a new area of programming.

FRACTALS were defined by Mandelbrot who conceived and developed 'a new geometry of nature'. Natural shapes, such as clouds, mountains, trees, coastlines, exhibit a totally different level of complexity to that of standard geometric shapes. Fractals describe many of the fragmented and irregular patterns found in nature and the degree of that irregularity is identical at all levels. For example, a coastline can be represented on a large-scale map as a series of bays or inlets. A more detailed map will reveal that the bays are themselves broken up into smaller bays and indentations.

A simple example of a fractal shape is the snowflake shown in figure one. The basic frame is an equilateral triangle (A). The next shape (B) has been formed by adding equilateral triangles, one third of the size of the original, on the central third of each side. The same process is repeated in (C) and can be repeated ad infinitum until the detail is too fine to see.

TALENT's fractal program allows you to choose one of twenty stored frame shapes or to define your own. The segment, or method by which each line is to be modified, can also be selected from a library of twenty stored shapes or can be user-defined. Finally, the computer draws the frame on screen at any level or generation of complexity you choose.

Program Design

The program has been carefully engineered. The interface should allow you to obtain pleasing results quickly and easily. You should not need to understand the basic mathematical concepts. All help is provided on-screen and no manual is necessary.

Main Menu — nearly always on

screen. Options are highlighted in turn by using the cursor keys and selected with Space. When an option is chosen, a drop-down sub-menu is displayed.

Sub-Menu — brought down when an option is chosen. Options are selected in turn with the Space key. All sub-menus have an ESCape option

which returns you to the main menu.

Segment Window — always on screen. This window displays the current segment selected out of a library of 20. The first 10 of those are defined. The remainder are stored as straight lines which can be picked up

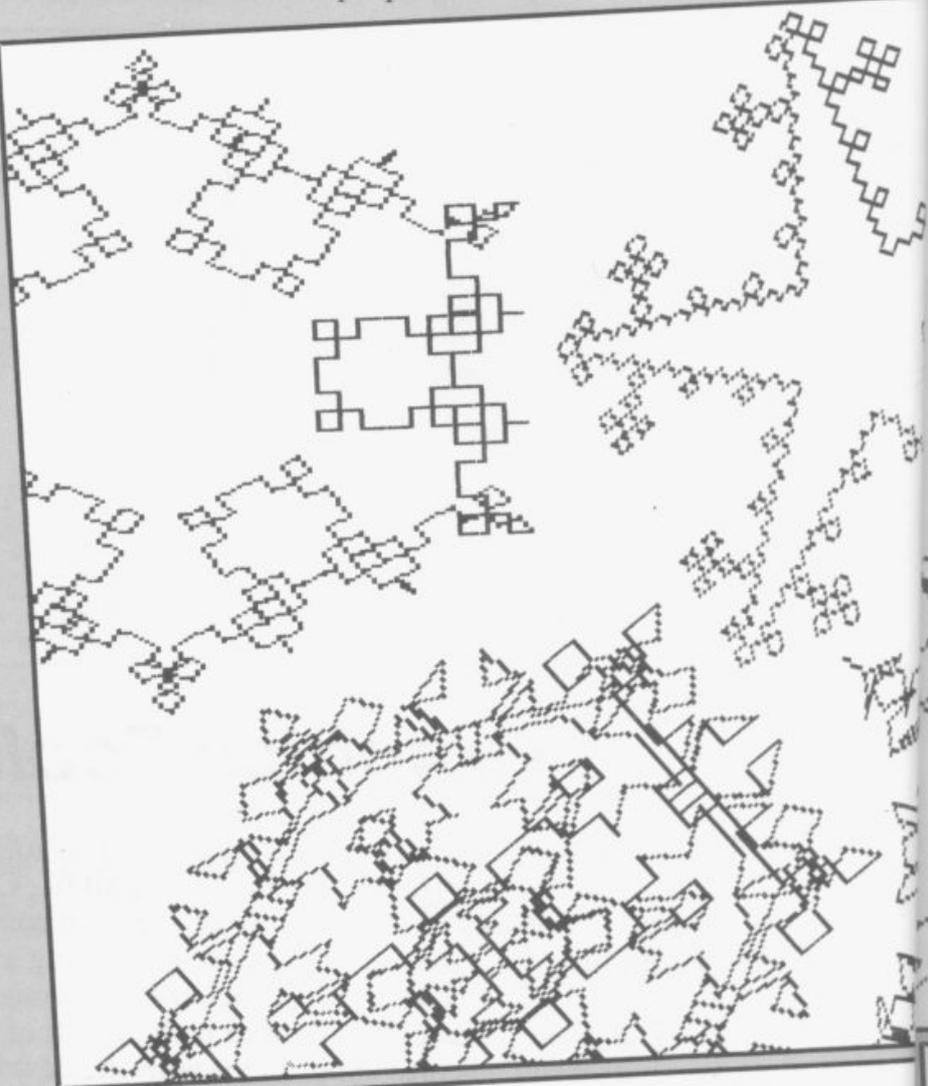

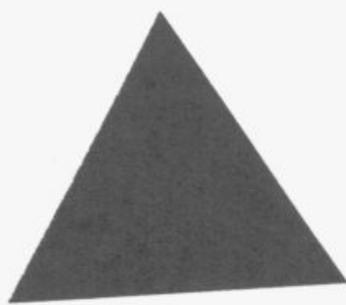

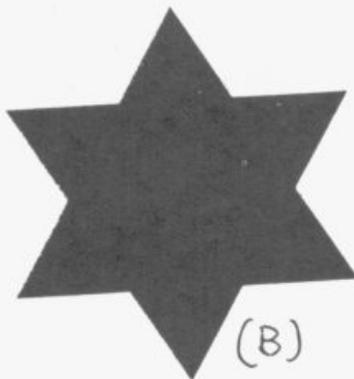

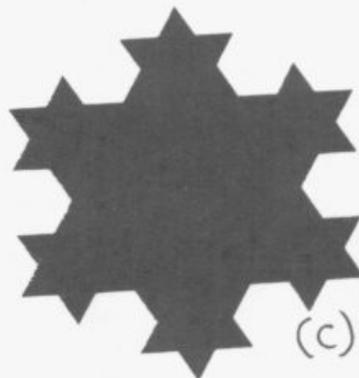

Figure 1. Snowflake fractal

(A)

(B)

(C)

and edited to become any shape you wish.

Frame Window — the same as segment window. Displays the current frame selected from the frame library. The first 10 are defined, the remainder can be edited in the same way as

segments.

Input/Error/Message Window — this window is used when input is required — filenames. It will also display errors and other messages.

Summary of functions

After Segments/Frames

On-screen edit — used to change the segment or frame on-screen. After the segment/frame is drawn, you move the cursor to a point on the line. Then pick up the point and pull it to a new position using the cursor keys. The space bar is used to register the change. That is useful for specifying irregular shapes.

Numerical data — you are asked to input a series of numbers—distance, angle—to specify the segment or frame. That is useful for specifying regular shapes. Distance is scaled proportionately, for example, a standard length for the frame is 50 and for the segment, 10. The angles start at 0 degrees and work clockwise — 90 degrees, 180 degrees, 270 degrees and back to 0 degrees.

Change Segment/Frame

The current segment or frame is changed to another in store — 1-20.

Draw Fractal

When this item is specified on the main menu, the sub-menu will ask for various data which you must enter as numbers on the keyboard. The options are mode, paper, ink, x co-ordinate, y co-ordinate, depth and scale.

Permanent Store

Format device will format a specified device.

Directory device will give a directory of the specified device.

Save fractals will save the present store arrays.

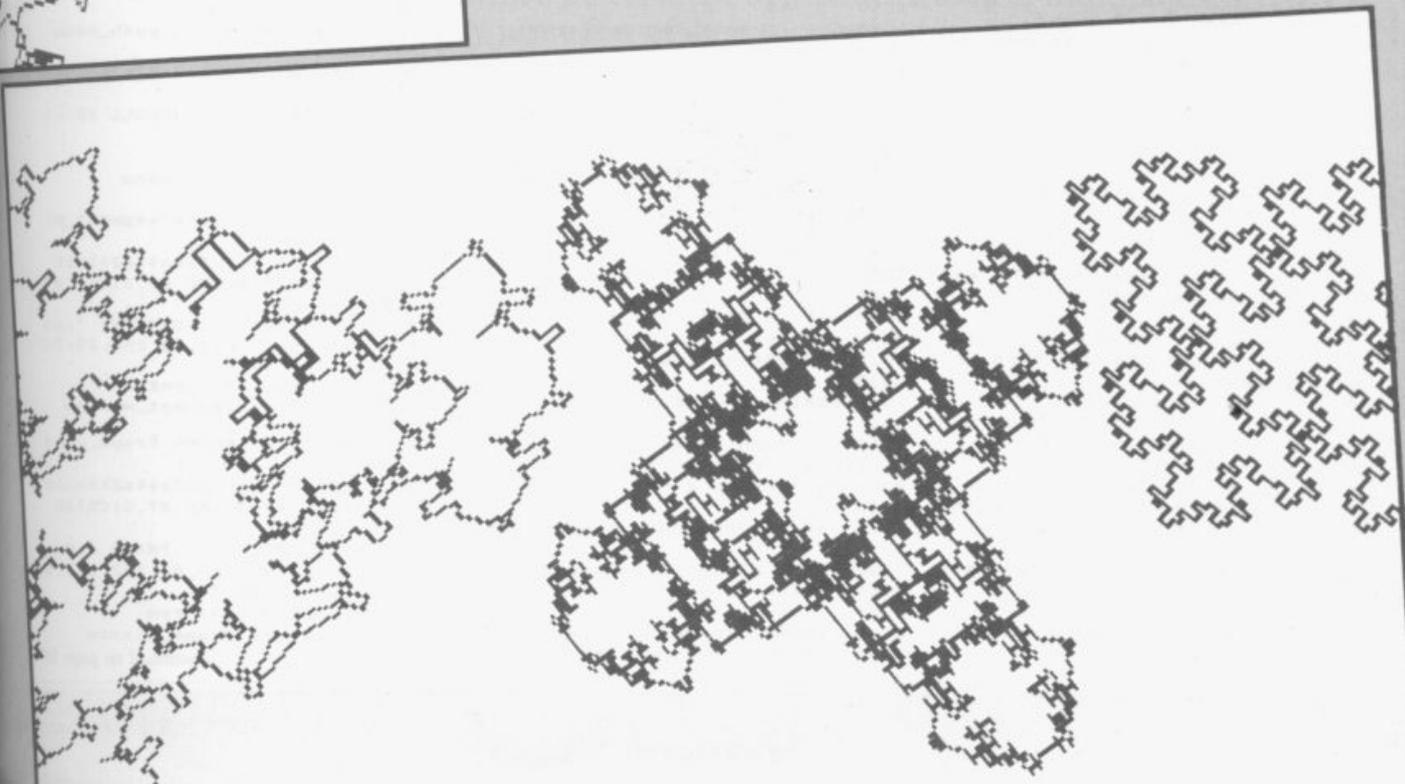

Load fractals will load the store arrays.

Additional information

Occasionally values — paper, ink — must be entered in the input window. The default value — printed in brackets after the option — is printed first. If that is to be changed, it must first be erased using the Sinclair erase sequence of CTRL and back arrow. Then the new value must be typed in, followed by ENTER.

An error message will be generated if a segment is 'closed' — the start and end point are put in the same place. If the start and end point of a segment are too close together, the segment will not fit into the window. It will also run off the main fractal drawing screen. It should be changed using the on-screen edit to make it fit.

Talent Computer Systems will be happy to supply copies of this program on request. Send a formatted microdrive cartridge, name and address and £1.50 handling charge to Talent Computer Systems, Curran Building, 101 St James Road, Glasgow G4 0NS.

Adventure

THE WORLD of Gordo Greatbelly comprises many strange lands in which can be found the solutions to all adventure games. After a long search, large amounts of liquor and a little bribery, Gordo has been able to convince a local artist to produce a map of those lands, giving away just a few of their secrets in the process. Back in the United Kingdom Richard Price provides a more down to earth look at the best adventures of 1985 and forecasts the trends of 1986.

Maru

The Dancing Ogre: Greatbelly's home base. A rambling fortified inn at the centre of the high Eshak plateau. Earned five stars in Nogi Yanor's 'Guide to Good Adventuring'.

The Plateau and Crevasse: A draught of elixir will allow you to go south, but not with more than five items carried. Headgear here.

Dragon: Can be deterred by a libation of oil.

The Skull Gate: May be passed only when fully clothed as a wizard.

Elephant: Offer, but don't give, some

The Slime Room: Waste no time here.

The Guardians: If $a=26$ then $z=1$.

Artic Lands

PLANET OF DEATH

The Old House: Its rotten floor will help you cross thin air.

Ravine: Beyond here lies a hut where protection may be found.

Cavern of the Green Man: This creature may be got, dropped and then destroyed. He has no attractive characteristics but his mirror does.

Laser: If held back by a force field, firing this twice followed by impromptu dancing should see you through.

The Lift Controls: 321 may help you enter your goal. Four may get you a

Temple of Ithukk: Centre of the cult of the Great Moon Goddess of the Northlands. Her priestesses are renowned for their savagery.

Colossus of Sinclav: The Red God of the North. Legend has it that he was devoured by Maksu-Elawon, the Smoking Mirror. Others say he jumped too high and is now a constellation.

Urunnar Swamps: Maru's northern frontier and home of the anthropophagous Snake Men.

Urtuun: Along with Kortuun, Amdruun and others, one of the great garrison posts of the empire.

The Empty Place: Waterless desert barrier protecting the irrigated plain of Maru.

Maru: Desert capital of the empire. Currently ruled by Janga Abn-Jangara, Consort of Mar, who is the Goddess of corn and water. Maru's wealth comes mainly from the silk and spice trades.

Braco's Tower: Commandery of the Brothers of The Axe — a guild of mercenaries and assassins.

Oasis of the Dream: The place where all Consorts of Mar stay during the month when they are to be united with the Goddess — ritually sacrificed.

City of Tents: The summer gathering place of the Eastern Barbarians. Their current Horse Lord is Malnach, Keeper of the Sacred Skull.

Ketland

The Cartographer: A map will be provided for a favour. Chopping and changing will warm his heart.

The Wall in Mint Condition: Waving your wand and uttering a spell of minty holiness will open new vistas.

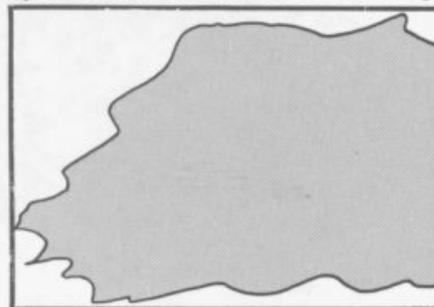

The Dog: If fed and suitably restrained this beast will drive away thieving rats and save your treasures.

Quest for adventure

Breaking his journey to refresh at an inn, Gordo Greatbelly puts quill to parchment to relate his travels and offer cryptic clues to those who follow

cupboard love. The beast will follow you, becoming a suitable hitching post when fed in the right place.

Quicksand: Fire an arrow with rope

attached. That should get you into the swing of things! The gear resides in a high hole.

EN Monster: A useful beast if you follow its directions through a hall — but fatal if attacked.

The Oak Door: First fill its gap, then retire into a cubby hole. Waiting six times here will demolish the obstacle.

The Morgue: Home of the dead who are undead. Delphia will be discouraged from wandering by a clove.

rise — a welcome lift.

ESPIONAGE ISLAND

The Clearing: The dark bundle is your chute.

The Wreckage: Examining a dark corner will provide currency to buy a weapon — useful against guards.

The Stitched Swamp: Stitched is sewn. Initially this word is directional.

The Control Hut: A socket for explosives and a switch to detonate. Take care!

The Helicopter: A straight southern route will bring disaster. Be devious

Best of '85

Pit your wits against the odds and pursue the road to adventure. Richard Price looks at the pick of the crop

THE HITCH HIKER'S Guide to the Galaxy, in its instructive and engaging way, offers words of great solace to those unfortunates who find themselves "stuck in a crack in the ground underneath a giant boulder you can't move, with no hope of rescue." Helpfully it suggests such travellers should "consider how lucky you are that life has been good to you so far."

If you're a computer adventurer, wherever you happen to be stuck, entombed, imprisoned, surrounded or just plain lost, much the same applies. You've never had it so good and all the signs show that it might get even better yet.

Many years ago, in the age of the mainframe dinosaurs, adventure was a new species, hiding behind the vast bulks of scientific or business programs and only coming out at night when the monsters were at rest. Then the great beasts died out and adventure evolved and mutated into many branches. That fast evolution has given players a huge variety of choice.

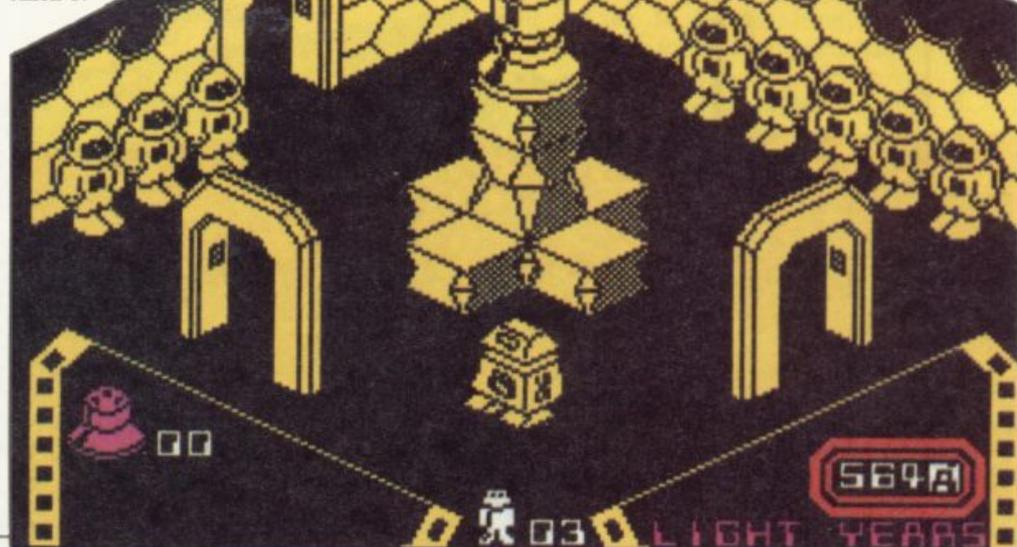

The choice is large, mainly because adventures tend not to be flash-in-the-pan. The good ones stick around and develop followings, unlike most arcade games which often disappear after only a few weeks' prominence on the shelves. Thanks to the *The Quill* and its graphic back-up, *The Illustrator*, the amateur games designer also

has the chance to break into the market, and even be successful in a small way. You can't do that with arcade games anymore.

The *Quill* boom has allowed individuals and small companies to get their fantasies down on tape and into the shops. There is no need for a vast knowledge of code programming, or teams of expensive brains working on even more expensive machinery.

Over the past year there has been a steady stream of games like those — the most notable success being *Hampstead*, back-

Above, a scene from Bored of the Rings. Right, Alien 8.

ed as it was by the big guns of Melbourne House. Delta 4 produced this year's classic spoof in the shape of *Bored of the Rings*, a genial and sick-humoured lampoon of Tolkien's vast fantasy — showing clearly that there is still room for young enthusiastic games programmers.

Although the big houses tend to charge quite high prices, even for *Quilled* games, they tend to be less expensive than tailor made programs. Those may not always be more than moderately difficult but they do represent real value for money, and their programmers will take risks with the quirky plots and picaresque humour. That is a great bonus as there is far too little knockabout fun in many of the huge and desperately serious professional productions. If you're a dedicated adventurer it's always worth keeping one eye on the small advertisements for games like those.

Connoisseurs will still go for the big vintages — large text games, more often than not, supported by location graphics. As usual, *Level 9* seems to be the frontrunner and has brought out no less than four polished adventures since last year's annual. All those new games feature graphics but, thanks to the techniques of text compression used by *Level 9*, the text and problems have not been too badly affected. It is really quite staggering to think how much can be squeezed into your 48K Spectrum.

Erik the Viking takes you on an odyssey through the icy northern seas — and is based on Terry Jones' book. The graphics

are evocative and there is an air of mystery and uncharted waters in the presentation. If you want to follow up on their earlier adventures like **Snowball**, you could do worse than try **Return to Eden** where a complex, unexplored planet mutates bizarrely as you wander.

My own two favourites are **Red Moon** and **Emerald Isle**. The first contains a vast magical world, based loosely on the Runequest roleplaying system. Your aim is to recover the stolen moon crystal, and your antagonists are powerful mages seduced by the forces of evil. There are hit points, combat routines and it is possible to cast a variety of spells to counter superhuman and supernatural foes. There is a large amount of detail and a convincing atmosphere.

Emerald Isle strands you on a desert isle with a difference. Instead of the usual cluster of native huts and palm trees you'll find a complicated civilisation. You are expected to push your way up through the social structure to survive and escape.

These days it is unusual to see large scale text-only games — even from Level 9 — and the Quilled games

don't have the same sophistication as custom-built compressed programs. That makes **Mordon's Quest** from Melbourne House something of a rarity. In this time-travelling game your aim is to wander through the ages retrieving the scattered parts of an immortality machine. The plot is admittedly rather old hat but the descriptions are excellent, fleshing out the storyline considerably. No space at all is wasted on graphics.

The traditional text game has its benefits but graphics have caught on in a big way. Animated games have become the biggest sensation of the year. Whatever your feelings about them, games like **Knight Lore** and **Dragontorc** have brought slick, classy moving pictures into the service of adventure.

My own view is that animated graphic adventures can never quite replace text — mainly because text ensures that you must use your imagination. No matter how good the pictures, they probably won't have the same breadth as your own mind.

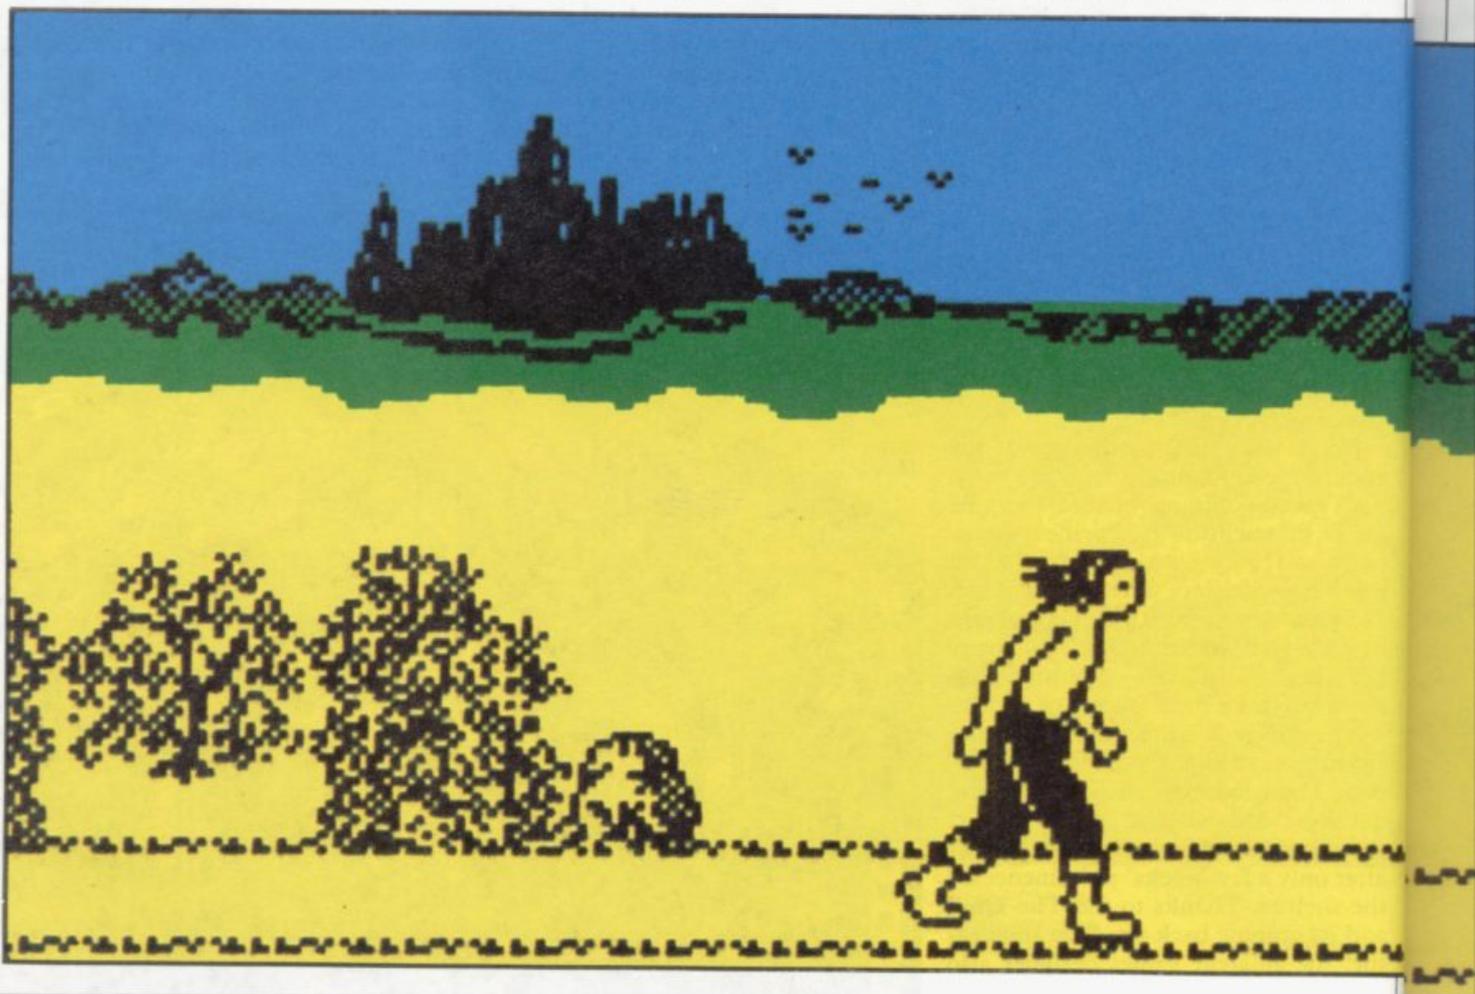

Despite that, the 3D effect and reacting environment of **Knight Lore** and its cousins gives you a strong

sense of involvement. They use a lot of old adventure techniques such as experimentation with objects and other logical puzzles. The complexity of the graphics uses up an awful lot of precious RAM and it's hard to see how much further they can be taken.

Alien 8, the follow up to **Knight Lore**, disappointed many players because of its similarity — pushing bits of a room around and timing moves to avoid obstacles is all very well, but it does have serious limitations.

There are only two animated games which, at least in my book, transcend all those objections. **Tir Na Nog** and **Dun Darach**, both from Gargoyle, are complete adventures.

Both games have realistic settings with a convincingly human central character — the hero Cuchullain. Both quests include a number of sub-quests and diversions and there are other characters who go about their own business. Cuchullain must not only use objects but must solve codes, logical problems and, at times, theological questions. Connections can be obscure and there is no straight progression from one task to another. The games present you with an entire

world — you must explore and get to know it well before you can even hope to reach a solution. You might even have to go to the library to find out more about Irish mythology!

Dun Darach — the most recent — places Cuchullain in a tortuous medieval city filled with shops, houses, temples and castles. The authors have set out to create a visual representation of places like Fritz Leiber's Lankmar — and have been very successful. If you buy only a few games make sure this is one of them.

Since the Apple Mac came along, just about everyone has oohed and ahed over its icon driven systems. Games designers were quick to see the potential for simply operated and visually attractive layouts.

Shadowfire and **The Fourth Protocol** are both controlled by icons. **Shadowfire** uses no text input at all and, although highly complex and sophisticated, it is essentially a strategy game. Its atmosphere is generated by high quality visuals and a set time limit. That high tech style is perfect for the setting where, in some suitably distant future, you must free a diplomat from an evil general's

clutches by stealth, guile and violence. There are definite echoes of Beyond's other big hit, **Lords of Midnight**.

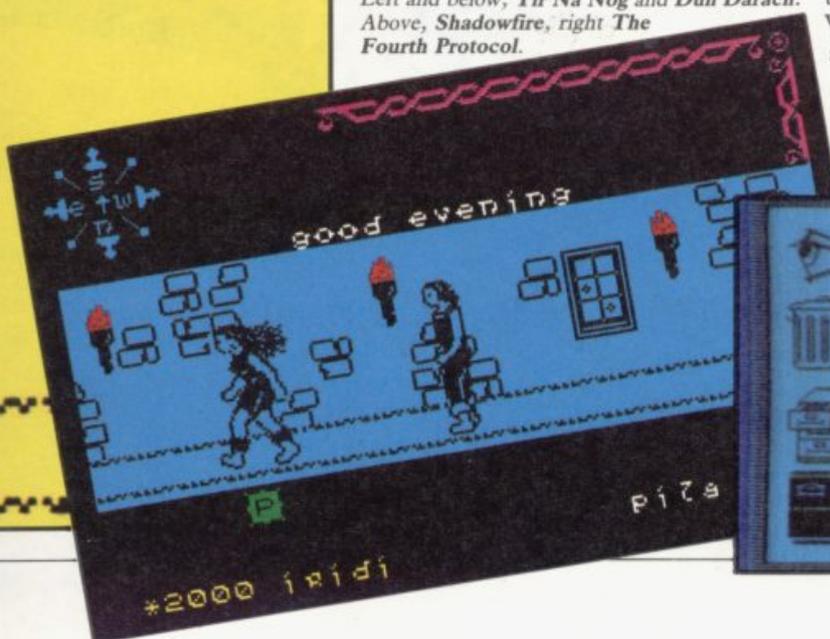

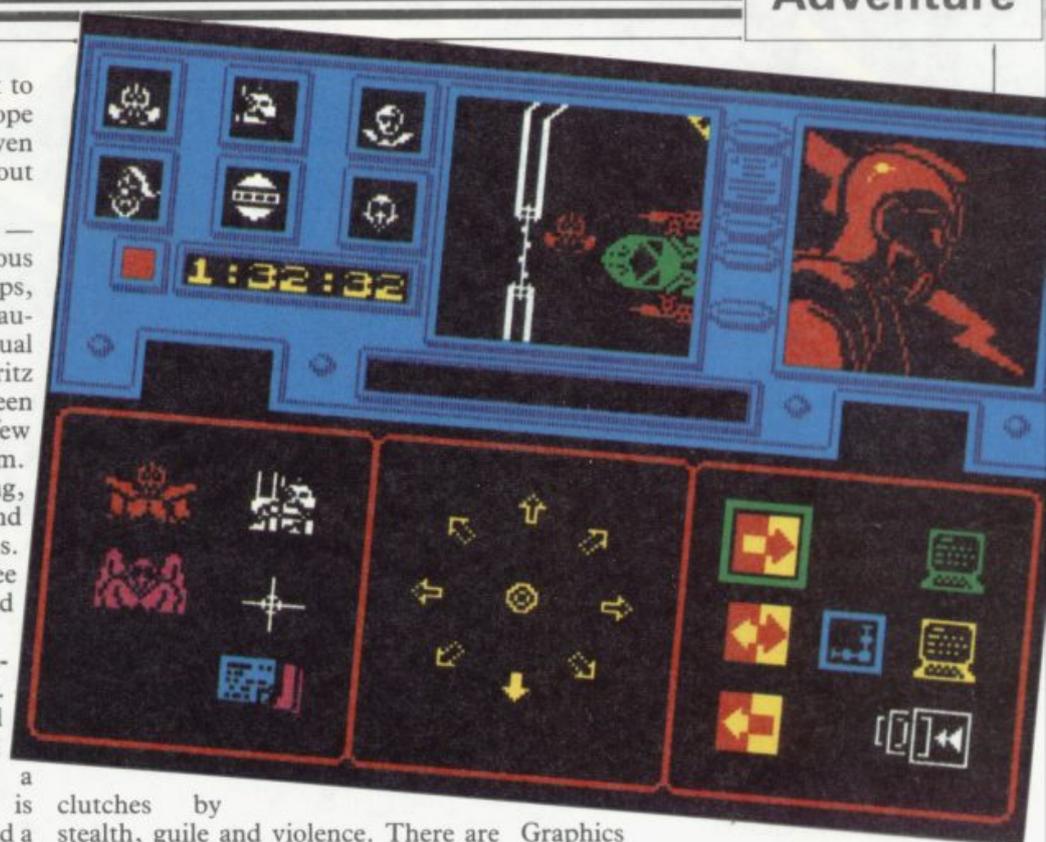

The Fourth Protocol is different. The game is split into three parts, two of which use an icon system. Many functions can be carried out by using only two or three keys and textual information, filing, telephone calls and manpower allocation can be handled with great ease. The simple manipulation of fairly complex material draws you ever deeper into the play — mainly because it's such fun to operate. It is all too easy to forget that you are there to catch traitors and locate bombs as you zip through the files or sort out codes.

