YOUR COMPUTER

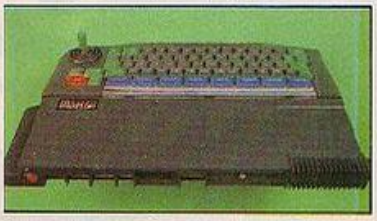
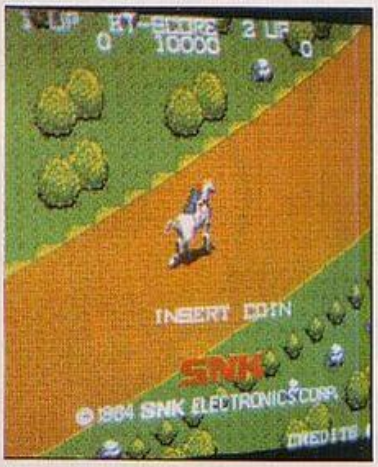
Contents

FEBRUARY 1985

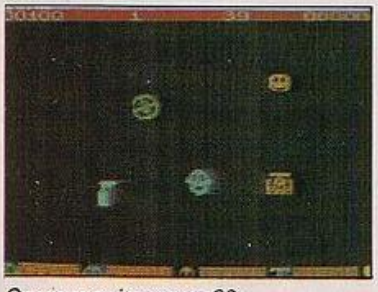
Software shortlist: page 35.



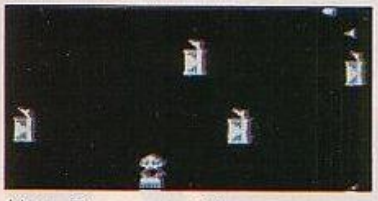
Enterprise review: page 46.



Arcades: page 54.



Spraymania: page 62.



Hero Zero: page 81.

22 LETTERS AND EDITORIAL: In mourning for the good old Vic-20, a ZX-81 fan writes and the "best" micro scores.

24 NEWS: Sinclair's electric tricycle, Atari's XE and ST computers with Infinity software and CBM 128 details.

27 FIRST BYTES: Hello to modems and hi to high-level languages.

31 COMPUTER CLUB: Paul Bond does some Saving with the GLC.

33 HARDWARE HITLIST: Hard-hitting hands-on experience of the new hardware. This month we look at the Opus disc drive and AMX mouse.

35 SOFTWARE SHORTLIST: From the Castle of Terror through the Dungeons of Ba to the Witch's Cauldron. Recent releases in the Gothic vein.

43 QUEST CORNER: Hugo North and his latest adventures.

45 COMPETITION: Win a Sinclair supertrike and ditch the skateboard.

46 ENTERPRISE 64: Lee Paddon tries out the sound chip named Dave and the video chip named Nick and votes it an Enterprise of great pith and moment.

50 WORDS: John Dawson Views and Scribes.

53 COMPETITION RESULTS: Who won a million bytes?

54 ARCADE KINGS: The pinball wizards are banished. Meirion Jones trips through Arcadia to see what new ideas the big games companies have created.

56 ZX-81 PINBAT: Just in case you're nostalgic for the pinball wizards, Colin Hogg and Dave Rogers have regenerated one in silicon.

61 VIC GUNFIGHT: Get off your horse and drink your milk. The outlaws are out to get you but don't kill any innocent bystanders. Game by James Sullivan.

62 SPECTRUM SPRAYMANIA: Computerised spray test simulators can check that anti-pest sprays kill the right thing. Julian Wood's game is based on this.

67 CBM 64 MARS BUGGY: Vahid Azodi gets you out of your rut with a rough ride across the Red Planet. Raster interrupt-driven smooth scrolling.

73 AMSTRAD CPC-464 — GET THINGS MOVING: You can use the Amstrad's INK command to produce animation on-screen. Simon James shows you how.

81 HERO ZERO: You are assailed by everything from dustbins to icecreams while collecting cargo. A useful disassembler is included in Jonathan Richard's game

86 BBC HOLDUP: Grab the bags of swag and drag them to the getaway car. Barry Wakelin adds new dimensions to the meaning of computer crime.

88 AMSTRAD DEATH RACE: C J Leigh's jaywalking simulation reveals a lot about the Amstrad. Add extra commands to your Basic lateral scrolling.

93 TELSOFT: How to download our games from the phone.

95 SPECTRUM SYNSOUNDS: Tim Closs soothes the savage breast.

99 COMMODORE 64 COMPOSER: Full control of the amplitude envelope, and the pitch envelope. Compulsion doth in music lie, says Philip Goward.

103 TAPE TO MICRODRIVE: Blocks of machine code from tape to Microdrive can overwrite part of the Microdrive Map or Channel. Colin Carruthers' solution.

107 ZX-81 GIANT TEXT: Franf Zym's program for the 16K ZX-81 and has three different character sizes.

111 BBC SUPERFILE: B A Naylor's computerised filing cabinet.

117 QL TUTOR: Phil Holliday continues his course.

123 RESPONSE FRAME: Tim Hartnell advises readers.

125 SOFTWARE FILE: Programs for all manner of home micros.

135 THE INDEX: *Your Computer's* alphabetical database.

154 DATEBASE: Paul Bond rounds up micro happenings.

REWRITE HISTORY THIS WEEKEND!

All action strategy games from SSI- -the world's No.1 war game company

At last here is your chance to see how you shape up as a General in a real battle! The pages of history record the triumphs and failures as Eisenhower, Montgomery, Rommel and Von Rundstedt battled in Europe and North Africa. But with a clear thinking strategist like yourself in command perhaps the historians would have had a different story to write!

U.S. Gold is proud to present four of the best strategy games by Strategic Simulations Incorporated:

KNIGHTS OF THE DESERT pitches the British Forces of Montgomery against the might of Rommel and his Panzer Divisions in the classic North African campaign of 1941.

BATTLE FOR NORMANDY commences on 'D-Day' June 6th 1944 and relives the Allied Forces attempt to smash Hitler's Atlantic Wall.

TIGERS IN THE SNOW reconstructs the legendary Battle of the Bulge as in December 1944 the Panzer Divisions of Von Rundstedt try one last gamble in a desperate attempt to halt Eisenhower's advancing Allied lines.

Who will be the victor and who the vanquished?

Only you have the answers!

And if you're looking for strategy with arcade action then **COMBAT LEADER** will test all your wits, depth of thought and reflexes in this toughest of battle challenges!

747 Flight Simulator

from DACC — The Simulation specialists

©Actual screen photograph (BEC version)

Unrivalled and unbeatable for accuracy and realism — the DACC 747 Flight Simulator is the most successful of its kind on home computers. The only simulator which shows all the essential flight and engine instrumentation of the Jumbo Jet, as they really are — real dials — and with a precise 3D view of the runway. The control and response of the 747 are faithfully reproduced using genuine aero-cynamics formulae. Start options include take-off, random landing approach, passenger and fuel load selection, etc. You control the throttles, elevators, ailerons, flaps, spoilers, landing gear, brakes, reverse thrust, etc. Joysticks are optional on all but Dragon and Tandy versions.

Cassette £9.95 (inc. VAT and P&P)

Spectrum version £7.95 (inc. VAT and P&P)

DON'T VAT THE PRESS

There are strong reasons to believe the Chancellor of the Exchequer is planning to impose VAT on your magazine.
Such a move would turn the clock back 130 years — the last tax on newspapers and journals was repealed in 1855. Since then 'No tax on knowledge' has been a principle agreed by all Governments, even in the darkest days of war.
A free Press is a tax-free Press.
No Government should be given the power to impose financial pressure on a Press it may not like.
Tell your MP to say 'NO' to any tax on reading.

Issued by the Periodical Publishers Association, London

Affordable and reliable printers from Micro P give you more Quality CPS for your money

Even in today's high tech world, for most of us, the written word is still the least expensive means of sending and receiving information. If you own a microcomputer the chances are that sooner or later later you are probably going to need a printer.

Micro P – CPP40

A low cost 4 colour 40/80 column printer/plotter capable of printing text or graphics on plain paper. The CCP40 is an ideal companion for small and portable micro's, as it is fitted with re-chargeable batteries – perfect for beginners.

Micro P –SHINWA CPA80

With 100 cps quality printing, the CPA80 probably gives more cps/£ than any other printer available today. The CPA80 is packed with features you would normally find on a more expensive printer. With an optional RS232 version available (even for the QL), this Epson compatible printer will hook up to a most any micro.

See them at your local dealer today!

Micro P – MP165

Looking for a matrix printer as well as a daisywheel? Well, the MP165 combines all the attributes of these two technologies to give a matrix printer capable of printing at up to 165 cps, as well as providing crisp Near Letter Quality, (NLQ) print at 75 cps. Features include a 2k buffer as well as both friction and tractor feed, as standard. Ideally suited to most popular micro's, the MP165 is now available in a new RS232 QL compatible version.

AMSTRAD BBC CBM64 SPECTRUM MEMOTECH NASCOM ATARI

"You really can't go wrong with any Level 9 game as they are all brilliant." *Crash Micro Sept 84*

RETURN TO EDEN

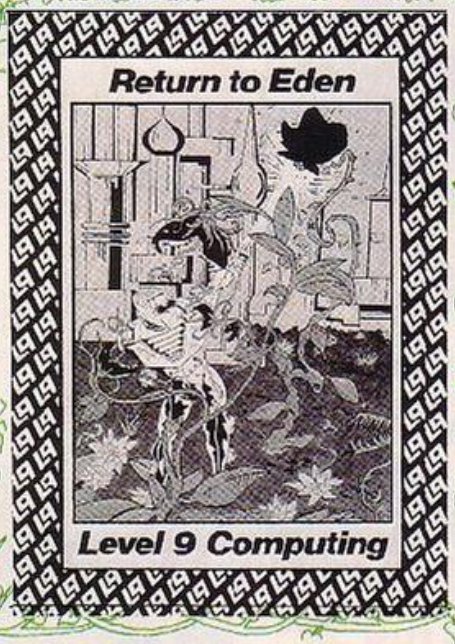
Level 9's first amazing full-colour graphical adventure.

Return to Eden is the long-awaited sequel to Level 9's top-selling Snowball adventure, set on the weirdest planet ever. Now it's here with 240 locations, masses of puns and puzzles and with hundreds of pictures in the AMSTRAD, CBM 64 and Spectrum versions.

"Whichever machine you own, if you have the vaguest tendency towards adventure playing then you must try one of these games (unfortunately you'll probably end up wanting to buy the lot."
– Computing Today, Aug 84

"The Level 9 Adventures are superbly designed and programmed, the content first rate. The implementation of Colossal Cave (Adventure) is nothing short of brilliant; rush out and buy it. While you're at it, buy their others, too. Simply smashing!" *– Your 64, June 84*

"Level 9 – arguably the producers of the best adventure games in the UK – have done it again. Lords of Time is a sparkling addition to its stable of winners."
– Acorn User, July 84



"One of the best adventure games I have ever had the pleasure to get my hands on. I can recommend Dungeon Adventure without the slightest fear of being contradicted. This is a massive sojourn into the unknown."
– Memopad, Oct 84

"The Saga of Erik the Viking . . . a remarkable Adventure game. It carries all the hallmarks of a Level 9 Adventure – problem, text display and size of map – with graphics of a standard I have not yet seen before in an Adventure."
– Computer & Video Games, Oct 84

"I thoroughly recommend these Adventures, they are excellent value for money. No self-respecting Adventure-addict should be without them. I believe Level 9 are producing a series of Adventures which should be regarded as classics." *– Page 6, July 84*

Available from the HMV Shop and good computer stores everywhere. If your local dealer doesn't stock Level 9 adventures yet, use the coupon to buy them from us, or ask him to contact: Centresoft, Microdealer UK, Lightning, Leisuresoft, R&R, Lime Tree, PCS (SW), MCD, Wonderbridge etc.

20th CENTURY FOX

TAKE A TEST FROM THE RANGE

So now you have got your home computer, you're ready to talk to Cumana – the best name in memory. Already a market leader throughout Europe for their range of disc drives, Cumana now have other products on offer, all to the same exacting standards that have made their disc drives the number one choice in the home and in education.

The Touch Pad

The Touch Pad is a low-cost graphic plotting aid for the BBC micro. This compact display cursor moving device simplifies programming with the touch of the stylus.

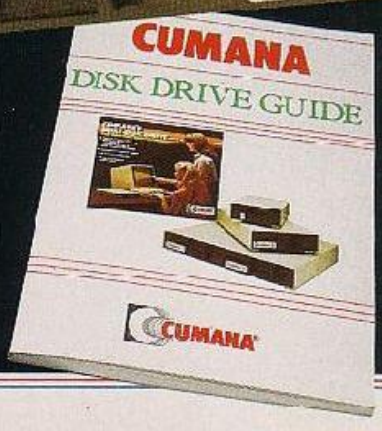
The product comes complete with an instruction booklet, basic software, stylus and connecting cable. Its uses are in graphics, computer aided design, education and games.

£69.95
including VAT.

BE SAFE NOT SORRY

Cumana's CS range of single disk drives have been subjected to the strict safety demands of the BEAB.
They have now been awarded BS415 approval, so if you value safety do not trust it to anything less than Cumana.
Cumana's dual range of disk drives have also been submitted for approval.

THE MARK OF SAFETY



Disc Drives

Cumana have spent years on research, development and marketing a range of drives second to none. Their drives are compatible with BBC, Spectrum, Dragon, Oric, Tandy Models I, III and 4 and Video Genie. They are fully guaranteed for 12 months and approved for electrical safety by the D.M.E.E. and are extensively used in GLC and I.E.A establishments. Cumana were the first independent disc drive supplier and are now Europe's market leader. Their products have been proven in the schools, universities and homes throughout Europe. Let us drive you in the right direction, send now for further details of the Cumana range, or see them at our distributors and at selected branches of W.H. Smith, Lasky's, Greens, Currys, and Spectrum UK.

DRIVE CUMANA

The Acorn Electron Computer
A microcomputer with a proven track record. Using BBC Basic, the Electron was deve oped out of the Micro that has been chosen for over 80% of schools participating in the Government's current Micros In Schools project. It connects into almost any TV set and cassette player and is supplied with a comprehensive User Guide which runs through, in a simple to follow manner, the basic principles of programming. A wide range of software is available, including games, educational packages and home accounts.

Cumana price
£199.00

Disk interface now available for the Acorn Electron, details from Cumana.

Cumana BBC Microcomputer compatible disk drives: retail price list.

Cumana disk drives supplied with formatting diskette, drive connecting cable and Cumana user guide. Independent power supply, mains lead and moulded plug included.

CS100 40 Track single sided (100K)	£159.95
CS200D 40 Track double sided (200K)	£203.95
CS200 80 Track single sided (200K)	£192.95
CS400 80 Track double sided (400K)	£219.95
CD200 2 x 40 Track single sided (200K)	£284.95
CD400D 2 x 40 Track double sided (400K)	£381.95
CD400/S 2 x 80 Track single sided (400K)	£359.95
CD800/S 2 x 80 Track double sided (800K)	£414.95

Cumana disk drives with independent power supply, mains lead and plug. Excluding other accessories.

CS100E 40 Track single sided (100K)	£149.95
CS200ED 40 Track double sided (200K)	£192.95
CS200E 80 Track single sided (200K)	£180.95
CS400E 80 Track double sided (400K)	£208.95

Cumana disk drives supplied with formatting diskette and Cumana user guide. Power supply taken from BBC Microcomputer, with lead supplied.

CSX100D 40 Track single sided (100K)	£119.95
CSX200D 40 Track double sided (200K)	£165.95
CSX200 80 Track single sided (200K)	£159.95
CSX400 80 Track Double sided (400K)	£189.95
3½ INCH DRIVES	
CSX351 40 Track single sided (100K)	£139.95
CSX354 80 Track double sided (400K)	£199.95
CDX352 2 x 40 Track single sided (200K)	£256.95
CDX358 2 x 80 Double sided (800K)	£383.95

The 'X' range takes its power from your microcomputer.

CS351 40 Track single sided (100K)	£169.95
CS354 80 Track double sided (400K)	£229.95
CD352 Dual 40 Track single sided (200K)	£299.95
CD358 Dual 80 Track double sided (800K)	£429.95

The 'CS' range comes complete with power supply.

DISTRIBUTORS/RETAIL

Available from the following retail outlets: W.H. Smith, John Lewis Partnership, Greens Leisure, Laskys, Spectrum UK.

Area distributors:
Addons Ltd. (Southampton) 0703 34775/6, Audio & Computer Centre (Jersey) 0534-74000, Eltec (Bradford) 0274-722512, South Wales Peripherals 0633-841760, HCCS Associates (Gateshead) 0632-821924 Hugh Symons (Bournemouth) 0202-26535, J. + National Dealer Network

Diskettes
Only when Cumana found a double density diskette up to their stringent quality control requirements, and at a price that made sense to the end user, were Cumana ready to put their name to it.

The result was a top quality diskette, complete with a plastic protective case for the ten-pack (they are also sold in two-packs!) together with index stickers.

Cumana diskettes are available now in both 5¼ inch and 3½ inch as single or double-sided, 40 or 80 track, from your local computer dealer. Don't trust it to chance, go for the best name on record.

All Prices Inclusive of VAT.
All 80 Track 5¼" Drives are Switchable to 40 Track Mode

Ask an expert why the Electron's the best micro in its class.

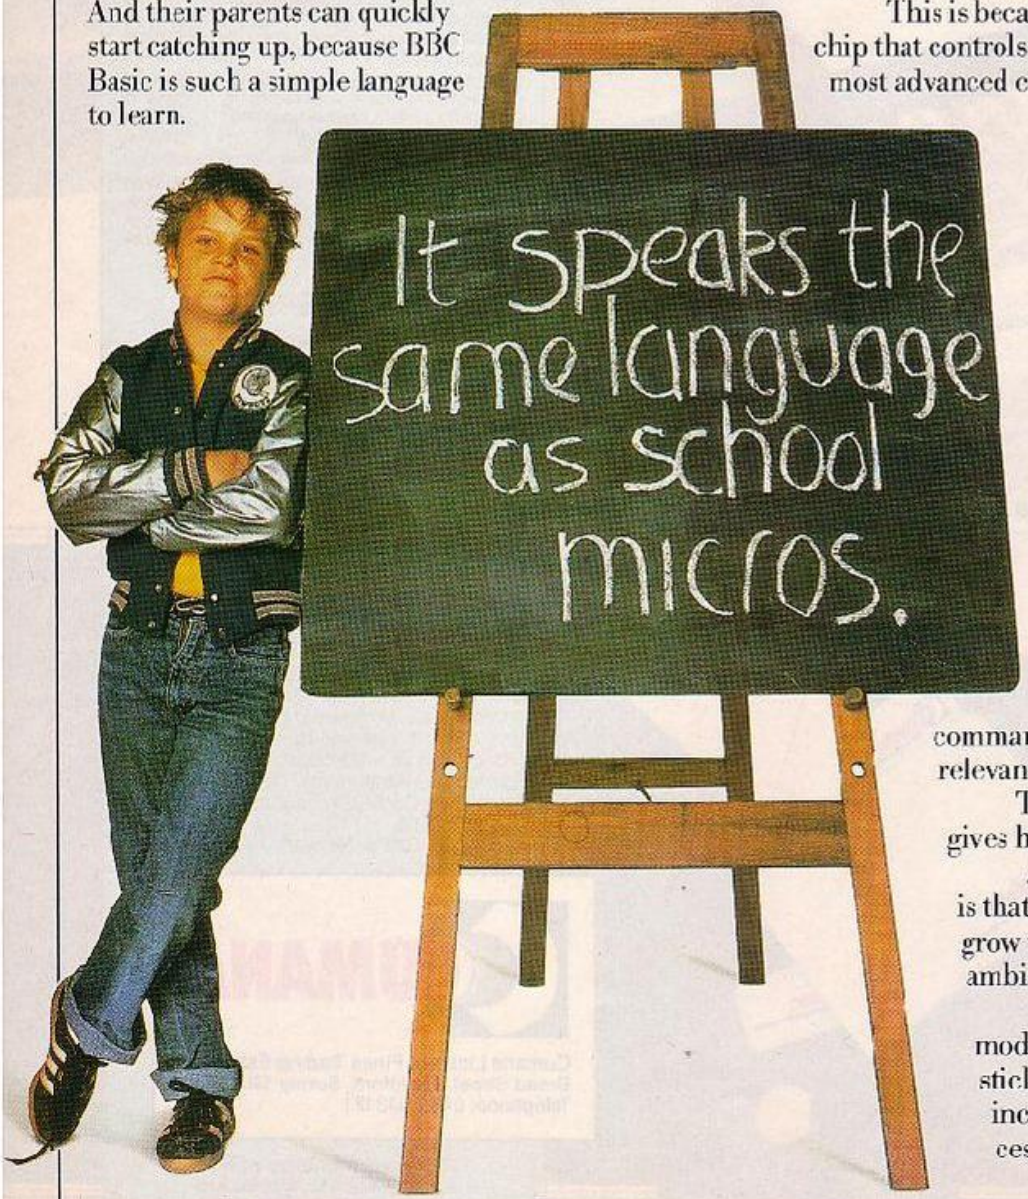
Most schoolchildren will tell you that one computer prevails in British classrooms today. Acorn's BBC Micro.

With a hint of pride, they'll also tell you that they're fluent in the computer language which Acorn developed for the BBC Micro. It's called BBC Basic.

And if you ask their advice on choosing a home computer for around £200, they're likely to tell you that there's really only one sensible choice.

The £199 Acorn Electron.

Like its £399 stablemate, but unlike any other micro, the Electron speaks BBC Basic. Which means that children can easily carry on with their computer studies at home. And their parents can quickly start catching up, because BBC Basic is such a simple language to learn.



However, language isn't the only thing which makes the Electron outstanding among every other micro in its price range.

A powerful choice.

The Electron is a 64K microcomputer which has 32K of RAM, combined with another 32K ROM.

This simply means that it has more power than most people ever need from a home computer.

Nevertheless, it has been designed to help you make the fullest use of its power.

For example, its graphics have the highest resolution of any home computer bar none.

This is because Acorn specially designed the chip that controls the graphics. And it's among the most advanced chips of its kind.

Indeed, it delivers twice as many characters across the screen as the Electron's nearest rival.

It expands into a system.

With the Electron, even total newcomers have been surprised at how quickly they can find their way into the complex world of computing.

Where many computers have keyboards which are confusing and clumsy to operate, it has a keyboard just like an ordinary electric typewriter's.

And for issuing main commands, there are single entry keys. Instead of literally spelling out the command, letter by letter, you just push the relevant key and it's issued.

There's also a built-in loudspeaker which gives high quality sound.

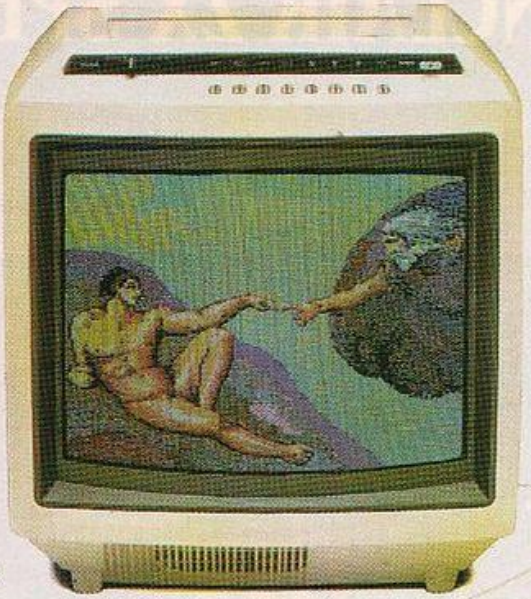
And what is perhaps most exciting is that the Electron has the capacity to grow with your knowledge and ambition.

With Acorn's Plus 1 expansion module, it can link up with a printer, joy sticks and fast-load cartridge software including View and Viewsheet word processing and spread sheet programs.

With the Plus 3 module, which will soon be available, you'll have a disc drive system and will be able to enjoy all the speed and convenience of 3.5 inch discs.

But let's not get carried away too quickly. You can start using and enjoying your Electron as soon as you get it home.

All you need is your television set and a cassette recorder.



The speed of a business micro.

Some home computers respond pretty slowly to your commands. After you've pressed the keys, they leave you twiddling your thumbs for more than a mere few seconds.

The plodders, however, are a very long way behind the Electron.

In fact, on processing speed, a recent bench test survey ranked the Electron up with such high fliers as the IBM PC and the Apple III. Both are machines which cost well over £1,000.

It's an astonishing accolade when the Electron makes no greater claim than to be a micro which is designed to become part of the family.

Your starter for free.

With your Electron, you'll receive a free introductory cassette.

It will give you a taste of the exceptional colour graphics. It will show you how the Electron can play and notate music.

And when it's given you some new ideas about home accounting, it will challenge you to a few games and even spend a few seconds doing your whole family's biorhythms for you.