It is always difficult to predict how things will develop over the next year. *Left and below, Tir Na Nog and Dun Darach. Above, Shadowfire, right The Fourth Protocol.*

Graphics are going to play a much greater part in games with an adventure format. If I were a betting man, I'd be prepared to put a few bob on icon systems achieving some prominence in the field. When I first started playing adventures on the Spectrum, I never imagined the transformation in presentation that would occur over a very short period.

Adventurers and arcade freaks are often seen as incompatible groups, scornful of the other's enthusiasms. Icon driven text systems, combined with high quality animation should go a long way to bringing the two sides together.

The new peripherals offering 64K RAM in a games package may be just the vehicle to achieve such a miracle. Wait and see. In the meantime, travel a bit and savour the exotic landscapes and faraway worlds of adventure. Whether you prefer text or graphics is unimportant — there's something out there to suit everyone.

Software Scene

Our expert team of writers bring you the highlights of last year's software releases. Did **Jet Set Willy II** find favour with the public, which were the best icon driven games, how can a computer help you to forecast the weather, and is there a good machine code assembler available for the QL? All those questions are answered, along with many more.

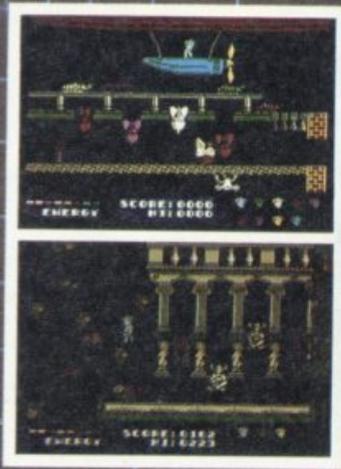

Clare Edgeley finds that sport has dominated the arcade action, while Chris Bourne finds fly fishing on the Spectrum is tedious and John Gilbert finds that utility manufacturers prefer the QL.

A guide to the latest business software is provided by Mike Wright and Mike Johnston, and education is the subject from Theo Wood.

Last but not least we parade the turkeys of the year and give our awards for outstanding awfulness and cruelty to software.

Clare Edgeley blasts her way through a wealth of challenging software

GET FIT QUICK just about sums up the last 12 months. 1985 has seen enough sports games to put you off doing anything more strenuous than lifting a pint glass, at least for the next year.

Since the 1984 Olympics, we have competed in every imaginable sport: played footie with Bobby Charlton, run rings round Daley Thompson and been KO'd by big Frank . . . There is hardly an action sport left which has not been turned into a money spinner, with a sportsman's name attached. What is wrong with Tessa Sanderson's Javelin anyway?

Daley Thompson's Decathlon was first to the tape back in November '84 and notched up a gold for Ocean when it jumped to number one in the charts for a few weeks. You have to compete in all ten events of the decathlon, taking part in the high jump, long jump and pole vault as well as track events. The 400m is the most gruelling and to keep up speed you must pump the joystick back and forth, which may result in a touch of cramp. The graphics are colourful and the game does give a taste of the real thing.

Melbourne House also attempted a compilation of events with **Sports Hero**, although it was nowhere near as successful as Daley Thompson. **Sports Hero** has you competing in four events – 100m sprint, long jump, 110m hurdles and the pole vault, over three difficulty levels. To gain speed you must pummel the run button and press the jump button before takeoff. Aching fingers seem to be the norm in that type of game and in many cases you will end up with a sick keyboard as well. There is no sound and the graphics are not fantastic, although the scrolling background is interesting. A few more events should have been possible.

More recently, **Brian Jacks' Superstar Challenge** from Martech reached the top ten, although it came a poor second to Imagine's **Hypersports**. Both contain a weird hotch-potch of events – some interesting, others boring. Brian Jacks gives you a pretty raw

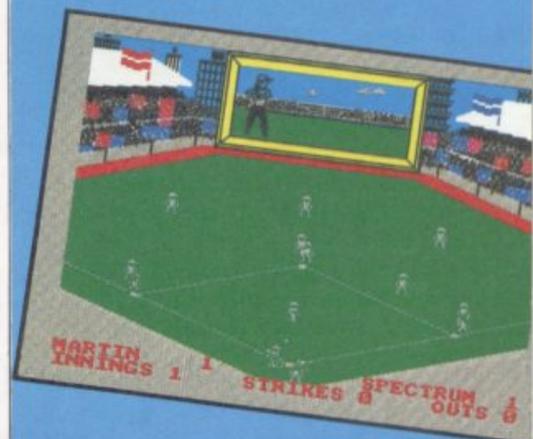

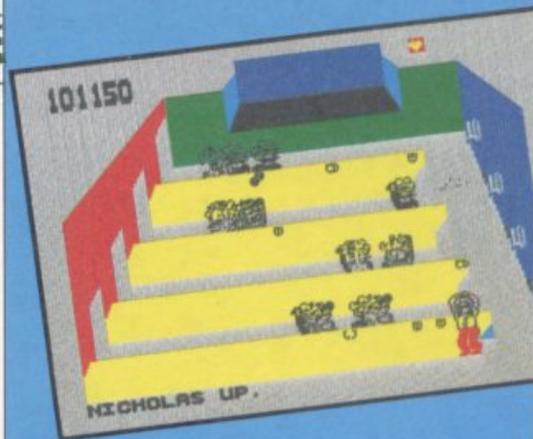

deal. For £7.95 you can immerse yourself in such exciting events as squat thrusts and arm dips. Those may be thrilling to watch on TV but on computer they are about as much fun as a wet blanket.

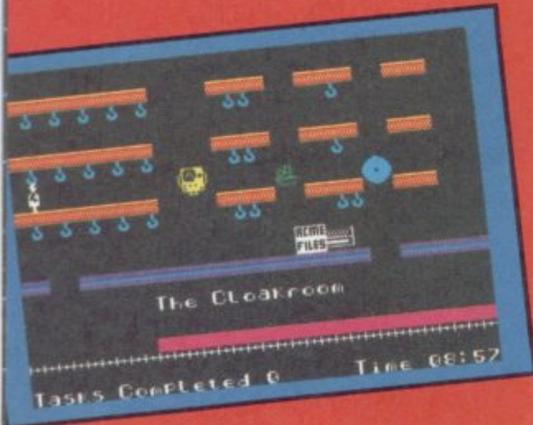

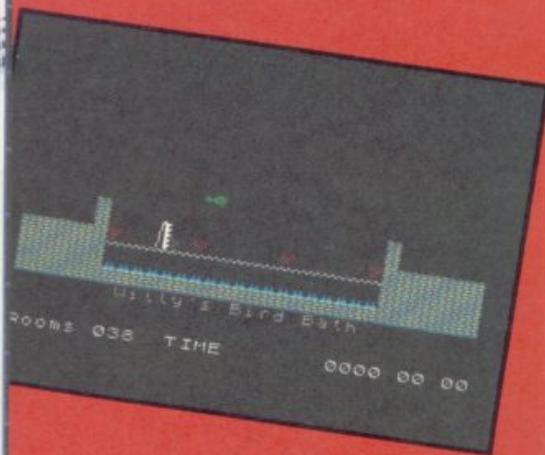

Hypersports is a different ball game altogether. Licensed from the arcade game of the same name, the computer version is very like the original, although some events lack imagination. When swimming – or floundering, if you forget to breathe – instead of tearing down to the end of the pool, the end moves towards you. Clay pigeon shooting is certainly one of the better events, in which you must shoot the skeets through automatically moving sights. The vault is tricky and rather than vaulting as far as possible from the horse, you are likely to end up on your head beside it. The graphics are generally thought to be more professional than **Daley Thompson's Decathlon**, though whether the game is better is a moot point.

Jonah Barrington's Squash from New Generation is an interesting concept which seems to have fallen flat. Knock a miniscule black ball round the 3D court and try to beat Jonah at his own game. Jonah is one of Britain's leading squash players. Much was made of the fact that a taped recording of Jonah's voice calls out the scores. Unfortunately, all you get is an unintelligible gabble and it is easier to read them on the score board anyway.

We awarded Imagine's **World Series Baseball** three stars in the June issue, which just goes to show that our forecasts are not always spot on. In June, July and August it remained at number three in the charts, only dropping to eleventh place in September.

The game opens with a traditional rendering of the American National Anthem. Then play starts, with one team pitching and the other batting. You can play with a friend or against the computer, adjusting the speed and direction of the ball when pitching and the strength and lift of your swing when batting. Loving attention has been paid to detail with a large

scoreboard displaying genuine adverts between innings.

Last, but not least, boxing – the sport for ugly mugs. Cauliflower ears and battered brains are only half the fun – just think what you can do to your opponent. A few months ago three games were released simultaneously on the back of **Punch Out!!**, a highly successful arcade game.

Elite's **Frank Bruno's Boxing** knocks **Rocco** and **Knockout** for six, and is easily the most playable and realistic, offering more possible moves and a greater number of competitors than either of the other games. It is also the only boxing game featuring a sporting personality – Bruno helped in an advisory capacity during production which explains the close attention to detail.

Gremlin Graphic's **Rocco** squares up well in the ring, though you will find it is not as easy to dodge your opponent as it is in **Frank Bruno**, and there are only three competitors. The scoring system is simple and the graphics are the clearest of the three games. It is worth playing and annihilates Alligata's **Knockout** in the ring.

Knockout is appalling and lacks any addictive qualities. It is the only game which uses colour – the others being mono – although that could have been sacrificed for extra playability. Other than left and right punches to the body and head, there is no facility for ducking and dodging, but at least you can amble away if the going gets too rough. You tend to spend a great deal of time seeing stars after being KO'd. At least it lives up to its name.

The legendary success of **Manic Miner** and **Jet Set Willy** lives on. Platform and ladders games are still the rage and dozens of versions have landed in the *Sinclair User* offices over the last 12 months. Two years ago **Manic Miner** was a sure recipe for success, and because it was ahead of its time a lot of money was made. Programming techniques are now more sophisticated and with games like **Alien 8** and **Spy vs Spy** around, who needs a **Manic Miner** spin-off?

However, they are here to stay and some at least are worth the money you pay for them. One of the more successful games is **Strangeloop**, released late in '84, which has gone a long way to repairing the damage done to Virgin by **Sheepwalk** – one of its earliest and most awful games.

A half-crazy computer is the source

of all your troubles in **Strangeloop** and, playing the part of a metagalactic repairman, you must shut it down. There are over 240 rooms filled with lethal swarf which attacks and damages your space suit. A jetbike waits somewhere and will make your task easier but you have to locate and refuel it first. Objects picked up will help with various tasks and friendly robots will patch your torn suit. The graphics are colourful and simple and there is even a facility for saving your position on tape, to be resumed later when you have recharged your batteries.

Jet Set Willy II is the biggest rip-off of them all as Software Projects has done little other than add about 70 extra screens to the original. Essentially it is the same as **Jet Set Willy** which was launched back in 1984. The plot is similar; clear up the house before going to bed and avoid the hundreds of lethal thingummies found in each room. Despite being little more than a re-release, **Jet Set Willy II** is currently doing very well in the charts.

Despite the lack of original thought, if you are still hooked on the challenge of platform and ladders, try The Edge's **Brian Bloodaxe**. A loopy game if ever there was one. Brian, a viking soldier has been trapped in a block of ice for centuries, and as it thaws, he leaps out shivering, but ready to conquer the British. Flapping loo seats, deadly ducks and mad Scotsmen are a few of the dangers that lurk on each level. Objects to collect and chasms to be leapt add to his daunting task. **Brian Bloodaxe** is at least as good as **Jet Set Willy**, with much visual humour and bright, clear graphics.

Hewson Consultants, which has made a name for itself in recent months with arcade adventures such as **Dragontorc** and simulations like **Heathrow ATC**, must have had a brain storm late last year with **Technician Ted**, which is totally unlike the semi-serious games released since. Guide Ted around a silicon chip factory while looking for a plate of the real things. Pick up knives, forks and other necessary implements and avoid several nasty traps. Easy to play and reasonably addictive, **Technician Ted** is not one of Hewson's best games but has done quite well in the platform and ladders stakes.

Artic's **Mutant Monty** is more sophisticated than **Technician Ted** and includes some extremely tricky screens requiring split second timing –

Arcade action

if you are slightly out, a lemon or some other incongruous object will squash you flat, and then where will the beautiful maiden be? It is a constant source of amusement that so much work goes into preparing intricate story lines bearing absolutely no resemblance to the game you are playing.

On the whole rip-offs are uniformly mediocre in standard and not the sort of game you would buy for lasting playability. Real fanatics will find Activision's **Toy Bizarre** and Micromega's **Jasper** a doddle, and probably have more fun playing blindfold with their hands tied behind their backs. Both games are average and employ run-of-the-mill graphics. In **Toy Bizarre**, the player leaps round the levels of a toy factory popping balloons while being chased by a gang of irate toys.

Meanwhile, in **Jasper** much the same thing is going on, only this time you are a furry rat collecting money bags and treasure chests while avoiding furry cats, rabbits and other hairy animals. Platform games are usually fast moving and it is generally easier to keep up with the pace using a joystick. Unless you have very strong fingers, **Jasper** is doomed as your only option is to use the Spectrum's sticky keyboard.

Arcade adventures have come into their own in recent months, some remaining for weeks at a time in the top ten. With the advent of games like **Gyron**, fewer people are willing to put up with games like **Jet Pac** - classics two years ago but now gathering dust in cupboards across the country.

Superior graphics is the name of the game and the Spectrum is being stretched to its limits in a constant effort to improve software. Some games combine excellent graphics with originality, though equally large numbers have been launched on the back of the successful few. **Ultimate's Knight Lore**, **Underwulde** and **Alien 8** are three successful examples and **Nightshade** is expected to do as well.

Underwulde is rather like a vertical **Atic Atac** featuring the Sabre-man who must escape a series of chambers while avoiding hosts of nasties. The pace is fast, the screens colourful - a devious game.

Knight Lore and **Alien 8** could, at first glance, be mistaken for the same game. Featuring superb 3D graphics, **Knight Lore's** hero must search a maze of rooms and find the ingre-

dients of a spell to lift a curse placed upon him. Each room presents a challenge and one wrong move spells instant death. The scenario in **Alien 8** is different from its predecessor and the quality of graphics is even higher.

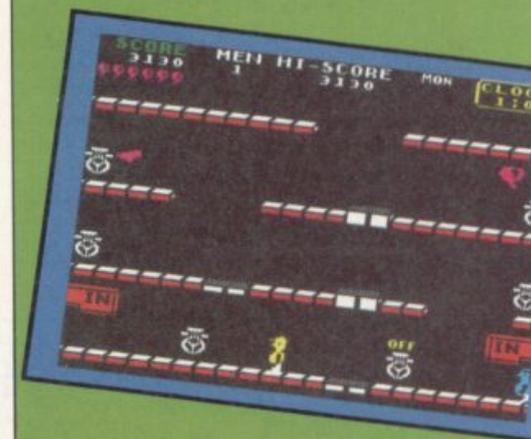

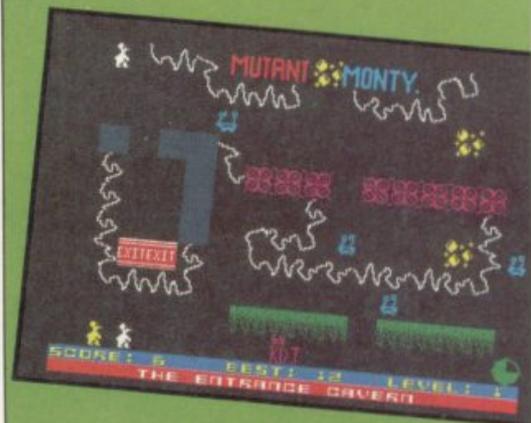

Wizard's Lair from Bubble Bus is an **Atic Atac** lookalike with shades of **Sabre Wulf** and is an excellent game, even if you have seen the same sort of thing before. Bubble Bus has made some attempt to change the scenario which covers three levels, accessed via a magic wardrobe lift.

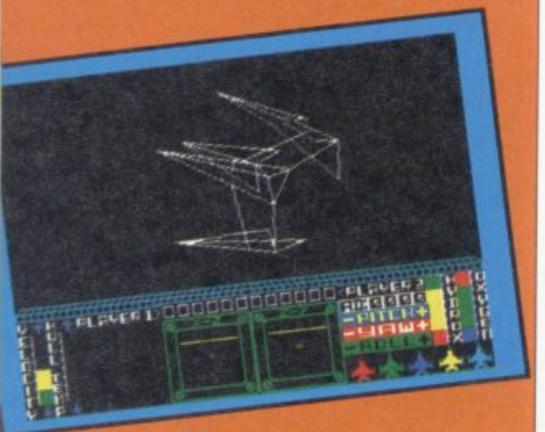

The programmers of Firebird's **Cylu** were influenced by **Alien 8**. **Cylu** is in the Silver range and at £2.50 represents very good value - it is almost as frustrating as the original but the graphics are a little patchy. Ultimate should be proud that so many companies want to copy their games, though it's a crying shame that those same software houses cannot put their combined programming expertise to good use, and produce something original of their own.

Games featuring film scenarios and famous names are often the subject of massive advertising campaigns, and Domark's **A View to a Kill** was no exception. Played in three parts you must guide the intrepid 007 through the streets of Paris, San Francisco and into Silicon Valley to stop the evil Max Zorin from tipping chip valley into the drink. The game received mixed reviews but, at the time of writing, it had just made it into the top ten - probably due to the James Bond name. It is an exciting game but lacks much visual detail.

The Rocky Horror Show from CRL is already sliding down the charts and does not live up to its namesakes, the film and play. Rescue Janet or Brad from the Medusa machine by finding 15 component parts of the de-Medusa machine. It sounds riveting. Your task seems enormous as you can carry only one part of the machine at a time and if you expect to meet normal sane characters in the castle, forget it. More could have been made of the graphics and the action is slow in places, but it is worth playing if only to meet Magenta who will strip you of your clothes. Wow!

Beyond's **Spy vs Spy** is unique and features simultaneous play between two players on a split screen. Take part in the zany humour of **MAD** magazine's two famous characters, the black spy and the white spy, each

trying to stop the other finding secret documents in a foreign embassy. Set whacky traps as you ransack each room before escaping to the airport. It is fun, highly addictive and very amusing. Buying the licence to films, books and names is an expensive business, and at last one company has made the most of it with an excellent game.

It is interesting to note that when one unusual game is launched others of a similar nature swiftly follow. Perhaps all programmers follow the same thought waves. Last summer we had an unusual trio of games, reviewed in May, June and August issues. Two are based on the human body – not the most obvious subject for a game.

Quicksilva's **Fantastic Voyage** is a thrilling game based on the sixties film of the same name, in which Raquel Welch is injected into the body of a brain damaged scientist. Unfortunately, your mini-sub breaks up and you have only one hour to locate all the missing parts. Searching is a novel experience as you rush from atrium to stomach to lung and heart in a never ending circle. Finding your way to the brain is difficult as it is not signposted and the turning is easy to miss. Dine on red blood cells to keep up your energy and clear any infections which frequently break out – normally in the most inaccessible parts of the scientist's anatomy. A great way to learn about your bits, and where they are situated.

Icon's **Frankenstien 2000** bears little resemblance to **Fantastic Voyage**, though it is played in a monster's body. Whoever heard of monsters smoking fags? This one obviously did and that is probably why it's dead. On reaching the lungs, battle with cigarette packets, avoid hopping frogs in the trachea, and fire at any oxygen molecules it is your misfortune to encounter. The graphics are uninspired and the game is simple.

Genesis' **Bodyworks** was reviewed in June and it is difficult to know what to make of it. It is hardly an arcade game – more of an illustrated, educational tour of the workings of a human body, describing the nervous, circulatory and respiratory systems.

Space Invaders was one of the first great games on the Spectrum and software houses have never tired of the theme. Space games crop up in all categories; simulations, adventures and arcade adventures. Activision has

even brought out **Ballblazer**, a sports game played in space. Way out!

Moon Cresta from Incentive is a traditional game in which you shoot everything in sight, and then dock with another space ship before taking off to do exactly the same on the next level. With complex games like **Starion** around one would think that games of this calibre would flop. But no, there must be some people around whose brains are in their trigger fingers. Surprisingly, **Moon Cresta** is creeping up the charts. Long live the aliens.

Melbourne House's **Starion** takes space travel seriously and combines a number of features, including the traditional shoot 'em up, word puzzles and anagrams. Kill off enemy space ships and collect the letters they drop, then unscramble those to form a word. Fly down to earth and answer a puzzle to change the course of Earth's history. There are 243 events to rewrite – and that amounts to a lot of flying time. **Starion** is well up in the top ten.

System 3 has come up with the goods against all opposition with the dreadful **Death Star Interceptor**, which has proved surprisingly popular. If you are really into boring games, this is right up your alley. Played in three sections, first take off into outer space, next avoid assorted aliens and then, as in *Star Wars*, plant a bomb in the exhaust port of an enemy death star. It is all thrilling stuff.

Quicksilva's **Glass** is amazing to look at. Psychedelic colours make you want to blink in this repetitive but addictive game. There are hundreds of screens to blast through, and whole sections are spent dodging columns as you hurtle through a 3D spacescape. The rest of the time is spent shooting radar antennae off unsuspecting space ships. The graphics make up for any limitations in the game and demonstrates that a traditional shoot 'em up need not be boring.

This final section consists of a number of games which cannot be categorised. A strange mixture falls into this area – many are shoot 'em ups in some form or another, others require an element of cunning and strategy.

Gyron from Firebird, a *Sinclair User* classic, is a unique game in which you must travel through a complex maze, dodging massive rolling balls and keeping a watchful eye on the

guardian towers to be found at each junction. Those shoot at you, but approaching from another angle may change the direction of their fire. As there are two mazes to get through, it should take months. **Gyron** is likely to deter arcade nuts, but for those with staying power, it is an attractive proposition. It did make a brief appearance in the top ten at the time of writing, but has since fallen away.

US Gold's **Spy Hunter**, based on the arcade game of the same name, is a faithful replica of the original. It all takes place on the road as you drive your souped-up sports car through a variety of traps laid down by the baddies. Equip your motor with a variety of weapons, obtainable from a weapons van which you drive into *Italian Job* style. Rockets, smoke screens and oil slicks are all strongly reminiscent of 007.

Elite's **Airwolf** is a game that we found so hard as to be almost impossible, and which everyone else seemed to find a cinch – and told us so in no uncertain terms! Try if you can, to fly your chopper down a long, narrow tunnel to rescue five scientists stuck at the end. Blast your way through walls, which rematerialise as fast as you can destroy them – a well nigh impossible task for those whose trigger fingers and joysticks have suffered from the likes of **Daley Thomson's Decathlon**. **Airwolf** has done better than we predicted. You can't win them all.

Ghostbusters, the mega box office hit last Christmas was a prime candidate for a computer game and Activision was first to the ghost. Featuring all the best parts of the film, it was an instant success and Activision did well to launch it simultaneously with the movie. Drive around the city coaxing ghouls into your ghost trap but listen out for a Marshmallow Alert. That giant sticky marshmallow man is quite capable of flattening whole streets unless halted. Greenbacks play an important part in the game as you have to buy your equipment to get started, and earn enough prize money for the number of ghosts caught, in order to take part in a final showdown with Zuul.

Finally **Tapper** from US Gold – another *Sinclair User* classic. **Tapper** is a simple but refreshing game centered round an all-American soda bar. You play a harassed barman, who must serve his customers with drinks. Easy at first as you slide them down the bar but wait until they have gulped

down the fizzy stuff. Running backwards and forwards between four bars, make sure the customers have got a drink, and catch the empties as they come skidding back. There are three difficulty levels, each one faster and more hectic than the last. **Tapper** is moving up the charts and we are sure that it will go far towards refreshing the parts other games cannot reach.

The fierce competition over the last 12 months has chased many companies into liquidation. There have,

however, been successes, particularly with a number of small software houses bringing new blood into the market. That can only be seen as a healthy sign.

The lack of QL games software is the only disappointment. Where is it? Other than a few basic programs such as **Reversi**, which cut its eye teeth on the ZX-81 years ago, there has been a dearth of games for this flagging micro. If games of the quality of **Knight Lore** can be produced for the Spectrum, why not for the QL?

Super fit and desperate for freedom, Monty makes his daring escape from Scudmore Prison. Hounded by the bastions of law and order, our frightened hero finds refuge with the criminal underworld who offer him his chance to breathe fresh air and bask in the sunlight once again. Moving from safe house to hideout

to underground lair, Monty must select the correct five elements of his freedom kit from the many he's offered and not miss out on the hidden gold coins that will make him a mole of leisure.

At last he's free but can he make the cross-channel ferry on time?

CBM64

CBM64

BEFORE PROGRAMMERS discovered sprites, 3D graphics and continuous fire buttons, strategy games were regarded as a sort of ideal computer entertainment. That was partly based on the idea that computers were essentially souped-up calculators and partly because mainframe computers were very good at games like chess.

If you were into computers when the Spectrum was launched, you'll remember titles like **Football Manager**, and **Flight Simulation** being held up as examples of the finest programs around. These days it's more likely to be **Alien 8**, **Shadowfire** or **Dun Darach**, and their reputation depends in great part on graphics programming.

One of the reasons for that is financial. In their wisdom, retailers and distributors tend to see strategy games as having a narrow appeal. They are the classic sleepers which sell steadily but slowly. The trade wants

tables for cross-referencing dice throws, gridded maps and strict sequences of actions within a given turn of play. They also took hours to play.

The computer is supposed to take all the argument of table-top gaming out of wargames. It quickly does all the adding up, it doesn't cheat, and it can handle secret moves easily.

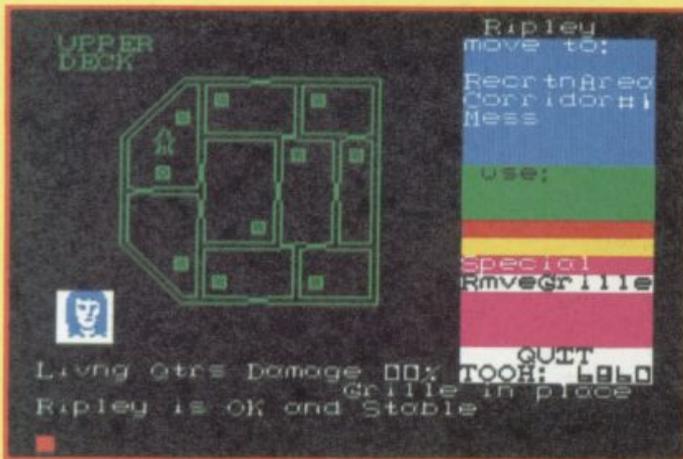

Unfortunately, most wargames never turn out like that. Graphics tend to be based on unrealistic grids, the rules appear over-simple, and the computer generally takes a vast amount of time to think about the moves.

One such game, which in other respects might have deserved success, was **ATRAM**. The name stands for Advanced Tactical Reconnaissance

The author is clearly fixated on jargon, which makes the rules almost unreadable, and all moves are keyed-in in a jumble of letters and numbers. It is so easy to make a mistake that you'll never be entirely sure whether you're playing the game properly. **Headbangers** and retired Harrier pilots only.

A much better two-player wargame is **Confrontation** from Lothlorien. **Confrontation** is a wargame system which allows you to design your own maps and, within reason, choose the composition of your armies. That allows you to play at a tactical or strategic level. The flavour is essentially modern, with armour and mechanised infantry supported by

Strategy

the money now and lots of it. That means quick-selling arcade games, preferably with some spin-off celebrity theme attached, which hits number one in the charts in a couple of weeks and stiffs out a month later.

Many of the fine strategy/simulation games, produced in 1985, saw little exposure in the shops — certainly not in the big high street chains. That does not mean they were no good. In fact, there has been something of an upsurge in the quality of strategy games recently, and most spectacularly in the field of wargames.

Wargames have as long a tradition as any sort of computer entertainment. If you've ever read the hefty instruction books for classic wargames of the past — Avalon Hill's *Afrika Korps* you'll understand why. Those rules tended to read like a computer program with complicated look-up

Chris Bourne takes a nostalgic trip through the battle-strewn fields of last year's strategy games

and Attack Mission, which turns out to be a NATO exercise in which the RAF and USAF battle it out using Harrier jump jets. The idea neatly sidesteps the obvious problems involved in trying to flog a game based on bombing the daylights out of Port Stanley.

The game is a computer-moderated boardgame with a glossy magnetic board and stylized pieces that you slide about as if you were a real NATO general. Unfortunately, the computer part is less fun. The only excuse for the program is to handle the boring bits like keeping track of how much fuel each jet has consumed.

footsloggers, artillery and air units.

To go with the system, Lothlorien has also released a set of four scenarios ranging from a fictional WWII invasion of Kent to guerilla warfare in Afghanistan and Angola. We found the Egypt-Israel scenario most interesting in that the open terrain left units extremely vulnerable without air support. The organisation of such support requires capturing and defending a chain of airstrips in order to reach Tel Aviv or Suez depending on which way you're going.

Nevertheless, **Confrontation** is still slow. The same cannot be said of **Overlords**, another two-player game

from Lothlorien. Loosely based on an old boardgame favourite, *Campaign*, it is played across a large area of fairly basic terrain. The concept is abstract, involving footsoldiers, generals, and the Overlord. The objective is to capture strongpoints — ownership of which generates one piece per turn. The fighting is equally abstract, based on the number and strength of the pieces in contact with the enemy.

Both players play simultaneously, and the game is so fast that you'll almost certainly need joysticks — preferably one each. The pieces whizz about the screen and that leads to a magnificent confusion as both players simultaneously attempt to outflank their opponent.

By and large, it is the epic battles of WWII which command the keenest attention from programmers. *Battle for Midway* is a strange hybrid from PSS, and incorporates arcade sequences. The Battle of Midway was a

the bunch is undoubtedly **Arnhem** from CCS. CCS, like Lothlorien, specialises in strategy games. For years CCS games were worthy rather than exciting, and almost always writtin in super-slow Basic. With **Arnhem** the company has finally struck gold.

The game follows the thrust of the Allied armies across the Rhine against fierce German opposition. The main idea was simple enough. The British were supposed to hurtle down country roads to Arnhem while American paratroopers were dropped on the bridges ahead to hold them for the main advance.

Of course it wasn't as simple as that, and neither is the game. There are a number of levels at which you can play, until you get to the full battle. A time limit is set, and if you don't capture the bridges quickly enough you lose. The German task is therefore to hold up the advance.

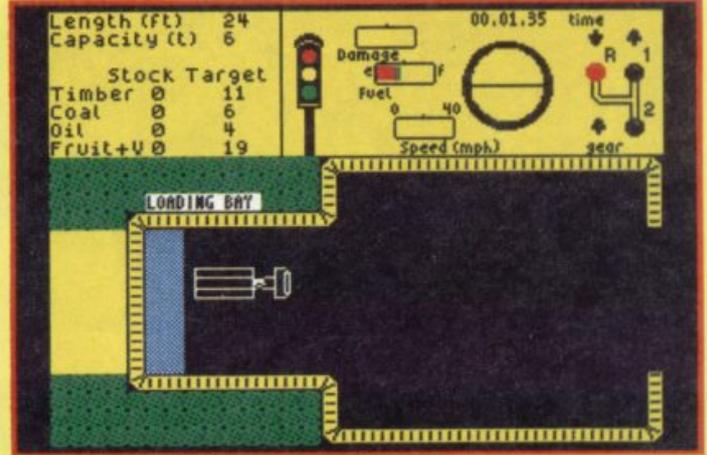

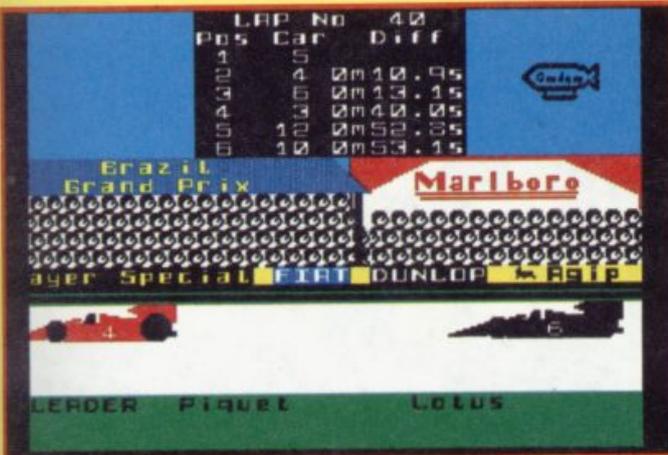

The graphics are pleasant, and in-

Europe. It was always doomed to failure, what with narrow country lanes and terrain choked in snow. The computer plays so quickly and viciously that you'll be hard put to survive.

Although **The Bulge** scores over **Arnhem** for speed, the graphics are less clear and the strategy less easy to fathom. Lothlorien has opted for simultaneous movement, and one is frequently reduced to hurling forces willy-nilly into the fray without much regard for tactics.

A pleasing feature of both **Arnhem** and **The Bulge** is that you can issue general orders to units which they will continue to obey until you change them. That is a sensible and much more realistic alternative and saves having to move fifty pieces every turn, slowing the whole flow of play.

Moving away from wargames, another category of great antiquity in computer circles is what is known as

crucial turning point in the war against Japan, when the US sent a force to smash the invasion fleet.

The PSS game falls into two parts. First, locate the course of the three arms of the Japanese forces. Having done that you must send out strike forces from your aircraft carriers to bomb them.

When battle is joined you get the chance to zap the Japs using a joystick, which rather spoils the point of a supposedly realistic wargame. The author claims it simulates the fog of war, or some such nonsense.

We found the game easy to beat — it's good to see the computer taking an active part in a solo game for once, but the graphics are primitive and not very clear. A year ago we might have had more praise, but there are better games around.

Much better, in fact, and the star of

formation about each unit's strength can be obtained by positioning the cursor. One of the best features is the movement system. You can choose to move in open or close order — open order means you are far less vulnerable to attack but cannot take proper advantage of the roads. The game can be played by up to three players — with three, one player gets the Germans and the other two play British and American forces.

The feel of the game is tremendously realistic, with the onus placed on keeping the British moving down the roads. **Arnhem** is absolutely recommended and will hopefully encourage other software houses to pull their socks up and match the standard.

Less attractive, but equally fast, is Lothlorien's **The Bulge** — the German counter-attack on Antwerp and Hitler's last great offensive in Western

the land-management game. An early example of the genre was *Hamurabi* which puts you in charge of an ancient kingdom. You are head of a population, and there is corn in the treasury.

The idea is to manage the economy — based entirely on corn — so that everybody gets enough to eat. There is enough corn to sow for next year with some in reserve in case of natural disaster.

Of course, the way the game is set up at the beginning, there is never enough, so you get to make decisions about how many people to starve to death for the greater good of the rest, and so on.

Such games are very easy to construct on computers, and if you want to write your own strategy game we suggest you try something along those lines. The secret is to construct a set of formulae governing the relationship

between various factors — for example, how much food do people need? How many people are needed to sow an acre of land? How much corn?

There are very few business-type activities that cannot be simulated in that sort of way. Two famous games of this type are **Football Manager** from Addictive Games and **Mugsy** from Melbourne House, in which you play a gangster trying to run rackets with the aid of a none too loyal gang.

Sadly, Kevin Toms — Mr Football Manager himself — has not managed to follow that enormous success.

Addictive has brought out a number of games along similar lines in 1985, but none of them match the old classic.

Software Superstar casts you as a producer of games. You have to allocate time and money each month to releasing games, programming, advertising and the like. Nice touches

Best of all, you can call pit stops for tyre changes, and the correct choice of timing may win or lose a race. The pit stop sequence is arcade based, and you have to manoeuvre a mechanic around the four wheels to complete it. Purists may have their doubts, but the speed of movement is linked to the amount of money you invested in the crew, and does not therefore make a mockery of the strategic element.

Formula One is a good game against the computer, but becomes really exciting when played with friends.

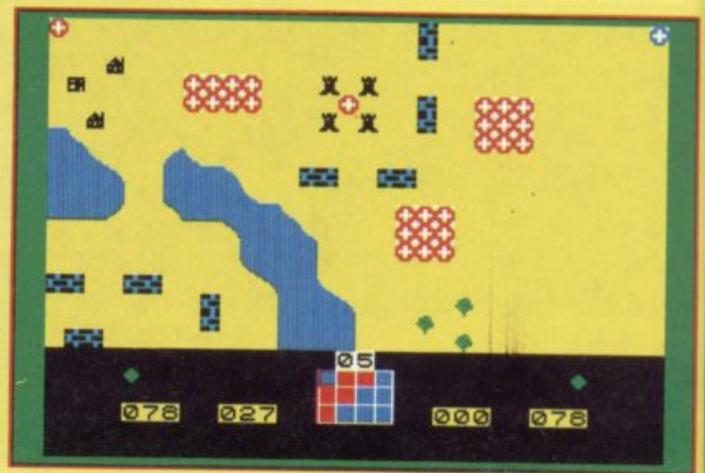

Almost as enthralling, although less well presented and rather more anarchic in play is **The Biz**, a simulation of the record industry from Virgin Games. You begin by choosing your social class — from stinking rich to unemployed — and then form a band. Hire a manager, go on the pub or college circuit and send endless demo tapes to bored record companies. If

with an array of instruments on the lower half of the screen and a view of the horizon with occasional crude landmarks. Some are better than others for speed and ease of use, and the best are still Psion's antique classic, **Flight Simulation** and Digital Integration's **Fighter Pilot**, which is rather more difficult but does allow for aerial dogfights.

DACC specialises in those features, and recently brought out **747 Flight Simulator**. We've taken a bit of stick at *Sinclair User* for giving it the thumbs down, but I still maintain it's an unexciting production, mainly because the Jumbo jet isn't a patch on a light aircraft for aerobatics.

Real enthusiasts will probably enjoy it, it is certainly a worthy and apparently highly accurate program. If you're looking for entertainment, though, try elsewhere.

You might try looking at **Southern Belle** from Hewson Consultants. The

include the decision to hype games or be honest about them, but the overall impression is dull, and we found it easy to get a hit program and reach the targets set.

Grand Prix Manager from the same outfit was equally tedious, with poor graphics to boot. Luckily CRL brought out the infinitely more entertaining **Formula One** — a *Sinclair User* classic — which we found totally compulsive.

Formula One is a full simulation of a grand prix season. Start off by hiring drivers and building cars — you have a million quid or so but it goes very fast. When the race starts choose your tyres and then watch the cars whizz past in convincing graphics. Messages inform you of the state of the track and incidents involving other cars, while a leader board keeps you in touch with the race positions.

you have the money, you can cut your own discs, but beware — without the clout of the big boys behind you it may all go to nothing. The ultimate goal is, of course, to get a number one, but the road is full of pitfalls.

The game is full of subtle humour — you may reckon a dry ice machine is just right for your tacky rock band, but watch your credibility plummet. You may even get a chance to sample drugs during the game. Try it and see where it gets you.

On then to simulation proper, by which is meant those worthy and sometimes addictive attempts to portray accurately a real-life experience. The original impetus comes from the flight simulators used by airlines to train pilots, and for some time software houses only seemed to be interested in mimicking those.

They all look more or less the same,

program simulates the old Pullman service from London to Brighton, and you have to handle the great steam engine all the way.

Initial levels involve handling only one or two controls while the computer does the rest, but you work up to a full schedule with stops, signals, hazards on the track, brakes and handling gradients, to name a few.

It is a surprisingly fulfilling program, and the wireframe graphics of recognisable landmarks along the track are well executed. You are marked at the end according to your accuracy on the schedule and how economically you conserved fuel.

Another unusual simulation is **Juggernaut** from CRL, in which you have to drive a container truck around town picking up cargoes. The screen shows an overhead view of the lorry and road, with traffic lights, status, steer-

ing and gears. The movement is slow and there are no other vehicles around — presumably you're driving in the middle of the night, council bye-laws notwithstanding. The irrepressible John Gilbert reckons the lorry looks like a Gillette GII razor. He's quite right, and although **Juggernaut** isn't a bad idea, the end result is rather dull.

Finally, a look at a few odds and ends which don't really fit any categories. One such **Minder**, a much-hyped trading game based on the famous television series.

You play Arthur Daley, the dodgy entrepreneur, and the idea is to buy and sell an incredible range of weird goods such as gold acupuncture needles while steering clear of the law in the form of mean Inspector Chisholm.

You do that by seeking out dealers and wide boys, either at their warehouses or in the Winchester Club. Terry, as ever, gets to do the fetching and carrying, and can also be hired to

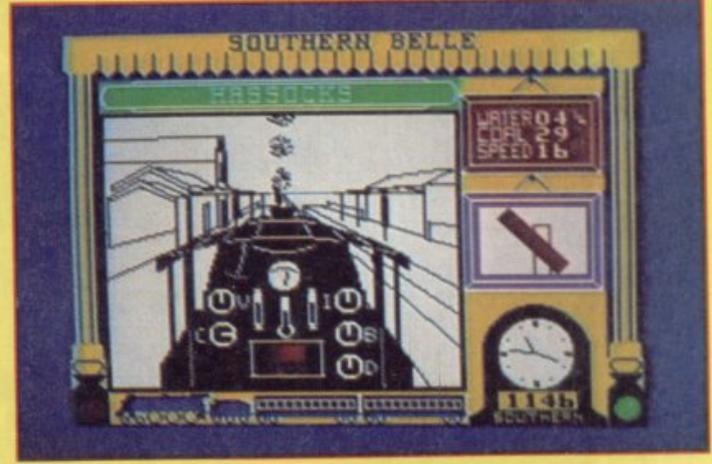

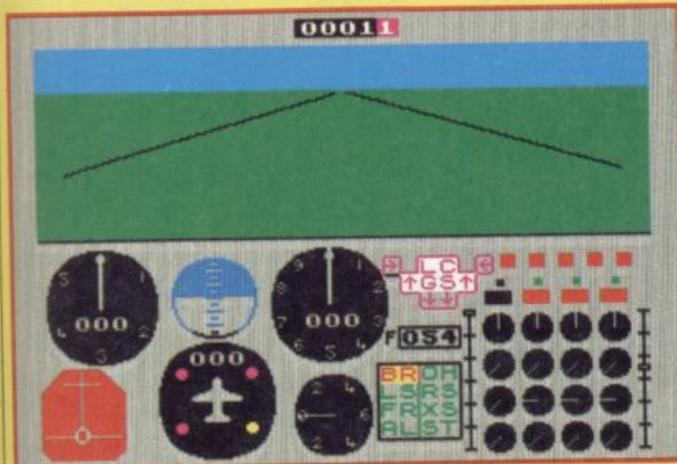

Alien on the other hand, from Argus, has plenty of depth but is difficult to get into. It follows the tense cult movie in which a devastating alien invades a spaceship and proceeds to exterminate the crew.

The game uses menus to pick characters, objects and locations in the spaceship *Nostromo*, while plans of the decks indicate your position. The idea is to destroy the alien either in a straight fight — fat chance — or by escaping from the ship and blowing it up by remote control.

You only see the alien when you are in control of a character in the same room. The rest of the time you can hear it as doors and ventilation grilles slide open, or your scanner picks up the presence of a living creature nearby. That makes for tremendous tension in the play, and the one drawback is the simplicity of the graphics which works against the otherwise strong illusion of involvement. Fans of the

sports arena which might come under the umbrella of simulations. Those are generally disappointing, especially in comparison with the arcade based sports games. Two, which play quite well, are **Steve Davis' Snooker** and **American Football** from Argus — which has the added virtue of not involving a famous personality. **Nick Faldo's Open** is a lovingly programmed simulation of the course at Sandwhich which suffers from one horrible flaw. The closer your ball is to the flag on the green, the more difficult it is to judge the angle at which you should strike it. In fact, the reverse should happen.

It is heartening to see arcade games taking on more elements of strategy in their play. Arcade-adventures such as **Knight Lore** or **Gyron** — if you can categorise those masterpieces at all — have as much to do with logical thought and planning as they do with swift reactions. That argues a growing

Overlords
747 Flight Simulator

Southern Belle

mind you — an important function when dealers discover goods are stolen.

In essence the game is simply trading, with a large text interpreter enabling you to bargain with characters in authentic Daley cockney — it understands words like bent, or pony. Once you get into it there's rather more strategy involved. You have to organise Terry's time so goods get collected and delivered on schedule, while you need sufficient cash to pay for the next lot.

Minder is a pleasant romp and deserved to do better in the charts than it did, but would have benefitted from a greater variety of incidents. Memory taken up with slang during the bargaining is fun at first but since it is really only window dressing it leaves you with the feeling that the game lacks depth.

film will enjoy it. Others may find it tough going.

We have made no mention of some of the plethora of spin-off titles in the

maturity, both among games publishers and also in public taste, as computer owners look for more than a quick joystick fix from their hobby.

SPECTRUM VERSION
AVAILABLE LATE AUGUST

Mail Order: MONOLITH,
3rd Floor, Lector Court, 151 Farringdon Road,
London EC1R 3AD.

Price £9.95 inc. P&P.
Cheques/POs payable to Monolith.
Credit cards call 01-837 2899.

CBM 64

ONE FEATURE which stands out when you look back on 1985 is the increasing sophistication of software in the learning field.

While previous years saw a mass of new software the quality was not necessarily good. There was a feeling that publishers were keen to jump on the bandwagon and produce software quickly for a perceived, rather than an actual, market.

Some of those programs were distinctly dull, but 1985 saw an increase in the games element and the fun/educational borderline became blurred.

Preschool learning

For the pre-school and infant age group **Romper Room** from Beyond is another attempt at using the Spectrum for initial alphabet teaching. **Romper Room** is much more lively than previous programs of this type. It features a character called Max who illustrates each letter with an action. The screen picture above is one example.

On the first game, Watch the Letters, both capital and small letters are shown together with a small sentence to be read by the parent. Max then acts the word, such as dancing for D. That is much more fun than a static graphic of an object.

The three other games in the package, Press a Letter, Find a Letter, and Letter Quiz work from that basis. Letter Quiz is the hardest of the games, where the player has to observe Max's action, determine the initial letter, and then press the letter

A first class romp

Theo Wood finds that educational software is a boon to teachers

on the keyboard.

Education publisher Macmillan has produced games which follow on from the kind of skills learnt in **Romper Room**.

Tops and Tails and **Castles and Clowns** are designed with the help of Betty Root, who is the 1985 President of the United Kingdom Reading Association. Those games are involved with the recognition of initial sounds and **Tops and Tails** introduces sound blends. Both feature games and, interestingly, two people can play. That is really useful when you have two children squabbling over who should play with the computer.

Mr T Meets His Match by Good Housekeeping, deals with memory skills. The players have to pick out pairs of animals as they turn over cards on the screen. The one-player option allows Mr T to be a forgetful or clever computer opponent. At a high-

er level the animals on the cards change to geometric shapes.

The other game, **Switcheroo**, provides food for thought as the task is to change one animal into another in four moves. That can be done by changing the size, colour, or animal. **Mr T Meets His Match** is an interesting package which deals with non-verbal skills using entertaining graphics.

Paddington's Garden Game is a gentle arcade frolic in which Paddington has to go around the garden to find a pot of marmalade, catching butterflies as he goes. The butterflies are released at the end of the game.

Joystick control ensures easy use. The game is innocent enough for the younger age group for which it is designed. Paddington fans should enjoy it, while practising hand/eye co-ordination.

Simple arithmetic

While today's educational thinking encourages calculators for yesterday's burdensome tasks of long division and multiplication, elementary numeracy cannot be ignored. Several programs work on that problem and are so designed as to deal with varying skill levels from five to 11.

Mirrorsoft's **Ancient Quests** package has a game called The Count which provides practice of simple counting to more complicated sums such as division and multiplication. Moving around the castle you must solve the problems posed before reaching the library where the Count

can be overcome.

The other game, King Tut's Treasure includes arcade action. You must move Professor Diggins around the screens, avoid the hazards and dig for the matching shapes, match a fraction with a decimal or fraction with a name.

Psion and ASK collaborated on two of the year's best programs which deal with numbers. **Estimator Racer** is another arcade classic in which you have to race around a track as fast as possible. The faster you go the more frequently you have to answer questions. The speed and level can be selected and depend on the type of car and player's control.

Estimator Racer is different from other similar programs in that it is not the correct answer which is needed but the one nearest to the answer. That skill is useful when using a calculator, and encourages quick thinking without the need for complete accuracy.

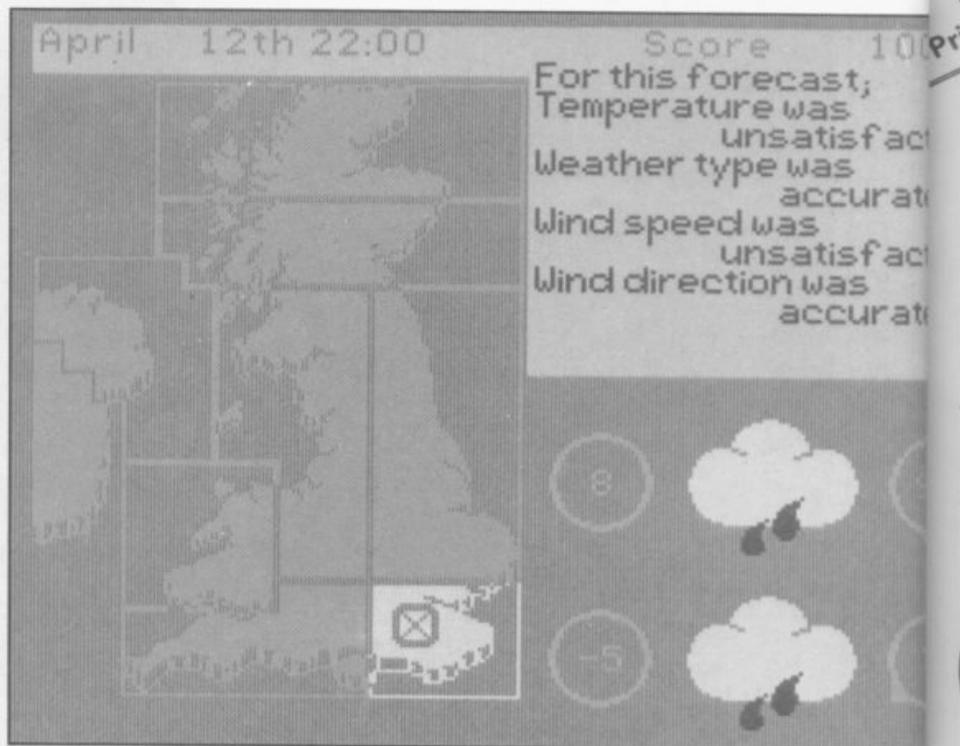

Number Painter is another program with the same pedigree. This time the aim is to reach the target number by painting out other numbers — such as +2, +3 — until the target is reached. Based on a platform and ladders game, and operating at a number of different skill levels, **Number Painter** is great fun and has enough action to appeal to players who are hooked on games.

Adventures

Adventure games have proved popular and the format is selling well in adventure books with multiple choice options. Taking an active role in the development of the plot, young readers are encouraged to improve their reading skills.

Mirrorsoft's **Phineas Frogg** must be considered a classic of its type for eight to 10 year olds. A story book is provided to fill in the plot background before you start the game, and a multiple choice of action is shown on each screen. There are also several arcade games which have to be played to solve the mystery, which is to save the scientist Mole from the Secret Lair of the Terrible Hamsters — SLOTH for short.

Jack in MagiLand could be played by the same age group, or as with Phineas, with younger non-readers as an alternative to reading a story. Based on the old tale it too has options. As a text-only adventure it lacks some of the interest of Phineas, but that is

compensated by using a more descriptive text.

Simulations

Simulations are one way of introducing a subject and practising skills. **Weathermaster** by Sinclair/Macmillan is one of my favourites. Using it you can play at being a weather forecaster.

Onscreen you see a picture of the British Isles and the frontal systems moving over the chart. The aim of the game is to provide a correct forecast. That must be done for each region until the whole country has been covered. If you can do that you can become a weathermaster — no mean feat.

Oilstrike is another in the Science Horizons series from Sinclair/Macmillan. It is a simulation similar to **Weathermaster** but this time you have to survey and drill for oil. The secret is to find suitable oilbearing strata before drilling, otherwise costs mount turning the operation into what could prove to be a fruitless exercise.

The success of sports simulations in the software charts proves their popularity. Two sports simulations which require more skill than usual are **Yacht Race** and **Run For Gold**, both from Hill MacGibbon.

Yacht Race is an introduction to the art of sailing and comes with a printed chart of the different courses. There are six levels of difficulty which allow the novice to learn by coping

with steering the dinghy before moving on to trimming the sails and setting the balance.

Run For Gold similarly requires a learning curve to fully master the pace and steering of your two chosen runners. Setting the pace too high for your runners will quickly tire them out. The object of the game is to increase your fitness level in local meets, before moving on to reach Olympic standard.

The Spectrum is not noted for its musical capability but one program stands out which uses what little there is to the full. **Music Typewriter**, from Romantic Robot, enables you to print out a score on to a wide selection of printers and interfaces.

The product is a real aid to budding composers who are working with a musical instrument. You can ENTER the notes with the help of the keyboard overlay which is provided, and edit the tune bar by bar.

A substantial section dealing with setting key changes, rhythm or tempo, as well as right or left-hand play options, means that the package can cover a wide variety of musical styles. You cannot use chords, but that is a failing of the hardware.

More Logo logic

Sinclair's own version of **Logo** was a critical success in 1984 and provided Spectrum owners with the chance to experiment with a full implementation

TWO
EPSON FX80
Printers to be WON

Interactive BASIC Programming 48K ZX Spectrum & Spectrum +

Don't let books blow your mind, use your computer to teach
you BASIC - what could be easier?

The only ZX BASIC programming course that runs in your Spectrum and gives you complete control over the computer.

Learn BASIC with your hands on the keyboard, not with your head in a book!

IBP consists of twelve programs called Learning Modules. Altogether more than 250K long! Whilst using a Module you will have complete control over your computer. So when IBP explains, for example, how to use the BEEP command you can try it out there and then before continuing. You will be asked to write programs throughout IBP. Don't worry though, you can call on two hints for each program and then get IBP to put its own solution into BASIC for you to look at and RUN. There are eighty programs like this. Many demonstration programs are given, also.

THE IBP COMPETITION

Epson FX80 printers are the best all round printers and Eigen Software are giving away two of them! To enter the competition you must write a BASIC program, record it on the official cassette (free with the IBP package) and send it to the address below. Entries will be considered in two categories: games and non-games. The writers of the best program from each category will receive a printer system. ALL other entrants will receive a copy of the two winning programs!

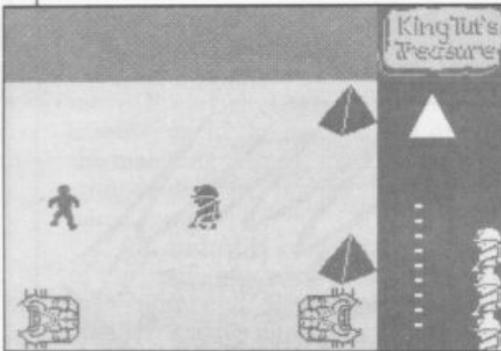

The whole Interactive BASIC Programming package costs £9.95.

If your computer shop does not stock Interactive BASIC Programming then send £9.95 for the package by return of post (p & p free) to:

Eigen Software

$$\hat{H}\psi = E\psi$$

EIGEN SOFTWARE create reality

*Ancient Quests, opposite
Phineas Frogg, below*

allows you to draw onscreen, change brush size and generally play around with colour and pattern without any programming skills. A program such as that can give some insight into how a graphic system works as well as being instantly useable.

Bookware

For 11 to 16 year olds the Century Communications book *Maths Tutor for the Spectrum* is to be recommended. It is not a revision package but a self-contained maths course in book form with a tape for a few pounds extra.

A maths course could well be very difficult to follow but author Robert Carter has brought a masterly use of language into play which ensures that the whole subject does not become too dry. The explanations in the book are outstandingly clear and simple, and use of the programs in the book reinforces understanding of the mathematical concepts required up to O Level.

Revision programs are the mainstay of the program lists for secondary school age. The best of those on the science side are the Pan/Hill MacGibbon packages, called Pan Course Tutors. They cover all the usual science subjects and come with a text book.

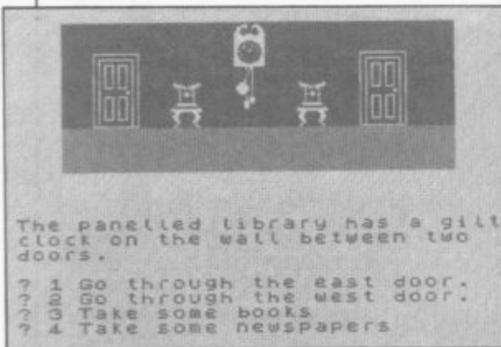

There are diagnostic tests at the beginning of the programs which help students to identify weak spots in their study course.

The student is then directed to a suitable module. The modules make extensive use of screen windows, with one for the explanation, one for a question and a third for hints.

Penguin has released more titles in its study range, which mostly cover English Literature. Those operate on database techniques which allow you to browse through and follow characters in a novel or play. As the study of English Literature is largely interpretive, and the space for text is extremely limited, it would seem that those and other, similar, packages offer little real advantage over revision notebooks.

Worldly wise

A program for older students which does not concern revision is **Worldwise**, a study of nuclear weapons. It operates as a database as well as providing a basis for playing negotiation simulations. It is meant as a factual program and not, in itself, an opinion former.

The panelled library has a gilt clock on the wall between two doors.

- ? 1 Go through the east door.
- ? 2 Go through the west door.
- ? 3 Take some books
- ? 4 Take some newspapers

continued from page 60

of the language. Two Logo lookalikes were released in 1985 which offer Logo facilities of Logo at a reduced price.

Spectrum Logo Graphics from Sigma deals purely with turtle graphics. Using a keyboard overlay the main commands can be ENTERed with single key stroke. Spacing between commands is added automatically. That may be of some help to younger children but the entry of commands will not deter most children. The big drawback with the program is, however, that routines cannot be SAVED.

The second Logo program was **Picture Logic**, from Addison Wesley. The program is a reworking of Heather Govier and Malcolm Neave's earlier program **Logo Challenge**.

Picture Logic adopts the structured approach to turtle-type graphics. The book accompanying the software takes you through the first stages and beyond by a series of exercises, called challenges, with many hints and tips to help beginners. In neither of the two programs is there any list processing facility which can be found in the full Sinclair version. If, however, you want turtle graphics and want a structural approach **Picture Logic** is the best buy.

One package which is easy to use and provides access to the Spectrum's graphics capability is New Generation's **Light Magic**. The program

The Richardson Institute for Conflict and Peace Research, at Lancaster University, operates an update system for members of the user group WUG — Worldwide Users Group, membership £2.00. Extra copies and microdrive versions can be obtained through the group at a special price.

Programs such as **Worldwise** can be used to provide the basis for intelligent discussion in an area which is renowned for bias and emotion, frequently unsupported by hard facts.

All in all, 1985 has been a good year for educational software. As it becomes less easy to rely on simple rule and drill exercises, producers of software are showing imagination and wit in their programs. In doing so the packages are becoming more attractive to use and more fun to play.

Mic

Nice Password. Shame about the Identity.

It's a unique combination.

Your Special Identity Number and Personal Password. The valuable key to huge databases teeming with activity, set on our Mainframes across the nation.

On Micronet 800, you're a valued individual, adding your own special flavour and personality to the database.

Take our exciting new "Gallery" - You control your personal screens for all to see. The intriguing "Chatline" public conversation service gives you freedom to express your views and meet some remarkable people.

All part of a tremendous Communications section that networks you to 60,000 Micronet and Prestel users across the country. Try Tele-shopping, or interview celebrities live on "Celebrity Chatline" every Wednesday night.

And there's FREE (& instant) National Electronic Mail, plus International Telex, and the Contact and SwapShop bulletin boards.

Get computer news first on Micronet's daily (and controversial)

"Newsflashes" and read up on the latest reviews and courses. Feast from our regularly changing menu of programs to download straight into your micro - absolutely free.

You also get access to Educational Computing's "School Link" and Prestel's huge 300,000 page database, including world news, business & share bulletins and optional homebanking. For only £16.50 per quarter, that's less than the price of a daily paper!

Micronet is unique amongst networks and bulletin boards as it keeps your phone costs very low with

special local* rate calls whenever you connect up - that's around 40p for a whole hours entertainment each evening.

The only accessory you need is a Modem, to get the best value for money around in micro communications.

Fill in the coupon for the full facts and send to Micronet 800, 8 Herbal Hill, London EC1R 5EJ. But be warned, Micronet 800 is a 'living' service with ever-expanding features. So maybe you'd be better to call in at your local Micronet 800 Action Station. There are thousands of Micronetters waiting to meet you!

To: MICRONET 800, Durrant, House, 8 Herbal Hill, London EC1R 5EJ. Telephone 01-278 3143. Please send me the full facts about Micronet 800.

Disc software

THE ARGUMENT over the usefulness of Sinclair computers in business continues. Supporters are mostly independent businessmen with small to medium size companies who are also computer enthusiasts. They have found that, within limitations, Spectrums, QLs and even ZX-81s can be used successfully for specific, clearly defined tasks. Although the detractors are a less homogenous group, their arguments have consistently centred on the lack of disc drives.

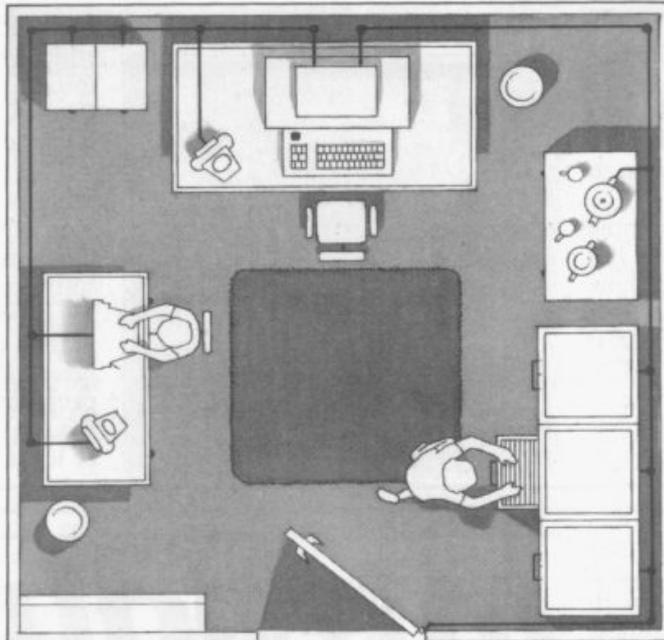

A bewildering array of disc interfaces and drives now exists for the Spectrum and QL. That is only the start, suitable software to run on the discs must also be found. While commercial tape or microdrive to disc conversion programs are available, and indeed most manufacturers now include one in their system, software written especially to make the most of a disc's features is rare. In part this is caused by many different systems occupying what is still a relatively small sector of the market. Software houses will not spend a great deal of time and money on writing programs that which will generate little or no profit.