But remember, although it holds 15 programs, the cassette will only give you a glimpse of the Electron's full potential.

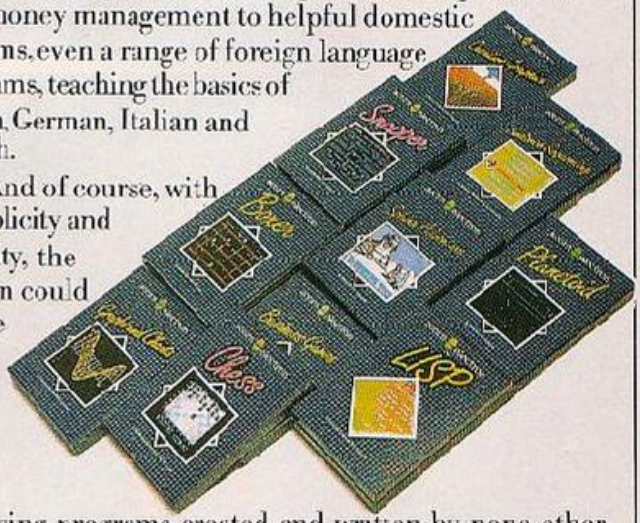
Because the potential is as infinite as your own imagination.

No shortage of software.

Although the Electron is still a relative newcomer to the market, the range of software available for it is considerable.

Besides plenty of games, there are many educational programs for children of all ages, from playschool to A Level.

There's a great deal to keep adults occupied, too. From money management to helpful domestic programs, even a range of foreign language programs, teaching the basics of French, German, Italian and Spanish.



And of course, with its simplicity and flexibility, the Electron could soon be processing programs created and written by none other than yourself.

You can find the Acorn Electron with its full complement of accessories and software at local Acorn dealers and major high street stores.

For the address of your nearest supplier, ring 0933 79300.

INDIANA JONES™

in the LOST KINGDOM™*

The artifact is just too tempting. Sure, no one has ever returned with it but they didn't have your brains and courage.
This treasure is worth any risk. An artifact containing the total history and knowledge of a lost, forgotten civilization! Just think what that could do for your career, for the university museum, and for your bank balance!
Of course, there is the small matter of finding it. The perils en route are sure to be the most fiendishly clever traps and puzzles you've ever faced. You'll need all your skill and daring just to survive.
Then there's the ancient curse . . . but what the heck; if it were easy, it wouldn't interest you, Dr. Jones – would it?

THE INCREDIBLE

Micro Speech Module

Speakeasy

JUST £29.95

AVAILABLE AT YOUR LOCAL Spectrum STORE

* *UNLIMITED VOCABULARY*
* *CLEAR AUDIBLE SPEECH*
* *COMPACT, STURDY & BUILT TO LAST*
* *USER FRIENDLY*
* *COMPREHENSIVE MANUAL INCLUDED*
* *SELF CONTAINED SPEAKER*
* *FULLY GUARANTEED FOR ONE YEAR*
* *POWERED FROM HOST COMPUTER*
* *VERSATILE! - the standard SPEAKEASY module can be programmed to speak in any language, for example ENGLISH, GERMAN, NORWEGIAN etc..... THE SCOPE OF THIS PRODUCT IS ONLY LIMITED BY YOUR IMAGINATION!*

* *COMPATIBLE with most popular micros. The standard module can be connected to virtually any computer via our large range of interface cables.*

INTERFACE CABLES CURRENTLY AVAILABLE		
**CBM 64*	**BBC*	**AMSTRAD CPC464*

A FANTASTIC NEW ADVENTURE GAME BASED ON THE POSSIBILITY OF A NUCLEAR WAR. WE'VE GIVEN YOU ALL THE INFORMATION YOU NEED. THE REST IS UP TO YOU. I WILL SURVIVE..... BUT WILL YOU?

ONLY £5.95 each

SPECTRUM
48k ADVENTURE GAME

OUT NOW!

SO YOU SURVIVED THE WAR..... CAN YOU NOW SURVIVE THE PEACE ?..... AGAINST THE BACKGROUND OF POST WORLD WAR THREE BRITAIN STRUGLE FOR SURVIVAL IN A NEW, STRANGE AND ALIEN ENVIRONMENT.

AZTEC SOFTWARE

AZTEC SOFTWARE LIMITED, 17A STATION ROAD, MIRFIELD, WEST YORKSHIRE. TELEPHONE (0924) 492826

Herbie Briggs has just destroyed the myth that all floppy discs are created equal.

They seem equal. Until you look at the seams.

That's where equality ends.

Most companies seal their discs with a spot here, a spot there. Leaving most of each seam not sealed at all.

Sooner or later, the seams might do what comes naturally: they bulge. Warp. Pucker. Open up.

Pens, pencils, fingernails—even a four-year-old's, like Herbie—can catch and snag in those wide open spaces.

That's sloppy. And dangerous. Because if you put a sloppy floppy into your disc drive, it can jam your drive. Ruin your drive head. Lose your data.

So much for their seams. Ours are different.

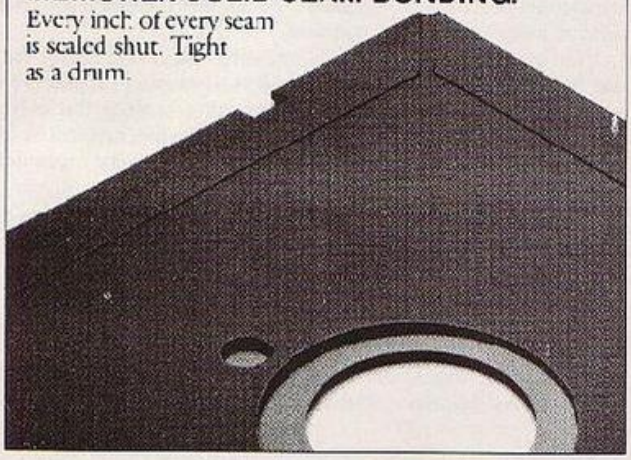
THE SLOPPY FLOPPY:
Sealed with a spot here, a spot there. Leaving unsealed seams everywhere.

Memorex uses a process we developed, called Solid-Seam Bonding.

Solid-Seam Bonding seals shut every inch of every seam of every Memorex® floppy disc. Tight as a drum. That makes the Memorex floppy stiffer. Stronger. And your data safer.

To resist bulging, warping, puckering, or opening up.

MEMOREX SOLID-SEAM BONDING:
Every inch of every seam is sealed shut. Tight as a drum.



To resist all the things that can jam your drive, ruin your drive head, or lose your data.

Which proves that a Memorex floppy disc isn't equal to all the others. It's better.

Solid-Seam Bonding is just one example of the extra care that goes into every Memorex floppy disc. Be it 8," 5¼" or the new 3½." Extra care that lets us guarantee every Memorex disc to be 100% error-free.

The next time you're buying a floppy disc—or a few hundred of them—just remember this:

It's always better to be safe than sloppy.

For more information on the full line of Memorex quality computer media products, including computer tape, call Memorex U.K. Ltd., 96-104 Church Street, Staines, Middlesex. Tel: 0784 51488

Your Data. When it matters, make it Memorex.™

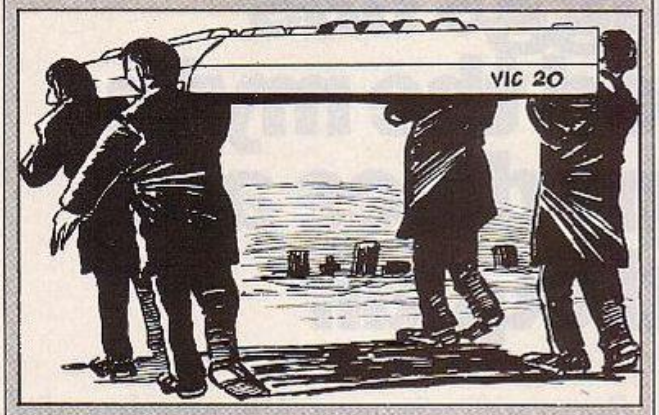
YOUR LETTERS

EPITAPH FOR ONE OF THE BEST



As a one-time owner of the Vic-20, I felt that I could not let this Grandaddy of computers be put to rest without, at least, a brief eulogy.

Since the Vic-20 was brought onto the market, a lot has changed in the world of computers. Its limited graphical and musical capabilities plus its minute memory did not give it much of a chance against today's 64K hi-res maestros.

Even so, the early days of Vic-computing will always be, for me, the "good old days". Those were the days when you struggled to fit a lot of program into a tiny bit of memory — a thing that every computer-programmer ought to have to do. The mega-memories of today's 64K elephants are asking for sloppy and wasteful programming.

I will never forget the hours I spent typing the latest Basic program from the pages of *Your Computer*, because there was nothing else available. Does anyone do this today? Back in the days of Vic, you spent nights poring over hand-assembled machine code. Compilers were things you dreamt of after your trusty Vic-20 had crashed for the fifth time.

Don't get me wrong, the computers of today are a lot better than the Vic-20 but, somehow, all the fun has gone out of computing, as I knew it.

The computers of today and their owners have a lot to thank the Vic for. I am sure that the passing of this Model T of the computer world will squeeze a tear or two from the eyes of many a computer enthusiast.

Matthew Longham,
West Germany.

GREAT SCORES!

Start with the flattery they said so . . . I avidly read your magazine each month among many other computer magazines and I certainly put it in the first two and I will leave you and the readers to guess what the other title is.

I read with scorn the vast scores claimed by computer gamesters, the thousands, hundred thousands and even millions look puny when viewed against the magnificent, astounding 3D, mighty, state of the art achievements that I have obtained. Just read this list and listen to the gasps of wonder from the readers . . .

In Raid over Moscow I have destroyed 10,234 stealth bombers and all of these inside the hanger which I have not managed to get out of yet. In Zaxxon 23,346 jets have hit the wall that scrolls toward you at the very start — I simply cannot find the first opening ever. On a flight simulator I have crashed 40,000 times at Gatwick and in Solo Flight I actually crashed my CBM-64 by going as high as possible and then diving into Kansas at full speed.

On Flight 737 I cannot even find the damn runway and wander aimlessly about all over the flaming airfield until I go off the edge. In Blue Max for some strange reason if you pull back on the stick you crash forward and by reversing the joystick I can now hit the tree at the end of the runway every time. At the Royal Birkdale golf I went round in 18,000 strokes over par and in International Football I lost 42 nil to the computer at level one.

I could go on for ever but I don't want to make other readers despondent about their own achievements. I just mention that in the Hoobit I have had 14,000 attempts to get the small door open in the very first scene and always end up jumping in the small chest which is always empty. Why do they make these games so easy???

R. Orlandini,
Seaview,
Isle of Wight.

NOT A SYNTH

In many articles and adverts the sound facilities on many computers are said to be the same as those found on synthesisers. This is not the case. In fact, on most computers you can define envelopes, pitches and the noise level, but they are missing a function which sound generators need to have to be called a synth: the ability to change the timbre or amount of harmonics — many harmonics = sharp sound, few harmonics = soft sound. It's usually a low-, high- or bandpass filter that's used to do this.

I'm saying this to warn people who are looking for a synth from making the mistake of buying what they think is a computer-based synthesiser, but which actualy is a computer-based sound generator — I've nearly done it myself: advertisers fault!

As far as I know the only machines which have a built-in synth are these: Yamaha CX5, Commodore 64 and Enterprise.

Johnny Brink,
Elsinore,
Denmark.

TELSOFT WORKS!

I have just tried two programs, Darts and DataCalc, since keying in Telsoft on Thursday evening. Both came over well — very few bad blocks and I'm very pleased with the results. Micronet is disastrous — I cannot get it to download with anything above a five per cent chance of success.

I have a Universal Modem Acapter which has enabled me to access Micronet and Viewfax in the past. Unfortunately, they have dropped ZX-81 software altogether. The problem with keying in your long machine-code programs is that it is all too possible to get them wrong. The checksum is no proof against getting values in the wrong sequence or overwriting another area of memory.

If you ignore the intricacies of 40 column display shifting etc to accommodate Prestel on a ZX-81 then your class of cownloader is ideal.

Anyway — you may be interested to know that Telsoft is fine on BBC B in Cheshire via an acoustic modem.

Ray Pearson,
Northwich,
Cheshire.

AMSTRAD DATA

I would like to clear up a few points about the Amstrad CPC-464, following information given in the January issue:

■ Pages 145-148: The Sprites article implies the 464 won't scroll its windows. It will scroll, both up and down, any of its text windows. The general form of the required code is:

```
DOWN  Locate n,l,l:print n, "cursor
      up"
UP    Locate n,l,m:print n, "Cursor
      down"
```

where n is the channel (window) number and m is the number of rows in that window.

If the whole-screen scrolling is required, the window 0 has not been altered from its start-up definition, then the following is all that is needed:

```
DOWN  Locate 1,1: print "Cursor
      Up" — or 2 "(Ctrl) E(Ctrl) K"
UP    Locate 1,25: Print "Cursor
      Down". Obviously this tech-
      nique does disrupt the
      cursor position.
```

■ Page 161: Symbol after 127 would allow re-definition of characters 127-255, not 128-255.

■ Page 173: The circle-drawing routine given in program 2 takes an unacceptably slow 12 seconds to draw one circle. The following takes less than 2½ seconds, and if Step 2 is

Table 1.

FUNCTION	(CHR$) CHARACTER	KEYBOARD	JOYSTICK	SCREEN
Beep (Bell)	7	CTRL G		R
CSR LEFT	8	CTRL H	LEFT	
CSR RIGHT	9	CTRL I	RIGHT	
CSR DOWN	10	CTRL J	DOWN	
CSR UP	11	CTRL K	UP	
CLEAR WINDOW	12	CTRL L		
RVS	24	CTRL X		X
CSR HOME	30	CTRL ^		

ZX-81 MICROS DESERVE BETTER

The survey conducted by Sharpey among Open University students, November 1984, *Your Computer* may have surprised a few people. The position of the BBC B and Spectrum as the most owned micros was to be expected, but the third place obtained by the ZX-81 ought to — though I very much doubt it will — make a few publishers and software manufacturers think again about so readily ignoring this pioneer of home computing.

That the machine is outdated I do not deny, but this is surely offset by the extremely low price at which it is now selling. Software and books for the ZX-81 have become extremely rare, while publishers of computer magazines seem to have forgotten that it ever existed.

There are, of course, some exceptions. Most notable are Software Farm, who are producing probably the best games ever seen on the ZX-81 and *Your Computer* whose listings are, in the main, superior to most commercial programs. So I appeal to publishers of books and software for the ZX-81. Please continue to publish, and please let us know that you are continuing to do so via advertisements.

S.P. Kaliszczak,
Lytham, Lancashire.

inserted after the For i% = 1 to 45, an acceptable circle is produced in just 1½ seconds.

```
10 MODE 1 : CLS : r% = 100 : x% = 320 : y% = 200: DFG: ORIG N x%, y%
20 FOR % = 1 to 45 : a% = r% * COS (i%) : b% = r% * SIN (i%) : PLOT a%,b% : PLOT – a%,b% : PLOT a% – b% PLOT – a% – b% : PLOT b%, a% : PLOT – b%, a% : PLOT b%, a%, PLOT – b% a% NEXT
```

■ Table 1 will help new users track cursor up/down control characters as the manual is not particularly helpful on this matter. They can all be used in the same style as CBM's cursor symbols:

■ The 464 manual fails to give an example of how to print a multicolour character. The following will print a wine glass, and characters high and outlined in black on a white background, filled with red wine, standing on a blue mat.

```
10 MODE 1 : INK 0,26 : INK 1,0 : INK 2,6 : INK 3,14 : PAPER 0 : BORDER 0 : CLS
20 SYMBOL after 200
30 SYMBOL 200,0,0,254,130,130, 130,130,68
40 SYMBOL 201,40,16,16,16,56,124
50 SYMBOL 202,0,0,0,0,0,124, 124,56
60 SYMBOL 203,16
70 SYMBOL 204,0,0,0,0,0,0,254
80 glass $ = CHR$ (200) + " ←"
90 wine $ = CHR$ (202) + " ←"
100 Mat $ = CHR$ (204)
110 PRINT CHR$ (22) + CHR$ (1) : REM turns on transparent mode
120 FOR x% = 1 to 37 STEP 4 : FOR y% = 1 to 21, STEP 4
130 LOCATE x%,y% : PEN 1 : PRINT glass$ " " : PEN 2: PRINT WINE $ "←" : PEN 3 : PRINT mat $ : NEXT : NEXT
140 PRINT CHR$ (22) + CHR$ (0) : REM reset to normal mode
150 PEN 1
```

■ Finally, new users will find useful the use of Ctrl and CSR keys to jump from one end to the other of a long line of Basic during editing. Also not mentioned directly in the manual is the possibility of re-executing a simple Basic instruction in a similar way to the CBM computers.

Cursor up to the line required, "wipe" across it with the copy key, over-typing any changes on the way, and press Enter. The command will be obeyed, without the need for re-typing it, or Copying it to a fresh screen line.

F Murfitt,
Crawley,
West Sussex.

CORRECTIONS

There is an error in the hex loader for the Spectrum game, Space Evaders, in the January issue. LET a = 0 at the end of line 70 should be deleted and re-inserted at line 65.

Before typing in the hex loader in January's Dragon program, Reversi, you need to reserve space for the machine code by typing PCLEAR 8.

More machine code was given than is necessary in the listing for CBM 64 Tiradians in January. When the hex loader asks you to input the start position, enter 3700 and ignore the code from 3680 to 36F8.

EDITORIAL

PRICE WAR – HUH! What is it good for? Absolutely nothing. That's what the computer manufacturers would have us believe, but when did the public ever lose out from cut-throat competition in the micro industry?

The last major price battles were fought in 1983 when Sinclair sparked a new conflict by pulling the Spectrum down to £130 and £100 from its original £175 and £125. Commodore answered swiftly with Vic-20 cuts and the whole campaign had fizzled out by that Christmas.

The result? — a lot of satisfied new customers and a body count of computer manufacturers featuring big names like Texas Instruments and Mattel, and several smaller ones such as Grundy and Jupiter Cantab.

All the signs are right for a new round of cuts this year, but this time Atari is the company leading the downward price charge. That may seem ironic — Atari was another of the once-powerful to fall victim in the 1983 wars. It lost $180 million in the last three months of 1983, and those financial wounds lay directly behind its sale to Jack Tramiel in the spring of last year.

Atari had hoped that the XL range of computers would lead to a return to better fortunes. In 1983 few would have expected that the £250 top-of-the-range 800XL would become Christmas 1984's bargain at £130 — and how there is talk of another cut to take the 800XL below £100.

Alone, that would hardly be enough to spell cheaper computers for everyone. But it is one of several movements which could add up to important changes in pricing this year.

How well computers sold at Christmas is the first key. Although the end-of-year boom couldn't be described as disastrous for companies like Sinclair, Commodore and Amstrad, it did arrive very late with all the activity concentrated in the last couple of weeks before the 25th.

That has resulted in larger warehouse stocks of unsold machines than expected.

Japanese dreams of an MSXmas failed to become reality, hit first by a lack of interest and then by the weak pound. Toshiba has already dropped its HX-10 to under £200 and the other MSX makers will be forced to follow suit to get their over-priced machines moving.

Even though Sinclair can outsell his competitors with the Spectrum even at its current price, he is well placed to make cuts if he has to. The profit margins in the Spectrum's prices are large enough for him to move them down a long way even if this time it isn't Sinclair who starts the war. The low chip count in Commodore machines will also permit them to rejig prices if they want to initiate the moves to get the market moving again.

It is an open secret that following the Electron principle Acorn is re-engineering the BBC Micro to reduce production costs and increase margins. That in turn could allow for price cuts. Late-comer Enterprise might also be obliged to look at a new price structure.

The final factor that hints at lower-cost computing is the number of new computers in the pipeline. Commodore as well as Atari have unveiled their latest products — see this month's news pages — and the Atari cuts already mentioned are clearly in preparation for the new machines. Commodore may also reposition the computers in its existing range by dropping prices and possibly machines.

How to write for *Your Computer*

We called this magazine *Your Computer* precisely because we welcome your views, tips and hints and even your criticism of machines and software in general. If you would like to see your name in print, whether on a Software File program or a full-blooded article, here is how to go about it. Ideally, all articles should be typed double-spaced on one side only of uniform sheets of paper. If listings can be dumped directly from a printer — you can always use a friend's or user group's — this minimises the risk of error. In a perfect world a cassette would accompany the article. That considerably speeds up the checking process. Not only do you get to air your own discoveries and opinions, but we will even pay you for the privilege. We pay £35 per published page — that's as it appears in the magazine and includes illustrations.

Why not give it a try? You have nothing to lose but your postage.

Knight on a white recharger saves British tricycle industry

SINCLAIR'S £400 ELECTRIC VEHICLE is more of a toy than the "ideal solution for all types of local journey" which the brochure claims although under current regulations anyone over 14 can drive the C5 electric tricycle on the road without insurance, tax or crash helmet.

The C5 looks a little like a small bobsleigh and going down the snow covered slopes of Alexandra Palace where it was launched it sometimes performed like one. However the 250 Watt electric motor which drives one of the back wheels proved incapable of powering the C5 up even the gentlest slopes without using pedal power. The tricycle soon started making a plaintive "Peep, Peep" noise signalling that the engine had overheated.

On the flat track inside the Alexander Pavilion the C5 showed how much fun a lightweight electric vehicle can be in a controlled environment. The three guiding principles of the Sinclair Vehicle Project as outlined by Managing Director Barry Wills are lightweight materials, good aerodynamics and traditional battery technology with an unconventional approach to design going back to first principles rather than adapting existing vehicles. "We don't take a standard car, van or bus" says Barry "and rip out the engine to replace it with batteries and electric motor."

The C5 is compromised by the need to sneak in under the quaintly named Electrically Assisted Pedal Cycle Regulations 1983. This lays down a maximum power of 250 Watts for the engine which gives the C5 a top speed of 15 mph on the level – less than most cyclists would manage.

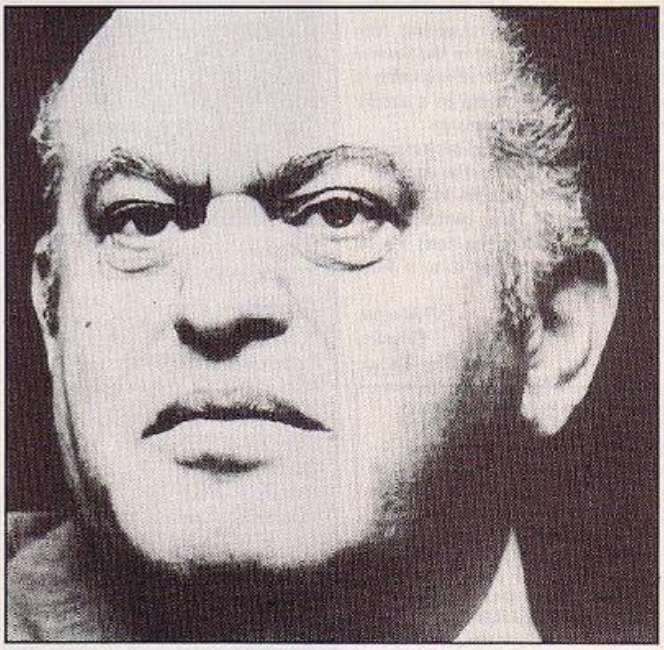
With one lead acid battery on board the tricycle has a range of 20 miles before it needs recharging but it can carry a spare battery which doubles its range without exceeding the 60 Kilogram weight layed down in the regulations.

Although the C5 is built by Hoover at Merthyr Tydfil in South Wales Sir Clive cast doubts on rumours that it is powered by a motor that would be more at home in a domestic appliance. He admitted that the company in Italy which builds the engine "does make washing machine motors "but added mysteriously that it "also makes torpedo motors".

Be that as it may a periscope would be handy if you intended driving the C5 on busy roads since your head is only at bonnet level. The steering is controlled by a crossbar under your thighs.

Tramiel stares into infinity as X13 and 5T rangers see the light

TRAMIEL WANTS more blood so the price of the 800XL is to be forced down yet again to £99 as part of a worldwide price war, and meanwhile in Las Vegas Atari's combative chairman showed the new Atari XE and ST ranges, outlined in *Your Computer* January, for the first time.



The XE is what Atari is calling the 8-bit range developed from the 800XL. The standard revamped 800XL will cost $120 in the United States with the 65 XEM music version incorporating a synthesiser at $160 and the 128K 130 XE at $200. The more expensive 65 XEP portable incorporates a 5 inch monochrome screen and 3.5 inch disc drive.

What really impressed visitors to the Atari stand at the Las Vegas Consumer Electronics Show was the software demonstrated on the new machines – especially a package called Infinity which incorporates windows, a friendly Help function and integrated spreadsheets, word processor and relational database.

Atari's new QL bashers based on the 68000 will start at $500 with the 130ST which has 128K, mouse, icons and all which begins to sound more like a Macintosh than a Sinclair, and goes up to $300 for the half-megabyte 520ST. Also scheduled are low priced 250K, and 500K drives with a 10 Megabyte hard disc coming too. Atari UK is saying nothing yet about when we can expect to see these machines this side of the Atlantic or what the prices will be.

Personal Assistant is undercover BBC B

ACORN HOPES to have the first of its ABC computers, based on a re engineered BBC-B in the shops by the end of the month.

The Personal Assistant as the bottom of the range model is called will be a packag of a new keyboard containing a slimmed down BBC and built-in View word processor and Viewsheet spreadsheet on rom together with a monochrome screen including a built-in disc dive drive. The price is likely to be less than £1,000.

The reduced chip count — Electron style — will also be used in the BBC which will be able to offer additional features or dramatically drop in price as a result. A tight-lipped Acorn spokesman would only say "that's one of the ways of making it cheaper to produce".

Price cuts for the BBC are coming anyhow after a bad Christmas for Acorn. The company admits that Electron sales were "not in the same league as Commocore or Sinclair."

QL helps out gardeners

PATRICIA AND TOBY Hodd want to turn the Sinclair QL from a home computer into a garden computer.

The Shrub Data Bank and Planner is designed to run alongside the Archive data base and it will then answer questions like "shrub, fragrancy, hardy" to describe what you want then "complete shade, moist" to describe the habitat it will have to survive in. Back will come the following suggestions "Elder, Privet, Skimmia, Winter Jasmine and Wisteria."

The Hodds are keen conservationists — with a history of wild life research in India who now live in Llangeitio Nurseries, Llangeithio, Tregaron, Dyfed, SY25 6QG which is where you should send your £12 if you want a copy of the program on Microdrive cartridges.

Schizoid Commodore shotgun blasts 64, 128 and CP/M targets

THEY CALL it "The Shotgun" — not because of the war with Atari but because the Commodore 128 hits three target audiences simultaneously.

First it is an important new machine in its own right with 128K RAM and yet another new, improved Basic 7.0. Second it can cut itself in half — the sawn-off shotgun — to run all Commodore 64 software — giving it an instant software base — and third it can run CP/M using a Z-80 processor in addition to its 6502 derived 8502 processor.

The 128 costs $250 and was officially launched at the January Consumer Electronics Show in Las Vegas, but with the exchange rate plummetting it is difficult to predict the British price when it arrives in the early summer. Commodore is also launching an IBM PC lookalike which may eventually come down to home computer prices and a portable called the LCD.

Match day for Amstrad

MATCH DAY from Ocean is likely to spread from the Spectrum to the Amstrad. Despite the problems of programming on the Spectrum Jon Ritman and Chris Clarke have produced a game which looks almost as good as International Soccer on the Commodore 64 as well as giving as good a game.

Ocean Producer Jon Woods claims that in some respects notably price — £7.95 it is better. Also "on the Commodore game players can walk through each other, on ours they can't."

Cambridge ain't big enough for both of us

SIR CLIVE'S much publicised Christmas punch up with Chris Curry of Acorn in the Baron of Beef pub in Cambridge is not the only example of an isolated occurrence in the computer industry.

The two multi-millionaires may have been unlucky to have been caught brawling in public after their respective companies end of year parties but similar feuds have been running elsewhere. According to one bruised Imagine refugee "Cambridge" is more mature and civilised" than most of the rest of the industry.

Up in the wild North-West Freeton which is supposed to be finishing the megagame Bandersnatch — another Imagine refugee — has been harassed by the arrival of a whole stream of unsolicited goods and services including a rubbish skip, 20 fire extinguishers 6 desks and a flood of junk mail.

Meanwhile Sinclair is supposed to have "made contact again" with "scum" as he called his ex-employee Chris Curry and the pair are supposed to be the best of friends again. The Fracas happened on the Friday before Christmas when Sir Clive lashed out with a furled copy of a magazine because he was angry about Acorn's "dishonest" advertising.

Traditionally Sinclair customers in a similar situation have just written to the Advertising Standards Authority to complain that the 28 days advertised has not been complied with — let's hope Sinclair has not set a precedent for more direct action by his customers.

Portable and powerful, Brotner's TC-600 is the next development from the EP-44 with more communications ability, more memory and a simple built-in word processor.

Range of programs available for MTX, BBC, Electron and Amstrad

Please order stating (1) Programs required; (2) Computer; (3) Amount enclosed; (4) Name & Address.
All prices include; packing & VAT. Overseas orders welcome.

I could do that...

The problem for December's competition was to write a program which played noughts and crosses. Still pursuing the theme of artificial intelligence, we also suggested that you might give the program the capacity to learn from its mistakes.

The winning program — for the BEC — came from S. O'Grady, 29 Linden Gardens, London W2. It does not include a learning facility but then it does not need to — the program never loses. Admittedly, managing to win or draw every time at noughts and crosses is not difficult.

We were impressed, however, by how short the program was. It uses the evaluation function described in David Levy's book, *Computer Gamesmanship*. This involves examining each possible move and counting the number of noughts or crosses in each horizontal, diagonal, and vertical row.

Line 230 then works out a score according to the formula: S = N3*128 − C2*63 + N2*31 − C1*15 + N1*7. N3 contains the number of rows of three noughts, C2 the number of rows of two crosses, and so on. The computer, which is playing noughts, makes the move with the best score.

If you do not have a BBC you should be able to convert the program fairly easily. MCD3 in line 50 gives the remainder when a number has by then divided

(continued on page 29)

BEGINNERS first bytes

Starting out in home computing? First Bytes is for you. Just write to *Your Computer* with any hardware or software problems, no matter how small or simple.

High-level languages

LAST MONTH'S First Bytes showed why operating systems are necessary: they handle all the boring housekeeping functions on a micro, and generally keep it ticking over. Thanks to them, the micro is your obedient slave, just waiting for your commands.

But to get your Spectrum or Commodore 64 to leap through hoops you need some way of telling it exactly what to do. This is where high-level languages come in.

They are called high-level because humans can understand them, more or less, and it is a well-known fact that we are higher beings. Low-level languages are things like machine code that only freaks who think in hexadecimal can cope with.

A high-level language is a computer language that uses a series of statements that look a bit like English, and whose rules — the "syntax" of the language — mirror those of everyday speech. In this way the whole business of programming becomes much more straightforward.

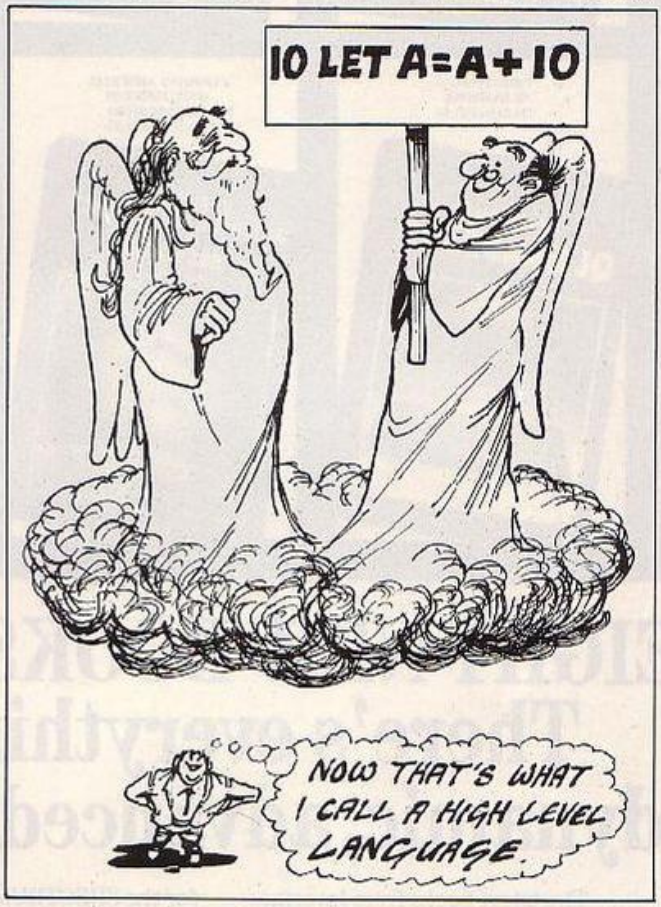
The most famous high-level language is of course Basic. Basic is so common that people tend to forget that it is only one of many ways of talking to your micro. Not only are there numerous other high-level languages, but also a whole range of progressively lower levels you can interact with a machine.

Basic stands for Beginner's All-purpose Symbolic Instruction Code, and was developed 20 years ago with the specific aim of creating a language that was reasonably close to English, and hence could be taught to beginners.

It uses simple words like If, Then, Do, Goto, together with the usual mathematical operators like + and . Each line of the program contains one or more sets of commands written using them. After a program has been written, it is then run.

The idea of running a program is something else we tend to take for granted, but is a key ingredient in developing advanced and powerful software.

Some high level languages, including Basic, allow you to enter a command which is obeyed immediately. This is fine for very simple calculations, but does not let you move on to more complicated problems.



In fact, programming languages do not always have this immediate mode of execution. For example Fortran, short for Formula Translation, can only run complete programs after they have been fully built up. In appearance its programs look very similar to ones written in Basic, which is hardly surprising since Basic was partly based on it.

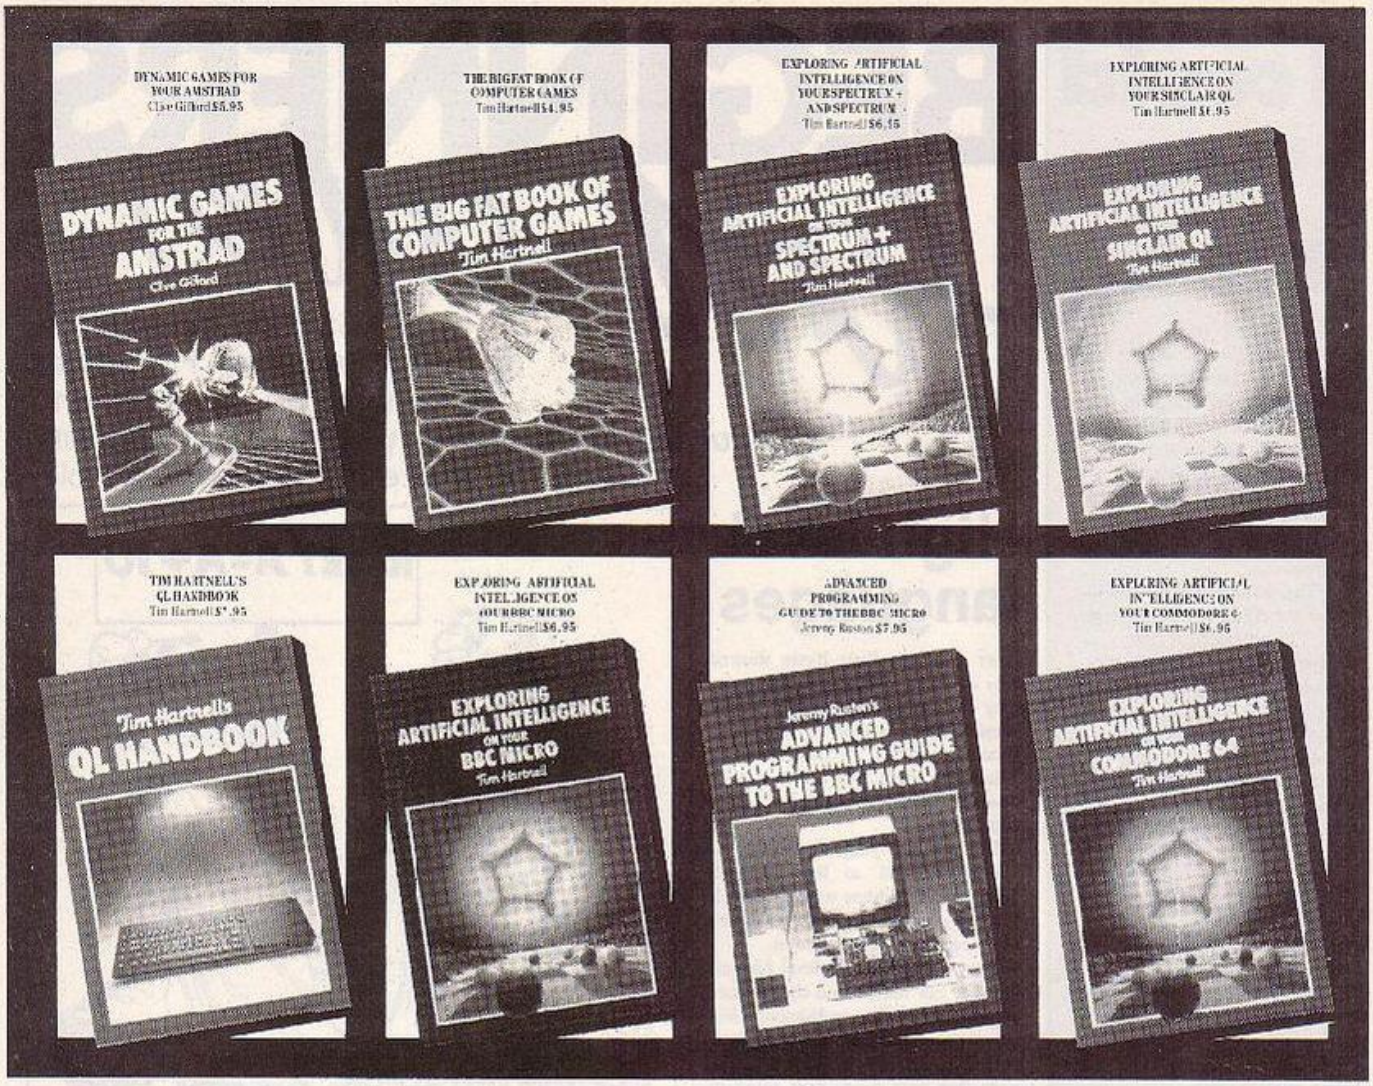
There are minor differences of syntax, but it is easy to move across if you know Basic. Fortran is used mainly for heavy number-crunching applications in science and engineering, and so is not often found on micros.

Another language in the Basic stable is Pascal, named after the French mathematician. It came about from trying to design a high-level language that would have all the advantages of Basic without some of its less desirable features. Advantages included that it was easy to learn and understand. Its less desirable features included the dreaded Basic Spaghetti Syndrome.

Anyone who has written Basic programs knows the temptation. When you find that your program does something unexpected, or has missed out a particular case, or needs modifying, you don't go away and write a whole new program. Instead you add a Goto or two.

This often works very well. Unfortunately it can leave the logic of your program as tangled as a plate of cold spaghetti — hence its name. This means that when you come to look at your program again in a few months' time, you cannot for the life of you work out how it is doing what.

(continued on page 29)



EIGHT NEW BOOKS FROM INTERFACE

There's everything you need to be dynamic, advanced, intelligent and fat!

The latest books from Interface Publications Ltd are determined to put new skills at your programming fingertips —

For instance:

If you're the dynamic type and you own an Amstrad, what could be better than our latest title "DYNAMIC GAMES FOR THE AMSTRAD"?

On the other hand, if your mind is far in advance of other earthlings . . . don't despair.

"ADVANCED PROGRAMMING GUIDE TO THE BBC MICRO" and "THE QL HANDBOOK" will stretch your imagination still further.

But where do you turn if your computer is giving you dumb answers? look at our "EXPLORING ARTIFICIAL INTELLIGENCE" series for the SPECTRUM – and SPECTRUM, the COMMODORE 64, SINCLAIR QL and BBC MICRO.

The mind will boggle!

We even have a new book for readers who think BIG.

It's called "THE BIG FAT BOOK OF COMPUTER GAMES" — for practically any micro.

All these new titles are written by the country's most respected computer authors . . . Tim Hartnell, Clive Gifford and Jeremy Ruston.

So don't despair if other books have left you feeling lethargic, jaded and hungry . . .

. . . go along to your local bookshop and let these eight new Interface books give you a "pick-me-up".

See them at all good bookshops or computer stores or write to:—

Interface Publications Ltd, (8YC)
9-11 Kensington High Street,
London W8 5NP.

BEGINNERS first bytes

(continued from page 27)

Pascal aims to stop this sloppy kind of programming. One of its tricks is not to have a Goto at all. Instead you must break up your program into neat and logical smaller units. Pascal is also very strict about saying what kind of variables you are working with — integer, real, and so on — and won't let you pluck them out of the air as in Basic.

All-in-all, Pascal is designed to encourage good clear programming habits in a high-level language. It is becoming available on an increasing number of home micros. So if you feel like a little discipline, it could be for you.

Another language that is beginning to appear is Forth. This was originally designed to control the movements of an astronomical telescope. It is still mainly used today for such control applications, especially things like robot arms.

Like Basic, Forth can respond immediately to a command or to built-up programs. One of its most powerful features is the ability to create new commands in the language as you go along. Whereas in Basic you are stuck with those that the designer thought fit to stick in, in Forth you use the fundamental commands to write new ones for your particular needs.

One slight disadvantage with the language is the way in which you write out mathematical operations. Because it was developed for specialist applications, the designer didn't worry too much about little oddities. One of these is the fact that you use what is called Reverse Polish Notation.

Effectively this means that all the numbers and functions are bunched together at one end of the line, and all the operators that act on them at the other. The way they interact together requires a certain amount of mental acrobatics.

If you wish to retain the ability to create your own functions and operators without having to sacrifice all the legibility of Basic, you could try something called APL.

This stands for simply A Programming Language. Like Fortran it has a strong mathematical bias to it, and it is very useful for writing one-line programs that carry out complex calculations very quickly.

One problem with most versions of APL is that they use a large set of extra signs that make an APL program look like Ancient Egyptian hieroglyphics. This also means that you really need a special keyboard too. Which is a bit of a joke when you consider that some micros like the Spectrum haven't even got an ordinary keyboard.

Happily a version has recently been launched for the QL that replaces all these symbols by simple words. The combination of the QL and APL creates one of the most powerful micro number engines around.

All the languages so far considered have been geared towards the processing of numbers. But another class of high-level languages is concerned with lists and rules.

These are languages that are beginning to produce significant progress in the trendy field of Artificial Intelligence. One that is available on several home micros is Lisp.

Its name comes from LISt Processing. It works by manipulating lists of things rather than simple numbers. Used properly, it can make deductions from associated lists of information. Another language that is used in this field is Prolog — Programming in Logic. A version called MicroProlog is just starting to come through, and offers the same possibilities of trying out programming in AI.

There are many other high-level languages in use today, and they are still being written. As home micros get more powerful and with bigger memories, so the range of options increases. Memory is an important factor because a language is just like any other program in that it needs space to store it in order to run it. For this reason many home computers put their Basics on a Rom chip. This saves valuable space, and allows the language to be used with the full Ram of the machine.

I could do that...

(continued from page 27)

by three; while DIV3 returns the number of times three divides into another number. X = 8 MOD3 could, for example, be replaced by X = 8 – 3*(INT(8/3). You may also need to replace the Proc statements by Gosubs.

For this month's competition the £15 prize will be awarded to the program with the most interesting bug or bugs. Quality is more important than quantity here: we are looking for those maddeningly elusive bugs that keep you up half the night. The program should not be more than 20 statements long, and should be accompanied by a note telling us what it is supposed to do.

Micros that can talk

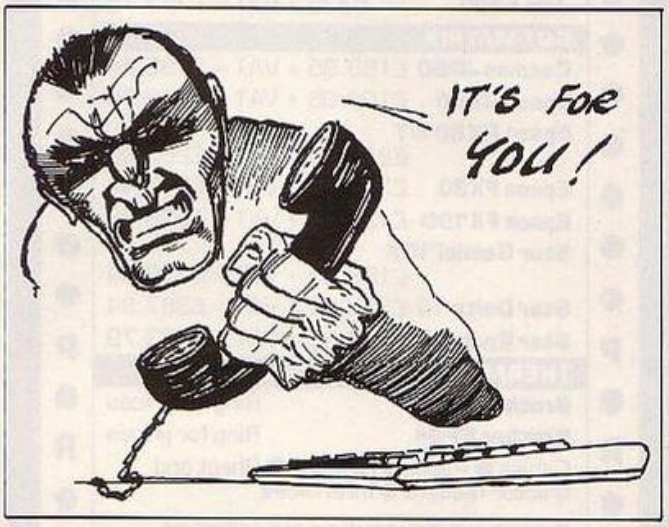
MICROS ARE pretty wonderful beasts, but they can be rather anti-social. After all, spending hours bent over a hot keyboard as your eyes go square from staring at the TV is hardly the best way of communicating with your fellow men and women. Yet potentially the micro could be the cause of a communication revolution.

Anyone who has used a mainframe computer at a university or in a big firm knows that much time is spent passing messages from terminal to terminal. Now wouldn't it be great if you could do that with your micros? All you need is a bit of wire to connect you up, except that really you would need bits of wire from you to everybody, and so would they.

Rather conveniently, this network of wires up and down the land already exists. It is called the telephone. All you have to do is to find some way of getting your computer to talk down it. The device used to do this is called a modem.

An obvious way is to convert the signals inside a micro into some kind of audible sound. The telephone can then carry this in the normal way. A modem incorporating something called an acoustic coupler is used for this purpose.

This translates the 0s and 1s that go to make up a computer program into two distinct frequencies. In this respect it is like Basicode described in October's First Bytes. These are then fed down an ordinary telephone headset by plugging it into special rubber sockets on the acoustic coupler. A similar acoustic coupler is used the other end to decode these two tones back into the machine readable binary digits.



Although simple in theory and fine in principle, there are one or two very obvious difficulties with this method. First, if the headset is disturbed while data is being sent there is very likely to be corruption of the audio bleeps and hence the information sent. Secondly, the whole system of using very fast changes of frequency — about 300 per second — is fraught with similar dangers.

Far safer is the direct connection modem. This allows you to plug your micro directly into the telephone system. After the modem has done some discreet preparation of programs to be sent, they can then be downloaded directly. This is both less likely to suffer from data corruption and potentially much faster.

There is the slight problem that British Telecom is understandably concerned about what you might shove down its precious telephone lines in this way. Direct connection modems are therefore subject to pretty exhaustive scrutiny by the British Approvals Board for Telecommunications.

It is illegal to connect a modem to the network that has not been approved. Approved models carry a round green sticker; models that are not approved must say so by carrying a triangular red sticker.

Naturally, approved modems cost more — the cheapest is about £100 against £50 for an unapproved model. But do not be tempted to cut corners. BT periodically tests telephone lines.

Besides, there is no real point. A few years ago, a modem would have cost several hundred pounds at the cheapest. Today, the £100 barrier is being breached all the time for most popular home micro models, and prices are still dropping. You can even get autodial modems for this sort of price. These are rather civilised devices that will even dial the number for you.

BETA BASIC 1.8

ENHANCED BASIC FOR SPECTRUM 48K
FOR GRAPHICS – STRUCTURED PROGRAMMING – DATA HANDLING

Release 1.8 is more powerful than ever! We don't have space to do this program justice – if you can't believe the ad, send us a large S.A.E. for further information.

Features: Commands are single-entry keywords in graphics mode. Syntax is checked on entry. Fully compatible with Spectrum Basic. Microdrive compatible. Comprehensive manual.
NOTE: Release 1.0 is still available for 16/48K Spectrum at £11.00.

ALTER screens colours (general or specific)
AUTO line numbering
BREAK out of code loops
CLOCK digital clock
CURSOR CONTROL CODES allow strings to have complex shapes
DEF KEY user definable keys
DELETE a block of lines
DO-LOOP structure
DPOKE double poke
EDIT specified line
ELSE used with IF ... THEN
EXIT from DO-LOOP
FILL enclosed area with specified ink or paper
GET waits for keypress
JOIN two program lines
KEYIN a string
KEYWORDS new keywords on/off
LIST/LLIST line ?) line
USED used with GOTO, GOSUB)
ON ERROR trap errors (with LINE, STAT and ERROR)
PLOT a string (may contain cursor control codes)
POKE a string
POP Basic's stack
PROC, DEF PROC, END PROC (for named procedures)
RENUM versatile renumber
ROLL all or part of screen in any direction by specified number of pixels, with or without attributes
SCROLL like ROLL, but without wrap round
SORT arrays very fast!
SPLIT program lines
TRACE program execution
UNTIL used with DO or LOOP
USING used with PRINT
WHILE used with DO or LOOP
XOS, YOS move PLOT origin
XRG, YRG change PLOT scale

FUNCTIONS

AND (bit-by-bit)
BIN# decimal to binary
CHAR$ number to 2 characters
CODE first colour
DEC hexadecimal to decimal
DPEEK double PEEK
FN, FN (dual use)
HEX$ decimal to hexadecimal
INSTRING string search
MEM free memory
MEMORY$ all of memory as a string
MOD modulus
NUMBER 2 characters to number
OR (bit-by-bit)
RNUM last RND
SCRN$ recognises user graphics
SINE fast sine
STRING$ repeats strings
TIME$ current time
USING$ formats numbers
XOR (bit-by-bit)

Only £11.00 inclusive! (Upgrade price for Release 1.0 owners is £4.00. This includes a 12-page supplement to your manual. Please quote date of purchase. If you did not purchase from us, state supplier and return original cassette.)