The Spectrum situation seems to be getting better, with two manufacturers, Opus and Kempston, setting the pace for available business programs. Although neither has yet had any software specially written OCP, in conjunction with the designers of the Kempston interface (Abbeydale Designers), has converted most of its business programs to make best use of the interface. The Opus system has **Mini Office** from Database Software, and Transform is converting its software to run on the system.

For the Spectrum more software is going to be available in disc format during the coming year. However, such software is still likely to consist of conversions to run on the systems rather than be designed to make the most of them.

QL software seems to have been

Fast and easy access can be yours with a disc drive

written, in the main, with disc drives in mind. While Medic has produced its own business software with its discs Quest has released CP/M 68K for its disc system. The problem is that while CP/M has become an industry standard operating system for Z80 processors with a glut of software written for it, CP/M 68K for 68000 processors has not yet made the same impression and software is still scarce and expensive. Again, partly because of the proliferation of disc systems for the QL (five at the last count), most of the software released for the QL in the coming year will be for use on microdrives and not for specific systems.

Having concentrated on disc systems for both the Spectrum and QL it would be easy to imagine that there is no place for other storage media such as microdrives and wafadrives. When the wafadrive was launched for the Spectrum it came with its own specially written word processor, **Special Writer**. There was also the promise of a database and a spreadsheet to follow. To the best of my knowledge those

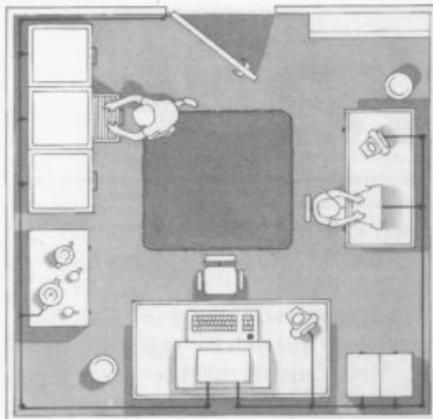

products are still waiting to be released and publicity about other software for the wafadrive seems virtually non-existent.

The main advantage of the wafadrive over microdrive was its reliability. Refinements of the design and manufacturing process seem to have improved the microdrive's reliability considerably. However, the wafadrive still seems more reliable — an important factor for business users wishing to keep large amounts of data.

There is no sign that further specially written software is likely to appear for any of the independent markets, but all software is likely to be written to run from tape or microdrive. If specialised software does appear it is highly likely that it will be that much more expensive than anything already available. Business software for the Spectrum probably costs about a tenth to a fifth of that for recognised business machines, while for the QL it is about a quarter of the cost. Although the quality of some software already matches that produced for more expensive computers, the overall quality can be expected to improve as programmers find new ways of extracting more performance from the machines. Despite those improvements the cost of the software can be expected to remain at a fraction of the cost of the business software for more expensive machines.

The majority of business programs for Sinclair computers are still written in Basic. Because of the low quality of Basic games compared to those written in machine code some writers have highlighted that as a weakness of such programs. That is not necessarily true. Machine code usually results in a program which is faster at processing data than one in Basic, but the majority of time in business programs is spent in entering data, not in processing it. Partly because of the games market there are many more machine

continued on page 68

continued from page 63

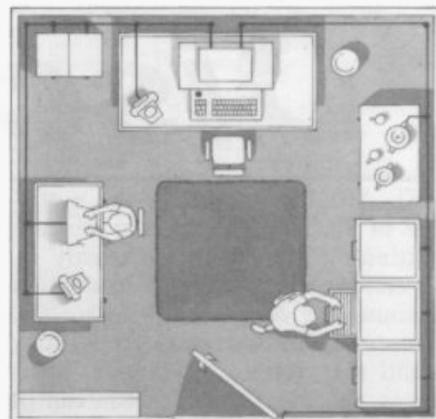

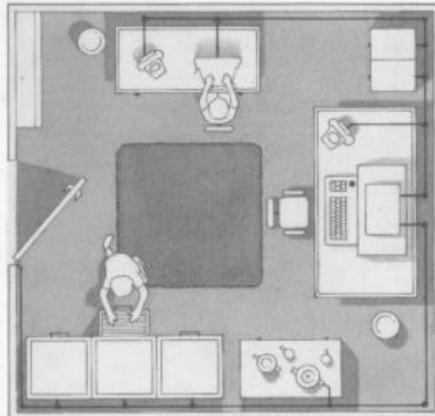

code programmers around. That is likely to result in an increase in the number of business programs written in machine code, although the more specialised programs will continue to be written in Basic.

Since the arrival of the Apple Macintosh a great deal of interest has been focused on WIMPS and how they make business software easier to use. In the jargon jungle WIMP stands for Windows, Icons, Mice Programs or programs that use a number of little screens or windows within the display screen. Each win-

dow can be scrolled independently of the others. They use pictures — icons — instead of words for a menu and use a mouse to enter data.

A mouse is a device which uses an on screen pointer to pick out and select icons. The pointer is moved by running the mouse across the desk and the icon is selected by pressing a button on the mouse. So far such software has been generally available only for the more expensive 16-bit computers. However, it is only a matter of time before WIMPS become available for the QL.

Windowing on the Spectrum may

be difficult but the **Fourth Protocol**, which was recently released by Hutchinson, uses icons and I understand that OCP has a graphics package in preparation that uses a mouse.

The coming year is unlikely to see much development of disc based programs, those that become available are likely to be conversions of existing software. However, developments can be expected as more programs are written in machine code and programmers, possibly using techniques learnt programming games, stretch the machines capabilities, allowing the use of icons and mice.

ANY ADVICE on buying business software needs to be prefaced with a word of warning. Before parting with your hard-earned cash for a business program you need to be as clear as possible in your own mind, firstly, what task it is that you want to computerise and secondly, just what you expect the computer to do for you. The third stage is to look at the software available and your specific requirements.

A surprising number of companies, big and small, have run into difficulties because they have neglected just that point. Given that computers are firmly based on logic, it is ironic that human reaction to them is so often illogical. A strange kind of mania sometimes afflicts normally rational people when computers are introduced into business. Those who don't know too much about computing either take an over optimistic view and see them as a magic wand to be waved over a problem, or they fear them as a branch of the black arts, to be avoided as far as possible.

On the other hand, there is the enthusiasts approach, which is little better, and involves using the computer wherever and whenever possible.

Introducing computers

Mike Johnston shows how you can easily computerise your business

That is fine for a hobby, but can be quite lethal in a business, and in the long run can cost much more than the purchase price of the software. It needs to be said that computers are not always the answer. Manual systems are quicker and more flexible for some jobs and inappropriate software will waste both your time and your money.

As a first step it is worth putting down on paper how a job works and exactly what you would like the computer to do. Armed with that, you will find it easier to evaluate and compare programs that are available.

In thinking about the way you do the job now, you need to ask a number of questions. Is your system likely to change in the near future? Will it expand or contract? How central is the job to the rest of your business? Is it time critical? Smaller business systems like the Spectrum and QL are most often used as an aid to business — for example, a word processor for standard replies, a spread sheet for financial estimates or for costings, or a database to hold mailing lists. That type of use can speed up your operation or provide facilities you could not otherwise manage.

However, if you intend to computerise your stocklist or accounts, you need to be more careful about the quality of the software you buy and to think about what you will do for back-up — a second QL for emergencies? — and for training.

Large companies pay systems analysts and designers to examine and describe the existing job and consider how it could be dealt with by a computer. As a small business user, you must effectively be your own consultant or systems analyst.

Suitability

The first and most important consideration when looking at software must be how far it goes towards meeting your requirements. It is unlikely to be a perfect fit, and you must decide if you are prepared to sacrifice some of the features of your present manual system to gain the advantages the program offers.

Alternatively, how easily can the system be modified to bring it closer to what you want or to meet your future needs? Is it fast enough, is it expandable, is it flexible?

Price

Sinclair computer owners are in the fortunate position of having a good deal of reasonably priced software available. If your experience of computers is limited, you could be in for a nasty shock if you decide to upgrade to a large business system. The price of a single program may exceed the entire amount you have spent on all your Spectrum programs.

QL programs are, of course, more expensive, partly because of the smaller user base, but they are still cheap compared with ordinary business programs. And QL owners start with the advantage of having the four most common business programs supplied free.

Reliability

If your latest shoot 'em up game fails to load one evening, or crashes just as you are about to exceed the all-time high score, you may be justifiably annoyed. However, if the same thing happens to your mailing list just as you are about to make a back-up copy, or to your accounts program as it works out your VAT returns, annoyance can barely describe the experience. You may lose days or weeks of work, and potential customers.

As a business user, the reliability of the software you choose must be of paramount importance. A program may be forgiven for being slow, poorly documented and hard to use, but it can not be forgiven for being unreliable if you intend to trust your valuable data to it. There are some programs which give a balance with 0.001 pence in the answer. Others that crash on simple input errors are mercifully fewer than they were but are still around. It is not too difficult to pick

out those watch the system lock up — preferably before you buy it. Some suppliers offer a help line or back-up service, and that is worth having.

Documentation

If the suppliers have bothered to provide a well written explanation of how there program works there is a reasonable chance they have taken the trouble to make the program approachable.

Dismal software documentation has a long history and there is still a lot of it about. It is often written by programmers with limited concessions to the novice, sometimes badly printed, full of elementary spelling mistakes, and even factual errors and omissions. You should not let that put you off though, particularly with regard to the smaller applications programs which may still be good, despite the poor presentation.

By all means have a go at computerizing some of your business applications — it can be tremendously enjoyable and educational — but unless you are clear about what you are doing, it will not necessarily help your business.

User friendliness

Just how easy it is to use a program can only be found in practice. It certainly helps if a program starts with a list of options, offers an easily accessible help facility when you get stuck and provides meaningful error messages when you make a mistake it is worth checking to see if the program you have in mind offers those facilities. However, there is sometimes a trade off between ease of use and flexibility. Some programs are user friendly because they are highly structured and will only allow you to take certain options.

Tailored to your needs

Mike Wright takes stock of the best business software around

APPLICATIONS software comes in many different forms. **Word processing** is probably the most commonly used of these and this is reflected in the number of programs available. However, on the Spectrum one, **Tasword II**, from Tasman Software stands out above all the others and has done so since it was launched. One unusual characteristic of Tasword is the large number of extension programs available for it, some from independent software houses. These include extensions to allow different print styles and one to merge data from the **Masterfile** database.

Spectext from McGraw-Hill includes a mailmerge program and a limited database in the package. **Spectral Writer** from Softek was originally released on Wafadrive but is currently being revamped for general release as **The Writer**. I am told that it will be able to read and write **Wordstar** files, allowing you to send files to the office computer via an RS232 link. **Word Manager** from OCP is another that we can expect to see being released shortly.

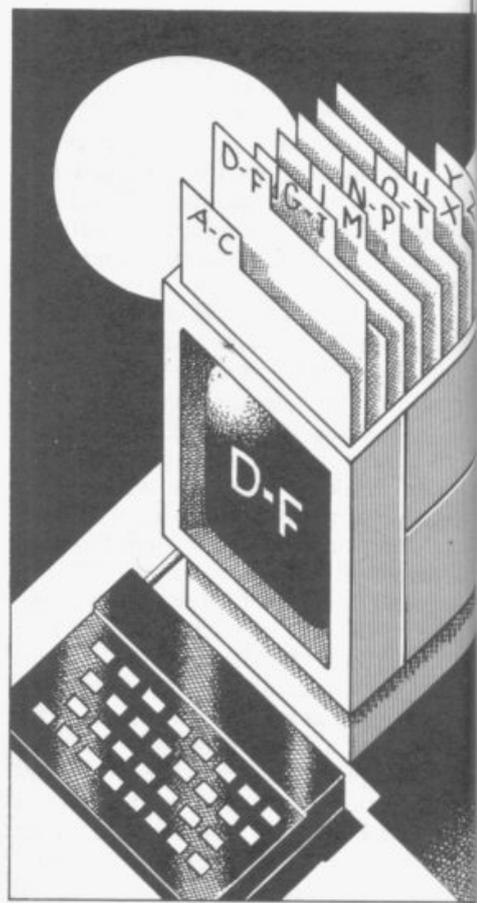

The only word processor available for the QL is **Quill**. That was written by Psion and is bundled with the machine. However, supporting programs are now available. Those include

a number of spelling checkers, the best of which seems to be **Qspell** from Eidersoft. **M-Spell** is bundled as part of Medic Data Systems disc system and is not generally available. Also included in their system is **M-Merge** which provides a mailmerge facility. The only commercially available mailmerge program I have come across is **Quilmerg** from Pitch Associates although I understand that Transform are working on one currently and that it will be ready shortly.

Features you should look out for when buying a word processor include insertion of new text at any point, word wrap, automatic justification, on screen editing, block copy, word search and replace and margin setting.

Databases vary in complexity from simple card indexes to full databases that are more akin to a programming language than a program. It is generally true that the more flexible a database, the harder it is to use. Before selecting any database you should consider carefully what uses it is likely to be put to now and in the future. You should also consider the amount of programming skill, in relation to your own, required to retrieve information from it.

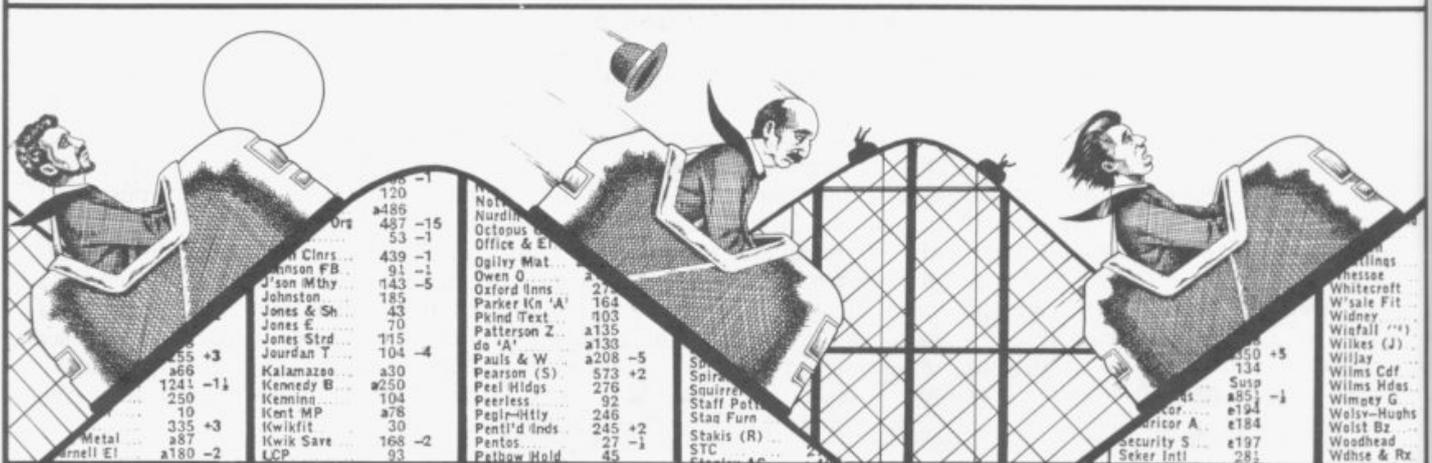

The classic Spectrum database is **Masterfile** from Campbell Systems.

Less flexible databases include **Vu-file** from Psion, **Superfile** and **V-notch** from Transform and **Datagenie** from Audiogenic.

Sinclair Research also publishes two dedicated databases in **Collectors Pack** and **Club Record Controller**, while OCP's catalogue includes **Address manager**.

The QL comes complete with its own very good database **Archive**, again written by Psion. However, it is not easy to use effectively and many companies are now releasing specialised routines that save the ordinary user having to write a program. **Archiver** from Eidersoft is one such program which provides routines for

User-defined possibilities

John Gilbert says: Why not stop playing games and do something useful instead?

THE DEFINITION of a utility in computer parlance has widened in the past year. In the early days of the industry it meant a program which aided the machine code programmer to accomplish a task. Now it can have five meanings.

The first category takes in the graphics and sound toolkits. Those expand the Basic command set, adding instructions which create shapes, fill them in, and save pictures to tape or microdrive. The sound generators sometimes included within those packages can make music or even create a voice for your computer.

Machine code utilities include assemblers, disassemblers and monitors, all of which are designed to help you write your own machine code routines. If you are not up to that sort of exercise you may like to acquire a new operating system or high level language such as Pascal, Forth or C.

General utilities which will teach you the highway code, help you with car maintenance or show you how to diet efficiently are also available.

Graphics packages have the most visible effect on a Spectrum or QL, and they have proved popular this year even with people who would not normally program a computer. **Light Magic**, from New Generation, started the interest in all things graphical during 1985. It carried on where **Melbourne Draw**, from Melbourne House, and **Paintbox**, from Print 'n' Plotter, left off.

The program is totally menu driven and can be operated either under keyboard or joystick control. There are five modes of display. The first is pen mode in which, you can draw on the screen using an electronic nib.

Circle and Fill mode will allow you to produce circles and arcs which can then be filled in with colour. Brush mode is similar to Pen mode but you can use 10 types of brush.

The block mode operates in parts, or blocks, of the screen. It allows you

to rotate and mirror blocks on pictures, saving time if you need to draw an object which is symmetrical.

Finally, the Text mode enables you to write on the screen. User-defined graphics can also be produced as a UDG generator is included in the package.

If **Light Magic** does not impress you then **The Artist**, from Softechnics surely will. It is one of the most powerful packages on the market.

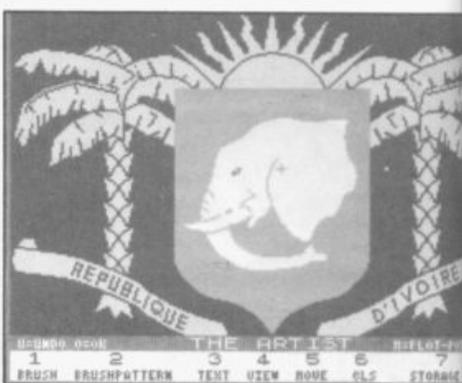

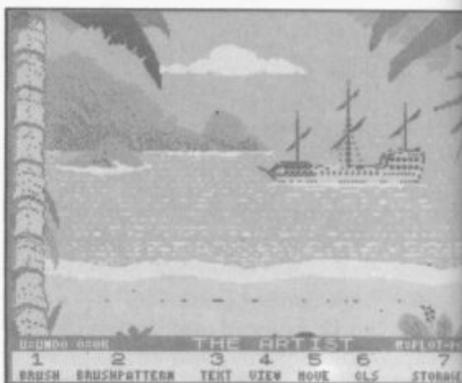

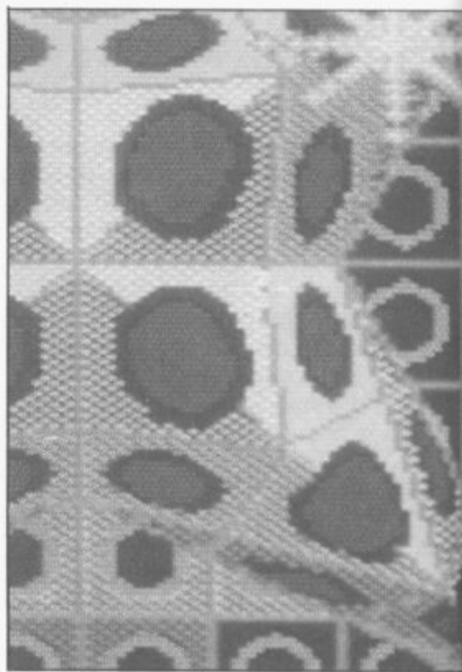

The Artist can be used to take one section of a picture and reproduce it on another part of the screen, where it can be enlarged or reduced. The package will also allow you to produce UDGs and an animator utility is included within the program. Not satisfied with that the author has also included a simple routine which will take a screen display and reduce the number of RAM bytes required to store it.

Art Studio, from OCP outperforms **The Artist** in almost every way. It has superior speed to the Softechnics package and the pull down menus are easy to use. It can be used with disc, tape or microdrive and contains a printer driver which handles most Spectrum compatible printers. It should be of use to professional artists and designers as well as to the home user.

A similar package came onto the market for the QL. **GraphiQL** marked the entry of quality software house Talent onto the QL scene. Not only can the package produce every conceivable type of line, circle, arc and angle, but it can also be used to define textures, using form and colour. Those can then be used with Fill routines.

The program allows you to enlarge shapes on the screen. That facility enables you to ensure that Fill texture does not leak out of a shape which has a hole in its border.

QL Art, from Eidersoft, has the same sort of facilities as **GraphiQL**

Left, *GraphiQL*; below left, three screens from *The Artist* and below right, three from *Art Studio*

but does not have the same professional edge to it. Unlike the Talent package it is fully menu driven. One of the faults with **GraphiQL** is that you must rely on the instruction manual or special help option for information about user commands.

Illustrator, from Gilsoft, is the long awaited adventure graphics designer for the Spectrum. It is no ordinary package as it produces graphic screens which can be put into adventures designed by Gilsoft's adventure design program **The Quill**. Although the routine can only produce static screen pictures it brightens up the adventures written by its sister program and gives adventure programmers more scope for invention.

White Lightning, from Ocean, is one of the most exciting advances in graphics design packages for the Spectrum that I have seen in the last year. Its aim is to allow you to produce high standard arcade game graphics and, in order to do that, you must use its special Forth-type language. The package combines a sprite generator with a screen layout designer. It is great fun to use and its limitations are only in the mind of the beholder.

A similar package has been produced for the QL, although **Super Sprite Generator**, from Digital Integration, will produce and animate only sprites and not full screen game backdrops.

The program adds extensions to SuperBasic and is run in two parts. The first is the generator and the second the animation routine. It is an excellent package which has been used by professional programmers to produce arcade games. **Night Nurse** from Shadow Games is one example of its use.

Only one good example of a sound toolkit came onto the market last year. **Varitalk** produces speech through the Spectrum Beep unit. Its performance can be enhanced using a loudspeaker or by putting the sound through a tape recorded output channel.

A large number of phonetic sounds are included in the package. Those can be accessed by using a code made up of the first letter of the type of sound required and the number of that sound from a list which has been provided on the cassette inlay. There are no parameters within the program to allow you to set emotion or inflec-

tion into the speech. You cannot even get the package to ask a question properly.

Machine code utilities may only appeal to assembly language programmers but that audience has grown larger during the past year, especially within the ranks of those who own a QL.

No less than four QL assemblers arrived on the market during 1985. The most powerful was from Metacomco. **The QL Assembler Development Kit** comprises a full screen editor, together with a three-pass compiler.

The editor can input ASCII code files and so can be used with code Basic programs and even word processor files. Once your assembly code listing has been entered you must save it to microdrive, or disc, and then load it into the assembler program. The package takes approximately two minutes — and three code overlays — to convert the code file into a machine code format.

Also included with the assembler is a library of QDOS calls. Those can be named within your programs. A linker was put into the second version of the assembler package at which time Metacomco dropped the price.

Computer One was also quick to produce an assembler for the QL. The difference between it and the Metacomco program is that it can be loaded into the machine complete with the source editor. You can, therefore, write your assembly program and then convert it to machine code without having to load any overlays from microdrive.

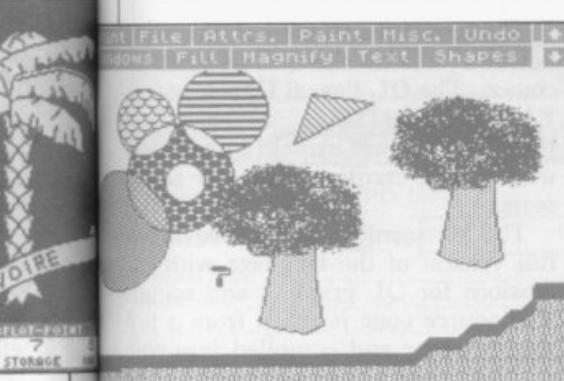

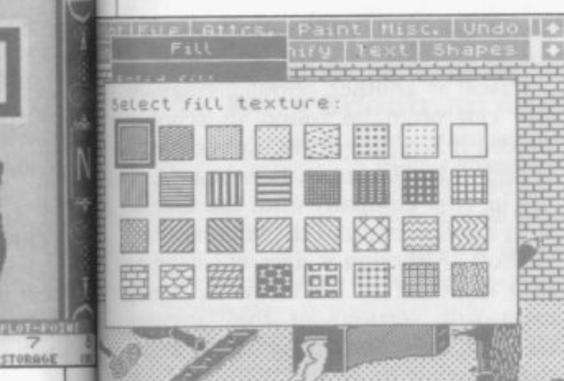

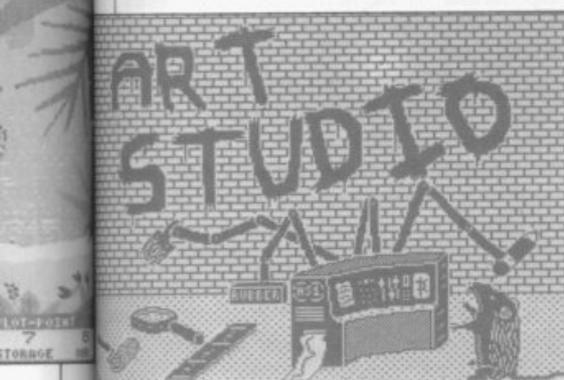

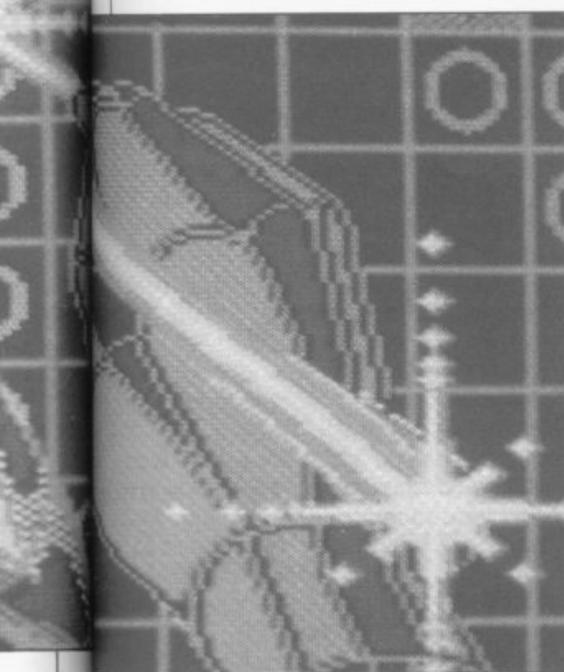

The Sinclair Research assembler is similar to that from Metacomco, but it is not as powerful. Incidentally, the full screen editor in the package was written for Metacomco. GST, the company which wrote the Sinclair assembler, just does not seem to have the knack of producing editors.

Adder Publishing was not as quick to produce an assembler package as Metacomco and Computer One but it did release one after the launch of its classic *QL Advanced User Guide*.

The program was similar in structure to the other products on the market but adheres closely to the notation in the User Guide Book.

It was some time before anyone realised that what the QL market was missing was a debugging tool such as a monitor or disassembler. That was

continued on page 74

continued from page 73

soon put right, however, as four companies put monitors onto the market almost simultaneously.

The first program came from Digital Integration. **QL Super Monitor** is an economical package, put out in a cassette format box. It performs its task well and allows to view and alter code in a hexadecimal format.

Computer One was again quick on the scene with a monitor which followed, and was compatible with, its assembler package.

Not to be outdone Hi-Soft also decided that it should bring out a token QL product and opted for Andrew Pennel's **QL MON**. Unlike the Computer One program it is not automatically invoked when the machine is powered-up. Pennel's monitor is a QDOS job and can be called simply by typing a new SuperBasic command, **MON**. As it is easy to break out of the package back into SuperBasic the monitor can reside in RAM, be called at any time, and not disrupt any of the other tasks being performed by the QL.

The same technique is used in Tony Tebby's **QL Monitor** which is produced by Sinclair Research. The package has all the usual debugging facilities, a one line disassembler, and routines which displays the values of the registers or a block of memory in hexadecimal.

Another good feature of the package is that you can set it to run on any channel or in any window. That means that you could set up several versions of the program within the machine, each of which work on different sections of code.

You may prefer, however, not to get tangled up in the web of machine code. That does not mean, however, that you have to stick to SuperBasic, or to buying packages off the shelf. You can still experiment with QDOS and machine code by buying one of the toolkits or SuperBasic extension packages which have just become available.

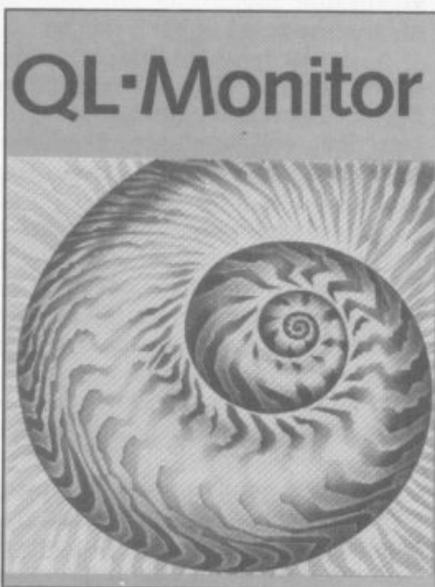

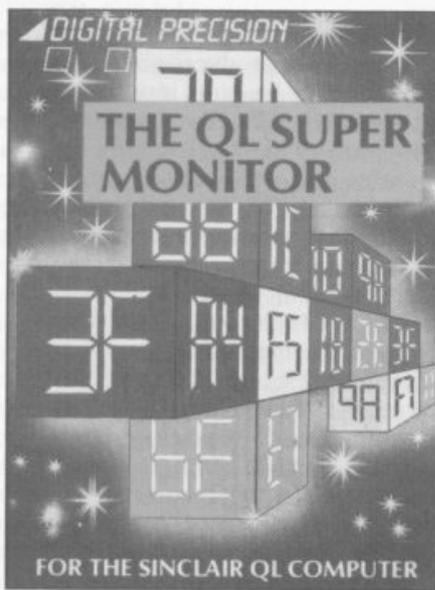

The most famous toolkit, of course, was written by Tony Tebby and can be obtained for the QL from Sinclair Research. It provides a whole spectrum of new SuperBasic commands and run-alone programs which show the power of the QL multi-tasking operating system.

The main body of **QL Toolkit** comprises SuperBasic extensions which control jobs, allocate or clear

memory, and display the status of the system.

A series of separate programs, some in SuperBasic, some machine code, are also included in the package. They provide a user-defined graphics generator, an exceptionally fast back-up utility, and a multi-tasked digital clock which can be run while the package is in operation.

One task which the toolkit will not

do is to check microdrives for errors or repair files which have become corrupt. Those sort of occurrences may be well known to you. They are unfortunate but fairly regular and if you do not have a back-up copy of a file you will usually be in trouble.

The **Cartridge Doctor**, from Talent, does away with many of the problems posed by the microdrives. It checks every sector on a cartridge to

see if any errors have occurred and informs you if files have been corrupted.

One you know about an error you can set up the **Cartridge Doctor** to deal with it. The most usual way is to read the file in and display it in ASCII format. A cursor is then provided by the program and you can rewrite any parts of the file which have been damaged. You can even repair the headers of files if necessary.

Machine code is a low level language because you cannot understand it but the computer finds it easy to understand. A high level language, such as Basic, is easy to understand from your point of view — as a user — but needs some translation before the computer can understand it. There are several types of high level language for both the Spectrum and QL.

Although Sinclair Basic, for the Spectrum, is highly respected it does have some faults and one software house, Betasoft has brought out a new version of structured Basic. Many of the additions provided by **Beta Basic** can also be found on machines such as the BBC Microcomputer, Amstrad and QL. They include **WHEN** and **WHILE** loops, a real time clock, new graphics commands and instructions to make Interface 1 and microdrives easier to use.

The Betasoft version of Basic is one of the best on the market for any machine. It has undergone several transformations during its relatively short three-year life span.

Pascal is another popular language and can often be found in schools. Indeed it is on the curriculum of some O and A level examination boards.

The first company onto the market with a full version of the language was Hi-Soft. Although it does not have an ISO standard of certification, which most full versions of the language have, it does run many times faster than Sinclair Basic and includes Logo turtle graphics.