Please send me:
Beta Basic Release 1.8. Payment of £11.00 is enclosed.
(or £11.50 for foreign orders). Cheques payable to BETASOFT.

I don't believe it! Please send me full details of Beta Basic 1.8. I enclose a stamped addressed envelope.

It's easy to complain about advertisements. But which ones?

Every week millions of advertisements appear in print, on posters or in the cinema.

Most of them comply with the rules contained in the British Code of Advertising Practice.

But some of them break the rules and warrant your complaints.

If you're not sure about which ones they are, however, drop us a line and we'll send you an abridged copy of the Advertising Code.

Then, if an advertisement bothers you, you'll be justified in bothering us.

The Advertising Standards Authority.
If an advertisement is wrong, we're here to put it right.

ASA Ltd. Dept 2, Brook House, Torrington Place, London WC1E 7HN

This space is donated in the interests of high standards of advertising.

If you have anything of interest to tell us about your computer club why not contact us on 01-661 3144.

Local news

Irvine

You can make contact with the Irvine hackers via Ewan Dalton, 21 Berry Drive, Irvine, Ayrshire KA12 0LG or telephone 0294 7657. Membership costs £2.

Whitehaven

The West Cumbria User Group serves the Whitehaven and Workington area. Activities include open evenings, computer courses and working on various projects — including speech synthesis, digitising graphics and a lightpen. Ring P Majid on 0946-62732 or K Purkiss on 0946-66586.

Gravesend

The Gravesend Computer Club now hangs out at the Council Tenants Club, Whitehill Lane, Gravesend, Kent. They meet every Thursday evening. Contact The Club Secretary, 58 Apsledene, Hever Farm Estate, Singlewell, Gravesend, Kent DA12 5EE.

Colwyn

Colwyn Computer Club meets at the Greens Hotel, Colwyn Bay. Contact D Bevan, c/o Abergele Road, Colwyn Bay, Clwyd LL29 7PA.

COMPUTER club

Paul Bond takes a trip to the banks of the Thames to discover what the besieged GLC is doing micro-wise.

TO BE OR NOT to be? Shakespeare may not have had the Greater London Council in mind when he penned these immortal words — but there is inevitably an element of doubt whenever one writes about a body linked with the GLC, subject as it is to such a withering onslaught from the central government.

David Kimpton put it this way with regard to the GLC Computer Workshop, of which he is head: "No-one has tried to identify functions which should not continue". The functions are certainly many and varied. The famous Room 97 — it is now just called the Computer Workshop — provides a chance for people to try out various types of personal computer. It is occasionally booked by London-based computer clubs like the Association of London Computer Clubs, BASUG, and the Independent Commodore Products User Group (ICPUG) — but it also provides seminars and workshops for voluntary organisations, community groups, trades unions, co-operatives and professional associations.

The premises opened in February 1982, and Mr Kimpton's job was originally to look after information technology (IT — remember that?) and the GLC. They kicked off by sending out a survey via the London Voluntary Service Council which has a list of the 5,500 voluntary organisations in the capital. Since then they have built up equipment, expertise and increased staff resources to 10.

Organisations which have received help include Age Concern Greater London, British Sports Association for the Disabled, the National Jazz Centre, the London Union of Youth Clubs, and various Family Service Units. In the last six months they have held 98 seminars, advised over 100 individuals and dealt with over 200 delegates from disabled organisations. These include co-operatives like the Collective Design and Building Co-operative and the Half Moon Theatre.

Systems advised on include everything from dBase II on a Televideo — as used by the Mental Health Foundation to build up a directory of caring agencies — down to the less recherché BBC Micro used by FLAT (Facility for Living & Assessment Together). FLAT is a small registered charity set up to provide training in self-help skills for mentally handicapped people in the London Borough of Southwark. The BBC is used as an administrative tool for budgeting and cash-flow analysis, and providing training sheets — each FLAT trainee has a planned training schedule — and mail. It is envisaged that the computer will eventually become a training aid using basic educational games. A BBC with a database Rom is also being used by Unity 70, an organisation for handicapped children.

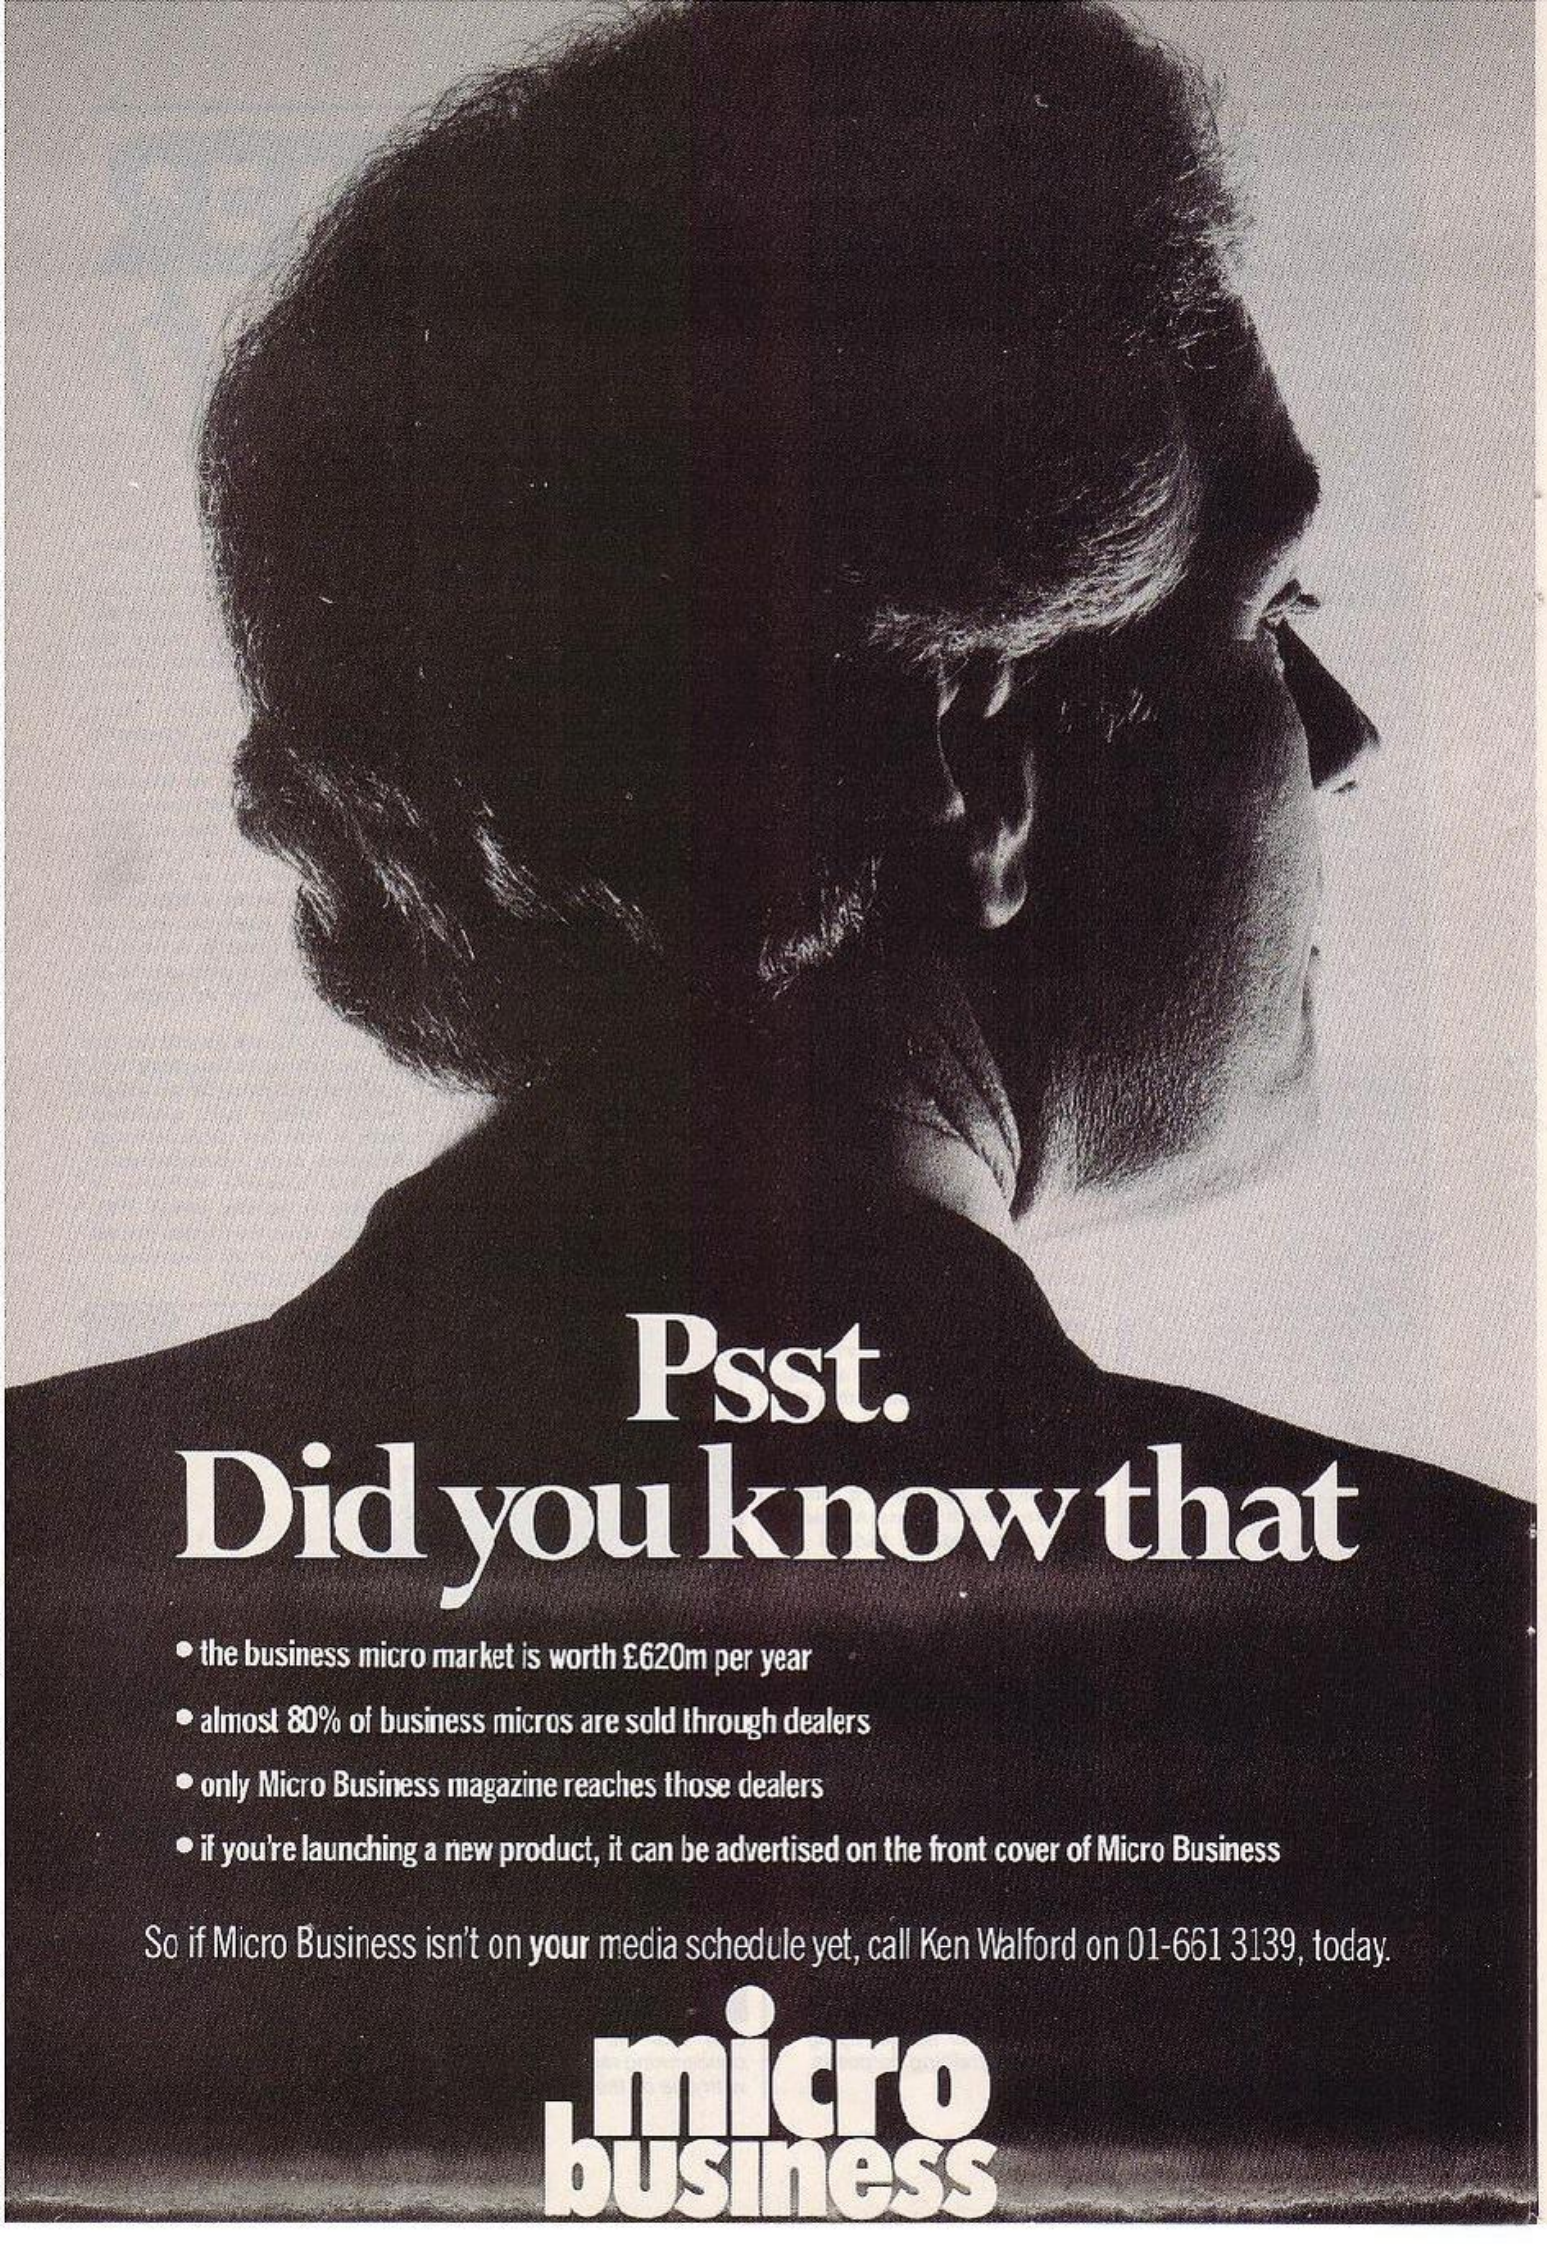
The GLC Computer Workshop doesn't just provide help for caring agencies — for example, some advice has been given to Fantasy Factory Video, a non-profit making organisation which is compiling a database list of all existing commercial and educational videotapes. The Workshop also maintains contact with groups like Microsister and Central London Women & Computing which provide resources for women using computers. The latter organisation can be contacted on 01-430 0112.

During the summer the Workshop developed a Braille word processor at considerably less cost than the £5,000 that existing specialised systems can cost. This was done by the simple expedient of placing a high-quality racing bicycle inner tube over the printer roller. Braille is all based on six dots arranged in pairs like the six on a dice-face. These are printed out by the full stop.

The GLC has put £30,000 into the London Festival of Computing held April 9-21, and hopes that this will go towards making more Londoners aware of what they can achieve with computers. More information about the GLC Computer Workshop is available by phoning 01-633 3592. Enquiries about the London Festival of Computing should be directed to BIPR on 01 734 2007.

Central London Women & Computing's Rachel Sanger using one of the six Apricots that CLWC have for training purposes. They are funded by the GLC.

Last year the GLC ran a competition for a computer game condemning racism. Here Ken Livingstone is seen zapping away with one of the winners.



Psst.
Did you know that
• the business micro market is worth £620m per year
• almost 80% of business micros are sold through dealers
• only Micro Business magazine reaches those dealers
• if you're launching a new product, it can be advertised on the front cover of Micro Business
So if Micro Business isn't on your media schedule yet, call Ken Walford on 01-661 3139, today.

HARDWARE hotlist

ADD-ON EXTRA

Opus

Disc System
Spectrum
£199.95

Opus have released a disc system for the Spectrum which they claim is totally compatible with the Microdrive operating system. This means that any program which runs on a Microdrive will run on an Opus system, at a much higher speed. The Spectrum sits on top of the metal interface and can be screwed into it, like Interface 1.

Apart from the Shugart disc socket there is a bi-directional centronics type printer port and a continuation of the expansion bus. The full range of Opus drives, three or 5¼ inch can be used. The system comes with a utility disc and a manual.

The manual is perhaps its only major failure as it rather assumes you know how to use a Microdrive. Still, you can always buy one of the many "drive your Microdrive" books. It represents excellent value at £199.95 for the complete system and is available from Opus on 01-701 8668 or from larger branches of Boots

Euromax

Joystick Interface
+4 and C16
£4.45

This is a useful add-on for C16 and +4 owners, giving them access to the huge range of Atari-type joysticks available. This includes Euromax's own range.

Interpress

Cassette Storage
£6.00

The Boneco Audio Cassette Safe can store up to 10 cassettes in a sliding draw. Several draws can be clipped together. The cassettes are stored vertically.

Euroelectronics

Printer Interface
Spectrum
£34.95 + cable

For those lucky enough to have one of the new colour printers, this interface allows full colour or four colour screen dumps.

AMX mouse

BBC
Advanced Memory Systems
£89.95

BY INTRODUCING paste-over windows, icons and, most importantly, a mouse, Apple's Macintosh almost allows you to bypass the keyboard as a means of operating the computer. When it appeared people predicted that it would only be a matter of time before the same features appeared on an 8-bit micro. Island Logic kicked off by using windows and icons in its excellent music program. And now Advanced Memory Systems has gone one better by adding a mouse to the BBC.

A sensitive joystick

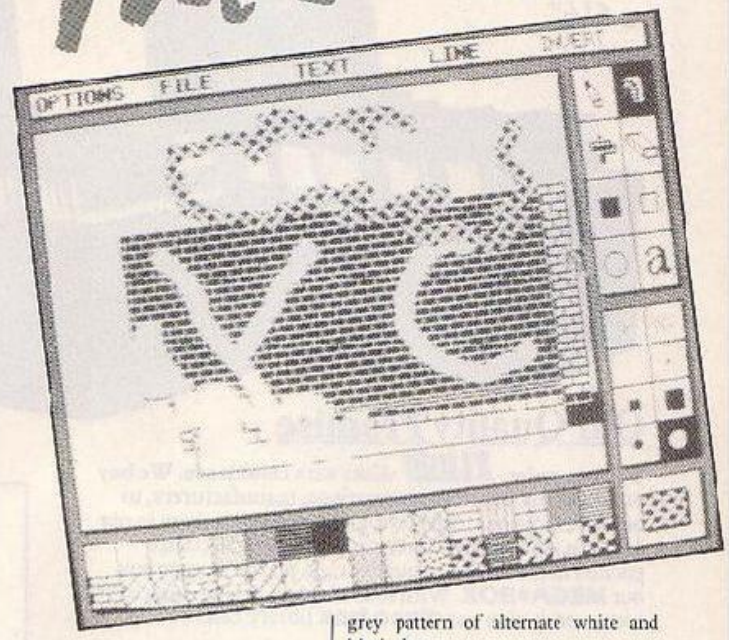
On its own the mouse is not much more than a very sensitive joystick or an upside down trackball, scaled down to fit snugly into the palm of the hand. It connects into the user port and needs a flat surface on which to roll around. What gives it its power is the accompanying software

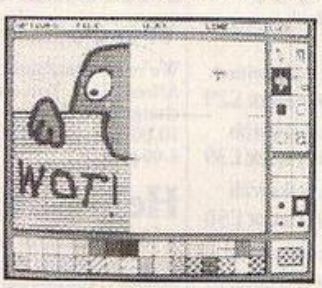
The AMX mouse comes with a Rom and several programs on cassette or disc. The Rom provides 15 commands which can be included in Basic or Assembly language programs. Together they allow you to use the mouse to control pointers, windows and icons.

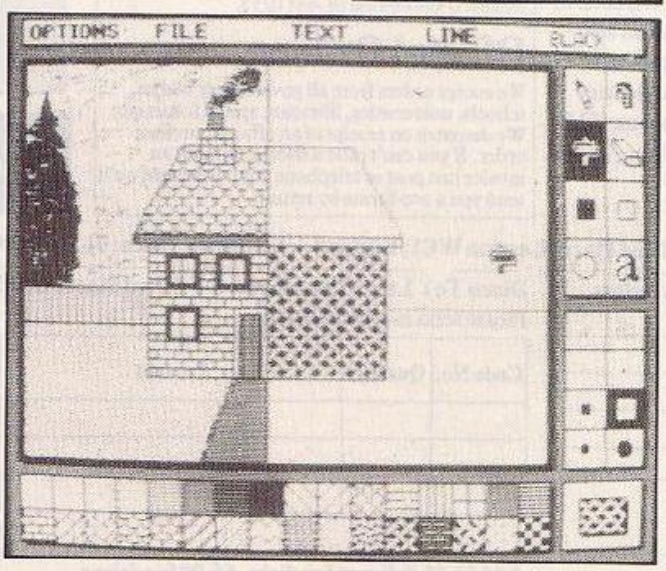
Icons are built in

Sixty four predefined icons, each made up of four characters, are built into the Rom. *Icon places the icon of your choice where you want it on the screen. Alternatively you can assign a particular icon to act as the mouse pointer. Then with the command *Movepointer you can use the mouse to move the icon around.

Among the other commands are *Window which draws a window with a border and *Button which defines the key codes generated by the three buttons at the front of the mouse. As the commands are only available in the BBC's high-res monochrome modes, 0 and 4, *Desk is handy since it clears the screen with a grey pattern of alternate white and black dots.







Just how effectively these routines work with the mouse is well demonstrated by the ArtworkX program. It is clearly modelled on the Apple's Macdraw program. Although it is not as powerful it must be one of the most impressive drawing programs yet to appear on a home micro.

To start off you are presented with a blank screen bordered by a number of boxes which show the options available. Eight icons at the right represent such facilities as a spray can, a pencil, a rubber, and a paint roller. If you want to use the spray can, you move the mouse pointer over the icon and highlight it by pressing a button.

Now you can choose a spray size and, from a range of 24 patterns, a spray texture or "colour". The mouse pointer changes into a spray can and by simply rolling the mouse around your desk top you can create the sort of effect favoured by subway graffitti artists.

A window pops up

When you highlight one of the headings along the top a window pops up giving a further range of options such as dumping the screen to a printer or including text in the picture. The mouse makes all these facilities exceptionally easy to use.

A standard reproach levelled against drawing programs is that they do not improve on pencil and paper. ArtworkX — in conjunction with the mouse — is one program that refutes this charge. Indeed this reviewer was hampered by requests to play with it from people who normally give computers a wide berth.

The original and still the leader in value.

MEGA•BOX measures 6¼" x 8¾" x 6½"

Our Quality Promise

You can order XLtron disks with confidence. We buy our disks in bulk from international manufacturers, to our specifications, then test, grade and retest them in our London laboratories. Every order of 25 or 50 comes packed in the same top quality rigid plastic storage box, our **MEGA•BOX**. With four dividers. Every order of 10 comes packed in our **disco·box** library case.

Fully Guaranteed

The XLtron quality control is so stringent that we can give our famous 'two for one' guarantee. If you find a faulty disk, return it to us, and we'll send you two in exchange immediately. All part of our five year guarantee.

Blue Max

CBM-64
£8.95
Shoot-'em-up
U.S. Gold

★ ★ ★

Blue Max flies again — but this time with Commodore markings. With its impressive graphics, this U.S. import first appeared in Britain for the Atari some 14 months ago. The screen display and sound are not as good as the Atari's.

You have to strafe and bomb ground targets — bridges, factories, boats, and artillery batteries — and shoot down enemy aircraft.

Although the setting is World War I, you are flying for the RAF at a time when only the RFC existed and are pitted against the Axis powers of the 1930s.

Yet those academic objections don't detract from what is a very good game.

New Cylon Attack

Spectrum 48K
£5.75
Shoot-'em-up
A'n'F Software

★ ★

In isometric perspective — 3-D to you, mate. This is what it says on the inlay, but I'm not convinced. No swopping through cosmos like Codename MAT.

You just stooge about left and right, up and down, peppering the oncoming hordes with laser bolts. Not very colourful, not very 3-D.

Zone 00

Spectrum 48K
Blow-'em-up
Allanson

★ ★

One of these games where you have to dodge around planting one bomb at a time to destroy your assailants. These include octopi chasing you round shipwrecks that look like Blue Peter badges, and later on yellow submarines and blue meanies.

QL Chess

- *Sinclair QL*
- *Psion/Sinclair*
- *Board game*
- *£19.95*

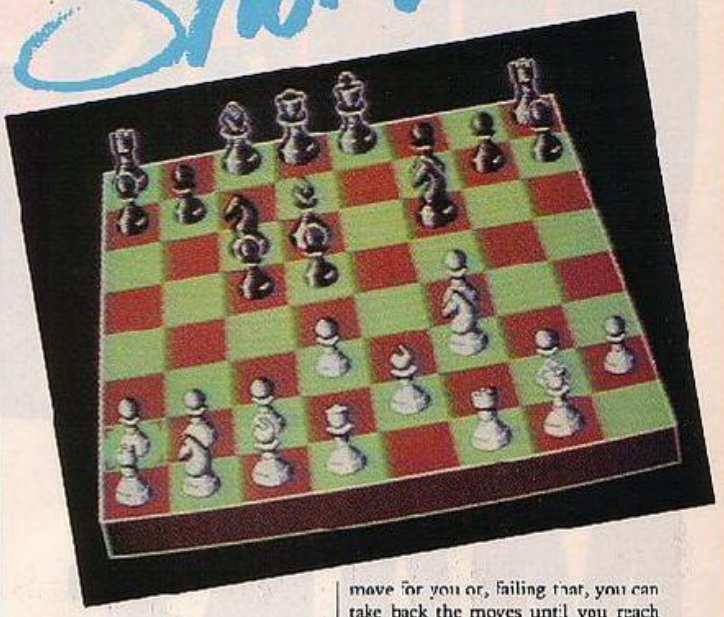
★ ★ ★ ★ ★

AS KARPOV AND Kasparov, toe to toe under a chessboard, were still slogging it out in what was to become the longest-ever world championship match, Psion was preparing its world-beating chess program for the commercial arena.

Although the Psion program was running on a 8MHz Sage computer when it tied for first place in the 1984 World Microcomputer Championship, its performance on the QL is still very impressive. Its strengths lie a lot deeper than the novelty of the program's three-dimensional graphics.

You should be able to find a level of play from one of 14 that will give you a good game. Those 14 levels can be doubled to 28 with the use of the Easy command — which puts the QL at the disadvantage of not being able to think about its move while you are thinking about yours.

If you really want an easy game, try the novice level 0. The computer will benignly play weakly whenever it looks like beating you. Of course that kind of help may not appeal, so the human can choose a response time from the QL, which can vary from a few seconds at the lower levels up to level 12's equal time — it averages out the time you are taking to move and then matches your pace.



For a game of correspondence chess length, level 13 gives the computer an infinite time to consider its move, and will only make up its mind when you force it to using the M, move now, key. Fans of chess puzzles will savour the Psion program's problem solving ability. It has eight levels.

When things are getting desperate you can ask the computer to suggest a move for you or, failing that, you can take back the moves until you reach the point where you blundered. If you actually manage to inflict a defeat on the silicon opposition you can call round friends and neighbours and bore them with a full-length action replay of your triumph.

But apart from playing a quality of chess never before seen on a home computer, what makes this program immediately attractive is the astonishingly high quality of its graphics.

Toby Wolpe

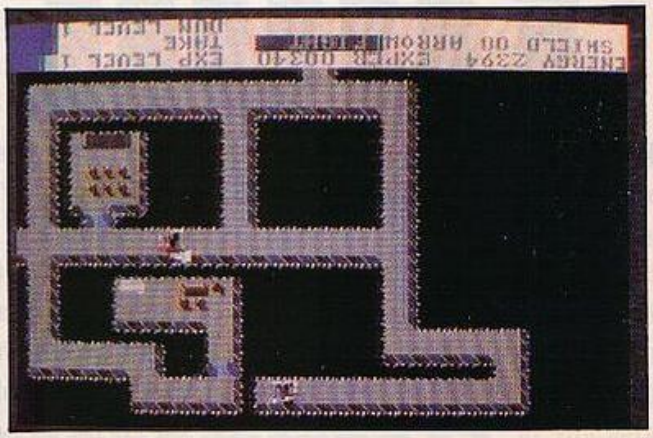
Dungeons of Ba

- *CBM-64*
- *Arcade adventure*
- *Quicksilva*
- *£12.95*

★ ★ ★

RECOVER THE FABLED stone of Ba before your energy runs out. This is a maze game with a difference. Norman the warrior has to fight his way through tunnels, pressing secret panels in the corridors to reveal hidden chambers with objects to help him in his quest. This is an arcade adventure which gives you the kind of section through the earth view of the action best exemplified by Dig-Dug — except that there is no digging.

I wouldn't go so far as to describe the graphics as spectacular — this is how they are described on the packaging — but nevertheless you are confronted with a fair range of weird and wonderful opponents from scorpions to assorted bovver boys, presumably the Guardians of the Stone. You can steer yourself around the maze with the aid of a joystick plus the function keys have been redesignated so that you can put up a shield, or fire an arrow, fight, or take an object. You simply punch the appropriate key before you squeeze the fire-button.

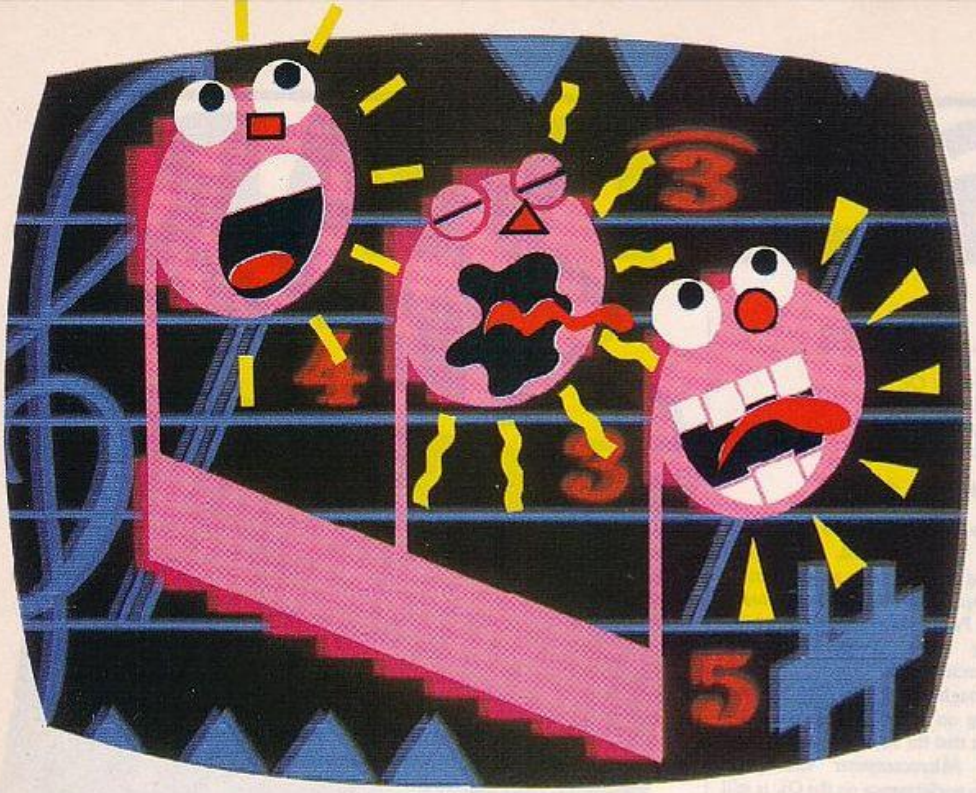


Shields are necessary because arrows will suddenly zoom down the corridors at Norman, though they don't seem to be much use against the denizens of the maze. If you do enter into fisticuffs with any of these beings the C-64 emits a realistic thumping and whimpering sound. With each contact your experience rating increases and your energy level drops.

You can pick up things in the most unexpected places. It is worth searching the apparently empty rooms which sometimes appear at adjuncts to the maze because you may discover food and drink, more arrows, or even a vial of unknown. This can make you zip around the maze at terrific speeds, or not do very much for you at all.

There are unexpected pitfalls and teleport traps which cause you to be pitched in with the most unpleasant company, the usual thumping and squealing resulting. All this kind of

(continued on page 37)



MAKE MUSIC YOUR FORTE.

Alright, let's al gather round the computer for a good old sing-song.

You'll find the new Commodore 64 Music Maker strikes exactly the right note, whether you're an accomplished musician or whether you are an out-and-out beginner.

If you can hum and know your ABC, you can start to play famous popular tunes immediately.

No matter if you've never played a note before.

Simply type in the notes from the SFX Tutor Handbook, then tap in the rhythm.

And, before you can even say 'Richard Clayderman', the automatic playback fills the room with music.

Once you've become a 'piano virtuoso, you'll quickly appreciate the Music Maker's other amazing capabilities.

You can synthesize musical instruments, even create your own 'synth' electronic sounds.

You can play notes polyphonically.

This is the smart way of saying you can play three different notes all at the same time).

At the press of a button, you can summon up pre-programmed rhythms and bass accompaniments to play along to.

These three rhythm combinations can be speeded up or slowed down.

You can even glissando (so long as you don't hurt yourself.)

That is, make a note slide up in pitch.

You can filter sound: reduce the treble, the bass, or both. You can save, on cassette or disk, a voice or tune for future use.

And, for better sound reproduction, you can connect Music Maker to your hi-fi system.

Music Maker has been designed, like all our software, to get the very best out of Commodore hardware.

It's the first in a series of packages which will fully exploit the Commodore 64's outstanding musical capabilities.

Commodore software: it costs no more, even though there's more to it.

SOFTWARE Shortlist

Tir Na Nog

- *Spectrum 48K*
- *Arcade adventure*
- *Gargoyle Games*
- *£9.95*

★ ★ ★ ★

SOME OLD HIPPIES might try and persuade you that Tir Na Nog is an Irish folkband that gained prominence along with Planxty and other unpronounceable names. These people will of course know that the phrase is Gaelic for land of youth. So here we have it, a computer game set in the Celtic Other World. There probably are Irish computer jokes but naturally you won't find any of that sort of thing in *Your Computer*.

Based on the great Irish mythological hero Cuchulainn, the game is billed as a "computer movie". Things being what they are today, it is very difficult for a self-respecting computer game to get into the shops without (a) being based on a movie, or (b) going the whole hog and actually pretending to *be* a movie in its own right.

Tir Na Nog has taken the latter course — the action is presented as though a camera is pointing at Cuchulainn, whom we are assured was known as Cucuc to his friends and intimates. Personally, I would not try calling the shambling knee-jerker at the centre of the screen anything other than Sir unless I had bought him at least three pints of Guinness. If he could play the bass guitar, he would certainly give Motorhead's Lemmy a lot to worry about.

He stands 56 pixels tall — that's pixels, not pixies — and is controlled from the keyboard. The animation of the character is very impressive.

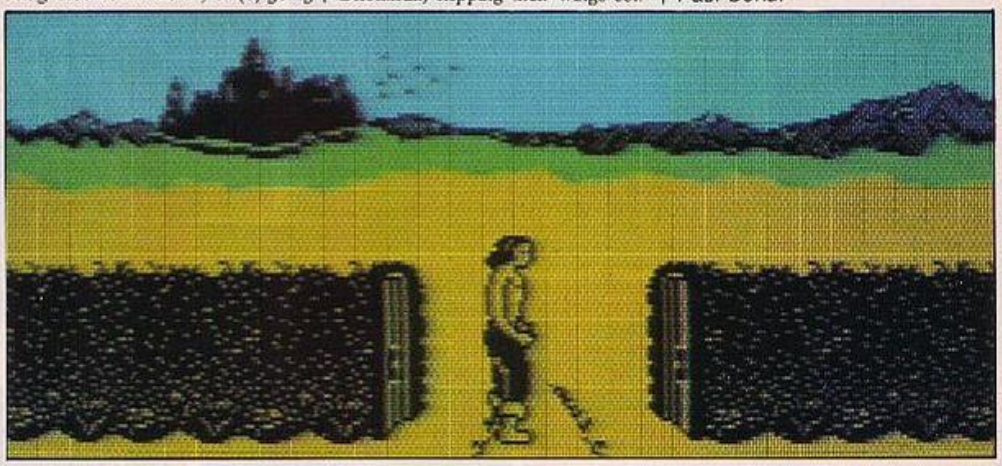
As he slouches disconsolately through Tir Na Nog, the detailed scenery in the fore and middle grounds scrolls past him. Birds of ill-omen hover around the castle of King Dhomnuil, flapping their wings continuously in the distance. Cuchulainn can carry up to four objects — though you have to check with the status area at the bottom of the screen to see what he is actually carrying.

Since everyone in the Celtic Other World is actually dead all you can hope to do is daunt them a little bit, and should anyone harm Cuchulainn seriously he just rematerialises at the entrance to Tir Na Nog — sans objects.

The purpose of the game is to locate and re-unite the fragments of the seal of Calum. Due to a breakdown in security, the seal was smashed into four bits by a servant of the Great Enemy, which has made life very difficult for everybody, the Great Enemy now being free to carry on business as usual, snuffing out galaxies, vesting pain and misery on mankind in the customary way.

Having located the pieces you have to persuade the owners to give them up.

Paul Bond.



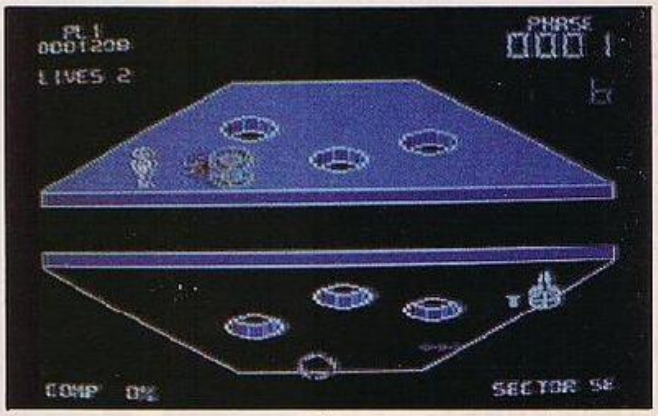
CAD/CAM Warrior

- *CBM-64*
- *Tasksel*
- *Shoot-'em-up*
- *£9.95*

★ ★

NOT A UTILITY program for computer-aided design/manufacture, but a shoot-'em-up. Perhaps with the role-merging of computer games that has led to such strange offspring as the arcade adventure and the arcade strategy game, we are now seeing the emergence of the arcade utility? Maybe future vidkids zapping away in the arcade will unwittingly be designing more efficient speedboats, aeroplanes or three-wheeled electric cars?

The screen presents you with two sides of a metal plate: the top and the bottom. There are some holes bored in it. You steer a robot around shooting at hostile objects. If he passes over a hole, he flips through to the other side of the plate and carries on doing much the same thing, only upside down. As the game progresses, you are presented with different configurations of plate and more hostiles.



The rather confused introductory pamphlet to the game warns us that as more and more of our environment is planned and constructed by machines, it will fall to the machines to interpret the rules by which we want to live.

Life is definitely out of balance in this scenario. The AI-12 is a machine for generating structures in exhibition halls. It is malfunctioning. Luckily

Ariolasoft
★ ★ ★ ★

This old Brocerbund original triumphs over other pinball simulations in its remarkable mimicry of the actual physics of a pintable. You can change the strength with which you pull the launch spring.

Psychedelia
CBM-64
£7.50
Freak-out cats
Llamasoft
★ ★ ★

What wakes Jeff Minter up in the morning? His llama clock, of course. Psychedelia is not a game — it's a program which generates patterns on a computer screen. Jeff exhorts us to (a) turn off the lights, (b) put on whatever music you like to freak out to (c) pick up the joystick and do it with feeling. There is an autodemo, or you can define parameters or call in presets, and you can record about 30 minutes of joystick input in memory. Guaranteed to blow your mind, as they say.

Statix
BBC
£7.95
Novelty
Psion
★ ★ ★

A close copy of Atari's unsung classic, Qix, Statix does not quite get the details right. There is no high score table, and not as much variety as in the original. Still, the game has immense appeal — of the sort guaranteed to grab those who disdain shoot-em-ups.

Superficially it resembles a painter-type game, but with the crucial difference that you are not confined to a grid. The idea is to cordon off 75 per cent of the screen while avoiding the Statix as it flutters around the open territory.

(continued from page 37)

there is a MAD-2 droid inside it — you must use this to try and find the missing cryo-wafer module which is the source of the trouble. Of course the AI-12 has internal defence systems and this is what your droid is shooting at.

You have to work your way through different levels — a maximum of 8192 screens is claimed but since they are all rather dreary and metallic there is not much to choose between them.

What you have to examine is the actual colour of the plates. All plates on the entry level have a top colour of light blue. There are eight different colour groupings. Different colour groupings have different ways of clearing plates. On some levels you drop time-bombs, on others — shoot to kill.

Every so often you get a chance to jump levels, otherwise the game would be very boring as it admits in the pamphlet.

You are given a rough map, but it covers only one quarter of the entry level. The solution to the game lies in screen 8192 and a large phase counter is provided at the top right of your screen to mark your progress. You are prohibited from entering certain areas without tokens or passwords. You are told where to find the tokens — occasionally — after each completed screen.

Paul Bond.

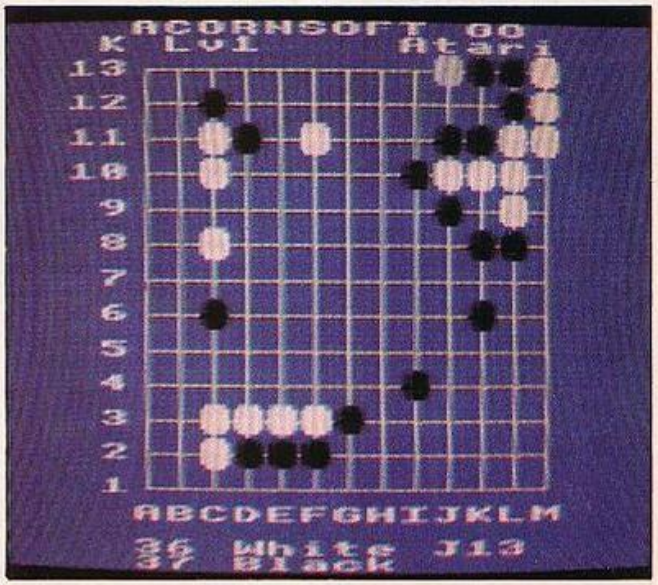
GO
- *BBC*
- *Acornsoft*
- *£9.95*
- *Board Game*

★ ★ ★ ★

ACORNSOFT'S GO program is a considerable improvement on Edge Computer's version reviewed in the December issue. For one thing it plays on a larger board, 13 by 13. It also plays a stronger game

In Japan Go is the national board game, played by millions including several hundred professional players. But over here it has yet to really catch on, and the problem most Go players have is finding someone to play with. Which is why a competent home computer version is particularly welcome.

The game is far more difficult to program than chess. Recently, computer board game expert David Levy predicted that even in 10 years' time no program will be able to play Go at anything above beginner level. One reason for this is that the game does not lend itself to the brute force approach as easily as chess. On a full 19 by 19 board strict calculation of the consequences of a particular move is not so important. You could argue that it offers greater scope for intuitive play resting on pattern recognition and a "feel" for the position.



In view of this it is not surprising that Acornsoft Go is better at tactics than strategy. The program tends to get bogged down in securing a small group of stones when there are larger gains to be made elsewhere.

Nonetheless most beginners will find it hard to handle. As well as a handicap option, there are two levels of play and it is quick to move at both.

Simon Beesley

Castle of Terror
- *Commodore 64*
- *Melbourne House*
- *£9.95*
- *Adventure*

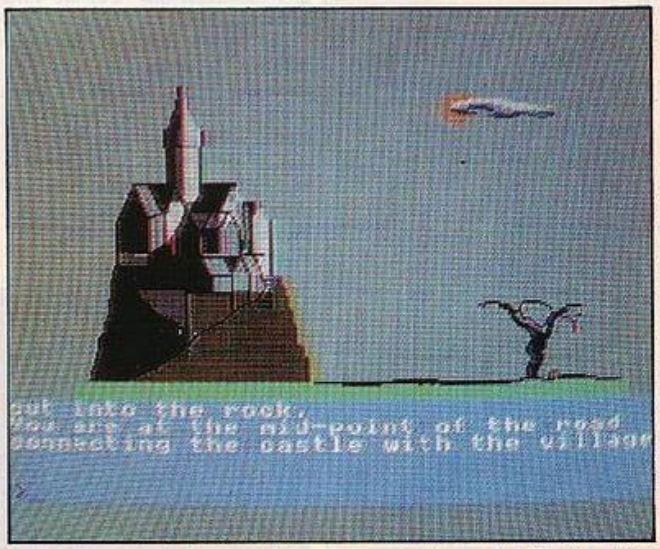
★ ★ ★

NO MAN HAS ever returned from the Castle you are informed by an old man in a pub. The reaction of any sensible person to this news would be to put as much distance as possible between him and said Castle. But, adventures being what they are, off you go, pausing only to grab any likely looking objects you find lying around the place.

The game is in two sections, the first is played in the village. When you think you're ready to tackle the castle you have to load the next section.

Success depends on persistance and close examination of the pictures.

There are 40 graphic screens altogether with accompanying eerie music. The program is rather fussy about accepting words, but does allow you to enter sentences so that you can skip several screens at once.



Your ultimate quest is to vanquish the evil Count, rescue the beautiful young maiden and with a bit of luck line your pocket in the process. Instant death — naturally enough — lies around every corner.

Tristan and Isolde

CBM-64
£8.95
Arcade adventure
CRL

★ ★

Will they be playing this one in the foyer between acts at Bayreuth? I doubt it. Originally a German game, this may have lost a little in the translation, but when you consider the sort of trouble that people have gone to in actually using real mythology in games like Tir Na Nog, this one does little justice to the Ring Cycle. You pilot a little man through rooms and he gets eaten by monsters. Incidentally since the central characters are Kunibert, the hero and Kunigunde the maiden in distress — not to mention the unlikely Wrumper, the baddie, where do Tristan and Isolde come in?

The Hellion

Oric 1/Atmos
£6.95
Shoot-em-up
Orpheus

★ ★ ★

With 101 screens, this should keep Oric shoot-'em-up fans happy. Your Hellion — mutant wasp — can be moved using the cursor keys, and the baddies fly at you from all directions. A fun game with a nice sense of humour.

MacMan and the Caber Eater

Spectrum 48k
Sinclair
Educational

★ ★ ★

The object of this program is to teach four to eight year olds to add and subtract simple numbers. This is done by multiple choice. It's visually appealing, and the quicker you can come up with the correct answer, the quicker MacMan will build his caber, foiling the dreaded caber eater!

SOFTWARE Shortlist

Witch's Cauldron

- *Spectrum 48K*
- *£6.95*
- *Mikro-Gen*
- *Adventure*

★ ★ ★

BUMPKINS OF the world unite. You have nothing to lose but your shape — you have been turned into a toad by wicked witch Hazel. Having failed the auditions for Paul McCartney and the Frog Chorus, it's down to you to seek out and concoct some spells and potions to help you regain human shape.

Witch's Cauldron is a graphic adventure game with a vocabulary of nearly 300 words. You can turn around in a room, getting different walls depicted on the screen, and if you examine things like the GRAMOPHONE very closely, you will find a DIAMOND

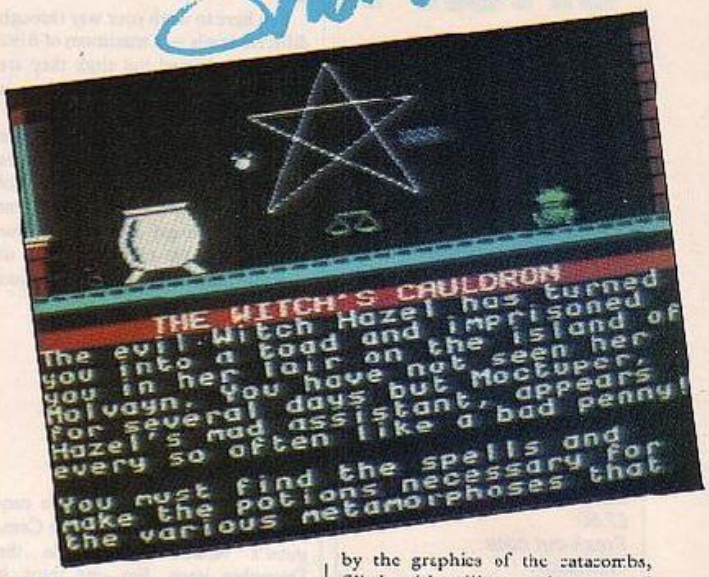
You can't pick up anything that a toad couldn't pick up, which basically means that anything large will have to be left behind. How a toad carries a diamond is a mystery to me — I guess it's okay if no-one gives him a hearty slap on the back. The plus side of being a toad in this game is that you can hop onto things like mantlepieces and examine them. While you can't open any doors you can hop up the chimney.