The big Pascal launch of the year, however, was for the QL, from Metacomco. The **QL Pascal Development Kit** did receive ISO standard certification — an award which is to Pascal what a BSA certificate is to car safety seats.

The Metacomco package provides a full version of the language with extensions for QL graphics and sound. The source code is taken from a full screen editor and compiled into true

PREMIER LEAGUE and EUROPEAN TROPHY

FOOTBALL MANAGEMENT STRATEGY GAMES FROM E & J SOFTWARE

PREMIER LEAGUE

OUR POPULAR LEAGUE GAME — FEATURES INCLUDE: Training, Team Selection, Substitutes, Half-Time Scores, Full Squad Details, Named Goal Scorers, Team Styles, Save Game, Financial Problems, PLUS MANY, MANY MORE!

AND NOW

EUROPEAN TROPHY

A SUPERB EUROPEAN COMPETITION STYLE GAME WITH THESE GENUINE FEATURES: Home & Away Legs, Away Goals Count Double, 2 Substitutes Allowed, Extra Time, Penalty Shoot-Outs (with sudden death), Match Injuries, Injury Time, Match Penalties, PLUS MANY, MANY MORE!

SPECIAL FEATURE

Transfer your PREMIER LEAGUE Winning side into EUROPEAN TROPHY.

48K SPECTRUM

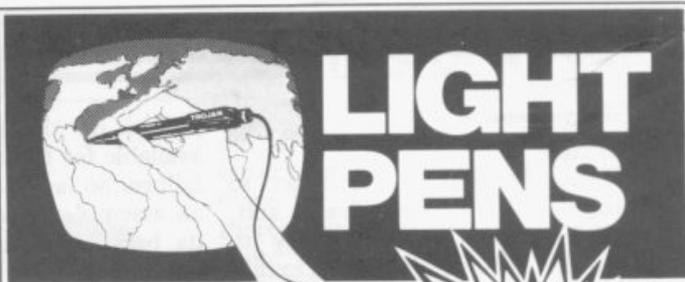

Both these top quality games use the Full Memory of your Spectrum and can be played separately or as companion games to STOP SPECTATING — START MANAGING

Both games are available by MAIL ORDER ONLY at the UNBEATABLE VALUE of £5.25 each. Or send SAE for full details.

SPECIAL TWIN PRESENTATION PACK OF BOTH GAMES AVAILABLE AT ONLY — £9.95.

Price includes postage & packing (add £1.00 outside UK).

ROMANTIC ROBOT present

Multiface one

No. 1 Spectrum multipurpose interface with

- 1) Fully automatic and universal 100% push-button back-up facility of any program to cartridge, disk, wafer, tape
- 2) Joystick interface 3) Composite video interface

All three in one compact box at an amazing price of

£39.95!

MULTIFACE ONE is unique both in unbeatable value and features:

- No extra software — has internal 8K ROM and 2K RAM
- Menu-driven with prompts & one-touch commands turning a complex task into a trivial procedure: 1) Push button 2) Select function — exit/return/save/change syntax 3) Input name 4) Select destination — tape/cartridge/wafer/disk
- Automatic, intelligent "compressed" saving for fast re-loading and economizing on space on cartridges, disks, etc. MULTIFACE saves only the relevant parts of RAM and leaves out the rest.
- Save to any type of peripheral — default syntax for MICRODRIVE WAFADRIVE & TAPE can be changed for disk systems, etc.
- Transfer from one peripheral to another is both attached at the same time, or save from 1st to tape, swap, reload & save to 2nd
- Can be used not only for pure back-ups — you can, for instance — stop any program — and restart anytime later or also — study/alter/customize — and then save, continue, etc. This way you can load and continue a game from where you got last, poke infinite lives, customize programs as you wish, etc. — "warm reset" — recover from a "crashed" computer (escape from infinite loops when the keyboard is inoperative, etc.) — save just a screen or leave out screen when saving a program
- Designed to remain attached to ROM programs it saved as it is meant only for personal use in accordance with copyright laws
- Through extension bus for connecting other peripherals

continued from page 74
68000 code.

It was the first QL product to receive a *Sinclair User* Classic and, indeed, it was the first utility to receive that award for software excellence.

Computer One brought out a version of Pascal which while not up to the standard of the compiler from Metacomco comes a very close second. The first version of the package compiles the source into P-code which, although faster than SuperBasic, requires the Pascal operating system to be in memory. Computer One later amended the program so that code could either be translated into P-code or compiled to form a job which would run without the operating system being present.

The compiler is more user friendly than the Metacomco package — all sections of the screen editor and compiler can be accessed through a menu based program — but the **QL Pascal Development Kit** wins hands down in the features race.

Metacomco and Computer One both brought out versions of the popular artificial intelligence list processing language LISP. The Computer One program is less expensive than the one from Metacomco. Both versions can deal with the QL graphics commands and both are interpreted.

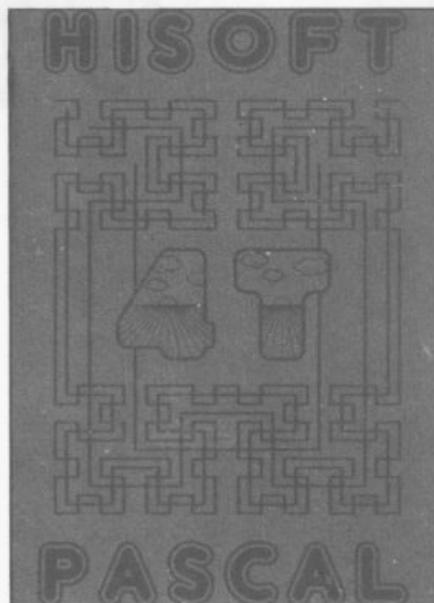

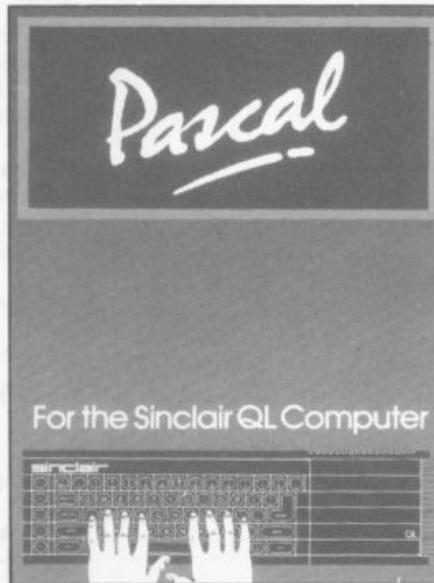

The medium level language C also proved popular with QL software houses during 1985. The first company to bring out a version was GST, which is famous for the 68K/OS alternative QL operating system. Unfortunately the product is a version of public domain RATC, a scaled down version of the original with additions to allow the use of QL graphics and QDOS traps. It is, of course, a compiler but the source must first be typed into a screen editor, run through a compiler which produces assembly language source, and put through an assembler to produce 68008 code. It is an unnecessarily complex operation and the code could be compiled in one go if GST had produced a machine code compiler.

GST also ranks among the companies which brought out QL operating systems in 1985. Its 68K/OS was originally intended to be the QL operating system. The package consists of a ROM board, slotted into the expansion slot at the side of the QL, and several microdrive cartridges.

As operating systems are usually

judged on the amount of software available for them 68K/OS is a dismal failure. So far GST has only produced an assembler and word processor for its baby. One wonders what would have happened if Sir Clive had decided to use the GST operating system.

The C/PM-68K operating system from disc drive manufacturer Quest Automation did little better than the

GST product. A few business packages are available for it but, despite the fact that it uses discs or microdrives, few software houses have taken up the challenge to produce anything of note for it.

A large variety of DIY utilities came onto the market in 1985. They teach everything from garden design to touch typing and computer athletics.

Sinclair Research wins our first Most Useless Utility Award for 1985 with **QL Gardener**. While it is obvious to see the benefits of a plant dictionary and garden design package for those who like gardening, and own a QL, with the dearth of QL software the company must be green behind the ears to bring out such a product. Where are all the fantastic business and educational programs which will show off the true power of the 16-bit — or is it 32-bit — machine?

Our second MUU of 1985 award goes to **Car Cure**, a program which aims to diagnose the problems which you may encounter with your car. All you have to do is type in the symptoms of your vehicle's illness and the program will come up with an answer to your problems — maybe. Most of the time it just recommends that you contact a qualified mechanic immediately.

Another car-orientated program which is marginally more useful than **Car Cure** is **Highway Code**. Through a series of multi-choice questions it will teach you about the signs and situations which you may encounter on the road. The graphics are simple, but effective, and the program has been checked by a qualified driving instructor.

If you want to stay fit then **Microfitness** from VO² is for you. It will take you through a series of carefully graded exercises culminating in — I hope for your sake — physical fitness. When it was reviewed early in 1985 our own Clare Edgeley found out how unfit she was!

Finally, touch typing programs for beginners came from QL software houses during the past year. Two were produced, one from Computer One and the other four months later, from Sinclair Research. **Touch 'n' Go** from Sinclair Research provides more in the way of graded exercises and a more complex results table.

The utility market is the area in which the QL has done best. There are many languages available for it and a host of machine code utilities which allow the use of the power of the 68008 processor and QDOS.

It is a pity that the same cannot be said of the Spectrum. Very few utilities were produced for the machine and most software houses have moved to other machines. That is unfortunate as the Spectrum still has a lot of power within it which lies untapped because people like you cannot get at it.

Turkeys

We haven't chickened out! The *Sinclair User* team has chosen four prize turkeys — possibly the worst games of '85

Action Biker

CLUMSY COLIN is Mastertronic's junk game compliment to junk food, in the form of *KP Skips*. Drive Colin's flickering white bike around a garish town in search of his friend Martin, to get him to the airport. On the way eat bags of *Skips* thrown on the road by people who, presumably, found them inedible. Lucky for Colin it's all a dream. Even Mastertronic couldn't make us swallow this scenario as

realistic.

The bike crashes frequently, the fuel runs out, there's little excitement. Controls are jerky, what actually moves is minute. Good luck and don't dally says Masterchronic at the end of the instructions. Who wants to?

Death Star Interceptor

THE GRAPHICS is not the only incredibly abysmal aspect of this game. System 3 Software has pulled

out all the stops to produce what it loosely terms a computer generated voice for the take-off sequence. All three sections of the games take the shoot 'em up category of game to new lows. Once the first stage, take-off, has taken place you must destroy as many aliens as you can while trying to stay awake at the same time. If you manage to keep your eyelids open, then you must drop your bomb down the exhaust port of the Death Star — see, the title of the game does have some relevance to the action. The game also bears a resemblance to the *Star Wars* film, but producer George Lucas is unlikely to take any action against the manufacturer. He would probably say that his film is not a comedy of errors.

911TS

'PORSCHE TODAY, bust tomorrow' goes a traditional proverb of the software industry. Elite's hideous game took the bright idea of producing a tape to promote Dunlop tyres as wrapped round the wheels of a Porsche 911TS rally car.

Throw some old scrolling routines in, pinch some bushes off the graphics from *Grand National* to add decoration, strew the road with logs and then wait for the punters to cough up the cash. Cough up, gag, gulp and throw up — *911TS* is utter trash, and all the more reprehensible for coming from a well-established company.

Rumour has it even the lads at Elite were ashamed of this one.

Therbo

'A CROSS BETWEEN American Football and World War III' — that's what Arcade Software says about **Therbo**. Clearly based on that tired old *Rollerball* theme, you push a futuristic rugby ball along the middle third of the screen to try and score a goal at one end. There are some coloured shapes — described by Arcade as 'shapes that move', I kid you not — which you can shoot at if you feel so inclined.

Unfortunately, for what would have been a dreadful game anyway, the computer makes a lousy opponent. One gentle push and the amazing Therbo will usually chunter into the goalmouth all by itself.

For sheer pointlessness, this one is in a class of its own.

At the sign of The Dancing Ogre

THE MASTER ADVENTURER Gordo Greatbelly is mystified. Where can his love, the Lady Marion, be and how can she save her? To find the answers to those questions he must question closely those who come to take vitals at his inn the *Dancing Ogre*. One of them is bound to know how he can rescue his sweetheart.

Are you brave enough to take on Gordo's task in this unique adventure game for the 48K Spectrum? If so you must be ready to deal with the tricks and traps which programmer Chris Bourne throws at you and the many artificially intelligent characters who will come into your bar. We wish you luck . . .

Program Printout

Instructions

COULD you run the Dancing Ogre tavern as expertly as the great Gordo Greatbelly himself? Here's your chance to find out. The Lady Marion has been captured and locked in prison. To get her out you'll need the password, known only to the adventurers who come to carouse at the Ogre.

Briefly, what's happening in the Ogre is shown in the yellow part of the screen. Your decisions are given in the black part. Press the appropriate number key to choose a decision.

Customers will only give you help if they like you, so keep them happy with advice or free food and drink. But don't be too generous — you've a living to make as well.

To enter the program, type in listing One and SAVE it. Then type in listing Two, RUN, and type in the code. When you have done that correctly, it will automatically be SAVED. Make sure you use CAPS LOCK throughout.

The program uses special abbreviations for graphics characters. An underlined letter should be entered in graphics mode. For instance, g5 and ig5 indicate the graphics and inverse graphics character on key 5. cc4 and cpc4 are control codes, in this case on key 4. cpc controls paper, and is obtained by pressing the key in extended mode. cc controls ink, and is obtained in the same way, but while also pressing CAPS SHIFT. Finally, 3★sp would indicate 3 spaces. In all those cases, do not enter the brackets which surround the abbreviations.

WDSOFTWARE

Rotten value if you want pretty boxes . . . We keep prices down, software quality up!

FOR THE SINCLAIR QL:

WD Utilities for Microdrives. £7.50 (mdv)

Save time and effort, avoid costly mistakes with our friendly programs. Single-key commands to LOAD, RUN, DELETE programs and files, or to BACKUP whole cartridges without accidentally over-writing! Prevent data losses by FORMATTING several times with one command. Display a 60-file DIRECTORY. EXTEND your QL with up to six extra microdrives. Automatically number and date your developing programs.

WD Utilities for Discs £10 on 5 1/4" — £12 on 3 1/2"

Different version for CST or MicroPeripheral Discs

All the benefits of the mdv utilities plus enhancements to use discs as well as four extra microdrives. Easy and SAFE backups from one to the other. Over 100 filenames displayed at once. Cut out 95% of keystrokes for most file handling.

RefQL, the QL Database. Frequent new editions

£2 each mdv or 5 1/4", £4 each 3 1/2" disc, plus £(edition)

An easy-to-use ARCHIVE(2) search/print program plus a growing database (usable with version 1 as well) and cheap updating. Where to find listings, reviews, instructions for printer connection, or hints and tips for the QL. Each edition holds 200 references more, costs £1 more than the last. Edition 5 fills an mdv with 900 refs, edition 6 will need two mdv or one disc, will have 1,100 refs. When you read this, we might have edition 9 with 1,700!

FOR THE QL SPECTRUM & BBC

(others to follow)

WD Morse Tutor £4 cassette or add media price above

The fast, efficient way to learn to read Morse Code. You can start ignorant, continue beyond RYA and Ham Radio standard. It has more helpful features than any other program or dedicated machine at many times the price. Discs unsuitable for BBC+.

FOR SPECTRUM

(others to follow)

WorDfinder £10 on mdv/5 1/4", £1 on 3 1/2"

For CHEATING at crosswords. Fills m-ss-n- letters, (10 letter word ending ATE, etc), and solves anagrams. 13,000 word vocabulary so not on cassette.

Tradewind £4 cassette or add media price

Trading, sailing strategy game.

Jersey Quest £4 cassette or add media price

Text adventure, based on real folklore.

*Prices include postage in Europe. Add £1 elsewhere.
ACCESS/MasterCard welcome.*

Send for more details or order from:

**WDSOFTWARE, Hilltop, St Mary, Jersey, CI
Tel: 0534 81392**

**LOAD, SAVE, CLEAR,
PLAYBACK SOUND
without unplugging leads!**

Specially designed, using British components, and carrying full 12 months guarantee, this unit is quick and easy to install with no modification to, or dismantling of, existing equipment.

*Special offer £14.99 plus 50p P+P
A must for the SINCLAIR user*

FEATURES

THE ROTARY SWITCH

Setting	Facilities
SAVE	Enables a Program to be 'saved'
LOAD	Enables immediate loading of program.
PLAYBACK	Enables playback of sound through either: (i) Amplifier/Music Centre system, or (ii) Cassette recorder speaker - N.B. to do this jack plug of Cassette 'ear' socket must be removed.
CLEAR	As a safety feature both the rotary switch has to be set at CLEAR, and the button above the setting depressed for 2 seconds, before the computer memory is completely cleared.

SAFETY FEATURES

Programs are completely protected, switch is changed from one position to another, even if they are 'running'.
'CLEAR' facility only works when button is depressed, and switch is at CLEAR. Depressing the button with switch in any other position has no effect on the operation.

Earlybird, 31 Gleneagles Drive, Penwortham, Preston PR1 0JT

MAIL ORDER ADVERTISING

British Code of Advertising Practice

Advertisements in this publication are required to conform to the British Code of Advertising Practice. In respect of mail-order advertisements where money is paid in advance, the code requires advertisers to fulfil orders within 28 days, unless a longer delivery period is stated. Where goods are returned undamaged within seven days, the purchaser's money must be refunded. Please retain proof of postage/despatch, as this may be needed.

Mail Order Protection Scheme

If you order goods from Mail Order advertisements in this magazine and pay by post in advance of delivery, *Sinclair User* will consider you for compensation if the Advertiser should become insolvent or bankrupt, provided:

- (1) You have not received the goods or had your money returned; and
- (2) You write to the Publisher of *Sinclair User* summarising the situation not earlier than 28 days from the day you sent your order and not later than two months from that day.

Please do not wait until the last moment to inform us. When you write, we will tell you how to make your claim and what evidence of payment is required.

We guarantee to meet claims from readers made in accordance with the above procedure as soon as possible after the Advertiser has been declared bankrupt or insolvent (up to a limit of £10,000 per annum in respect of all insolvent Advertisers. Claims may be paid for higher amounts, or when the above procedure has not been complied with at the discretion of *Sinclair User*, but we do not guarantee to do so in view of the need to set some limit to this commitment and to learn quickly of readers' difficulties.

This guarantee covers only advance payment sent in direct response to an advertisement in this magazine (not, for example, payment made in response to catalogues etc, received as a result of answering such advertisements). Classified advertisements are excluded.

Helpline

ANDREW HEWSON is highly regarded as a Spectrum expert. His regular column in *Sinclair User*, has been running for three years and has helped answer the questions asked most frequently by the thousands of users who read the magazine.

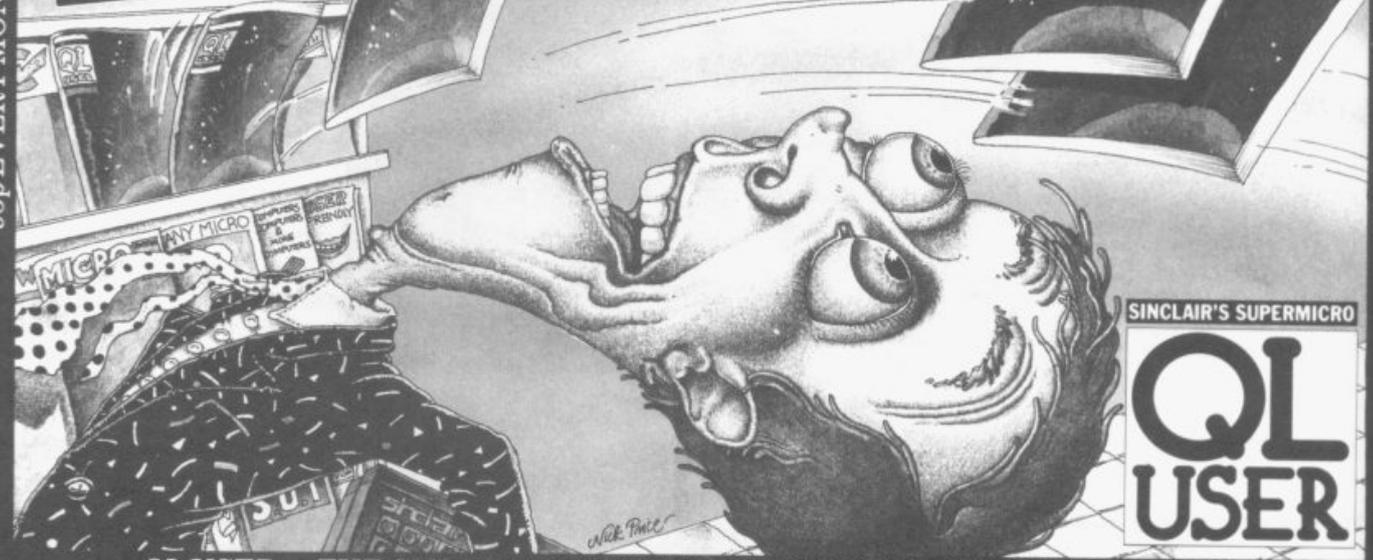

In this special edition of Helpline he shows how you can get to grips with user-defined graphics and explains how sprite graphics can be implemented on the Spectrum without the use of additional hardware.

SINCLAIR'S SUPERMICRO
**QL
USER**

QL USER — THE ONLY MAGAZINE FOR QL OWNERS AND ENTHUSIASTS.

IT'S 1985 — THE YEAR OF COMMUNICATIONS

Why buy programmes for your Spectrum when a world of free 'telesoftware' is open to you. Discover Prestel, Micronet 800, Viewfax, bulletin boards and open a whole new world. Even user to user.

Everybody's doing it — linking their home computers to giant mainframes and networking to thousands of other micro users via the phone and a modem.

A whole new world of mainframe games, electronic mail, free 'telesoftware', electronic notice boards, real time conversation, armchair shopping and home-banking will be at your fingertips! And at local and cheap rate, phone charges are only around 40p for a whole hour's entertainment.

Spectrum 16k, 48k, Spectrum + The VTX 5000 Modem comes complete with all the software (in ROM) required to access the world of electronic communications, networks, telesoftware and databases (both public and private.)

(User to user software on cassette £3.95 extra)

Terminal Emulation Software Package to link to commercial databases and bulletin boards which use ASCII format on cassette £6.95.

The VTX 5000 requires no external power and fits under your Spectrum to become part of the machine. Only one lead links your computer to the outside world.

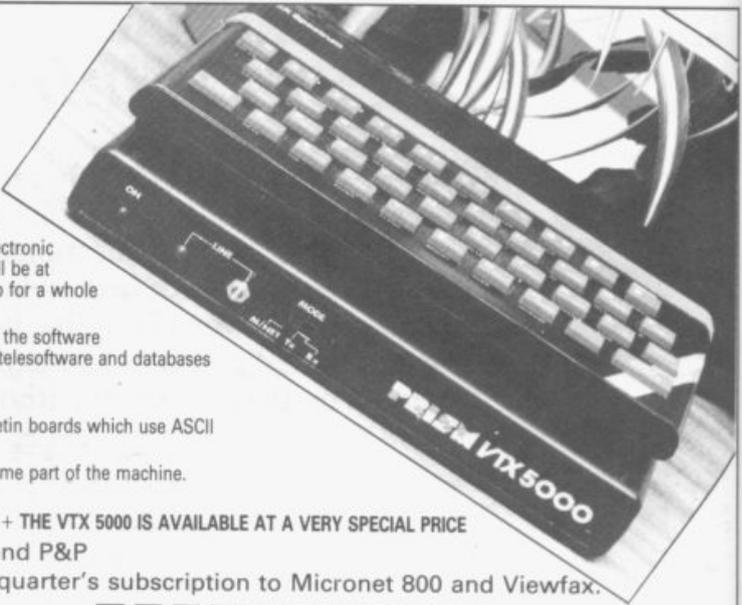

**FOR THE SPECTRUM 16K, 48K AND SPECTRUM + THE VTX 5000 IS AVAILABLE AT A VERY SPECIAL PRICE
£69.95 inclusive of VAT and P&P**

Order your **VTX 5000 NOW** and get a **FREE** quarter's subscription to Micronet 800 and Viewfax.

All modems provide 1200/75 baud, enabling access to Prestel, Micronet 800, BT Gold, Farmlink, Citiservices, Homelink, and some free bulletin boards (some databases and networks require a small subscription). Fully BT Approved.

Simply clip the coupon and send it with a cheque (payable to Modem House) to:

MODEM HOUSE
70 Longbrook St
Exeter,
Devon EX4 7AP
Tel: (0392) 69295

- Please send to me:**

IN THIS COLUMN I cover two related topics. The first shows you how to create new user defined characters and access them. In the second I discuss the simulation of sprite effects on the Spectrum screen, and in particular explain how to obtain flicker-free moving graphics.

There are two methods for creating new characters other than DRAW, PLOT and CIRCLE commands which are too slow and cumbersome for most purposes. The simplest is the user defined graphics facility in which up to 21 new characters can be defined and assigned, one to each of the letter keys A to U. The form of each new character is stored in eight bytes of the 168 bytes reserved for that purpose above RAMTOP, at the top of memory. The character assigned to a given key can be obtained by pressing the graphics key — CAPS SHIFT 9 — before and after the letter key.

The method of encoding and decoding the eight bytes can be understood with the help of some knowledge of binary numbers. Every character in

the Spectrum character set — and every new character created by you — is defined relative to an eight by eight grid. Each element in the grid is called a pixel which can be set to either the INK or the PAPER colour. It is the precise arrangement of INK or PAP-

“You can create new user defined characters and flicker-free moving graphics”

ER coloured pixels in the eight by eight grid which creates each character.

Each of the eight bytes devoted to a character defines the setting of one horizontal line of eight pixels using the following system. The contents of a byte — which lies in the range 0 to 255 in decimal — is read as an eight digit binary number, so there is a one-to-one correspondence between pixels

and binary digits. A binary number consists of zeros and ones only. All pixels for which the corresponding binary digit is zero are set to the PAPER colour, whereas all pixels for which the corresponding digit is one are set to the INK colour.

Very often the first and last bytes of the group of eight controlling a given character are zero. Those two bytes determine the top and bottom of the character, and a zero setting ensures that all corresponding pixels are set to the PAPER colour. Thus when the character appears on screen it is separated from other items on the lines above and below. For a similar reason each byte usually contains an even number which is less than 128. As a result, all pixels at the right and left are set to the PAPER colour enabling that character to be distinguished from its fellows on either side.

When the Spectrum is first switched on, the UDG characters are set to a copy of the capital letters on the corresponding key. It is a simple matter to alter those characters. Table

one lists a Basic program which does the job. Also listed in table two are the numeric codes for the letters in the Greek alphabet.

That system is designed to provide a set of 21 new characters at most. Additional sets can be defined by altering the UDG systems variable held at 23675 and 23676. The number in UDG is the address of the first byte of the first graphics character, that is, the character assigned to the A key. When the Spectrum is switched on it is set to 32600 — 16K machine — or 65368 — 48K machine — reserving 168 bytes for the 21 characters between the UDG address and the top of RAM.

In principle UDG can be changed to point to any address in RAM, but the simplest approach is to reduce it by 168 for each additional character set required. It is also necessary to reduce RAMTOP by a similar amount so that the graphics characters do not interfere with the stack, thereby causing the machine to crash.

RAMTOP is normally set to one less than the value of UDG and the CLEAR instruction must be used to alter it. Thus, to create space for one additional set of graphics characters on the 16K machine enter

```
CLEAR 65199
POKE 23675,176
POKE 23676,254
```

The CLEAR command moves RAMTOP down to 65199 and the two POKES reset UDG to

```
UDG = 176 + 256 * 254 = 65200
```

That leaves 65536 - 65200 = 336 bytes between the address pointed to by UDG and the top of RAM which is enough space for two tables, each 168 bytes long.

The UDG facility is flexible enough

```
10 INPUT " ENTER THE LETTER TO BE REDEFINED "; A$
20 LET A$ = CHR$(CODE A$ - 32 * (A$ < " £ "))
30 IF A$ < "A" OR A$ < "U" THEN BEEP .2,24 : GOTO 10
40 FOR I = 0 TO 7
50 INPUT " ENTER BYTE NUMBER "; J
60 IF J < 0 OR J > 255 THEN BEEP .2,24 : GOTO 50
70 POKE USR A$ + I, J
80 NEXT I
```

Table 1. A Spectrum program for defining new user defined graphics characters.

for most purposes despite the limitation of 21 characters per set, but the user should also be aware of the technique for redefining the ordinary character set.

There are 96 characters in the ordinary Spectrum character set. That starts with character code 32 — the space or blank character — and ends with the copyright symbol — code 127. They are defined in an analogous fashion to the user defined characters by a table which is held in ROM at address 15616. Each definition is held in eight bytes making the table 768 bytes long.

The address of the beginning of the table is 256 more than the value held in the CHARS system variable, located at 23606 and 23607. Bearing in mind that the code of the first character in the table is 32, it can be seen that the address of the first of the eight bytes defining a given character is $PEEK\ 23606 + 256 * PEEK\ 23607 + 8 * \text{character code}$.

Creating a new character set from scratch is a complicated task as the shape of each letter or digit must be worked out in detail. The best technique is to move RAMTOP down by 768 bytes, copy the entire Sinclair character table into the area above RAMTOP, and then reset CHARS to point to the new area. That is the function of the program in table three. New characters can then be created as modifications of the Sinclair originals.

There is considerable interest amongst Sinclair owners in techniques for putting sprites on the screen, and that is no doubt spurred on by the many interesting effects generated by professional games companies. Unfortunately, a typical good game takes six months to write and it is impossible to describe fully the techniques used in a single article. All I can do is give a taste of one aspect — how to produce flicker-free sprites.

The word sprite refers to a picture element superimposed on the video signal which is separate from the main body of information taken from the computer's memory map of the screen display. Imagine the existence of special hardware which intercepts

the ordinary video signal on its way to the television, and modifies it to create the required picture element.

There is an unreal quality to this idea of changing the video signal from its proper form as derived from the memory map, and that is reflected in the use of the word sprite, with its images of elves, to describe the effect generated. The form of the sprites — their colour, position and shape — is controlled by the values of various parameters in an analogous fashion to the way in which the system variables control functions in the Spectrum.

The main advantage of a hardware sprite system is that it allows the central processor chip to delegate the creation of multiple moving elements on the screen display, leaving it free to work on other tasks. The result is that games and other programs which use the sprite hardware are able to run faster than they otherwise would.

Thus it may seem surprising that the Spectrum should be popular as a games machine even though it contains no sprite hardware. The reasons for its continuing success are complex but there is one important contributory factor. The Z80 chip at the heart of the Spectrum has a large number of register orientated instructions and 16

```

10 CLEAR 64599
20 FOR I = 0 TO 767
30 POKE 64600 + I, PEEK (15616 + I)
40 NEXT I
50 POKE 23606, 88
60 POKE 23607, 251

```

Table 3. A 48K Spectrum program to move the character table above RAMTOP and reset the CHARS system variable to point to the new table. For use on a 16K machine alter the following lines:

```

10 CLEAR 31831
60 POKE 23607, 123

```

means there must be some mechanism for deleting the sprite from its old position and placing it at its new position. The deletion phase normally comes before the placing phase although that is not essential. What is essential is that there must always be one, and only one, version of any given sprite in the display file when the scan is made to transfer the information to the television screen.

To understand how this one and only one rule operates, some knowledge is required of the way in which a TV picture is constructed. In the UK a TV picture consists of 625 horizontal scan lines. Each line is refreshed every fiftieth of a second in an alternating sequence — all odd numbered lines are refreshed in one scan and all even numbered lines are refreshed in the next. That ensures a complete picture is constructed every twenty-fifth of a second.

A scan of half the lines actually takes less than a fiftieth of a second to complete so there is a short delay between the construction of each half picture. That delay allows the electron beam — which writes the picture on the screen — enough time to fly back from the bottom right of the screen to the top left. There is then a synchronisation pulse which ensures that the writing of the next scan starts at the correct instant.