There is plenty of SOOT here and for your first trick you can throw it over your shoulder. Unfortunately one of Hazel's unpleasant creatures generally happens along and devours you, just as you are about to become more socially acceptable. If you can avoid becoming part of a monster's ment, you have a schedule of about 10 metamorphoses to go through. Talk about getting away for a change!

The program understands plain adventure English; it is possible to give commands like "Put the water in the cauldron".

The game contains over 90 different locations — most are illustrated with a full colour hi-res picture. Not all the objects are useful, and there are supposed to be around 700 different possible actions in the game. Good fun, but you have to remember that one small step for a man is a giant leap for a frog.

Paul Bond



Gift From The Gods

- *Spectrum 48k*
- *Ocean*
- *£9.95*
- *Arcade Adventure*

★ ★ ★

ORESTES HAS A problem. Mum ran off with another man and then ran off with his kingdom. The only way he can get it back is to enter the Labyrinth.

The Labyrinth, apart from being a tricky place to find your way around is filled with various monsters trying to sap our hero's energy. Fortunately he has friends in high places: Zeus has given him a Sword and Apollo has given him the Seven Tears of Icarus which can be used to mark chambers within the labyrinth.

Apart from the monsters, you've also got to cope with mum who is busy moving objects around. She'll also kill your sister Electra, given half a chance, which would be a blow as the Gods have revealed the solution of your quest to her.

All this plot detail gives the game plenty of flavour. It is complemented by the graphics of the catacombs, filled with pillars, columns, and animated monsters. The controls are easy to use using a combination of joystick movements and the fire button to move, fly, fight, pick up and drop objects. There is also a pause key which helps when making a map.

Your task is a long and difficult one. It's a large maze, and even when you find the objects, there are only six real ones among the 64 scattered around. Should Clytaemestra manage to kill Electra, your task will become immensely more difficult, so much of your time will be spent chasing Clytaemestra around so that she doesn't have a chance of getting to Electra.

The Greek legends of heroic quests make great themes for games and this is certainly a well executed example.

- *Arcade*

★ ★ ★

FOLLOWING UP their successful version of the arcade classic 3D Tank Duel, this is an excellent version of the current arcade hit. There are four screens to battle through: a space battle with the tie fighters, a low level run over the ground defences, the trench, and finally a shot at the reactor.

There are many difficulty levels running from the turkey shoot to the suicide run. All stages are in 3D with your cockpit controls in the foreground. The controls are nice and responsive with climb, dive, roll and fire; a variety of joysticks can be used.

Good meat-and-potatoes arcade action.

Lee Paddon

Kuma AMSTRAD CPC464 software

Holdfast | Gems of Stradus | Star Avengers | Galaxia | Music Composer

Logo | Database | ZEN Assembler | EASIVAT | Home Budget

An outstanding selection from Kuma's rapidly expanding range of Entertainment and Application Software for the Amstrad CPC464 Micro-computer.

Book:

● **The Amstrad CPC 464 Explored**

This superb book is designed to let every CPC464 user, at whatever level, get the most from his computer. After an introductory section on the special Basic features, the book looks in depth at the excellent sound and graphic facilities including: ● *Animation* ● *Windows* ● *Character sets* ● *Multitasking* ● *3 Voice Times* ● *M/C routines for Basic* ● *Use of Zen* ● *Use of O/S* ● *Sample programs*

Available from your nearest Amstrad CPC464 Stockist.

Kuma Computers Ltd., 12 Horseshoe Park, Horseshoe Road, Pangbourne, Berks RG8 7JW.

Please send full catalogue on Amstrad CPC464 products.

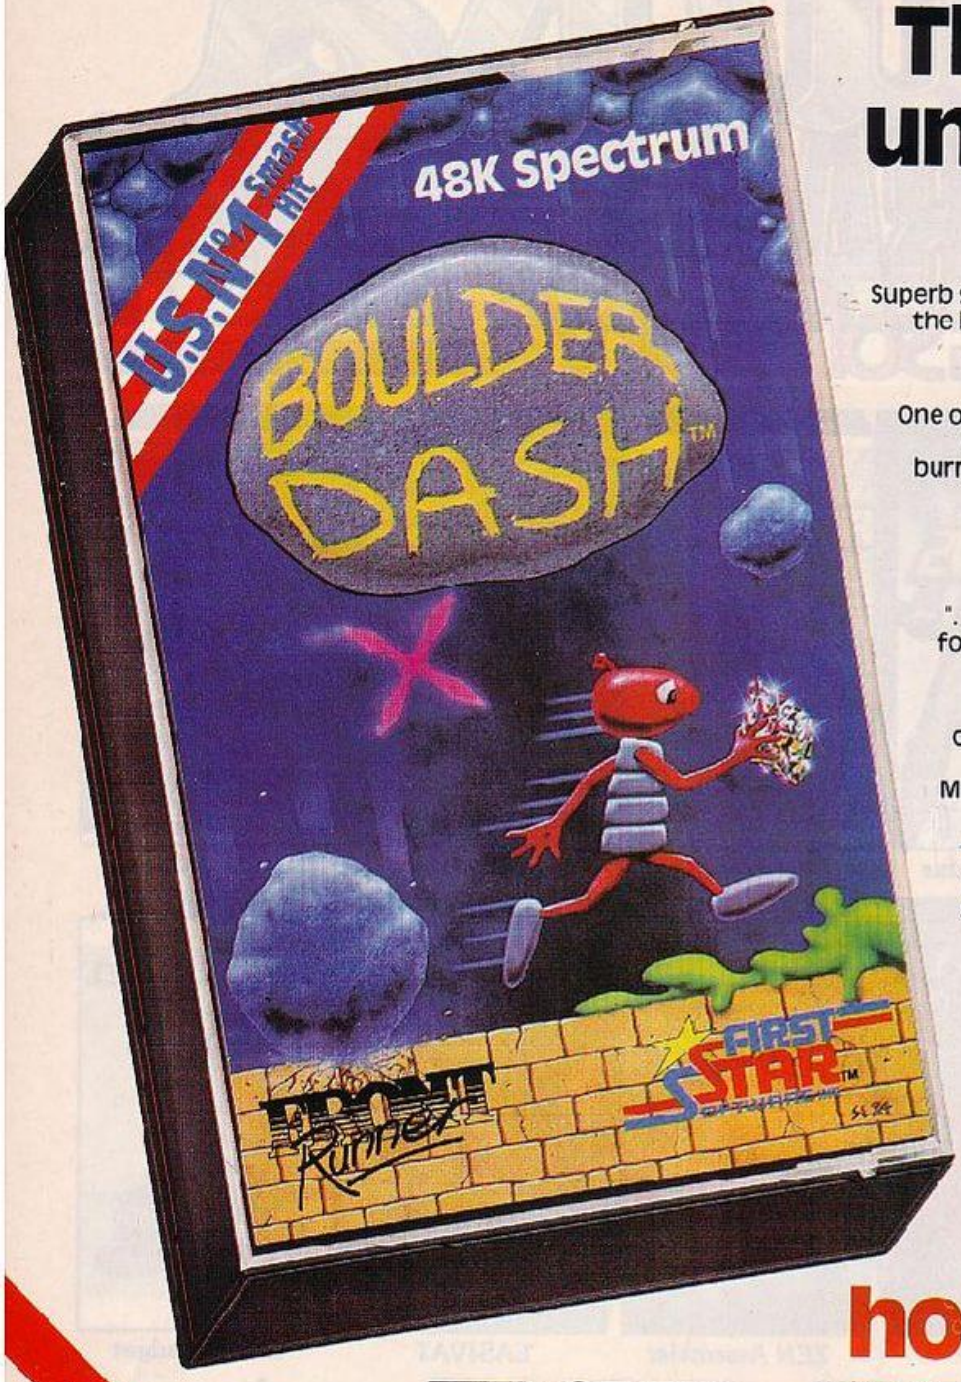
Now on 48K Spectrum



The ultimate underground adventure

Superb scroll routine, described by experts as one of the best pieces of Spectrum programming ever! Sixteen mystical caves, 5 levels of play, joystick or keyboard options.

One of the toughest tests of strategy and reflexes ever! Starring "Rockford" ™ the incorrigible burrowing bug in his restless quest for gleaming jewels.

U.S. Reviews

"... Boulder Dash should be leading contender for anybody's action-game-of-the-year award."
Burt Hochberg **GAMES Magazine**

"... a magical mix of challenge, charm and originality ... easily one of the best computer games of the year."
Michael Blanchet **Chicago Tribune Syndicate**

"This game will be mentioned in my will ... what silicon is and integrated circuits were always meant to be ... subtle brilliance and unceasing magic ... in a class by itself ..."
Craig Holyoak **Deseret News**

"First Star has done a first rate job on BOULDER DASH ... the graphics are dazzling ..."
The Video Game Update

"BOULDER DASH takes the cake ... the overall quality is excellent ..."
John Skoog **K-Power Magazine**

This one's hot for Xmas!

The crystal ball

At the time of writing, Doomdark's Revenge, the follow up to Beyond's brilliant Lords of Midright, has only been on the market a week but already I have heard of one player who has completed it. Astonishingly, David Harvey of Dereham in Norfolk managed to succeed in the new quest after playing it for just six days.

There's still the third part of the trilogy, The Eye of the Moon, to come. We lesser mortals are still gathering our armies in part 1.

If you've got any Christmas cash left, all three parts of The Ket Trilogy from Incentive Software are available in a handsome gift pack at the special price of £12.95, a saving of £3.55 on the set. A splendid bargain for adventurers.

A helping hand

Readers — can you assist with a plea for help form B. Kamphuis of The Netherlands concerning Quicksilva's Smugglers Cove?

He can't cope with the wide trench, oak door, trap door and collapsed tunnel. Can anyone help?

For Artic's Golden Apple players:

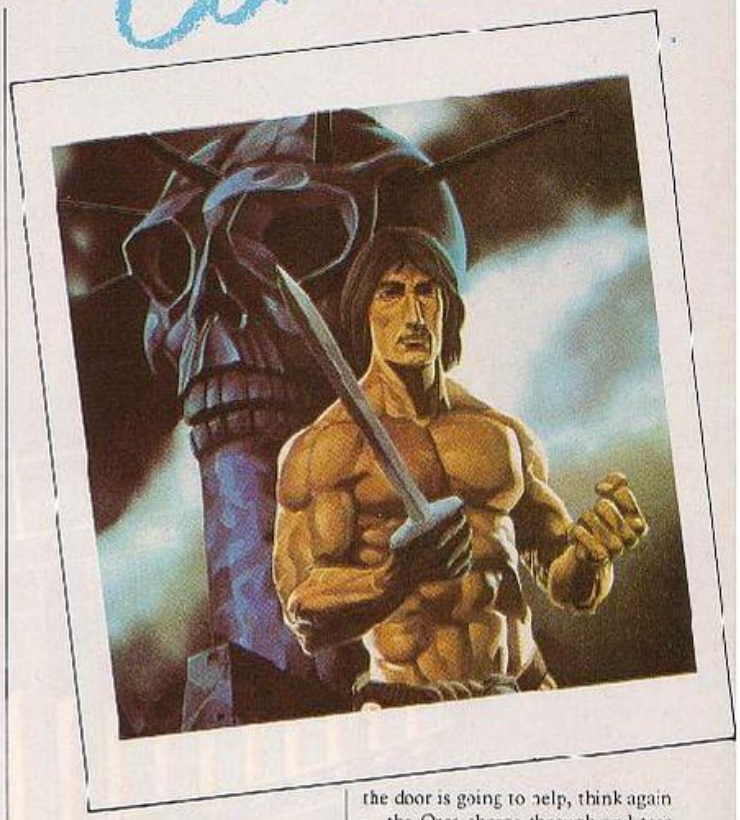
QUEST Master

Our man with the brass lamp and the key to a thousand mysteries sheds light on new adventure programs. Lost? Never fear, Hugo North is here.



Tower of Despair

Spectrum
Games Workshop
£7.95

SPECTRUM OWNERS should keep a sharp eye out for this. It is a text-only adventure with a big difference. For instance, the character set has been immaculately redesigned and decorated so that the text appears like a monastic illuminated manuscript. Very attractive.

The adventure is an enthralling atmosphere and is imaginatively detailed. This is an adventure where examining objects will pay rich dividends. A glossy booklet sets the scene and includes a couple of maps and a number of pictures of the major locations.

You must first find the Gold Gauntlet before you journey to The Tower of Despair, there to overcome the owner of the King of Skulls, the evil Malnor, who once more threatened the land.

Tower of Despair is just the program for those who like thick and rich detail, oodles of atmosphere and plenty of challenge. Games Workshop are perhaps better known for their expertise in other areas of the fantasy game world.

Blade Warrior

Spectrum
Cable Software

THIS IS A TEXT adventure, written with the aid of Gilsoft's ubiquitous Quill. The game has a largish vocabulary — over 140 verbs, fast response and an interesting plot. Your job is to hunt down the Black Witch, following in the footsteps of Mazar the Wizard who went before but has not been heard of in many moons.

The game has one of the best openings I can remember seeing in an adventure. You have been chased by a large band of Orcs and in your anxiety to escape have lost all your possessions. You now stand at a dead end, a wall at your back. There is a solid door in the wall but the Orcs are closing in for the kill.

The wall is unclimbable and if you think that simply rushing through the door is going to help, think again — the Orcs charge through and tear you to pieces. As they say on TV, now get out of that!

Forest of Doom

CBM-64
Penguin Books
£4.79 + VAT

THIS IS A computerised version of the best selling Fighting Fantasy gamebook of the same name.

It is mainly a text game, the prose being presented teletype style on a manuscript — a scrolling scroll! You make decisions by selecting from a number of choices given at the appropriate point.

The game remains very faithful to the book but in order to cram the whole thing on to a micro, some of the game's data has to be loaded in at different stages. The program automatically tells you when to do this.

There are a number of options to make the playing enjoyable. You can control the speed at which the text is printed, even pause it, and can return to the start of a section, just like you would turn back a page in a book. You can even store and recall a scroll to your own text — very handy for making notes as you play.

I liked it — a splendid fantasy yarn and a refreshing change from the usual style of adventures.

Sorcerer of Claymorgue Castle

Various
Adventure International
£7.95

THIS IS the best adventure out of my leather pouch this month. I must confess to liking all of Scott Adams adventures but this is definitely his finest yet.

You play the part of Beanwick, an inexperienced wizard, whose mission is to enter Claymorgue Castle and recover 13 lost stars. When you start, you already have a number of spells and will find more on your travels. Only trouble is, you don't know what these spells actually do.

If you want attractive graphics, you'll find them here.

AVAILABLE FROM High Street Computer Retailers and branches of W.H. Smith, Boots, John Lewis Partnership, Laskeys, Currys.

EVEN THE PRICE WILL KEEP YOU IN THE BLACK

This sleek, black Microvitec CUB medium resolution colour monitor has been designed to be totally compatible with the Sinclair Q.L. An ability to display 85 column text is combined with outstanding graphic capabilities – at a price that won't break the bank.

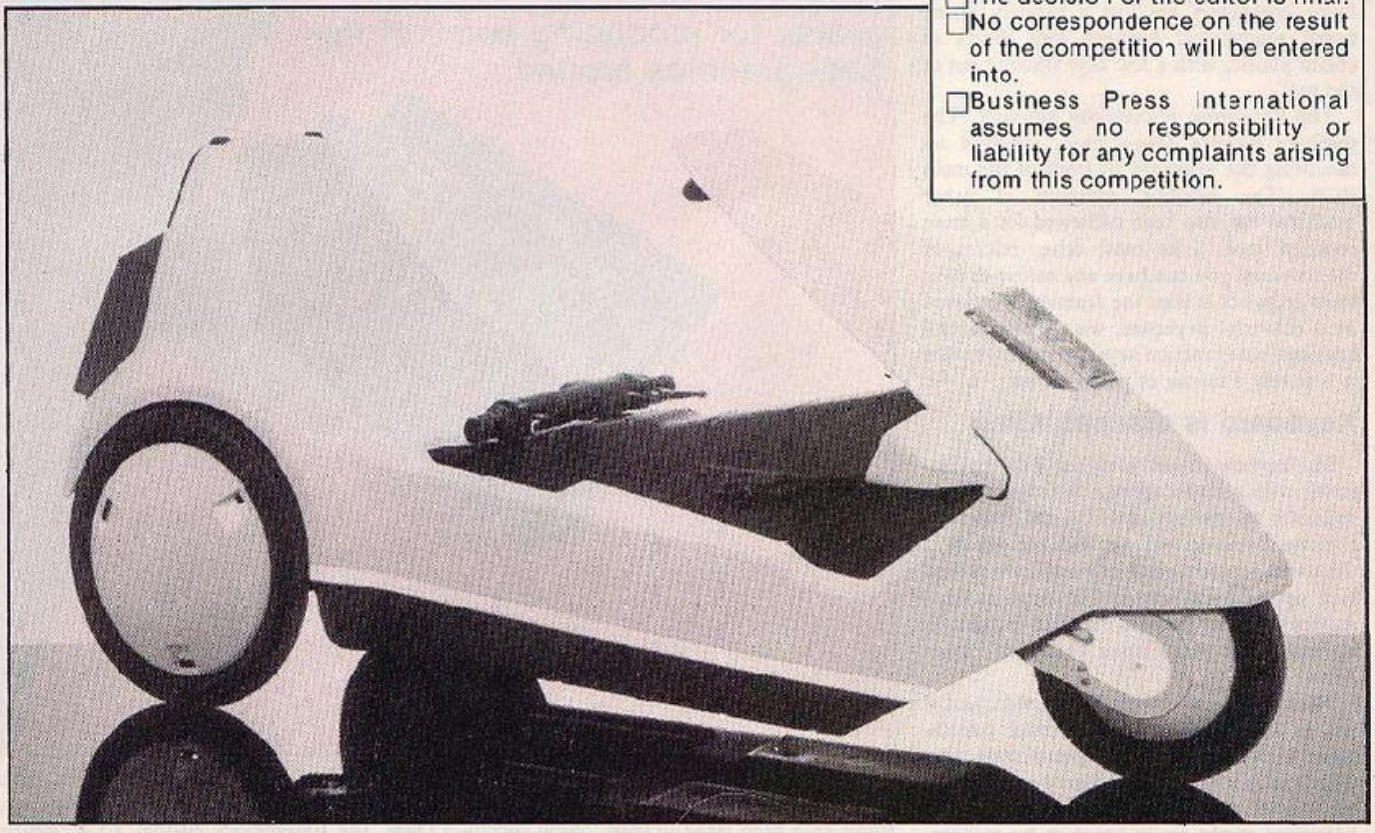
SINCLAIR C5 CLIVEMOBILE *Competition*

Our Uncle Clivemobile may look like a latterday Mod scooter but it doesn't necessarily mean that Sinclair's gone off his rocker. Win one of these C5 electric super trikes in our fabulous February competition and be the first silent rider on your block.

RULES

- ☐ The winner of the competition will be the person who numbers the features of the C5 correctly and enters the most original idea for a computer gadget to go in a car in the view of the editor.
- ☐ The name of the winner will be printed in the April issue of *Your Computer*.
- ☐ All entries must arrive at the *Your Computer* offices by the last working day in February 1985.
- ☐ Each person may enter the competition only once.
- ☐ Entries to the competition cannot be acknowledged.
- ☐ No employees of Business Press International or their relatives may enter the competition.
- ☐ The decision of the editor is final.
- ☐ No correspondence on the result of the competition will be entered into.
- ☐ Business Press International assumes no responsibility or liability for any complaints arising from this competition.



SINCLAIR C5 *Competition*

Put yourself in Sir Clive's place. You have just launched your C-5 supertrike and before going on to produce electric four-wheel cars, buses, trucks and juggernauts, all guided by artificial intelligence and travelling at 200mph, bumper to bumper, you want to ease yourself in by inventing a computerised gadget which will make driving easier or more fun. Invent a gadget then give it a name, fill in the coupon — remembering to put the features of the C-5 in order — a 1 in the box next to your favourite feature, a 2 besice your next preference and so on. Then send it to *Your Computer*, L-22', Quadrant House, The Quadrant, Sutton Surrey SM2 5AS.

- ☐ Low running costs
- ☐ Easy to park
- ☐ Low purchase price
- ☐ Can be driven by 14-year-olds
- ☐ Lightweight

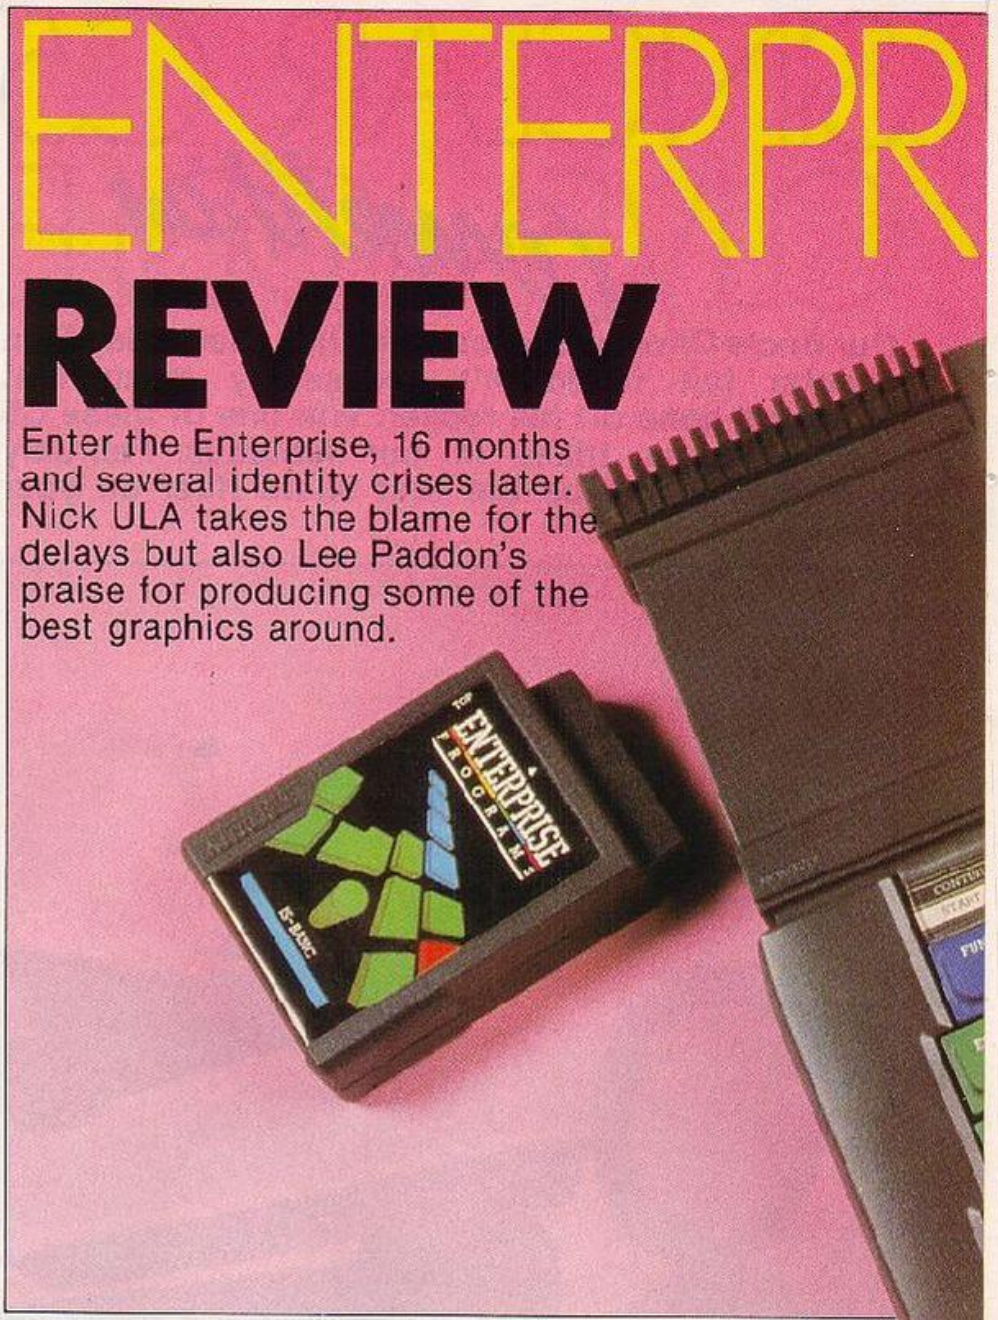
ENTERPR

REVIEW

Enter the Enterprise, 16 months and several identity crises later. Nick ULA takes the blame for the delays but also Lee Paddon's praise for producing some of the best graphics around.



IN AN INDUSTRY notorious for broken delivery promises, the Enterprise stands head and shoulders above the competition. First seen in public in September 1983, the machine is only now going into mass production.

When first announced, it seemed to offer a level of performance most micro owners only dreamed about. However, a lot of bytes have flowed under the bridge since then. Several innovative new arrivals have beaten it to the high street, and the industry stalwarts are even more entrenched with huge user bases and software support.

A year or so ago, a machine had to be good to succeed, now it has to be very good to even survive. So how does the new machine measure up to the competition? Geoff Hollington, the designer of the Enterprise's casing, had some hard words to say about the looks of other machines when *Your Computer* interviewed him in January 1984: "Most home computers are just a printed circuit board sandwiched between two sheets of cream plastic, with a few keys sticking out of the top".

The Enterprise is certainly different. The machine is only 33mm high, achieved by mounting the keyboard in front of the main PCB. The box-like contours of other machines has also been eschewed for a more rounded look. Like most other micros of recent years, you can have any colour as long as its grey, but at least the drabness is relieved by a colourful keyboard, with green control keys and blue function keys. Whether you like it is purely a matter of personal taste.

Keyboard is disappointing

The keyboard itself is rather a disappointment, with a rather spongy feel that will not endear it to touch-typists. On the plus side, the keys are nicely laid out, with everything in the usual positions, and any odd keys tucked well out of harm's way. The most striking feature of the keyboard is the built-in joystick, instead of the more usual cluster of cursor keys.

This looks a bit on the flimsy side, and it will be interesting to see how much punishment it can take from the games fraternity. That aside, it is certainly a very easy way to edit text and programs, although the hamfisted might easily knock it by mistake. There are eight function keys, which can be used with the shift and Alt keys to produce 32 combinations.

Around the back of the case are a series of ports. Enterprise seems to have cut costs here and we are left with the old edge connectors, instead of a few proper sockets which cost that little bit extra. There are ports for two joysticks, an RGB monitor, a printer and a serial/network port.

There are also the necessary sockets for a television, a power supply but no on-off switch, and a cassette port. The reset button is usefully positioned at the extreme left of the rear panel. One press for warm reset, two for cold.

The Rom bay on the left of the machine can accommodate Roms up to 64K and on the right is the expansion socket which gives access to not just the main address and data buses, but the audio and video circuitry as well.

The internal architecture of the Enterprise is unusual. Bank switching and sideways Roms have been taken to their logical conclusion. The address bus is extended from the usual 16-bit Z-80 bus to 22 bits and hence 4Mbytes. This is achieved by dividing the address bus into two.

The two most significant bits are used to select one of four 16K pages. This page address is read from an eight-bit register in Dave, the Enterprise's custom ULA, which also handles sound production. Of these 256 pages, the top four are the video Ram, which can also be shared by programs, and the operating system's scratchpad.

The system Rom sits in the bottom two pages, and the cartridge turns up in pages four to seven. While this is all very clever, it does rather tie up the processor, which has to mess about with page address. Still, when you've got a Z-80A processor cracking along at 4MHz, you've got a little time to spare.

The operating system EXOS has been designed for flexibility. All devices are accessed using channels. This will of course allow simple expansion.

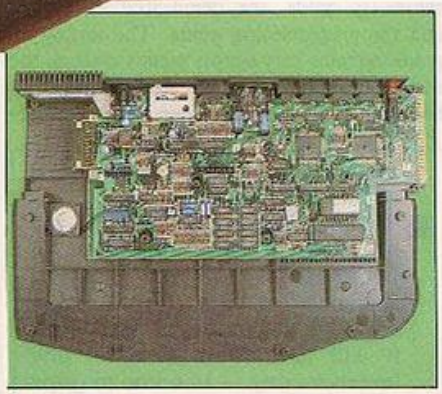
Apart from Dave, the other custom chip in the Enterprise is Nick, apparently the cause of all the delays. Nick handles the screen, and it hardly seems surprising some trouble was encountered with this revolutionary design. Most computers have a certain amount of memory assigned to the display. This might

ISE

vary with the video mode in use, but you are always sure where it is.

Nick changes all that. Any part of the 64K of Ram can be assigned to Nick. The user simply defines parameters of mode, width and height, and the operating system assigns the required amount of Ram to it.

It is a similar concept to graphic windows, but these windows can be slid around the screen at will. There are five modes, lo-res graphics, hardware text, hi-res graphics and software — 80 column — text, and attribute mode which mixes the two. On top of that you also have to specify the number of colours you want. This can be 2, 4, 16 or 256 colours. The more colour, the less horizontal resolution.



Maximum resolution is 672 wide by 512 deep, although this can be doubled using "interlace". The text is on an 8 by 9 matrix, with 25 lines. The versatility of the video display will enable complex graphics to be built up easily, and with a modest memory overhead.

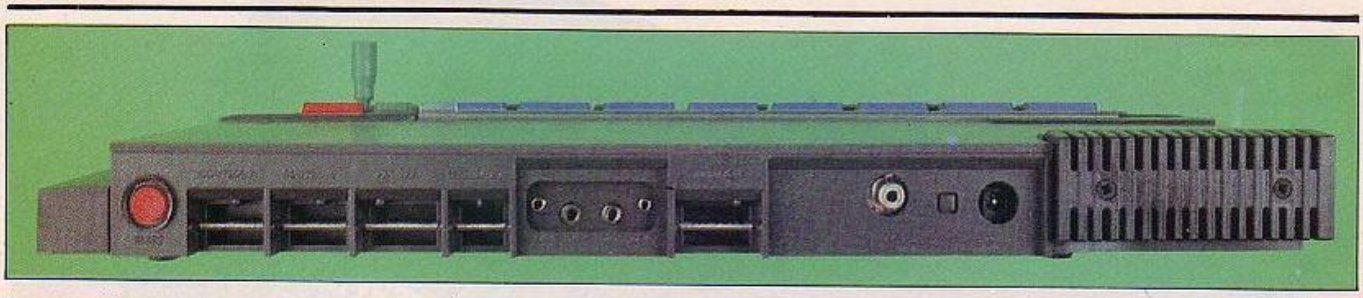
When Dave isn't busy with memory maps, he's producing some very pleasant sounds. There are three sound and one noise channels. The sound is in stereo over eight octaves, and rather wasted on the internal speaker, using external speakers or headphones is a must if you want to appreciate Dave's finer points.

Each sound command can state volume and pitch as a function of time, in stereo. Various special effects can also be produced using distortion, filtering, using another sound channel to determine the cut-off frequency, and ring modulation.

The Basic comes on a cartridge and is another one of the machine's strong points. Whilst retaining all the usual features of standard Microsoft basic, IS-Basic has features which normally only come as Basic extensions.

The central philosophy is obviously to encourage the programmer to think structure, and borrows many features from Pascal. If this sort of language had been the standard when Basic got going, it might not have got

(continued on next page)



(continued from previous page)

such a bad name for itself.

Apart from the usual If . . . Then . . . Else structures, which can be carried over several lines, it supports Do loops using While or Until conditions at the beginning or end of the loop. There is also an Exit command for further flexibility in structures. The Case statement is rather like setting up a "flag" which is tested to determine if certain statements are executed.

IS-Basic supports the use of "global" and "local" variables. This means that a subroutine can use the same variable as the main program without being affected, merely passing parameters to the main program as needed. This means that subroutines can be transportable from program to program, without having to be rewritten.

An extension of this idea is that several programs can be resident in Ram at the same time, with the same line numbers. Control

and variables can be passed between them when editting programs.

The principal graphics command is Plot, which moves the graphics cursor. If the co-ordinates are followed by semicolon, a line is drawn between the new and old position in the current ink colour. There is also a set of Logo type graphics commands as well as Ellipse and Fill commands. Ink, Pen and Border colours are selected from a palette of 256 colours. These can be selected by number, or name, or you can specify the amount of red, blue and green you want. Possibly more use to commercial artists and printers than programmers.

Sound commands are simple. The Basic sound command can be followed by a number of parameters stating pitch and volume over time and any special effects. A series of sound commands can be issued to the four channels, and these sit in a queue waiting to be executed. In case you lose all track of the duration of sounds on the various channels, a Sync command will set you straight, or just Clear the queue and start again.

The Basic is generally very comprehensive, and really lets the user get at the guts of the machine without having to resort to machine code all the time. If anything it might be accused of being rather longwinded and unwieldy, but then you don't have to use all of it.

The very wide format of Basic commands means that very little error checking is done when the program is entered. There are also a number of words which can only be entered in immediate mode, although this is really only a minor criticism of a fascinating dialect of the Basic language.

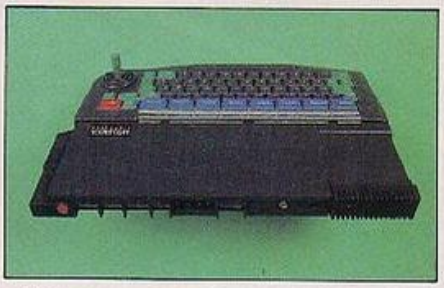
The only reason I can imagine for a programmer wishing to leave Basic is speed. I'm afraid IS-Basic isn't going to keep Beeb owners awake at night. Even the humble Spectrum shows the machine a clean pair of heels on most benchtests.

Included with the machine is the power supply, UHF lead, two cassette leads, the Basic cartridge, the inevitable demonstration cassette and several booklets. These are the setting-up guide, the demonstration manual and the programming guide. The setting-up guide explains very simply what's what on the machine, so that the terms used in the other books won't mystify even the complete novice.

It also explains how to load taped software. This is certainly a simple process on the Enterprise, you just hit the button marked start. To make sure you get the playback volume right, there is a blob on the display during loading, and if this flashes green to red, the volume is correct.

As far as the demonstration tape goes, the programs are hardly dramatic. But at least they are short Basic programs which will actually teach you how to write your own rather than the designer's *pièce-de-résistence* in 30K of machine code which teaches you very little.

Finally we come to the programming guide,



which at nearly 230 pages looks fairly daunting for even the seasoned veteran. It is divided up into three sections: getting acquainted, the tutorial and the reference section. Getting acquainted is the standard beginner's introduction, but worth a glance through by experienced programmers. It steers the path between mystification and concescension very well.

The next section introduces the core of IS-Basic. It spends a large amount of time on the structure commands, with plenty of examples, but towards the end rather glosses over several of the more interesting subjects, for instance it barely mentions attribute graphics.

So while the beginner will have something to keep him busy, anyone interested in graphics will be forced to pick up the clues from the demo tape, or wait for the inevitable flood of "Get the most from your Enterprise" type books. The reference section gives a comprehensive list of IS-Basic commands, a glossary of computer jargon and a few more hints on using sound and vision. Not a bad effort all in all.

The Enterprise has a built-in word processor, which although rather crude could save on TippEx if your typing is a bit rough. It lacks features such as "search and replace", block move or block delete. It is, however, easy to use, with helpful on-screen prompts. Another handy idea is that a listed Basic program becomes a word processing file, so you can scroll up and down the whole listing. How many times have you let the line you wanted to edit scroll off the top of the screen and cursed this end-of-the-world effect? ■

CONCLUSIONS

- For £250, or £350 for the 128K version due out later this year, there is no doubt that the Enterprise offers the best value for money in hardware terms. The Basic is easy to use and will appeal to the beginner. To the more experienced programmer, the completeness of the Basic will be a revelation — no more Peeks and Pokes.
- They will also be able to delve quite easily into the depths of the operating system due to the open nature of the system and its channel based architecture. The hardware buff has also been catered for with the inclusion of the sound and video lines on the expansion bus.
- Perhaps the only cloud on the horizon is the reaction of commercial software houses. Because of the revolutionary concept the machine embodies, it will take them time — and hence money — to come to grips with the machine, especially if they want to get the most out of Nick and Dave.
- Thus Enterprise may find itself caught in a Catch-22 position where commercial software will not be developed until there is a big user base, and people won't buy the machine until they see that software is available.

NO FUZZ.

NO BOTHER.

The remarkable new Ferguson MCO1 TV is built on the famous TX chassis, so naturally it offers the best in picture quality.

But it also features DIN sockets for direct RGB and Composite Video input. Which means every signal, from whatever source, is transmitted directly to the screen without being demodulated.

The result is clear to see - and hear. No more fuzzy images. No more dull colours. Sharper wording and no hiss or hum on the sound.

Unique automatic source switching allows you to plug in your video recorder and any home computer with RGB output and leave them set up.

There's no need to unplug anything unless you want to carry the highly portable Ferguson MCO1 around with you.

A computer monitor that's also a colour television is the ideal second set for the modern family.

RENT OR BUY

And now you can rent or buy the Ferguson MCO1 from DER.

Rental costs just £8.95 a month. For that you get a lead compatible with your computer and full DER service. Or you can buy the package for only £225.

Simply fill in the coupon now and we'll arrange a free home demonstration soon.

The Ferguson MCO1 from DER will help you to understand all your programs more clearly. No fuzz, no bother.

We supply leads for the following computers BBC A and B, Acorn Electron RGB, Oric RGB, Lynx RGB, Sharp MX-711RGB, Dragon C/Video, Vic 20 C/Video, Vic 64, Colour Genie, Sord-M5, Newbrain, Atari 300 Canon MSX.

I would like a free home demonstration of the Ferguson MCO1 Colour TV/Computer Monitor.

VIEW AND SCRIBE

TEXT IS IDEALLY suited for manipulation by a microprocessor. The alphanumeric symbols involved can all be described by the permutations of eight bits — one byte — and many documents are shorter than the 16 bit addressing capability of the 6502 and Z80 CPUs.

VIEW and SCRIBE are word processor programs for the BBC microcomputer. VIEW is the official Acornsoft product and SCRIBE is distributed by Eucon Ltd. in Swansea — Merlin Computer Products, Eucon Limited, 35/36 Singleton Street, Swansea, SA1 3QN — Telephone 0792 467980.

A "word processor" program is comparatively easy to write in Basic provided that you limit yourself to a short text and only a few facilities. These programs are often published in computer magazines but really ought to be put into a different category as they bear little resemblance to a professional piece of word processing software. A good wordprocessor is like a sharp woodworking plane — unobtrusive, effective, versatile, ready to hand and conducive of good results.

There is, however, no single best wordprocessor because different people use "text" in entirely different ways for different purposes. A journalist will rarely want to handle a document longer than three or four thousand words. Conversely, the ease of operation and the speed at which text can be entered may be terribly important.

The layout of the printed text is likely to follow a simple pattern. On the other hand, a technical author, a mechanical engineer or a biochemist may require more than 80 columns for the production of tables and complex format controls to permit the insertion of diagrams, the representation of mathematical symbols and references to footnotes at the bottom of the page.

A person running a small business may wish to incorporate individual names and addresses into letters, and may want to alter the contents of the letter according to whether or not the recipient has paid a bill recently, enquired after a product or made one of a number of different mistakes in filling out an insurance proposal.

You could write one program that would deal with all these tasks and some people have tried to do this. "Integrated" software packages such as "1-2-3", "Symphony", and "Jazz" aim to offer both word processing and data handling in one package so that text can be mixed with the results from a spreadsheet analysis, or merged with data from the built-in database program.

But it is still very difficult to make the package comprehensive and simultaneously easy to use.

A menu, for example, is a screen display which allows you to choose which operation the program should carry out next. Menu-driven programs are easy to use but tend to become irritating after some time as the user becomes familiar with the range of options available. This problem becomes particularly important when the computer is used with a serial terminal rather than having a memory mapped display.

It takes longer to clear and then write a screenful of information on a serial terminal. Wordstar solves the menu difficulty by allowing the user to choose any one of four levels of help. At one extreme half the screen is taken up with helpful messages; at the other, you are assumed to know what you are doing and no messages are displayed.

VIEW can be used with either a cassette recorder, or one or two disc drives. It has many attractive features and some important drawbacks. If you use VIEW with the BBC micro set to Mode 3, you will be able to type and display text as it will look on an A4 sized piece of paper. You will be able to hold about 7,500 words of text in memory at any one time. Using a 40 column display VIEW will hold approximately 25,000 characters in memory, about 4,000 words. Secretaries and other professional word processor users will find it very difficult to work with a 40 column display.

The top line of the VIEW screen is reserved for the "ruler" which shows where the left and right margins are set, the position of any tab stops, an optional bell signal, and whether the text will be justified or not. Further information is given about Insert/Overwrite mode and Format mode which is another name for word-wrap. The starting options for VIEW are all fixed as the program is contained entirely in ROM firmware. Figure 1 shows two typical ruler lines.

SCRIBE uses a similar ruler line and is a very friendly progam which uses menus and messages to show the choices that are open to you at any stage of processing a document. SCRIBE is supplied as an 8K Eprom and a 40 or 80 track disc holding a number of procedures and utilities. To make sensible use of SCRIBE you will need two disc drives. The first, drive 0, holds the SCRIBE disc while the second is used for the disc holding the text. You could manage with a single disc drive but SCRIBE does use the program disc quite often to call up editing utilities such as "Reformat" so you must keep your documents on the same disc as some of the SCRIBE procedures.

Figure 1. VIEW Format rulers.

```
F I>...  .....*.....<.....  b.....<
```

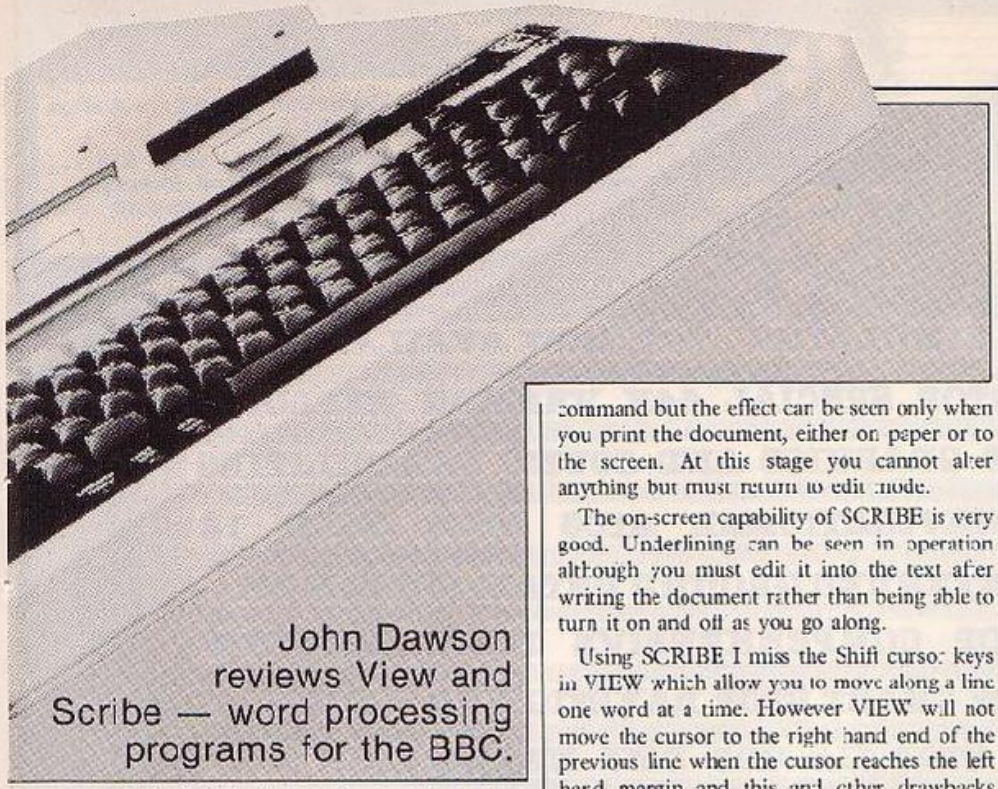
Produces text that lies between the triangular arrow margins. The computer beeps when the cursor passes the "b".

```
F I.....>...  .....*.....*.....  <
```

This ruler line shows a wider left margin and two tab stops. Up to 126 ruler lines can be set in a document; more than enough for almost any purpose.

Figure 2. Onscreen capabilities.

	VIEW	SCRIBE			
Enter text 40/80 cols	Yes	Yes	Wordwrap ON/OFF	Yes	No (always On)
Enter text > 80 cols	Yes (max 132)	No	Tab stops	Yes	Yes
Centre text	No	Yes	Decimal tab stops	No	Yes
Fill & Justify	Yes	Yes	Left and Right margins	Yes	Yes
Right Justify	No	No	Reformat paragraph	Yes	Yes
Underline	No	Yes	Global Format	Yes	No (automatic)
Page breaks	No	Yes			
Set page breaks	No	Yes			



John Dawson reviews View and Scribe — word processing programs for the BBC.

Unlike VIEW A 2.1 and many other microcomputer based word processors, SCRIBE establishes a number of fixed format "pages" when you create a document. The pages are laid out on the disc and you fill the pages as you type. An 80 track single density disc will hold between 55 and 60 A4 sized SCRIBE pages. The enormous advantage of this approach comes when you wish to move backwards through a document.

The Edit command in VIEW is fine provided that you only want to work your way through the text from the start to the finish. But if you forget to carry out some editing or decide that a couple of paragraphs will read better earlier on, you must save the block of text on to the disc, finish editing the text and start all over again from the beginning. When you come full circle you can set a marker, exit to the command level and read in the block of text from the disc. If the block is longer than the spare capacity in VIEW — about 1,200 bytes in Mode 3 — you will have to change into Mode 7 because VIEW stops reading from the disc when the free space is full.

Using SCRIBE you can move to any page in your text just as you wish. Press function key f7 and the prompt line asks "Page number?". The up and down cursor keys will select the previous page or the next page respectively after saving the current page to the disc.

For longer reports, book chapters, articles, essays and epic poems, this facility cannot be overrated.

If you want to move beyond the adjacent pages you simply enter the absolute page number and the program will move to the page you want. The number of the current page is displayed constantly at the top of the screen. There are two other important commands that will repaginate the document, moving excess material into or out of consecutive pages until all is arranged correctly.

The on-screen editing and display capabilities of the two programs are shown in figure 2. Note that this figure refers to what the program can do to display text on the screen while you are editing it. VIEW A 2.1 can right justify text, for example, by using an edit command but the effect can be seen only when you print the document, either on paper or to the screen. At this stage you cannot alter anything but must return to edit mode.

The on-screen capability of SCRIBE is very good. Underlining can be seen in operation although you must edit it into the text after writing the document rather than being able to turn it on and off as you go along.

Using SCRIBE I miss the Shift cursor keys in VIEW which allow you to move along a line one word at a time. However VIEW will not move the cursor to the right hand end of the previous line when the cursor reaches the left hand margin and this and other drawbacks create a niggling handicap. Neither program is perfect in terms of the cursor commands. The edit facilities are shown in figure 3.

SCRIBE permits far better control of the printed document than VIEW. The Printer driver generator program that is available for VIEW does make use of the features in a range of printers but the codes for obtaining the commands, although superficially easy to use, are clumsy for out of the ordinary functions such as one and a half line spacing. SCRIBE presents you with 18 global options to change the format of the text or to switch between a serial and a parallel printer.

Once you have established the conditions that are to apply to a particular document you can save them with the text so that they will come into operation when you access the document again. You can alter the master disc to make the program boot up with a different set of default values — a clever combination of firmware in the Eprom and software on disc.

Figure 3. Edit commands.

	VIEW	SCRIBE

Mail merge	Yes (limited)	No (database *)

CONCLUSIONS

- Both VIEW and SCRIBE are more powerful and easier to use than Wordwise. SCRIBE works in much the same way as a commercial word-processor such as the Wordplex series. It is a deliberate, careful program well suited to professional computer users, that is people whose livelihood depends on not making mistakes and getting work done on time.
- If you work under great pressure producing short documents such as press releases then VIEW will be marginally faster to use. You must set against this the continuing errors in the VIEW program such as the failure to recognise a full file specification.
- The documentation for VIEW is quite long but curiously incomplete.
- VIEWINDEX and the VIEW Printer Driver Generator program add to the facilities in VIEW but the combination of an Eprom and disc in the SCRIBE package is flexible and powerful. An integrated database package for SCRIBE will be on the market when this article is in print.
- Both VIEW and SCRIBE are good wordprocessors and you should try to test both before deciding which to buy. Probably I shall use SCRIBE for most of my writing — articles and books — but VIEW is no bad choice either.