Clearly, if a complete half scan takes about a fiftieth of a second, the maximum amount of time between deleting a sprite from its old position and placing it in its new position is also about a fiftieth of a second. The cost of not replacing the sprite in time is that the sprite image flickers as it disappears and reappears. The timing of the deletion phase is obviously important and the best way to keep track of it is to use the least significant byte of the FRAMES system variable, located at address 23672, as a clock tick. That variable is up-dated every fiftieth of a second in time with the synchronisation pulse of the TV.

bit instructions which allow it to execute relatively complicated routines quickly.

In contrast, the 6502 at the heart of the Commodore 64 — a sprite machine — has a large number of addressing modes but few internal registers and 16 bit instructions. It is as though the Z80 chip is very good at talking to itself whereas the 6502 is designed to talk to other chips. Thus

the Z80 is able, to some extent, to make up for the lack of supporting hardware by working harder itself. Needless to say, good programming techniques are required in order to exploit the extra sophistication of the Z80.

Sprites are moving objects and so a simulated sprite must move around the Spectrum display file, perhaps changing its form as it does so. That

Books

AS THE market becomes more sophisticated, authors have had to cater for the needs of new groups of users.

If hacking is your pastime or machine code is your staple diet then there are books for you. On the other hand, if you prefer a gentle introduction to Basic or SuperBasic you will find that whole shelves have been dedicated to your needs.

John Gilbert sorts through the mountain of computer literature which has kept users happy during the past year.

ALTHOUGH few authors have produced computer books which have reached the best seller lists, technical authors must be amongst the most prolific writers in the world. A literary mountain was produced in 1985 alone, in order to further the knowledge of Sinclair computer owners and the popularity of Sinclair machines.

One author who almost reached the non-fiction best seller lists was Hugo Cornwall with **The Hacker's Handbook**, a slim but explosive book from Century Hutchinson. Hugo Cornwall still remains an enigma, even his name is a pseudonym.

The Hacker's Handbook is a skill-

ful mixture of personal experience, stories from secondary sources and practical information. Indeed, the way in which the book has been written leads me to suspect that Cornwall is a journalist as well as a hacker, or that the book was ghost written by someone from Century Hutchinson.

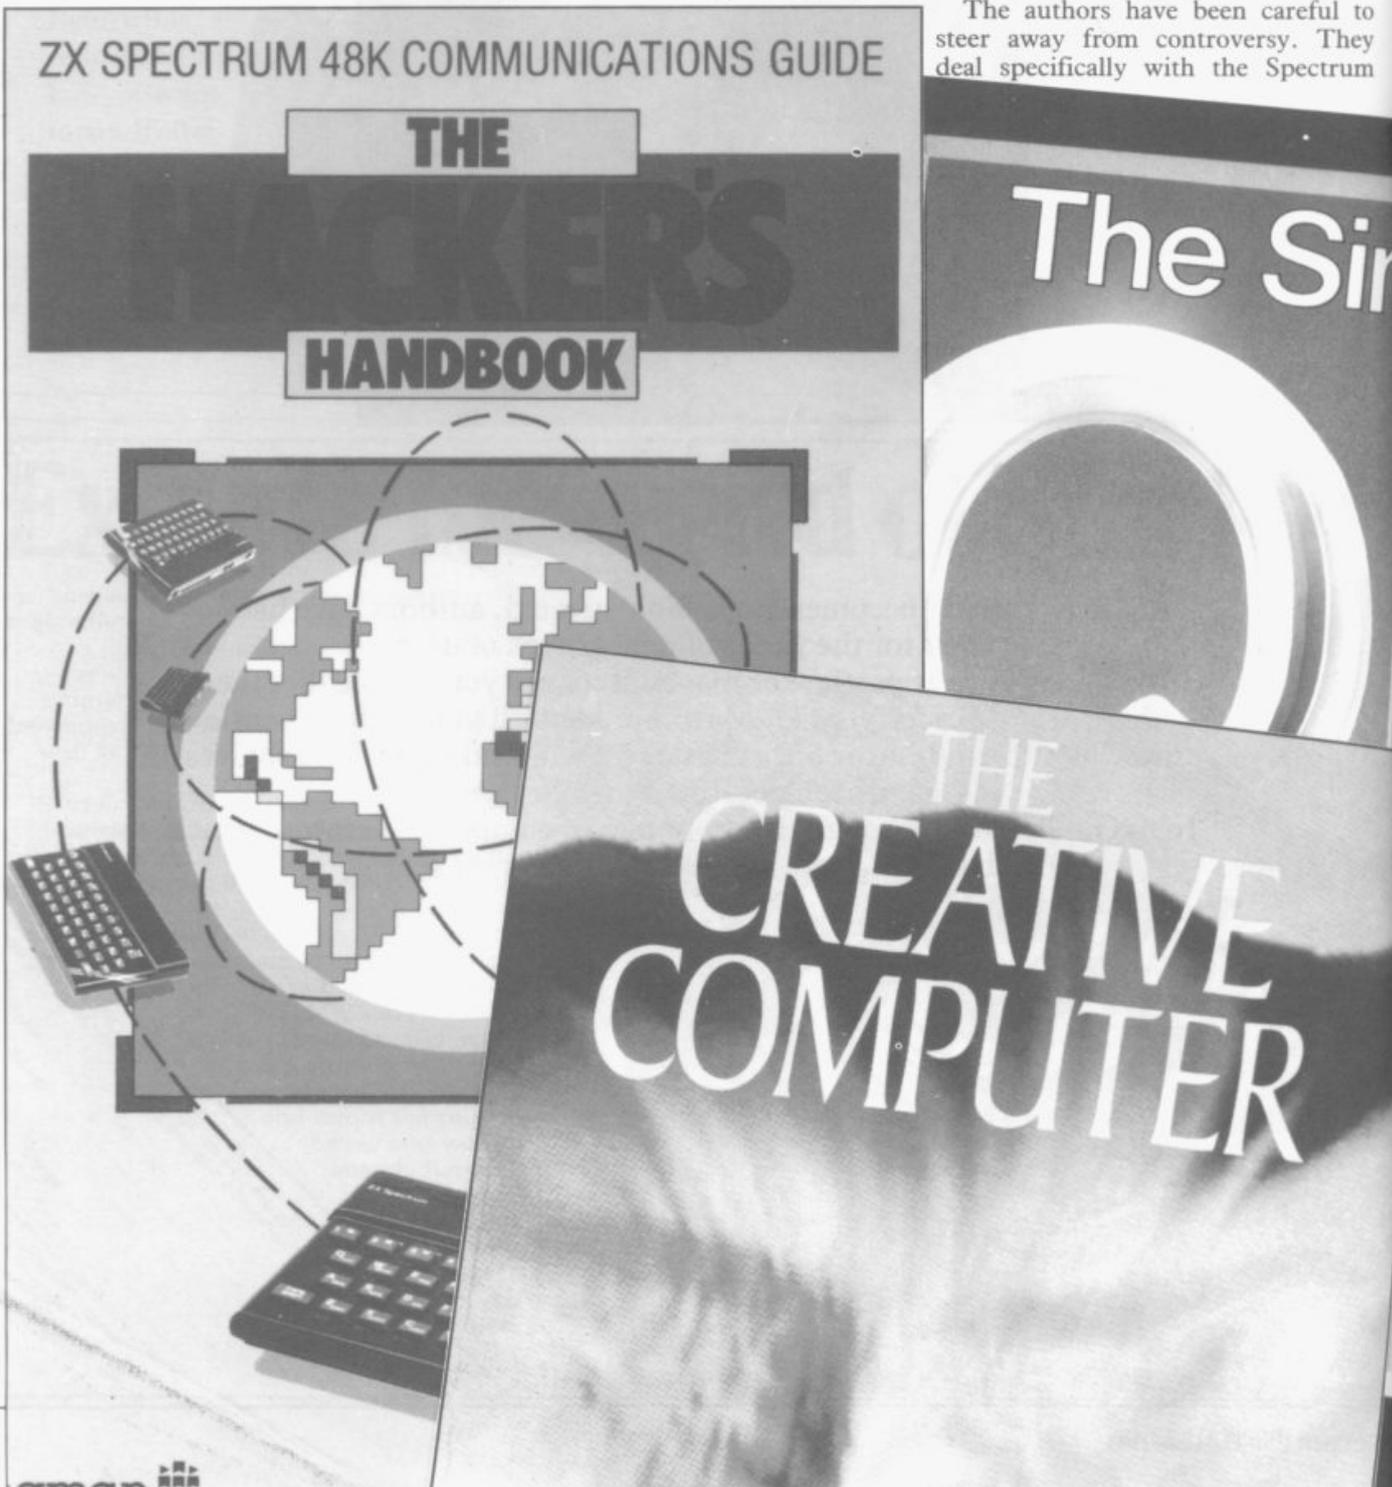

The practical information in Cornwall's book nearly landed him — her? — in trouble. It begins harmlessly enough with an introduction to innovations in communication technology. Once past that, and some innocuous remarks about his programming experience, Cornwall starts getting technical — and goes way beyond

the definition of baud rate.

Although Cornwall gives information on communication protocols and how to go about finding passwords for various types of system, he is careful to point out that hacking is done more as a sport than as a criminal action. If it were more than that, banks would be defrauded daily, and our security installations would be broken into every evening.

The same point is made in a book written by Geoff Wheelwright and Ian Scales, published by Longman. It too is called **The Hacker's Handbook**, although it takes a slightly different angle on the subject.

The authors have been careful to steer away from controversy. They deal specifically with the Spectrum

and how it can be connected to systems such as *Micronet 800* and *Prestel*. An overview is given of both systems together with information on how to connect your computer to a VTX 5000 modem.

The final section of the book takes a look at electronic mail and bulletin boards. Telephone numbers are given to allow access to boards which are open to the public. Although Wheelwright and Scales are not as revealing as Cornwall about the secret world of the hacker, their introduction to the subject is practical and interesting.

Another subject of major interest to the computing public, especially QL owners, has been the secrets contained within the QDOS operating system which has been so highly vaunted by several books. There are no fewer than three titles on the market which jostle

for acclaim as the best book about QDOS.

They are **The Advanced QL User's Guide** by Adrian Dickens, from Adder; **The QDOS Companion** by Andrew Pennel, from Sunshine; and **The QL Technical Guide** by Tony Tebby and David Karlin, from Sinclair Research.

The books from Dickens and Pennel are very similar in structure. The first to appear was the one from Adder. Dickens managed to obtain the QDOS documentation from Sinclair Research and put together a book using it. The result is, none the less, impressive and, despite the mistakes, provided an introduction to the 68008 chip and operating system. Each QDOS trap was listed and examples of its uses were given.

As well as discussing memory management, graphics, sound and file processing, Dickens also included a chapter in which he showed how SuperBasic worked. Detailed appendices showing the memory map, full 68000 instruction set and microdrive formats were also provided.

Pennel's book differs only slightly from the advanced guide. It arrived on the market four months after Dickens' book and the result was a text full of examples which had obviously been created by the author.

The companion is structured as a graded introduction to multi-tasking, Input/Output, device drives and the QDOS utilities. Information is also included on the 8049 second processor, which acts as a control for the keyboard and sound, as well as an explanation of how to create external ROMs.

The third book, from Sinclair Research, resembles the **QL Advanced User Guide** but was rather a disappointment. It provides all the information that you would require to program QDOS but its style is clinical, with almost no examples to illustrate the wealth of knowledge given by the authors. It is a humourless read and, even as a reference book, lacks depth. The one or two paragraphs used to describe each trap, exception or interrupt are barely enough. Tebby and Karlin could at least have included a section detailing an example of QDOS in action. As

it stands, the authors expect readers to share their competence — not a healthy assumption for any technical writer to make.

The Psion business packages, bundled with the QL, did not escape the attentions of authors last year. Three companies brought out books which cater for the business or home user who wants to put **Quill**, **Archive**, **Abaca** or **Easel** to work.

Hutchinson was the first onto the scene with a series of QL handbooks. The series contained one title aimed at **Quill** owners and one aimed at **Archive** owners.

Word Processing with the Sinclair QL, by Mike O'Reilly, is competently written, although it is long-winded and says little. It shows how to power up the QL, how to load in **Quill** and how each of the commands work. It even goes as far as to show how a

letter can be written and reports drafted. Unfortunately it does not go much further.

Database Management on the Sinclair QL, also by Mike O'Reilly and also from Hutchinson, is much the same as the introduction to **Quill**. It does little better than the official Sinclair manual, a damning fault, as that manual leaves a lot to be desired.

The Hutchinson books are not the best on the Psion packages, and it is left to the series of Psion books from Century Communications to fit neatly into that niche. There are four books; one for each of the packages. The book on **Quill**, written by Clare Spottiswood, marked the series as a winner. Even Sir Clive Sinclair stuck his oar in and said that it was one of the most fab things he had ever seen. The simple style, combined with diagrams, cartoons and many useful examples, makes the book a joy to read.

Other titles in the series are similar in style but have different authors. **QL Archive**, by Ian Murray, provides the easiest and most interesting explanation of the database package ever committed to print. It is a delight to read, and the examples provided can be practically useful. Although it arrived late on the scene it should be very successful.

Sunshine also provided a book on the Psion packages, although it combined all four and was different in approach from the titles from Hutchinson and Century. **Quill, Easel, Archive and Abacus on the Sinclair QL**, by Alison McCallum-Varey, may be a bit of a mouthful, but it achieves its aim easily and concisely. The book shows how the four packages can be used together in a business environment. It also shows how to import and export information from them and which of the programs are compatible for each operation.

It was the first book to include comprehensive examples which were worth entering into the Psion packages and which stretched them to their limits. It also showed that the author had an understanding of the QL, while her colleagues in the computer publishing industry showed only their ignorance of the subject.

To be fair, Sinclair Research was to blame for much of the ignorance which authors exhibited after the launch of the QL. Boris Allan is the classic example of a writer so keen to get a book out about the new machine that he forgot the cardinal rule. Wait

until a finished product arrives. His book, **The QL Companion** from Pitman can still be found on the bookshelves of WH Smith and Boots.

Anybody who buys it in the hope of learning something new about SuperBasic will be disappointed. It was written with the aid of a pre-production manual. That would have been alright if Sinclair had not decided to change SuperBasic. The language has gone through three transformations so far.

He is not alone, however. Other authors and publishers have made the same mistake. One such disaster was the **QL User Guide**, written by Lionel Fleetwood and published by Sigma Press. The author's object was to produce a book about SuperBasic and the Psion bundled packages. He also took his information from the manual and most of his examples were approximately half a page long — or one page when he was at his most impressive.

The best was yet to come. Fleetwood had obviously intended to write a section on the 68008 chip and QDOS but never quite got around to it. His publisher obviously expected it, as early copies of the book had a slip of paper stuck over part of the back cover. It hid the publisher's blurb about the 68008 section which was to have appeared in the book.

Hutchinson also tried its best to go to the rescue of knowledge-parched SuperBasic users. The company managed to produce a series of five books in what seems to be a record time of two months.

The first in the series was **Introducing the Sinclair QL** by Garry Marshall.

It gave simple explanations on how to plug in and switch on the machine, followed by a résumé of SuperBasic and an equally short section on the four Psion packages.

The other five books — mentioned at the end of this article — ran along similar lines. The authors wrote about the same subjects, but in a different style.

Fortunately, Hutchinson boosted its reputation for QL books by launch-

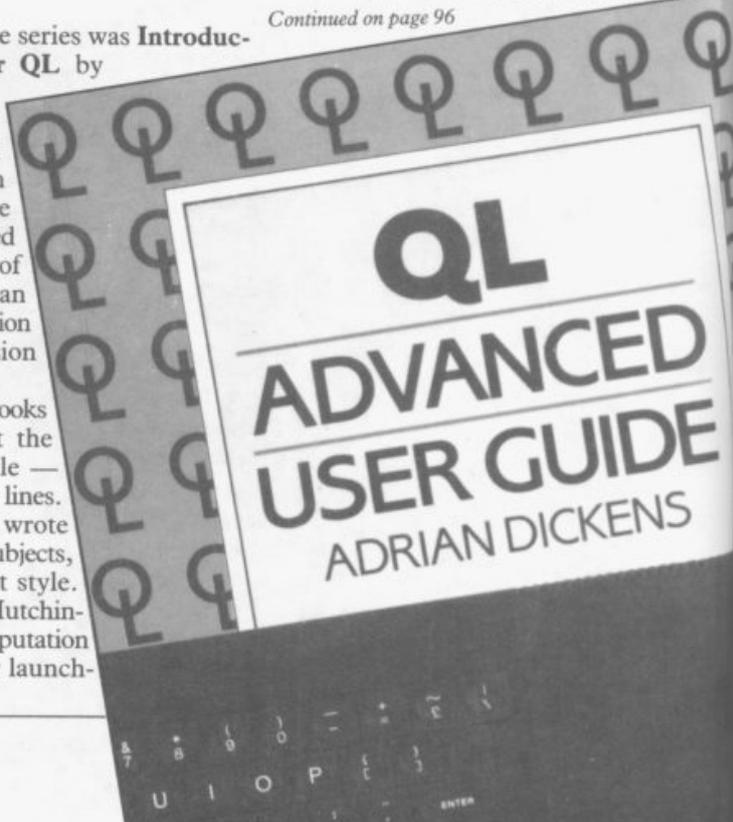

ing another five books, six months after the first part of its series. They dealt with graphics, machine code, business uses and database management.

Machine Code Programming on the Sinclair QL, by Martin Gandoff was the best of the five titles. It provided one of the most readable introductions to the art of 16-bit 68000 programming. Unlike many of the other books which tried to cover the subject, such as **QL Machine Code** from Melbourne House, it dealt specifically with QL hardware and software. The most important chapter of Gandoff's book was the section on exception processing. It showed how to invoke QDOS routines and was followed by an explanation of multi-tasking which even a newcomer to machine code programming could grasp. It is one of the most outstanding books of 1985.

Using Graphics on the Sinclair QL, by prolific and blunt-styled Garry Marshall, provided another exceptional contribution to the QL book scene. The text deals only with SuperBasic graphics commands but it does explain the different types of screen co-ordinates, windows and scaling windows. The examples provided are still worth running and provide some of the simplest but most effective graphics displays you can obtain on the QL.

The other three titles tied the series of ten books together. **Profiting from the Sinclair QL**, by Barry Miles, showed how to use **Abacus** and **Data-**

Illustrating Super-Basic on the Sinclair QL

by DONALD ALCOCK...

... introduces you to Super-Basic on this popular machine. Packed with examples and in the same unique style as the author's previous books, it explains and illustrates useful programming techniques, including graphics, state tables, list processing, sorting and recursion. The ideal companion to the Sinclair QL, this book is both a complete guide to the facilities available on this machine, and a clear reference manual for Super-Basic.

Comb-bound £5.95 net

The ZX Programmer's Companion

JOHN and CATHERINE GRANT

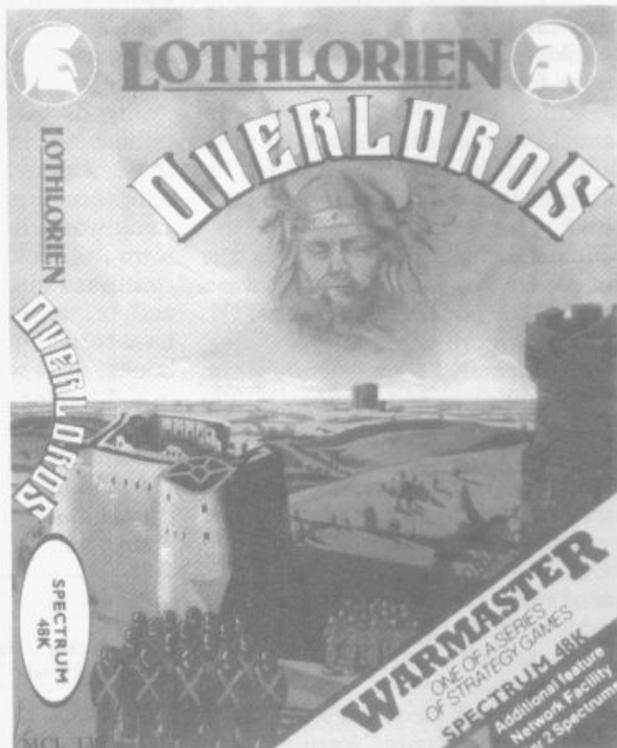

Complementing the instruction manuals supplied with the ZX81 and the ZX Spectrum, this guide gives advice, supported by many well-written examples, on how to design and write programs for ZX machines. The authors have been closely involved with writing built-in software for the ZX range, and so are well-placed to give many useful tips. For anyone using ZX machines, this book will be the ideal companion.

base Management on the Sinclair QL — Mike O'Reilly performed the same service for **Archive**. Neither of those two titles expanded much on the manual but they did manage to score points on style. The Psion manuals for both packages were sketchy and uninspired.

Finally, **Making the Most of the Sinclair QL**, by Dick Meadows, was a repeat of **Introducing the Sinclair QL** with a few more examples.

Unfortunately, the enthusiasm which publishers had for the QL did not pay off. Only 50,000 QLs were sold worldwide during the year of its launch. As a result, the QL publishing market is not a happy place at the moment.

One area which is looking healthy is that of artificial intelligence. The most notable contribution for the Spectrum came from Keith and Steven Brain — no puns please.

They showed techniques by which the computer could learn simple games, understand English sentence input and construct intelligent replies. Most of the information described algorithm methods and not heuristics. That means the programs which they developed in the book use a method which the computer steps through every time. An heuristic is a method by which the computer learns from its mistakes by trial and error, and a little more about such techniques would have been appreciated.

One book which did deal with heuristics was **The Creative Computer** by Donald Michie and Rory Johnston. It is a general computer book which publisher Penguin/Viking pointed out was unlike anything which had ever been printed. That pronouncement sent reviewers into a flurry trying to obtain a copy.

The premise of the book is that it is possible for computers to take in data and, from that information, produce new data. The authors show examples of intelligent systems, most of which accept knowledge from professionals such as doctors or architects. Those computers can then use that information to diagnose a disease or even find an oil field.

It becomes obvious that all Michie and Johnston are talking about are relational databases, commonly called expert systems.

Nobody wrote a book on true artificial intelligence last year, even though some authors tried to disguise their

books as such. True AI is bound up with all sorts of philosophical questions, and consciousness must also be linked with the subject.

Trends within the computer book publishing industry are similar to those within the field of artificial intelligence. Few people have said anything worth listening to. The trend in formula books started in 1984 and continued into 1985. It is still with us and, as a result, computer authors have turned out copies of each other's books, texts which say the same thing in a different way.

Unfortunately, for both publishers and authors the public has caught on. It is no longer willing to put up with a standard of publication which is no better, and sometimes worse, than the

pulp fiction of the 1920s.

If both the computer industry and book publishing industry are going to survive then authors had better start coming up with new ideas. There are many fields which have not been covered this year. They include the use of computers as control devices, how to go about connecting your machine to the outside world using telephone or radio links, or even the new graphics science of Fractals. None of those subjects was covered last year, but each expands the use of the Spectrum and QL and the interests of their owners. It is about time publishers thought less about making money on formula books, and more about continuing the interest of those who use computers.

Mysteries of the operating system

THE POWER of both the Spectrum and QL is derived from operating systems which manage memory, handle graphics, deal with sound and implement Basic.

Marcus Jeffery, machine code programmer and technical author, explains how QL QDOS works. He shows how you can tap its resources through utility routines in the ROM which can be accessed using QDOS Traps.

John Lambert, the *Sinclair User* hardware correspondent, completes the overview of operating systems with a look at the important routines within the Spectrum ROM, giving explanations of how they can be used within your own Basic and machine code programs.

IT WAS DURING early 1984 that the rumours of Sinclair's super micro began to take concrete form. When the Quantum Leap finally appeared however, it was very different to the one viewed at the early press launch.

The operating system was completely different, and the first buyers were faced with an additional 16K EPROM stuck onto the back of the machine, because Sinclair had not been able to fit SuperBasic onto the EPROM inside.

Although Sinclair was supposed to have learnt from previous mistakes, such as those which plagued the Spectrum, the QL was a bug-ridden disaster which received extremely bad press. However, the unexpected EPROM did finally disappear, and the QDOS operating system was upgraded to version 1.02, having disposed of, at least, the more serious bugs. That was closely followed by the 1.03 version of QDOS, which seems to have eliminated 'most' of the errors, and is still around today.

With all those changes, it would appear to be almost impossible to write any 68008 software, making use of the features of the QL. No sooner had you written it, then the machine version changed. Indeed, the machine version was changing so rapidly that Sinclair included the function VER\$, which would tell you which version you had. The most recent of those returns the code JM, although some lucky people have already mistakenly received the JS upgrade. Fortunately, things are not really that bad, thanks mainly to the QDOS operating system. It is that which provides you with a stable interface to the machine, whichever version you may be using.

QDOS is very different from the operating systems found on more traditional micros such as the Spectrum. On those smaller machines the operating system handles all the user input/output, interpretation of command lines and Basic programs, and communication with external devices, such as the cassette, keyboard and screen and so on.

Figure 1. Main memory map

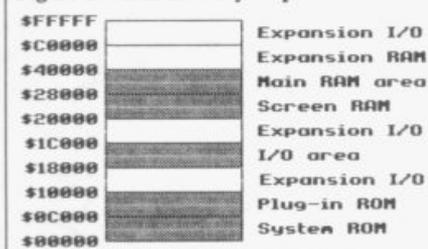

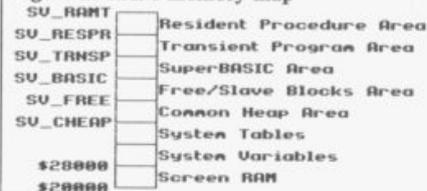

Figure 2. RAM memory map

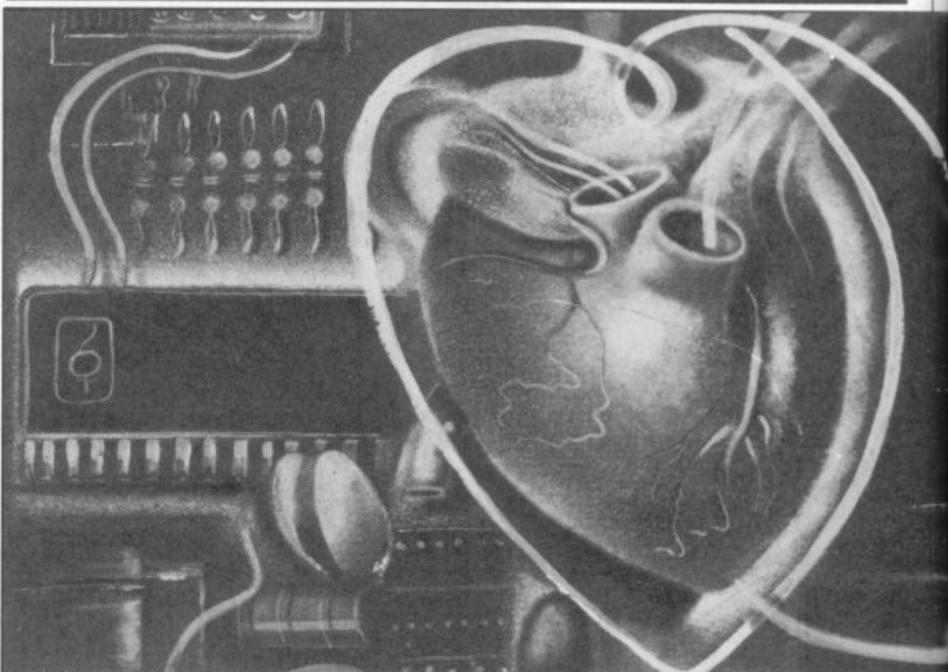

QDOS, on the other hand, is merely a collection of routines which are available for use if necessary. It is the SuperBasic interpreter which handles all the routine matters normally associated with the operating system. That is just a job, albeit a rather special one, running under QDOS. In fact, when first developed, SuperBasic was to be in the form of a cartridge

holes' — see figure one.

Figure two shows a more detailed breakdown of the RAM area. You can easily check that. For instance, run the program in figure three. The loop numbers may not mean much to begin with, but if you convert them to hexadecimal, you get \$20000 to \$27FFF — the 32K screen. When the program is running, you will see the screen fill up with random colours.

If you run that in MODE 4, you will get a similar pattern to that which appears when you press the reset button, but MODE 8 gives a flashing abomination. If you can be bothered to wait for that to finish, type in the command CLS. That will set the TV

QDOS

which would load into ROM. That would have caused no real problems. If you wanted to use SuperBasic then it would obviously take up memory, and if not, then it could be overwritten — it was only a QDOS job.

Before looking at the two main methods of accessing QDOS, a little background information may be helpful.

The standard QL has 128K of RAM, which is located between locations \$20000 — \$ stands for hexadecimal — and \$40000. Below that sits the ROM containing QDOS and the SuperBasic interpreter, the plug-in ROM area and the input/output area, together with a couple of 'reserved

window paper to red, but you will notice that some of the set flash bits can still have an effect.

Although proving that the screen is indeed where it's supposed to be, that is not particularly useful. A much more interesting area of RAM is that set aside for system variables. Those are just like the system variables on the Spectrum, and can provide lots of useful information. They are situated in the area of memory beginning at \$28000 — 163840 in decimal. It is unlikely that this area will change, but to be safe, a 68008 TRAP instruction will return the base address, then the system variables can be found as offsets from that. We will see how to

Figure 3.

```
100 CLS
110 FOR byte = 131072 TO 163835
120   POKE byte,RND(0 TO 255)
130 END FOR byte
```

use traps later, but for the present, try typing the following:

Print peek_w(163976)
which should give you the answer zero. Now change the value by typing poke_w 163976,-1

If you now type in the instruction to reset the value, you should find yourself working in upper-case:

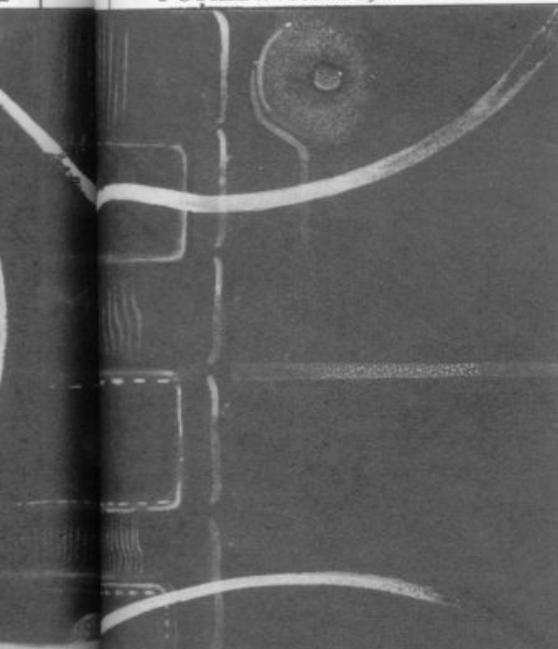

POKE_W 163976,0

Other system variables which you may like to try POKE_W with are
163980 — Key repeat delay (default 30).

and

163982 — Key repeat frequency (default 2).

For example, type
POKE_W 163980,1

then try to reset that to the default value. The keys have a tendency to repeat themselves before you are able

Figure 4.

Mnemonic	Offset	Decimal	Size	Description
SV_CHEAP	\$04	163844	long	Base of common heap area
SV_CHPF	\$08	163848	long	First free space in common heap
SV_FREE	\$0C	163852	long	Base of free area
SV_BASIC	\$10	163856	long	Base of SuperBasic area
SV_TRNSP	\$14	163860	long	Base of transient program area
SV_TRNFR	\$18	163864	long	First free space in transient program area
SV_RESRP	\$1C	163868	long	Base of Resident Procedure area
SV_RAMT	\$20	163872	long	Top of RAM + 1

Notes:

- Offset — That is the hexadecimal offset from the start of the system variables area, usually \$28000.
- Decimal — That gives the decimal address, assuming a start address of \$28000 (163840 decimal).
- Size — That is the size of the variable for peeking. With memory locations that will always be 'long', so POKE_L should be used.

to take your finger off!

Probably one of the most oft-PEEKed Spectrum system variables is the one holding 'the last key pressed'. You will be pleased to know that the QL has a similar location. Try out the following line:

REPEAT loop:PRINT PEEK_W (163978)

After hitting the ENTER key, the left hand column of the screen will start filling with the number ten, which just happens to be the ASCII code for the Command Entry key! Hitting other keys, including keys combined with CTRL, SHIFT and ALT, will change the code accordingly.

The system variables also show how memory is divided. You will have noticed that the SuperBasic program area — the top of RAM, and so on — were shown in figure two by their official mnemonics. That is necessary due to the dynamic memory allocation on the QL, meaning that few areas are permanently fixed. However, you can find the values for those mnemonics by PEEKing the appropriate system variables. Those are shown in figure four.

We will now look at the two main methods in which you can access QDOS routines. Those are firstly using standard system traps, and secondly via a number of system vectors.

The system TRAPS make use of the 68008 TRAP instruction, which takes the form

TRAP £n

where 'n' can take any number between zero and 15. Of those, only traps zero to four have been previously defined for access to QDOS, the rest being available for your own routines.

Of those traps, TRAP £0 is a special case for entering Supervisor Mode. The 68008 processor in the QL is able to operate in two modes — User Mode and Supervisor Mode. When in User

Mode, which is normally the case, the machine is somewhat restricted in the operations it can perform.

Alternatively, in Supervisor Mode, the alternate A7 register is used for the CPU stack pointer, and it is possible to change the contents of the upper byte of the status register, and privileged instructions, such as RTE — ReTurn from Exception — are available. In general, unless you want to run a trace, which executes a user-written debugging routine after each instruction, or use complex interrupts, that particular trap can be ignored.

Before looking at the other trap instructions in detail, let us see how they can be accessed from SuperBasic or 68008 machine code. QL SuperBasic is not over endowed with routines to use 68008 machine code, but correct use of the RESPR, CALL, POKE and PEEK instructions is sufficient for most purposes.

In general, a QDOS trap will expect to find values in certain registers informing it as to which routine is required — register D0 — and any other necessary parameters. Upon returning from the appropriate routine, some registers may have been set to various values. The SuperBasic CALL instruction is an excellent means of executing a machine code routine. Not only is the routine CALLED, but up to 13 registers may also be set with optional parameters, with the form:

CALL location, D1, D2, D3, D4, D5, D6, D7, A0, A1, A2, A3, A4, A5

The only registers missing from the list are D0 — which is initially set to -15 and should be reset to zero before returning to Basic; A6 — which holds an important value based on an offset from the start of the SuperBasic area; and A7 — which is the user stack pointer. The machine code routine will return to SuperBasic with an RTS instruction.

The CALL instruction is fine for passing parameters to machine code routines, but there is no equivalent facility for returning them. The only reasonable way of doing that is to place the appropriate values into a sequence of spare locations, then PEEK them from Basic.

We can try that out using a small program to call trap one, with register D0 set to zero. That trap has the MT.INF — Manager Trap System Information — and will return the ID of the current job and the QDOS version number.

Figure 5.

```

100 CLS
110 mach_code = RESPR(100)
120 load_code
130 CALL mach_code
140 print_registers
150 STOP
160 :
170 DEFine PROCedure load_code
180 RESTORE 290
190 location=mach_code
200 REPEAT loop
210   READ wor
220   IF word=-1 THEN EXIT loop
230   POKE_W location,word
240   location=location+2
250 END REPEAT loop
260 PRINT"Code entereded."
270 END DEFine load_code
280 :

400   READ r$:PRINT r$," = ":
410   PRINT PEEK_L(location+4*reg):TO 20;" (":
420   FOR ch=0 TO 3:PRINT CHR$(PEEK(location+4*reg+ch)):
430   PRINT")"
440 END FOR reg
450 END DEFine print_registers
460 :
470 DATA "D1","D2","D3","D4","D5","D6","D7"
480 DATA "A0","A1","A2","A3","A4","A5"

```

Just type in, and run, the program in figure five. That has been written as a general routine which will load and execute a piece of machine code, then dump the contents of registers D1 to D7 and A0 to A5, the same as the CALL instruction.

In order for that to work, the last instructions in the machine code data should always be:

```

LEA $OC(PC), A0
MOVEM.L D1-D7/A0-A5, (A0)
MOVEQ #0,D0
RTS

```

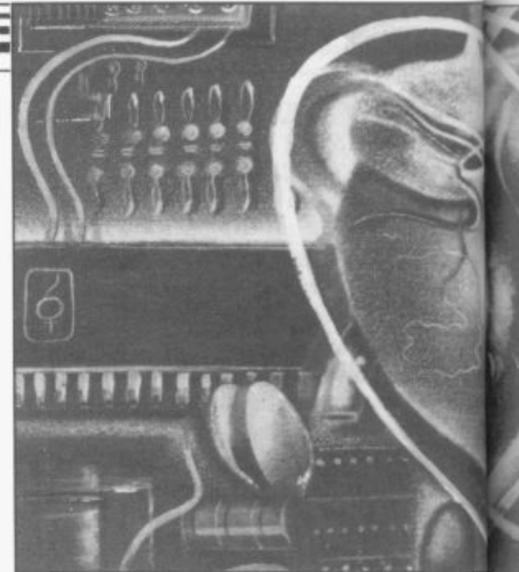

The additional instructions in figure five set register D0 to zero, and execute trap one.

If you look at the registers afterwards, D1 does not look very impressive, but has actually returned the current job number. Since the current job is SuperBasic, job number zero, that is easily overlooked. More interesting is the ASCII code for register D2, which should contain a number, such as '1.03'. That is the QDOS version number, referred to in the introduction. The TRAP #1 calls are known as Manager Traps and are detailed in figure six.

There are only four subdivisions of TRAP #2. Those allow you to open and close a channel, delete a file on a channel, and format a device, such as a microdrive, as detailed in figure seven.

The subdivisions of TRAP #3 are

probably the most interesting, being concerned with input/output, especially to the screen display. Those take the form of a host of routines to read and alter windows, colours, text/

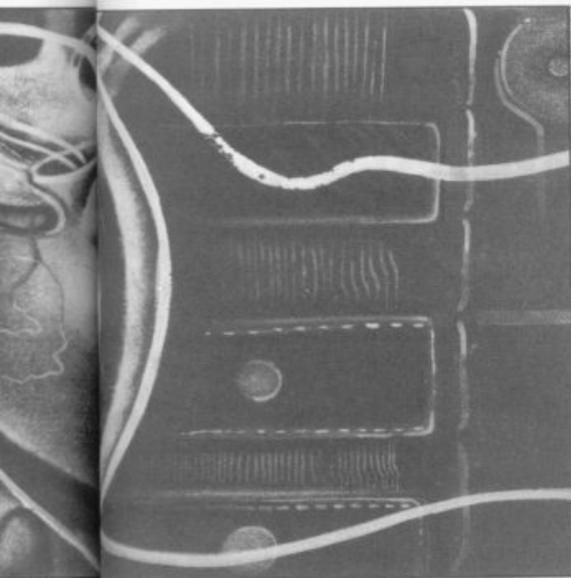

graphic cursor, and so on. Trap #4 is really for use by the SuperBasic interpreter, converting future trap parameters to relative, rather than absolute, addresses.

Having said all that, it is the machine code programmer who is likely to find the greatest use for those traps. Useful though many of them are, using the SuperBasic command is going to be quicker than loading data, then using the CALL instruction.

The second method of accessing QDOS is via the system vectors. There are a multitude of those, situated from memory location \$CO.

Figure 6. TRAP #1

Mnemonic	Reg. D0	Description
MT.INF	\$00	Return system information
MT.CJOB	\$01	Create a new job in the transient program area
MT.JINF	\$02	Return information on a given job
MT.RJOB	\$04	Remove a job from the transient program area
MT.FRJOB	\$05	Force remove a job from the transient program area
MT.FREE	\$06	Find largest allocatable free space in the transient program area
MT.TRAPV	\$07	Set job exception table vector
MT.SUSJB	\$08	Suspend a job
MT.RELJB	\$09	Release a job
MT.ACTIV	\$0A	Activate a job
MT.PRIOR	\$0B	Change the priority of a job
MT.ALLOC	\$0C	Allocate area in heap
MT.LNKFR	\$0D	Link a free space back into the heap
MT.ALRES	\$0E	Allocate resident procedure area RESPR
MT.RERES	\$0F	Release the resident procedure area
MT.DMODE	\$10	Set or read the present display mode
MT.IPCOM	\$11	Send a command to the IPC (Intel 8049)
MT.BAUD	\$12	Set the baud rate
MT.RCLCK	\$13	Read the clock
MT.SCLCK	\$14	Set the clock
MT.ACLCK	\$15	Adjust the clock
MT.ALBAS	\$16	Allocate Basic area
MT.REBAS	\$17	Release the Basic program area
MT.ALCHP	\$18	Allocate common heap area
MT.RECHP	\$19	Release the common heap area
MT.LXINT	\$1A	Link an external interrupt service routine
MT.RXINT	\$1B	Remove an external interrupt service routine
MT.LPOLL	\$1C	Link a polling 50/60 Hz service routine
MT.RPOLL	\$1D	Remove a polling 50/60 Hz service routine
MT.LSCHED	\$1E	Link a scheduler loop task
MT.RSCHED	\$1F	Remove a scheduler loop task
MT.LIOD	\$20	Link an I/O device driver
MT.RIOD	\$21	Remove an I/O device driver
MT.LDD	\$22	Link a directory device driver
MT.RDD	\$23	Remove a directory device driver

Machine code programmers will find a number of those vectors useful. Unfortunately, the most generally useful vectors, concerning ASCII to binary and hexadecimal conversion, will not be functioning until version 1.04 — according to Sinclair's manual!

That still leaves one of the most useful features available on the QL — the ability to extend SuperBasic. The vector BP.INIT (at \$110) can be used to add a list of procedures and functions to the SuperBasic name table. From then on, those routines can be used in SuperBasic in the same way as the routines built into the SuperBasic ROM.

For example, suppose you wanted to turn the example in figure five into a SuperBasic function. You would first need a table of the following form:

DC.W 0	:	There are no procedures
DC.W 0	:	Zero marks end of procedures
DC.W 1	:	We are defining one function
DC.W ptr	:	Relative pointer to function
DC.B 6	:	Length of function name
DC.B 'VERNO\$'	:	Name of function
DC.W 0	:	End of function definitions

Having defined your table, a simple piece of code to point to the table (register A1), then a jump via the BP.INIT vector, will do the rest of the work. That looks something like:

```
LEA    TABLE(PC),A1
MOVE. W $110,A2
JSR    (A2)
RTS
```

Figure 7. TRAP #2

Mnemonic	Reg. D0	Description
IO.OPEN	\$01	Open a channel
IO.CLOSE	\$02	Close a channel
IO.FORMAT	\$03	Format a sector of medium
IO.DELET	\$04	Delete a file from a channel

Figure 8. TRAP #3

Mnemonic	Reg. D0	Description
IO.PEND	\$00	Check for pending input on channel
IO.FBYTE	\$01	Fetch a byte from channel
IO.FLINE	\$02	Fetch line of characters (end = \$0A)
IO.FSTRG	\$03	Fetch a string of bytes
IO.EDLIN	\$04	Edit a line of characters
IO.SBYTE	\$05	Send a byte to channel
IO.SSTRG	\$07	Send a string of bytes
SD.EXTOP	\$09	Call an external operation
SD.PXENQ	\$0A	Return window size/cursor position (pixel coords)
SD.CHENQ	\$0B	Return window size/cursor position (char. coords)
SD.BORDR	\$0C	Set window border width and colour
SD.WDEF	\$0D	Redefine window
SD.CURE	\$0E	Enable cursor
SD.CURS	\$0F	Disable cursor
SD.POS	\$10	Set text cursor
SD.TAB	\$11	Set text cursor horizontal position
SD.NL	\$12	Newline
SD.PCOL	\$13	Set cursor to previous column
SD.NCOL	\$14	Set cursor to next column
SD.PROW	\$15	Set cursor to previous row
SD.NROW	\$16	Set cursor to next row
SD.PIXP	\$17	Set cursor position to pixel coordinates
SD.SCROL	\$18	Scroll entire window
SD.SCRTT	\$19	Scroll top of window
SD.SCRBT	\$1A	Scroll bottom of window
SD.PAN	\$1B	Pan entire window
SD.PANLN	\$1E	Pan cursor line in window
SD.PANRT	\$1F	Pan righthand side of cursor line
SD.CLEAR	\$20	Clear all of window
SD.CLRTP	\$21	Clear window above cursor
SD.CLRBT	\$22	Clear window below cursor
SD.CLRLN	\$23	Clear cursor line in window
SD.CLRRT	\$24	Clear window to right of cursor
SD.FOUNT	\$25	Set or reset the character font
SD.RECOL	\$26	Recolour window
SD.SETPA	\$27	Set paper colour
SD.SETST	\$28	Set strip colour
SD.SETIN	\$29	Set ink colour
SD.SETFL	\$2A	Set flach mode
SD.SETUL	\$2B	Set underline mode
SD.SETMD	\$2C	Set write mode (XOR, strip, transparent, ink)
SD.SETSZ	\$2D	Set character height, width and spacing
SD.FILL	\$2E	Fill rectangle in window
SD.POINT	\$30	Plot point
SD.LINE	\$31	Draw line
SD.ARC	\$32	Draw arc
SD.ELIPS	\$33	Draw ellipse/circle
SD.SCALE	\$34	Set window scale
SD.FLOOD	\$35	Set or reset fill mode
SD.GCURS	\$36	Position the graphics cursor
FS.CHECK	\$40	Check all pending operations on a file
FS.FLUSH	\$41	Flush buffers for a file
FS.POSAB	\$42	Position file pointer absolute
FS.POSRE	\$43	Position file pointer relative
FS.MDINF	\$45	Get information about medium
FS.HEADS	\$46	Set file header
FS.HEADR	\$47	Read file header
FS.LOAD	\$48	Load file into memory
FS.SAVE	\$49	Save a file from memory

You can try that out by entering the program in figure nine, which will save a machine code file to 'mdv1_verno'.

At any future date simply type the following:

```
cd = RESPR(100)
LBYTES mdv1_verno,cd
CALL cd
```

Then typing
PRINT verno\$,
a\$ = verno\$

or whatever, will return the required result.

Figure 9.

```
100 mach_code = RESPR(100)
110 location = mach_code
120 REPEAT load_code
130   READ word
140   IF word = -1 THEN EXIT load_code
150   POKE_W location,word
160   location = location + 2
170 END REPEAT load_code
180 SBYTES mdv1_verno,mach_code,100

What's the best thing next to your Spectrum?

The LMT Disk Interface?

PROBABLY! No need for expensive 3" or 3.5" Disks, just plug in any 5.25" standard (e.g. BBC compatible) disk drive. Complete with a Parallel Printer connector, a Tape to Disk Copier, an Onboard Screen Dump, and Micro-Drive Compatibility. Add to this a FREE Utilities Disk with a Built-in Word Processor, a Database, Help Files, and Network Controller, and it must be a BARGAIN at only £89.99

The LMT Keyboard?

PROBABLY! A professional, State of the Art Keyboard, featuring 68 keys, including full size space bar, dedicated Numeric pad, Cursor pad, *,.,,/,,-, and ENTER, all full-travel sculptured keys. Complete with full fitting Instructions (English not Yapiknees), Graphics Shift Key, Individual Extended Mode key, separate Caps Lock key, it should be the most expensive on the market. In fact its only £49.99

LMT add-ons, the best thing next to your Spectrum

All prices include VAT and Carriage

LMT Computers Ltd
Unit 1 South Street Commercial Centre
Bishops Stortford
Herts CM23 3AL
Tel: (0279) 506801

CONNECTORS AND CABLES FOR THE QL AND SPECTRUM

FOR SPECTRUM

56-WAY EXTENDER CABLE, 6in LONG APPROX.

(a) For one peripheral (1F1M).....	£7.75 each
(b) For two peripherals (1F2M).....	£12.50 each
(c) For three peripherals (1F3M).....	£15.50 each
56way IDC connector (for ribbon).....	£3.45 each
Wafer drive printer cable RS232, 1.5 metres	£6.50 each
Waferdrive printer cable Centronics, 1.5 metres	£9.50 each
Spectrum cassette cable	£1.25 each

INTERFACE '1' CABLES

RS232 Printer cable, (1.5 metres).....	£8.50 each
Microdrive extension cable (17")	£5.00 each

CLASSIFIED PRODUCTS & SERVICES LIMITED

St Cuthbert House
St Cuthberts Way
Aycliffe Industrial Estate
Newton Aycliffe
Co Durham DL5 6UT
Tel: (0325) 313131

QL CABLES

RS232 printer cable (1.5 metres).....	£8.00 each
RS232 connector on 2 ft cable.....	£1.50 each
QL Joystic connector on 2ft cable	£1.80 each
QL Joystic adaptor for Atari type.....	£4.50 each
QL Monitor cable (mono)	£1.50 each
QL to RGB Monitors	By request

We offer a full cable assembly service. We also stock all types of connectors and cables; send SAE for further lists.

All the above prices include VAT. Please add 50 pence P&P to UK and European addresses. Trade enquiries welcome.

THETFORD MICROS

SPECIALIST IN SPECTRUM REPAIRS

21 Guildhall Street,
Thetford,
Norfolk,
Tel: (0842) 61645

Service Department
Unit 4, Leyland Close,
Thetford, Norfolk,
Tel: (0842) 65897

Why wait weeks to get your Spectrum repaired

We at Thetford Micros (Service Dept) have just put into operation a new fully equipped workshop to allow us to keep up our 24 Hours "Guaranteed" repair service on your Sinclair Spectrum computers. We have fully trained staff and our workmanship and repair work is fully warranted to give you the confidence that your micro is in the safest hands. Any first time repairs will be £16.00 + VAT + £2.00 postage and package = total £20.40 for any repair on your computer. We also specialise in the repair of the Spectrum microdrive, Interface I, II and ZX printers at the same standard charge. Payment may be made by cheque, Barclaycard, Access, American Express, or Postal Order. So all you have to do is post your faulty Spectrum to us along with payment and we will do the rest, your repaired Spectrum will be back in the post within 24 hours (we never sleep!) and depending on the post office it will be back with you within 5-6 days. We have already undertaken repairs from all over England and the continent.

We also undertake repair work on Acorn, Commodore, Amstrad, Texas, Dragon etc., at the lowest of prices.

Any problems with your micro phone Pete on the above telephone numbers — I'll be only too pleased to assist.

£35.00+VAT & P&P for all QL computer faults. £39.00+VAT & P&P with microdrive fault.

We also produce our own Spectrum "48K Upgrade Kits" complete with fitting instructions. £24.00 (VAT+P&P) inclusive. Switchable UHF — composite video can be fitted to your Spectrum for only £14.00+VAT+£2.00 P&P.

Trade enquiries welcome

Written any good programs lately?

Micronet 800 are currently looking for good quality Spectrum programs to load onto our mainframes and offer direct to our thousands of members.

If you're a talented programmer, you'll earn a substantial fee, or top royalties, as well as seeing your 'name in lights' across the Micronet database!

We'll distribute your programs as 'telesoftware' — stored on our mainframes and delivered via the phone lines to Micronet subscribers nationwide. It's revolutionary, and it's the future of software distribution.

Just send us your cassette, with your name, address, phone number, and a brief description of the program, and 'mainframe and fortune' could be yours!

Contact: **Phil Godsell,**
Software Manager
Micronet 800
8 Herbal Hill,
London EC1R 5EJ.

TO MANY PEOPLE the Spectrum is typified by a flashing K in the corner of the screen. Few stop to think how the K go there in the first place.

The Spectrum ROM is a complex 16K machine code program which handles all the difficult tasks which go to make up a computer.

Luckily, you do not have to understand what is under the bonnet to be able to use the Spectrum, but once you start delving into machine code, you will find that the ROM contains many useful routines which you can use in your own programs.

OPEN.

00024 0018 GET-CHAR

Collect a printable character into A.

00032 0020 NEXT-CHAR

The A register is loaded with the next character to be interpreted.

00040 0028 FP-CALC

Used by the Floating Point Calculator as an indirect jump to 335Bh. The RST 28 should be followed by a byte which represents the operation to be performed on the calculator stack.

That is not as difficult to use as it appears at first sight. It works in a similar manner to Forth; numbers are

23728/9. Due to a misplaced byte any hardware which uses it would cause a system reset.

Reading the keyboard

00654 028E KEY-SCAN

The main keyboard scan routine. A value, representing one of the 40 keys, is returned in E, if pressed. D will hold a value if one of the shift keys is also pressed. If no keys are pressed DE will hold FFFFh. If more than two keys are pressed — or if two keys are pressed and neither of them is a shift — the zero flag is reset.

ZX ROM

You cannot harm the Spectrum by using software, so just type RANDOMISE USR n — where n is from 0 to 16383, the position of the ROM — and see what happens.

The explanations below show some of the ROM routines which you can use within your Basic and machine code programs. Each is introduced with two numbers followed by a name. The first number is the start address of the ROM routine written in decimal and the second is the same number but converted into hexadecimal. The name given by Sinclair Research to the routine follows.

Many of the routines can be run in a Basic program by entering RAND USR followed by an address. Others can only be used within machine code programs. Some require that the Z80 registers are set up with particular values. The information for such set ups are shown in the explanations.

00000 0000 START

RAND USR 0 provides a good way to clear the Spectrum memory without having to pull the plug.

The Spectrum makes full use of the Z80 RST instructions. All of them are used for functions which need to be done quickly:

00008 0008 ERROR-1

When an error occurs the Basic interpreter goes through this address. Used with GET-CHAR and NEXT-CHAR when adding your own Basic commands.

00016 0010 PRINT-A-1

Called with A holding the character to be printed to the current channel. It can be used to print control characters as well as normal ASCII. See CHAN-

put on the stack and the operator simply takes the top two and performs the required operation.

In the following example two numbers — 2 and 2 — are put on to the stack, the operator (+) is added and the result — 4 — is put back on the stack. The last call prints it.

LD BC,2 : put 2 on calculator stack

CALL 2D2B :

LD BC,2 : put 2 on calculator stack

CALL 2D2B :

RST 28 :

DEFB 0F : code for add

DEFB 38 : code for end calculation

CALL 2DE3 : print result

The calculator does not perform calculations particularly quickly, by machine code standards. You could write your own dedicated routines which would be much faster, but it is nevertheless very convenient.

00048 0030 BC-SPACES

This specifically makes room in the workspace; BC holds the number of bytes for which to make room. It uses the more general routine at 169E.

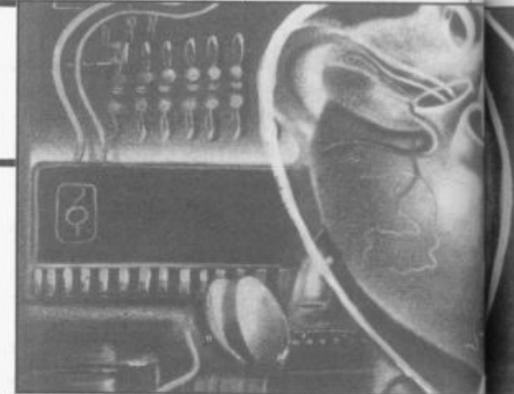

Two interrupt routines were designed for the Spectrum:

00056 0038 MASK-INT

The maskable interrupt routine which is called every 1/50th of a second when the ULA puts out the picture. The system variable FRAMES is updated and the keyboard read.

00102 0066 RESET

The non-maskable interrupt. It was designed to allow external pieces of hardware to control the Spectrum by a jump to the location, pointed to by

Making Beeps

00949 03B5 BEEPER

The main Beep routine. Called with DE holding frequency ★ time, in seconds, and HL the number of T states per cycle.

01016 03F8 BEEP

This uses the top two numbers on the calculator stack as parameters. The top one is the pitch, the second the duration.

01134 046E SEMI-TONE

Table of 12 floating point numbers representing the 12 semi-tones in an octave.

ZX81

01194 04AA ZX81

Just to prove its heritage, the Spectrum contains a piece of code — 24 bytes — from the ZX81. It is totally useless as far as the Spectrum is concerned but you might be able to do something with it.

The cassette handling routines.

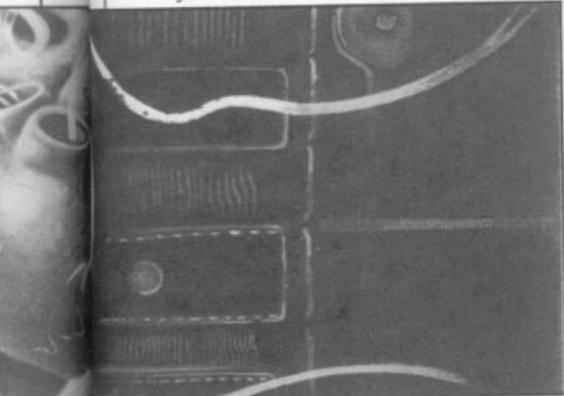

Although some people still have problems the cassette port is one of the Spectrum's better features. It can accept a wide range of speeds — plus or minus 20 per cent — and volumes. For interesting border displays try calling various addresses at around 1280 (decimal).

01218 04C2 SA-BYTES

Used to save both the header and data.

A=0 for a header or A=FFh for data. IX holds the start address and DE the length. A header is 17 bytes, the first one holds the type of file, 0=program, 1=numeric array, 2=character array, 3=code bytes.

The next 10 are the filename and the next two the length of the data in the following block. The next four bytes vary according to the file type. For programs, 1 and 2 hold the value of LINE — or 2 holds 80h if LINE is not used — and 3 and 4 the length of the program. For arrays, 2 holds the array name and for code, 1 and 2 hold

the start address.

01366 0556 LD-BYTES

Loads, or verifies, both headers and data. A=0 for headers, A=FFh for data. The carry flag is set for loading and reset to verify. IX holds the address it loads to and DE the length.

02348 092C ME-ENTE

Routine used to merge program lines and variables. The carry flag is set for variables and reset for Basic lines; the zero flag is set if it is a replacement and reset if an addition. HL points to the start of the new item and DE where it is to go.

02466 09A2

The cassette error messages.

Screen and printer routines. Bit 1 of FLAGS determines where it goes.

02548 09F4 PRINT-OUT

Used by RST vector 10H for printing control codes, printable characters and tokens. Register A holds the code on entry. Each type of code has its own routine which can be called separately.

03282 0CD2 PO-SCR-3

Middle of the normal scroll routine but it can usefully be called from Basic to scroll the display upwards by one line.

03405 0D4D TEMPS

Copies the permanent colour system variables to the temporary ones.

03435 0D6B CLS

Clears all 24 lines of the display.

03583 0DFF

You won't find this in the manual, but it is a useful call from Basic to scroll the bottom half of the screen up a line.

0358 0E00 CL-SCROLL

The proper routine which scrolls the screen B lines.

03652 0E44 CL-LINE

Called with B, holding the number of lines to be cleared at the bottom of the screen.

03762 0EB2 COPY

Same as the Basic keyword and copies the screen to the ZX printer. 0ECD copies the printer buffer to the printer.

03807 0EDF CLEAR-PBF

Clears all 256 bytes of the printer buffer.

The main editor routines start at 0F2C. They are used to input to the lower screen and during INPUT.

04264 10A8 KEY-INPUT

Reads a valid key, taking note of the mode, from the keyboard into A. If no key is pressed the carry flag is reset and the zero flag set.

04317 10DD

A partially useful call — part of a larger procedure — which toggles CAPS LOCK on and off.

Initialisation

04535 11B7 NEW

This is used both on power up and when NEW is entered. The only difference is that with NEW RAMTOP, P-RAMTOP, RASP, PIP, and UDG are retained.

04756 1294

The part of the initialisation which prints the Sinclair copyright message.

The MAIN-EXEC routines starting at 12A2. These perform most of the work of the Spectrum, when it is not actually running a program. It, and other parts of the program, call various subroutines as required.

05010 1392

Table of error messages.

05588 15D4 WAIT-KEY

Waits for a valid key press. Calls KEY-INPUT until the carry flag is set.

05606 15E6 INPUT-AD

Inputs a character to A from the current channel. The carry flag is set if a character is input else the zero flag is used to signal EOF.

05633 1601 CHAN-OPEN

Does not open a channel, but makes the channel attached to the stream,

whose number is held in A, the current one. In other words,

```
LD A,3
```

```
CALL 1601
```

will direct output via RST 10 to the printer. A can be in the range FEh to 03h.

The streams are: P — printer; S — screen (top 22 lines); K — keyboard (bottom 2 lines); R — reserved (workspace).

Table 1 shows examples of stream use. The cursor representation, translated into a hex number, must be put into the A register before CHAN-OPEN at address 1601h is executed.

A=FDh 'K' — used for prompts and when the screen is cleared.

A=FEh 'S' — used for listings and CLS

A=FFh 'R' — prints data to the workspace.

Can be used to simulate keyboard entry.

A=00h 'K' — prints error messages.

A=01h 'K' — selected by input.

A=02h 'S' — normal screen output.

A=03h 'P' — normal printer output.

Examples of stream use

Table 1.

05714 1652 ONE-SPACE

Loads BC with 1.

05717 1655 MAKE-ROOM

BC holds the amount of room needed, HL the address after where it is required. A test is made to make sure there is enough spare space.

06329 18B9

Part of a larger routine which increases HL by 5 and puts the contents of HL in A.

06510 196E LINE-ADDR

On entry HL holds a Basic line number. On exit it holds the address of the line, or the first line after, and DE holds the address of the previous line.

06629 19E5 RECLAIM-1

The opposite of MAKE-ROOM. Reclaims memory space from DE to HL.

Each Basic Line is interpreted by the routines which start at 1B17 in the ROM. Those are preceded by a table of address offsets for each Basic keyword.

07290 1C7A EXPT-2NUM

Uses EXPT-1NUM to evaluate two numbers separated by a comma.

07298 1C82 EXPT-1NUM

Evaluates the number pointed to by CHADD. During syntax checking it checks to see if this is a valid number. When the program is running it puts the number on the calculator stack.

07308 1C8C EXPT-EXP

As EXPT-1NUM but for strings.

07828 1E94 FIND-INT1

Operating Systems

Compresses the last value on the calculator stack into register A. It uses the FP-TO-A routine at 2DD5h and reports out of range errors.

07833 1E99 FIND-INT2

Compresses the last value on the calculator stack into BC. It uses the FP-TO-BC routine at 2DA2h and reports out of range errors.

07962 1F1A FRE-MEM

Uses the TEST-ROOM routine at 1F05 to find the amount of free memory. This can be called from Basic by PRINT 65535-USR 7962.

08020 1F54 BREAK-KEY

General routine to test for the Break key being pressed. Returns with the carry flag reset if Break is pressed.

08252 203C PR-STRING

Prints the string, using RST 10, pointed to by DE, of length BC.

08859 229B

Mid-procedure call that sets the border colour to A — into range 0 to 7 — and updates the system variable BORDCR.

08874 22AA PIXEL-ADD

Finds the address of a pixel on the screen. Entered with the co-ordinates in BC. Exited with the address in HL and the position of the pixel within the address in A.

08933 22E5 PLOT-SUB

Plots the point — pixel — pointed to by BC.

10418 28B2 LOOK-VARS

An important routine which searches the variables area for the variable pointed to by CHADD. If this variable exists it returns with the carry flag set and HL pointing to the first letter of the variable name in the variables area. If a match cannot be found the carry flag is reset.

10929 2AB1 STK-STORE

Puts the values in A, E, D, C and B on the calculator stack.

10990 2AEE DE, (DE+1)

Loads DE with the contents of DE+1 and points HL at DE+2.

11249 2BF1 STK-FETCH

Takes the last five bytes off the calculator stack and puts them into B,C,D,E,A.

11400 2C88 ALPHANUM

Sets the carry flag if A holds an alphanumeric character.

11405 2C8D ALPHA

Sets the carry flag if A holds a letter of the alphabet — upper or lower case.

11544 2D18 NUMERIC

Resets the carry flag if A holds a number.

11560 2D28 STACK-A

Converts the number in A to Floating Point form and puts it on the calculator stack.

11563 2D2B STACK-BC

Converts a number in BC to Floating Point form and puts it on the calculator stack.

11682 2DA2 FP-TO-BC

Compresses the last value on the calculator stack into BC. If the value is greater than 65535 it returns with the carry flag set, if negative the zero flag is reset.

11733 2DD5 FP-TO-A

Compresses the last value on the calculator stack into A. If the value is greater than 255 it returns with the carry flag set, if negative the zero flag is reset.

11747 2DE3 PRINT-FP

Prints a Floating Point number. You can use it with STACK-BC as an easy way to print the contents of a register.

LD BC,num : number to be printed

CALL STACK-BC : put on stack

CALL PRINT-FP : print it

12457 30A9 HL=HL*DE

A useful routine which multiplies HL by DE and puts the result back in HL. BC and DE are preserved.

HIRE SPECTRUM SOFTWARE

- * OVER 500 different titles available for hire including **ARCADE, ADVENTURE, BUSINESS, EDUCATIONAL**, etc.
- * OVER 10,000 tapes in stock. All publisher's originals.
- * **LOWEST HIRE CHARGES** — hire up to 3 tapes at a time, from only 63p (plus P&P and VAT) for 2 weeks hire.
- * **FREE** printed **CATALOGUE**.
- * **FREE** newsletter with hints, tips, reviews, etc.
- * **TAPES** for sale at **DISCOUNT** prices, (eg **MANIC MINER £2.00**).
- * **FAST, FAST SERVICE**. All tapes sent by 1st class postage.
- * **HALF-PRICE OFFER** — **LIFE** membership **ONLY £3.00** (normally £6.00).
- * **FREE** first hire tape. (For limited period).
- * **EUROPEAN MEMBERS WELCOME**. (Payment in Sterling).

Have you ever been disappointed with software you've purchased? Now you can hire it first. If you like it, buy it at £1.00 off our already discounted prices. If you don't, send it back and it will only cost you the hire fee.

NSL is the best **SPECTRUM** library, with over 8,000 delighted members, the largest range of tapes and controlled by our computer with 22 mb hard disc. **JOIN TODAY**, or, if you don't believe our claims write or phone 01-661 9240 for a catalogue, and check our competitors. We're confident you'll join **NSL**.

NATIONAL SOFTWARE LIBRARY

42 Harefield Avenue, Cheam, Surrey SM2 7NE.

I enclose £3.00 for **LIFE MEMBERSHIP**. Please rush my membership kit to me. If, within 28 days, I'm not delighted with your service you'll refund my membership fee.

THE HARDWARE and software buyers' guides produced by *Sinclair User* provide immediate and up to the minute information on the products which you can buy for your machine, be it a Spectrum or QL.

The software guide gives star ratings to all the products reviewed in *Sinclair User* in the past year. It is combined with a list of software publishers.

The hardware section contains information on most of the add-ons available for the Spectrum and QL. A list of component manufacturers and repair services make the directory one of the most comprehensive available in any magazine or book.

Hardware and peripherals

Looking for a printer or a joystick? Who do you contact? Below is a list of companies, their telephone numbers and the hardware they produce

INTRODUCTION

IT HAS BEEN estimated that in the 12 months from the launch of the ZX-81 to the launch of the Spectrum a new Sinclair related company was formed every 36 hours. Since then, over three years ago, that pace has scarcely diminished. This booklet contains details of about 300 different items of hardware for the ZX-81, Spectrum and QL.

Due to considerations of space the details given on each product are limited, but you should be able to find almost any type of add-on you could wish for. We have given the telephone numbers of all companies so that you can contact them for further details. The figures in brackets in the comment column are the issue of *Sinclair User* in which a review was published.

When buying hardware, always tell the manufacturer exactly what you want to do with it and whether you will be using it with other add-ons. In that way you can avoid disappointments later. Take note of whether the add-on you want is dead-ended — that is, whether it does not have the user port carried through for further add-ons. If that is so you will need to buy a two-way connector.

There is a limit to how much additional hardware the computer can support, and usually it is no more than two items. If you are using a flexible connector that can also affect add-ons so keep it as short as possible, preferably about 2-3ins.

Try not to keep plugging and unplugging add-ons in the user port, as with the ZX-81 and Spectrum the port soon wears out. It can be built up again with solder but prevention is better than cure. The port can become dirty in use which can lead to the computer crashing at odd moments or behaving erratically.

Lastly, always check that there is a key in the edge connector of the add-on; if it is missing you could damage the computer. Most important, NEVER plug, or unplug, anything into the user port without first turning off the power.

JOYSTICKS All joysticks used on Sinclair machines use the Atari standard. Some have Autofire and some have two independent fire buttons.

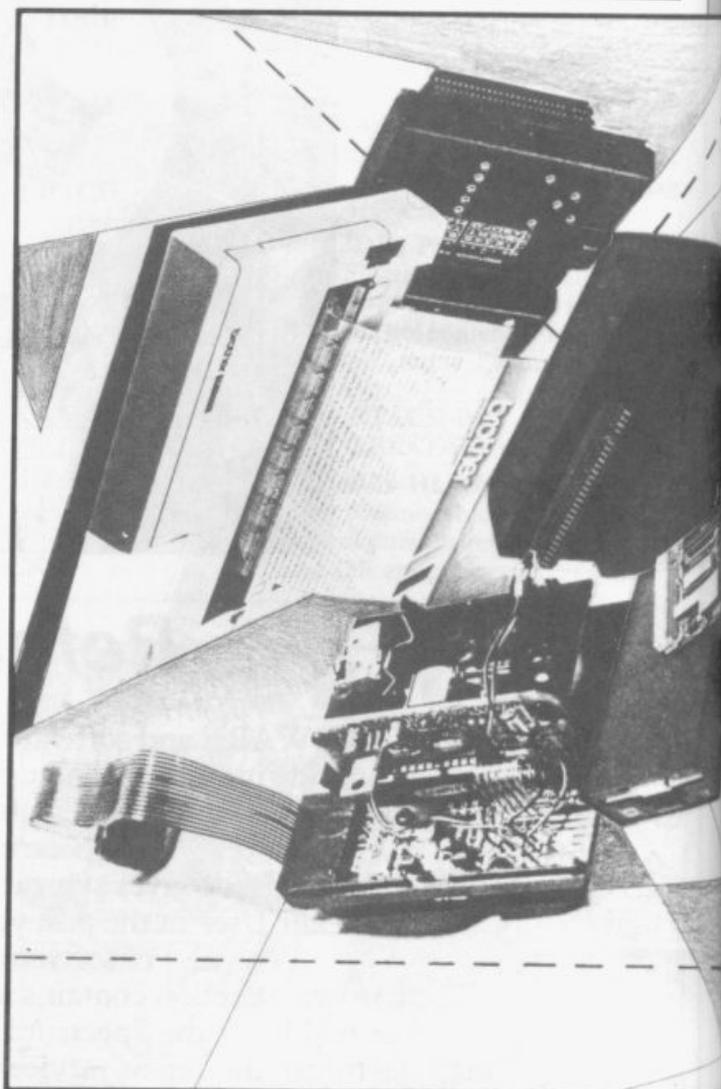

JOYSTICK INTERFACES All these interfaces accept standard joysticks. Check that your joystick can make use of any additional features. If buying a programmable interface try it out before buying, as some are easier to program than others.

PRINTERS Many of these printers are available from more than one place. Shop around for the cheapest price — the target prices were taken from current adverts.

PRINTER INTERFACES Check that the interface is the same as your printer, Centronics or RS232. If RS232 check that you can get a suitable cable for it.

KEYBOARDS Adding a full-sized keyboard usually means opening the computer, which will invalidate your warranty.

FAST STORAGE Disc systems tend to be more expensive but

you can use the drives on more than one computer and the cost of storage, in pence per K, is quite low.

GRAPHICS AIDS Where possible try before you buy.

SOUND/SPEECH Output through the TV tends to degrade the picture and will not work on a monitor.

RAM Upgrades for the Spectrum are normally 32K.

MODEMS All but the Protek require a wall socket to operate.

MONITORS The Spectrum requires an adaptor to run a monitor — see **ODDS AND ENDS**.

TAPE DECKS Most domestic mono cassette recorders will work with the ZX-81 and Spectrum. These here have all been designed specifically to work with computers.

INPUT/OUTPUT A selection of the products that these companies produce.

ODDS AND ENDS From flexible connectors to robots, from reset switches to CP/M.

JOYSTICKS

Product	Contact	Price	Comment
Kempston Junior Pro	0234-856633	5.95	Single fire button
AGF Quickshot I	0243-823337	7.95	Old favourite. Two fire buttons. Good value
Cobolt	0751-73315	8.95	Has no base and takes getting used to. Good for track-type games

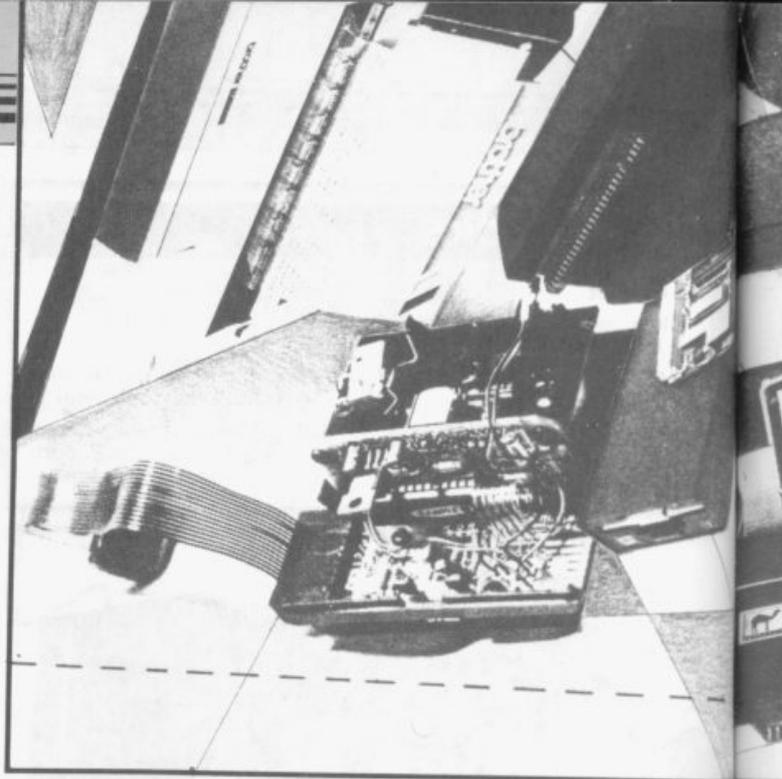

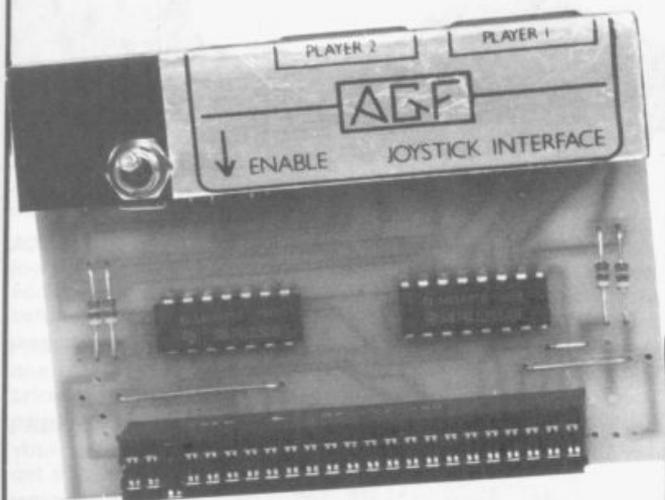

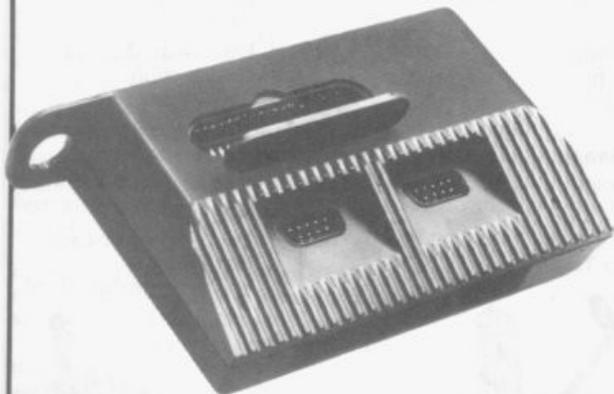

Consumer Electronic Slik Stick	061-682-2339	8.95	Stick is small and rather stiff
Vulcan Gunshot	01-203-6366	8.95	Hardwearing and imprecise. (May'85)
Dean Superchamp	0344-885661	9.95	Cable winds into base. Stick rather loose. (Oct'84)
Nidd Valley Flightlink	0423-864488	9.95	Two independent fire buttons
RAM Quickshot II	02514-5858	9.95	Old favourite. Stick loosens with use. Autofire
Stonechip Superstick	0252-333361	9.95	

Voltmace 3S		10.00	Two independent fire buttons. Well made. Good value. (Oct'84)
Frel Flightlink	0584-4894	10.50	Two independent fire buttons. Very precise but fire buttons small
Consumer Electronic Starfighter	061-682-2339	10.95	Short but quite good
Eidersoft QL Joystick	01-478-1291	11.95	Standard Quickshot II with QL plug. (May'85)
Kempston Formula 2	0234-856633	11.95	Three fire buttons. Long travel stick. (June'85)
CGL Champion	01-508-5600	11.95	Two fire buttons. Autofire
Kempston Pro 3000	0234-856633	12.75	Two fire buttons. Leaf switches
Cookridge Zipstick	0532-670625	12.95	Two fire buttons, suckers on base
DK'tronics Quickshot II	0799-26350	12.95	see RAM
Kempston Pro 5000	0234-856633	13.50	Ball on joystick and two large fire buttons
Frel Quickshot II+2	0584-4894	13.95	Standard Quickshot with two independent fire buttons. (Oct'84)
CGL Boss	01-508-5600	15.99	Popular American stick. Heavy duty
Kempston Formula I	0234-856633	16.95	Micro switches. Recommended (June'85)
Consumer Electronic Joysensor	061-682-2339	19.95	Uses membrane touch pad. Difficult to get used to
Cookridge Sureshot Supreme	0532-670625	19.95	Fitted with QL plug. Good action. Recommended
CGL Bat Handle	01-508-5600	27.99	Two fire buttons and leaf switches
Cheetah RAT	01-833-4909	29.95	Infra-red remote control with interface (Nov'84)
CGL Super Three Way	01-508-5600	29.99	Two fire buttons and leaf switches. Interchangeable sticks

JOYSTICK INTERFACES

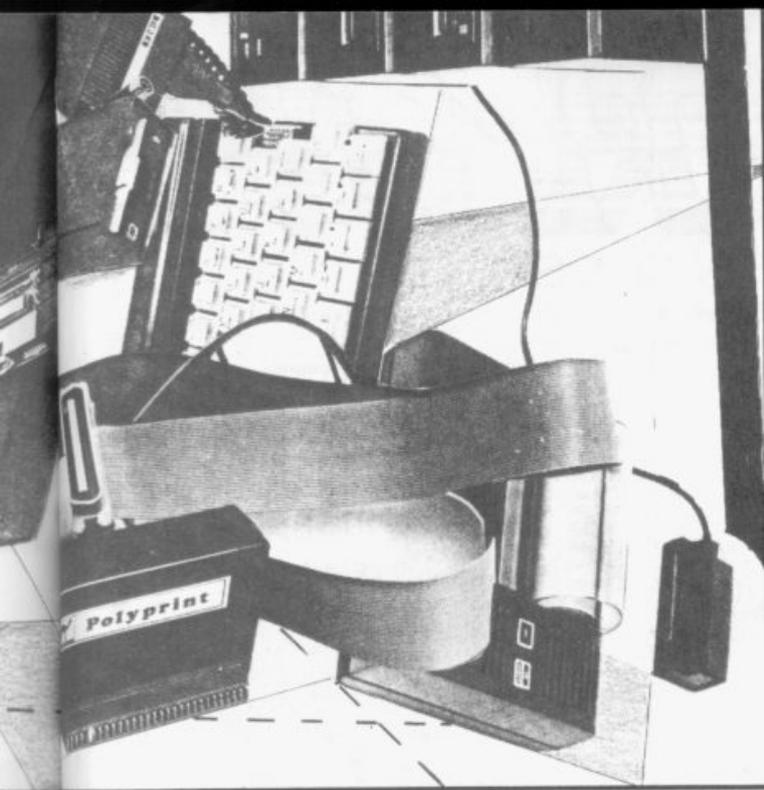

Product	Contact	Price	Comment
CLPS	0930-52204	4.95	QL adaptor for standard joystick. (May '85)
Miracle Systems	0272-603871 x210	4.99	QL adaptor for standard joystick
Bud Pilot	0670-856616	9.95	Kempston compatible. Power-on LED. (June '85)
DK'tronics	0799-26350	9.95	Kempston compatible
Kempston	0234-856633	9.95	Kempston compatible
AGF Protocol 1	0243-823337	10.95	Cursor. Reset switch
AGF Protocol 2	0234-823337	10.95	Kempston compatible. Reset switch
Cheetah Spectrum Interface	01-833-4909	11.50	Dead ended. (£12.75 with extender). Kempston compatible
Bud Interstate 31	0670-856616	11.95	Kempston compatible. Reset, rapid fire
DK'tronics Games Player	0799-26350	12.95	Kempston compatible. Freeze, slow motion
DK'tronics Dual Port	0799-26350	13.00	Sinclair and Kempston compatible. (Mar '85)
Sinclair Interface 2	0276-65311	14.95	Two sockets and ROM slot. (Dec '83)
Datel Games Ace	0782-273815	17.95	Kempston compatible. Auto fire, Beep amp
Kempston Pro	0234-856633	18.95	Kempston, cursor and Sinclair compatible. ROM slot. (June '85)

AGF Protocol 3	0243-823337	19.95	Programmable with reset switch
Bud Interstate Pro	0670-856616	19.95	Programmable
Frel Comcon	0584-4894	19.95	Programmable. Two independent fire buttons. (Oct '84)
Kempston Score Board	0234-856633	19.95	Large console and joystick
Nidd Valley	0423-864488	19.95	Programmable. Two independent fire buttons
Datel Turbo Ace	0782-273815	22.95	Cursor, Sinclair and Kempston. Beep amp
DK'tronics RAM Turbo	0799-26350	22.95	Tape programmable
RAM Turbo	02514-5858	22.95	Two sockets. Cursor, Sinclair and Kempston compatible with ROM slot. Full rear connector. (Sept '84)
Downsway Rainbow	03727-27222	23.95	Programmable
AGF Protocol 4	0993-5432	24.00	Programmable. Move stick and push button to program. (June '84)
AGF Protocol 4	0243-823337	24.95	Programmable with reset switch. Also Kempston compatible and autofire. (Jan '85)
Stonechip Page	0252-318260	24.95	Programmable
Page	0705-407908	26.00	Programmable. Move stick and push button to program. Rapidfire. (Sep '84)
Fox Programmable	0493-732420	28.95	Program held in battery-backed RAM. Easy to use. Very good value. (Feb '84)

PRINTERS

Product	Contact	Price	Comment
Dean Alphacom 32	0344-885661	54.95	Thermal. Direct replacement for ZX Printer. (Annual '85)
Epson P40	01-902-8892	109.00	Thermal dot matrix. RS232. Poor quality

Seikosha GP50S	0442-60155	138.00	Plain paper dot matrix. Direct replacement for ZX Printer. (Annual'85)
Tandy CGP 1154	0922-648181	149.95	Serial. Uses four colour pens. Slow. (Annual'85)
Brother HR5	061-330-6531	159.95	Centronics or RS232. Thermal dot matrix. Battery-mains. Best of the cheap printers

Brother M1009	061-330-6531	199.95	Centronics and RS232, dot matrix. Good features, slow. Target price £187.45
Statacom Sakata SCP800	01-661-2266	207.00	Plotter using Tandy four colour pen system. Cheap
Smith-Corona Fastext 80	01-900-1222	224.25	Poor RX80 imitator. (March'85)
Olivetti JP101	01-785-6666	228.00	Ink jet. Quiet but blurred print. (Annual'85)
Seikosha 100	0442-60155	228.00	Centronics dot matrix. Noisy with poor print
Microline µ80	0753-72331	229.00	Budget printer without a budget price. (Annual'85)
Shinwa CPA80	0932-242777	229.00	Centronics dot matrix. RX80 imitator
Smith-Corona TP1	01-900-1222	235.00	RS232 daisy wheel. Target price £217.35
Brother EP44	061-330-6531	253.00	Thermal portable typewriter with RS232. Good print but slow
Seikosha 250	0442-60155	270.00	Centronics dot matrix. Noisy with poor print
Epson RX80	01-902-8892	286.00	Standard by which other low cost printers measure themselves. Target price £212.75. (Annual'85)
Mannesman Tally MT80	0734-788711	299.00	Good looks, few features. (Annual'85)
Daisy Step 2000	0932-242777	332.00	Centronics daisywheel. Good value at target price of £258.75
Kaga KP810	0442-60155	366.85	Centronics dot matrix. Many features including NLQ and 3K buffer. Target price of £282.90
Canon PW1080A	0279-26777	367.00	Centronics dot matrix. Very fast with many features, NLQ, 2K buffer and programmable characters. Target price £286.35. (Annual'85)
Dyneer DW16	0753-72331	378.00	Daisywheel. Can accept Epson and Diablo codes. (Annual'85)
Silver Reed EXP500	0734-752273	378.35	Daisywheel. Reasonable speed. Target price £326.60
Brother HR15	061-330-6531	445.00	RS232 daisywheel. Includes 3K buffer. Target price £401.85
Epson FX80	01-902-8892	503.70	Dot matrix. Many features, programmable characters, proportional spacing and 2K buffer. Target price £361.10

Euroelectronics ZX Lprint III	0684-292448	34.95	Centronics and RS232. Cable £9.95 extra. Eprom software. (June'84)

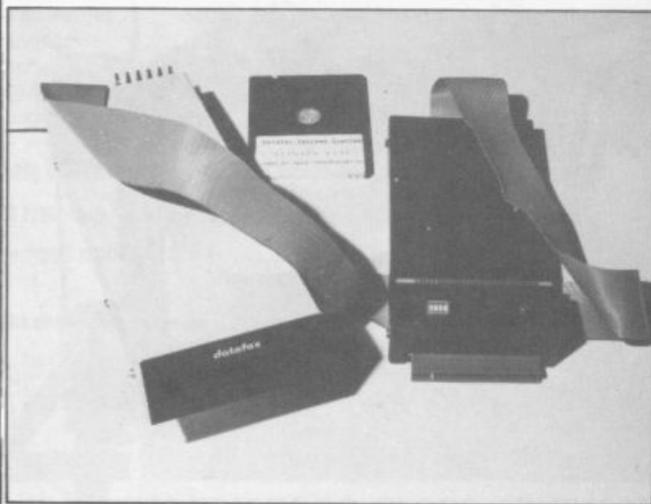

Camel Print-SP	0223-314814	34.94	Centronics. Includes cable. Tape software. (Jan'85)
Tasman	0532-438301	39.90	Centronics. Includes cable. Tape software. Compatible with commercial software. Copy to many printers
DK'tronics Centronics	0799-26350	39.95	Centronics. Includes cable. Tape software. Expensive. Limited Copy. (Mar'85)
Kempston E	0234-856633	39.95	Centronics. Includes cable. Eprom software. Good features. (Mar'84)
Camel PolyPrint	0223-314814	51.69	Centronics. Includes cables. Eprom software and seven international character sets in ROM to screen or printer plus Tasword 2 setting
Miracle Systems QL	0272-603871 x210	29.95	RS232 to Centronics. First and least expensive. Adaptor, £5.00, for use on Spectrum. (Aug'84)
Downsway QL	03727-27222	31.95	RS232 to Centronics. 9600 and 19200 baud. Switchable. (May'85)

Care Electronics	0923-777155	49.95	RS232 to Centronics. QL. Switchable 75-9600 baud
Technology Research	0784-63547	49.95	RS232 to Centronics. QL. (April'85)
CST Q-Pi	0223-323302	49.99	QL. Centronics — lets you use PAR in place of SER. Good value

SPECTRUM FAST STORAGE

Product	Contact	Price	Comment
Eprom Services Cartridge System	0532-667183	34.95	Uses Eproms for storage. Microdrive-type commands. Programs can be made to auto-run on power up
EMS	0733-75025	65.00	(£199 with drive) old Primordial Peripherals stock
Statacom	01-661-2266	75.00	(£240 with drive). Uses top 8K of memory. Cheap. (Feb'85)
LMT	01-367-0035	79.95	Includes Centronics port
Rotronics Wafadrive	0494-452757	99.95	Includes two tape drives, RS232 and Centronics ports plus software. Slow but has edge on microdrive. (Dec'84)
Servicon Dynamics Quickdisc	0594-542021	99.95	Includes RS423 and RGB. Uses 2.8in disc. Slow but good
Sinclair Research Microdrive	0276-685311	99.95	Includes tape drive, RS232 and network plus software. Slow. (Dec'84)
Technology Research Beta	0784-63547	109.25	Very popular, uses little memory. Now with proper filing system and format in ROM. Recommended. (Jan'85)
Watford SPDOS	0923-40588	125.35	Technically very good system. Includes software. Good value. (Jan'85)
Servicon Dynamics	0594-542021	149.44	(£264.38 with 3in drive). Expensive

Gordon Microframe	0292-280467	149.50	Includes motherboard system. Expensive as just a disc interface but good if you want extra cards
Timex	01-340-0310	199.00	Includes 3in drive, RS232 port. Poor manual but good system. CP/M upgrade. (April'85)
Opus Discovery	0737-65080	199.95	Includes 3½in drive, Centronics and joystick ports. Uses microdrive commands — commercial software on disc. Recommended. (May'85)

QL FAST STORAGE

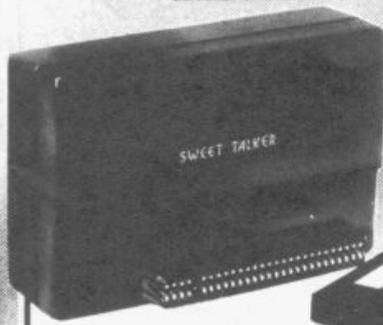

Product	Contact	Price	Comment
Micro Peripherals	0256-473232	113.85	(£194 with 3½in drive). Toolkit on disc. Good value. (June'85)
Silicon Express	0533-374917	113.85	(£249 with 80 track, double sided 5¼in drive), includes Toolkit
Computamate Q-Disk	0782-811711	149.00	Made by CST. The first available, now seems over priced. Includes Toolkit. (April'85)
Medic	0256-460748	249.95	Includes drive and Centronics port
Quest	04215-66488		CP/M 68K system
Cumana	0483-503121	TBA	Based on OS9 operating system, due to have a host of extras
Technology Research	0784-63547	TBA	Will include Centronics interface and RAM

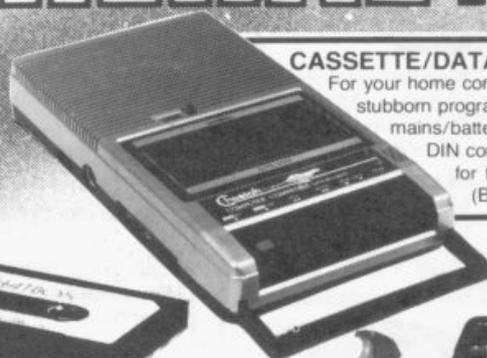

KEYBOARDS

Product	Contact	Price	Comment
Sinclair Research Spectrum Plus kit	0276-685311	20.00	(£30.00 if fitted by Sinclair). Has to be a bargain at the price. (June'85)
Kelwood K-Board	0709-63242	28.05	Unimpressive, unprofessional. (Oct'84)

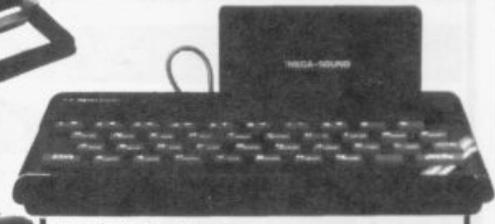

PERIPHERAL POWER

CHEETAH "SWEET TALKER"
Based on an allophone system, program any word or phrase, providing unlimited speech. Now make your Spectrum talk. Compatible with Interface I & II and Spectrum + **£24.95**

CASSETTE/DATA RECORDER
For your home computer, will allow easy loading of even the most stubborn program. Features include single key record, mains/battery, accepts standard computer leads and 5 pin DIN connector. Also provides exceptional audio quality for fine listening. (Batteries not included) **£24.95**

MEGASOUND
For 48K Spectrum and ZX Spectrum +. Achieve amazing sound capabilities that your Spectrum has been lacking. Just plugs into the user port at the rear of your computer and amplifies sound through your T.V. **£10.95**

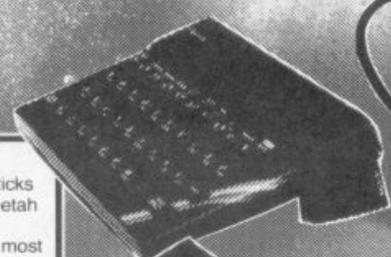

32K RAMPACK
Upgrade your 16K ZX Spectrum now! The Cheetah 32K Rampack simply plugs into the user port at the rear of your computer and increases the memory instantly. **£39.95**

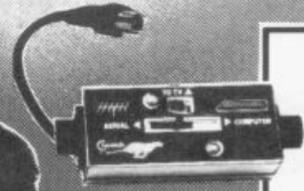

SPECTRUM JOYSTICK INTERFACE
Simply plugs into the user port at the rear of the computer and accepts any Atari style joystick including Quickshot and Kempston. Comes without rear edge connector at **£11.50**
or with connector which allows other peripherals to be stacked up at **£12.75**

56 WAY EXTENSION CONNECTOR
Cheetah's 6' long extension cable enables Spectrum periph... to be distanced from your computer ... **£7.95**

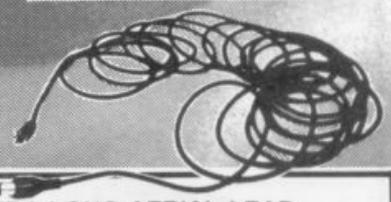

R.A.T.
Conventional joysticks are dead! The Cheetah Remote Action Transmitter is the most sophisticated computer controller available! Infra red transmission - so there are no leads trailing across the living room. Touch control, extremely fast, can be used with Cheetah RAT/ Kempston compatible software. Complete with receiver/ interface. **£29.95**

AERIAL SPLITTER
Cheetah's neat splitter unit complete with self adhesive pad allows you to keep your T.V. and computer aerial leads plugged in without disturbing the picture **£2.25**

HI-STAK FEET
These instantly applied stick on feet for your ZX 81, Spectrum, New Brain, VIC, TRS etc. tilt the computer and make your keys easier to see and more enjoyable to use, allowing smoother programming. **£2.99**

EXTRA LONG AERIAL LEAD
Over 15' long. Our super lead will allow you to sit back away from your T.V. and enable you to play games in the comfort of your armchair. **£1.50**

All Cheetah Peripherals have rear edge connectors for compatibility with all Sinclair accessories.

Prices include VAT, postage & packing.
Delivery normally 14 days.
Export orders at no extra cost.
Dealer enquiries welcome.
Cheetah, products available from branches of
John Menzies **WHSMITH** **Rumbelows**
WOOLWORTH Spectrum dealers
and all good computer stores.

“Destined to become one of the all time classic games” *SINCLAIR USER*

“An absolute joy” *ZZAP! 64*

“A must for adventure enthusiasts” *PERSONAL COMPUTER WORLD*

“Truly original” *CRASH*

After reviews like that, what more can we say?

“I think the best thing to say about this game is BUY IT!” *ZZAP! 64*

Frederick Forsyth's THE FOURTH PROTOCOL — THE GAME is available on cassette for the Spectrum and CBM64 at £12.95 and on disk for the CBM64 at £15.95. Published by Century Communications, a division of Century Hutchinson Ltd. Brookmount House, 62-65 Chandos Place, London WC2N 4NW