COMPETITION of the Year

WHEN WE SET the Competition of the Year we thought you would find it a doddle. Most of the quotations contained a clue to the personalities who said them. The others could be found by a process of elimination. Who else but Acorn supremo, Herman Hauser, could have talked about leapfrogging Clive Sinclair? And surely Douglas Adams is the only one who makes jokes about computers.

But only a third of the entries matched up the quotations correctly, with more people stumbling at the second quote than any other. This was said about the Spectrum in 1982 by an unusually flippant Clive Sinclair. The correct order of personalities was as follows: 6, 7, 5, 8, 2, 4, 1, 10, 3, 9.

Clive Sinclair's quip was perhaps a little too close to the bone. A large number of the quotations submitted as tie-breakers were about Sinclair's delays and the claimed unreliability of his computers. Paul Mummery, 48 Woodland Gardens, N. Wooton, King's Lynn, Norfolk had the Queen waiting to knight Clive Sinclair: "What do you mean, Clive Sinclair might be a little bit late?". This wins him a VTX-500 modem for his Spectrum.

The best quote along these lines came from K. Joughin, 32 Woodlea Road, London N16, who wins the Yamaha CX-5M for "Never deliver today what you can deliver in six months' time". Tactfully attributed to A Computer Manufacturer, we felt this struck a suitably sonorous and pithy note. A. Goodsell had the same idea expressed slightly differently and wins a copy of Melbourne House's adventure program, Sherlock Holmes.

D. Walker, 16 Manor Gardens, Hunmanby, Filey, N. Yorks, almost got it right with: "So, Merlion, we are agreed, Mr Walker of Hunmanby will take the first prize", attributed to the Editor. What the Editor actually said was: "Mr Walker shall have a modem".

The other modem goes to BBC owner J. Watmough, A16 Hepburn Hall, St Andrews, Kingdom of Fife, Scotland who had Herman Hauser saying, "Well, has anyone run a power station with a ZX-81?".

We awarded a day at the controls of a Rediffusion flight simulator to M. Burton, 15 Boswall Quadrant, Edinburgh. His inspiration was: "O Romeo, Romeo, wherefore art thou Romeo — Silence, fair maid, I hath nearly scored a million at Pac-Man". P. Aylin's quote was "I never win anything in these bloody competitions". Not in itself original but we were touched by his rather earnest "N.B. this can only be funny if I actually win something" — for which he wins a copy of Sherlock Holmes.

For the rest, copies of Sherlock Holmes to A. Karhumaki, D. Tordoff, B. Allan; and copies of Elite to N. Olner, S. Cunningham, T. Hunt, C. Fraser, F. Hatten, A. Furness, J. Hammond, M. Simper, and I. Davidson win themselves a binder each.

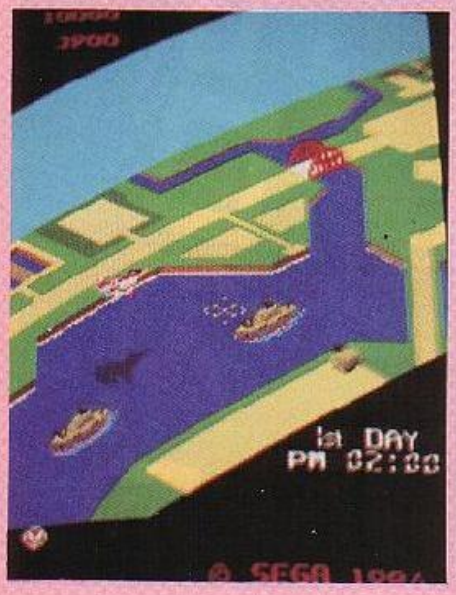
INTO THE A

It seems that what happens in the arcades is a good guide to what will happen on home micros. Meirion Jones investigates.

WHEN CHARACTERS like Pac Man sprang from the screens of the expensive purpose-built consoles lurking in pub corners on to home computers everyone was amazed.

Back in 1977 if you wanted to play Space Invaders at home you had to buy a £1,500 monochrome arcade monster. If you were lucky you could even have colour — although the conversion looked as if it had been done by an over-enthusiastic Blue Peter presenter.

"Well all you need for this toy is a black and white video game and three strips, red green and blue, of see-through sticky backed plastic, just stick the plastic on the screen and there you have it. Super. Next week Eugene will be showing you how to build your own software house, and Clive will tell you how to deliver a micro within 28 days. Great."



And when you finally tired of zapping invaders it would cost you another £1,000 to change to a different game. Within two years most arcade games make the transition to the home micro often losing little but price on the way. Machines like Atari's £130 800XL makes a surprisingly good alternative to pumping cash into a coin slot if you want to play Pole Position or Pac Man, and you can have a whole library of different games for a few tens of pounds.

So if we want to look at the action games of the future for our home computers the first place to look is today's arcades. Obviously adventure games which may take hours or days to play are developing faster for the home than they are for the coin machines. There the operators are looking to make a fast buck.

Even so, the graphics are increasingly emulating those of their arcade cousins, despite the advantages that custom video circuitry gives the slot machines. Often they use the same processors — Atari's latest System 1 machine for instance which is introducing Marble Madness to windswept seaside piers and unswept motorway service areas around the country is based around Motorola's 68010 — a chip off the same silicon block as the 68008 in Sinclair's QL.

Even the technological edge which laser-based games such as Firefox and Mach 3 have given the arcades is about to be nibbled away by the likes of Pioneer with its MSX micro plus laser disc home system — *Your Computer* December 1984. The Pioneer will come with the relatively crude Sega Astron Belt which launched the first wave of laser slot machines in 1982.

Astron Belt used a deliberately degraded Star Wars style background film on video in the hope that the relatively crude computer-generated profile of a spaceship which you guide to the death star would not appear too artificial. Its successors had different strengths, Atari's Firefox put more effort into the computer animation while Mach 3's appeal stemmed from its power to convince you that you really were manoeuvring an F-15 hurtling over the tree tops. Even if you occasionally wondered how the enemy attack helicopter managed to fly backwards at 500 miles an hour just so you could get a clean shot at them.

But the latest generation of laser generated cartoon games — like Super Don Quixote — would make Hanna Barbera drool. You can sit and watch the entertainment rather than play yourself as a would-be windmill tilter guides the Don past hazards new fencing off giants or skipping from rock to rock to avoid being swept off in a flood.

Unfortunately the graphics have sometimes outstripped the abilities of the writers to make the games challenging. It is easy to see why Minoru Arakaura — the American President of Nintendo, one of the Japanese companies which has been at the forefront of arcade entertainment — says "there are no real games on laser yet; it is just a matter of reflexes and timing. No skill or strategy on the part of the player is involved."

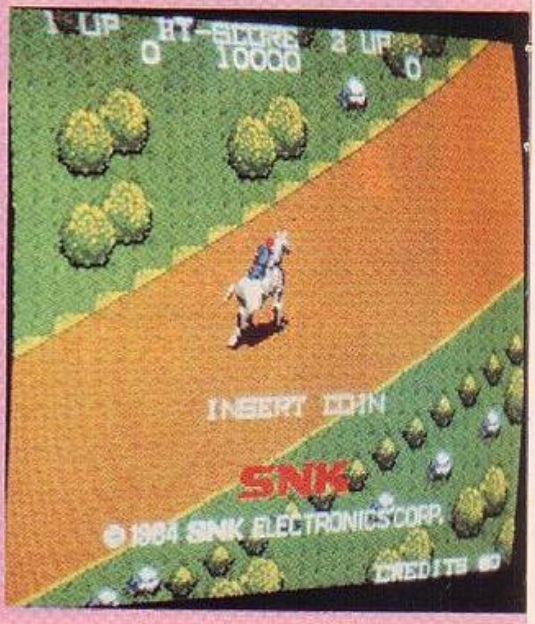
But then again Nintendo has no laser games of its own so perhaps its just sour rice on his part.

It will be a long time if ever before home systems can hope to compete with rides like Doron's "swear-you-are-there" SR-2 which looks like a squashed minibus on hydraulic rams but is actually a sophisticated simulator designed for amusement parks and big arcades.

It was demonstrated for the first time in this country at the January 1985 Amusement Trades Exhibition International at Olympia. Up to a dozen people can take their seats in the SR-2 and when the doors close and the front screen lights up you soon lose any feeling that you are watching a film as the module you are in starts to tip and sway to complete the illusion of motion.

At the show a bunch of sober suited, cynical sales executives joined me for what was billed as a roller-coaster ride on the SR-2. Everyone was suitably impressed but unenthusiastic when the simulator tipped 45° backwards as the front view showed the first slope when the roller coaster was cranked up.

Then after reaching the top and starting the long descent the speed with which the



RCADES

hydraulic rams were able to tip us backwards and forwards and side to side as we went through the dips and bends shook everyone out of their complacency. When we hurtled into a shadow and out the other side to find ourselves flying free over a river there were 11 gasps and a cry of "Holy smoke" from an alarmed but polite middle-aged American.

Even more startling was the run down a bobsleigh track which followed it — now we could understand why they asked us to wear seatbelts as the cabin snaked from side to side through the icy bends, before emerging on a race track in severe danger of crashing into a Porsche.

This first SR-2 in this country will go to Bicton Park in Devon — there are already a few of an earlier model in places like Blackpool — but if you want one of your own I am afraid it will cost you £80,000 plus £1,200 for every new film and software module you order.

Money is the name of the game for arcade operators and Paul Moriarty of Taitel, one of the biggest distributors of machines in Britain, which originally brought Space Invaders to these shores has to decide which of the many games he is offered will be the winners. In a typical week he might get three different new arcade games, often from Japan, which come on interchangeable circuit boards or discs if they are for the lasers.

The boards are getting smaller all the time — the latest batch is notebook sized. All you have to do is slot one in and change the labels to turn your Pacman machine into Pac Land. The TV screen is often on a turntable so you can convert the console to an upright game like Crown Golf in seconds.

He tries them out at a number of test sites — the list is secret and the places are rotated as a precaution against piracy. If the take is good, an exceptional new game can take as much as £80 a day on one machine. Then Taitel will buy up to 500 boards in one go, and at £500 to £700 a board that can be a lot of money.

Piracy poses the same sort of problems as elsewhere in the computer industry. In the early days the producers were naive about copying but now every board comes with a security chip — although it is only a matter of time before that is broken and then copies are produced by the thousand — often made in Taiwan. When the locations of test sites have leaked out, says Paul "it has been known for an employee of another firm to go in and rob the board."

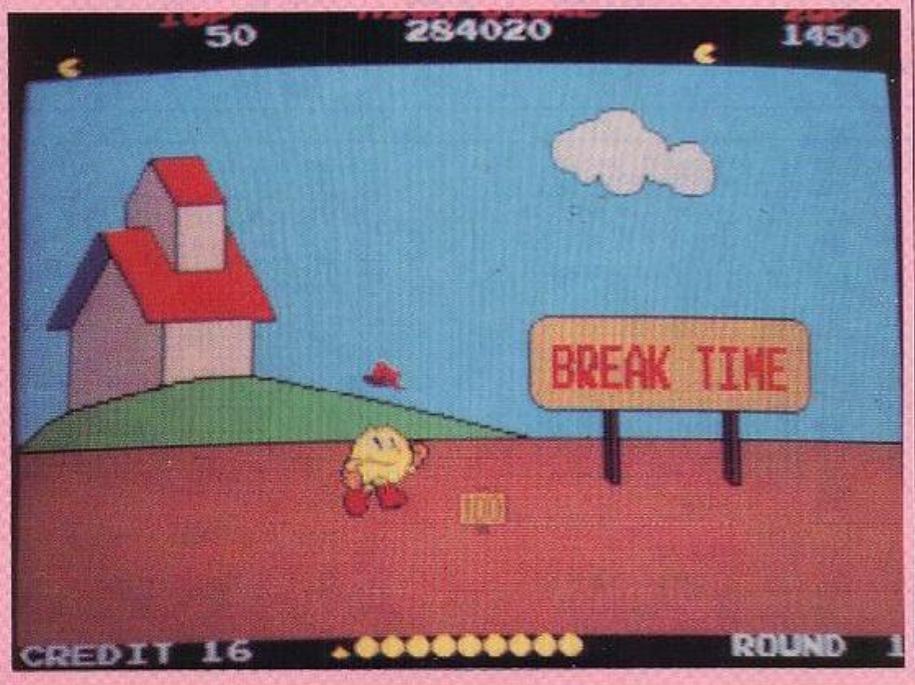
At least laser-disc based games are much more difficult to copy by like many others in the business Paul still has his reservations about them. "They have to be made cheaper" he says and with price tags of £2,000 to £5,000 for a complete laser system compared with about £1,300 for its conventional equivalent you can see what he means.

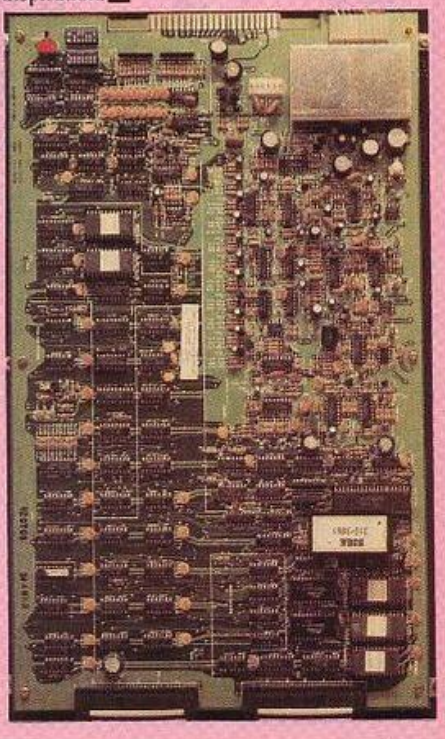
Machines are getting bigger — Sega's GP World has two TV screens, Atari's TX-1 three — but not necessarily better. Paul's own favourite game is still Qix which he thinks was ahead of its time "they should re-release it now" but he thinks that the newer "conventional games are getting as good as laser".

He can point to games like those shown on this spread — Pac Land with its cartoon quality graphics and Future Spy which takes the Zaxxon idea a whole step further. Gladiator, also shown, he is less enthusiastic about because despite some very good graphics in chariot racing sequences it is too much like the racing games which dominated 1984's Olympic summer.

Games like Track and Field and Hyper Sports were astonishingly successful but they caused their own problems as consoles took a hammering from would be sprinters and long jumpers. Those companies that opted for the joystick rather than buttons to control what was happening on screen soon realised their mistake as the sticks took a year's wear in a couple of weeks. Sometimes the strain can be too much — in the case of Buck Rogers Taitel eventually had to fit £100 cast iron joysticks to take the punishment.

Many of the latest Japanese games stress individual combat — like Punch Out and Karate Champ II, while tie-ins with films such as Indiana Jones and the Temple of Doom and television series are still popular sources for inspiration. ■





PINBAT

WE HAVE TRIED to make a game that is different to traditional Pinball but which retains the feeling that skill and judgment, as well as a certain amount of luck, are all involved. Machine code is used for animation effects, score display and the bats, leaving all control of the "marble" in Basic, but using an array system to speed things up.

As with our other ZX-81 programs nearly everything is done by direct Poking and Peeking, to and from the ZX-81's character-mapped screen memory so everything in the game 'actually exists' on screen, not just as co-ordinates. Note that the Demo mode runs at about half speed.

It is possible for the marble to collide with any of 24 different types of object — left wall characters, right wall, gates, bats, etc. — and in most cases a different routine is needed to provide a suitable reaction, such as a bounce, a bonus, a special effect, etc. The most obvious approach is to use a series of If . . . Then checks to sort out which object the marble has hit and so which routine to call, but even in a fast Basic this would give an uneven response and a noticeably 'sticky' bounce of the marble.

Pinbat uses a more structured system, where the codes of the characters that the marble hits are read directly from off the screen and used to slice out individual elements from an array which in turn contains *pre-arranged* line numbers to Goto.

An example will make this clearer; Look at line 40; X is the marble's position onscreen, so X + DI — direction — is the marble's next intended position, and the Peek of this gives you the character that the marble is about to "hit".

Now assume that the marble has just hit a 'minus' character. The Sinclair Code for this character is 22, so the 22nd element of the array H gets selected and this contains the line number of the required routine to Goto in this case the "lost marble" routine at line 470. In this way the single line 40 can branch directly to all the necessary routines, most of which will then go back into the main loop.

Line 4280 specifies the line numbers associated with each of the characters that the marble could hit, and is a handy reference. In practice, all the array subscripts are shifted up by one — by line 4300 — because Sinclair arrays do not have a zero element.

A little extra planning-ahead is needed to initially fill up the Goto array with the correct line numbers, but the advantages are more than worth the trouble. The method is practically independent of the number of choices to be made, and so could be expanded even further without loss of speed, but at present only Sinclair Basic allows this particular type of computed Goto. In some ways it is more powerful than an On Goto command.

Note that the first element of the Goto array contains 10, so that when the marble is hitting Chr$ zeros — i.e. travelling through empty spaces — line 40 will Goto line 10 to continue the main loop. Also, as a safety precaution in case of typing errors, *all* those elements of the Goto array that correspond to unused characters have been given a default value of 460, so that if the marble hits something it shouldn't, say a score-digit character, then line 40 branches to line 460 which prints "error" and stops the program before the marble can plough on through addresses that

Disassembly.

Dave Rogers and Colin Hogg challenge you to become a pinball wizard on the ZX-81.

shouldn't be Poked!

This includes the ZX-81's dreaded Newline characters, lurking unseen down the side of the screen, the Poking of which invariably results in irretrievable crashes.

Something else that can't be seen onscreen is a "character 90" just above the launch channel. It is Poked there by line 670 — it can't be printed — and it is not seen because there is no bit-pattern for it in the ZX-81 Rom so it just looks like a space character, but it is used here as an invisible trigger. When the marble hits it then line 40 branches to line 440, printing a 'lid' over the launch channel to seal it off.

Line 230 looks odd, but it is the shortest way of selecting one of nine different directions at random, by using the Codes of various Chr$ sliced out of a string to yield values rather than doing calculations.

Note that when any of the machine-code sub-routines return to Basic their value is 0, so wherever you see "+USR" in the listing this is just a short way of calling a machine-code subroutine, it does not affect the numerical value of whatever calculation it was included in.

Usr 16514 Scrolls screen line 22 — columns 1 to 28 — sideways by one space, with wrap-around — this moves the various bats — *either* under Inkeys control when in play mode, or in response to an automatic routine when in Demo mode. All the other m-code subroutines return to Basic *via* this bat-move routine, thereby giving more continuous bat control.

Usr 16588/Usr 16608 (Separate entry points into the above routine). Scrolls line 22 left/right respectively. This is done simply by swapping adjacent *pairs* of display file bytes and then moving in sideways increments of one, repeating 28 times in all. Wraparound is achieved automatically when using this method since after a complete line of swaps the line itself will have moved one way but the end character will have been 'bucket-brigaded' across to the opposite end — work it out!

The "autobat" routine starts at 16536. It scans the screen to find the bat and the marble, works out their relative column positions and then calls whichever of the above scroll routines is needed to move the bat to catch the marble.

Usr 16694 Scans the screen (lines 4 to 16) for "asterisk" and "plus" characters, and wherever one is found swaps it for the other giving an animation effect. The next time it is called it will swap the characters back to their originals.

Usr 16689 As above, but scans for left and right brackets characters.

Usr 16699 Same again, but for characters whose Codes are held in addresses 16690 and 16691 i.e., redefinable by Poking those addresses.

Usr 16638 Adds one to the score (which is held in a permanent store area, see below) then copies this into the screen.

Usr 16652 Copies the score onto the screen but without adding anything to it.

Poke 16660 Spacing between digits when score is copied onto the screen.

16734 to 16740 Score store area. Before each game, lines 860-880 in the Basic reset these bytes to "zero" characters.

First enter 'Fast' mode then type in, as line one, Rem plus exactly 230 of any characters. Now type in the whole listing and, *resisting* the temptation to Run it straight away, Save and label two backup copies!!

When first Run, the machine code gets Poked into the Rem and is sum-checked as it goes in. Having corrected any errors, as indicated, and checked that the program works, you can then erase all lines from 7000 onwards and Save a few working copies using the Autosave (goto 3000). Always Clear before Saving otherwise you will Save the array on tape, making loading unnecessarily long — the array — is 1k in actual size, since each number = 5 bytes — also select "slow" mode.

Please check carefully the following lines — "gas" indicates characters obtains using graphic mode and Shift: All greys are gsH.

230	gsW, gsR, gs6 inverse 7, 8, 9, keywords Code, Val, Len. *No* extra spaces.
960	inverse right bracket, 30 spaces, inverse left bracket.
970	inverse left bracket (gsI). 980 gs2, gsR, gsH, gsW, gs4.
2460	(all inverse) Q, –, Q. Second string, Y.
4260	(This line is so important it is checksummed). gsQ, gs7, gsW, gs2, gsR, inverse Y, inverse Q, inverse space, gsN, gsJ, gsM, gsF, gsG, gsH, gs0, gsI (rest are normal characters).
1010	gsF, gsJ and inverse zeros are used.
2040	one space between the brackets.
4090-4100	gsN and gsM are used.
4410-4430	gsD and gs6 are used. Type exactly as shown, some words 'contain' marbles for use on their screen.
5110	2 inverse spaces, inverse 0, 2 inverse spaces, inverse 0, Inverse space, 7* gsF, inverse space, inverse 'hogrog', 7* inverse spaces, gsJ's and gs B's.
440	inverse left bracket, 2 inverse spaces.

When playing, use two fingers of one hand

(continued on next page)

(continued from previous page)

rather than two hands, it's much easier to control the bats. The wraparound can sometimes be used to advantage to quickly reach marbles on the opposite side of the screen. You score points by hitting stars or rollover targets — inverse numerals.

At sidewalls the marble obeys simple laws of reflection, but at stars or grey blocks the marble gets thrown off at a *random* angle. At "triboosters" the marble is deflected whichever way the tribooster characters are pointing at the time, and then a new tribooster, of random type, gets printed, this being essential to prevent the marble from ever getting stuck in an infinitely recurring pattern of bounces.

Physicists may like to note that with few exceptions marble motion is assumed to be Newtonian, frictionless, perfectly elastic and in zero gravity(!).

Main variables.

H(N)	'On Hit Goto' array.
X	Position of marble on screen (start of display file plus an offset).
DI	Direction of marble — 1 = right, 33 = down, etc.
M$	Messages and Marbles Rack
M	Pointer, keeping track of progress along M$.
B$	Bats.
SN	Screen number.
DEM	Demo mode if set to one, Play mode if zero.
D$	Demo select, input by player.
ANG	Angle of score display.
P$	Printing strings.
S$	Screen storage strings
D, A	Down/Across printing co-ordinates.
JDR	Undefined variable to stop program on errors.

Typed copies of this program are available for £2.50 from:

11 Carnarvon Road, Walton, Liverpool, L9 1EB. The cassette also includes two of our other ZX-81 games.

Line-by-line.

7	New direction is 33 or −33 to 'channel' marble straight up or down.
8	Reverses the newly picked direction in the case of the marble hitting the channeller directly from underneath.
10-40	Main loop. Line 40 is particularly efficient (see text).
50-110	Tribosters. Three entry points for three different tribooster directions, but all return via 110 which prints a new tribooster of random type over the old one.
130-150	Dropgates. 130 swaps characters 137 and 138 to animate gate.
160-190	Sidewalls. Simple laws of reflection are obeyed e.g., at left wall, if collision is in south-west direction then DI = 32, rebound is south-east with DI equal to 34.
200-280	Flingers. Marble is thrown off at any of eight directions. To choose these at random a string is sliced which contains characters that will yield the required numbers — after 164 removed from them.
260	If chosen direction takes marble into a clear space then go back to main loop, if not, then stay in flinger routine until a clear route is chosen.
290-330	Rollover targets. Line 310 peeks the character and adds one to it thus incrementing the rollover number each time marble passes over it. The bracketed function resets nines to zeros.
420-430	This caters for the occasions when the marble hits the edge of the score display, causing the marble to run diagonally across it.
340-390	Bounces off bat. Bats are made from three different characters, each causing the marble to bounce off at a different angle.
400-418	Bonus routine.
460	Stops the program if marble hits an unspecified character, this especially protects against 'newlines' being poked and causing a crash. Program is routed to this line because all unspecified elements of the Goto array are filled with value 460.
440-450	Prints "lid" over launch channel when marble hits the — invisible — character 90 present onscreen just above the channel.
470-492	Marble lost. "Twinkles" marble where it hit the baseline.
600-620	Start new marble.
630-660	Moves the string M$, which contains "messages and marbles" across the bottom of the screen until either a marble character is detected whereupon the 'ready to launch' routine at 680-690 operates or a fullstop character is detected, which is used as a trigger for jumping to the "next screen" routine.
692-696	Slides a gate open at top of launch tube.
700-800	Miscellaneous decisions.
730-770	Game-over routine. Calls all the animation scans at once, until player decides to play again or go into demo mode.
800-820	Demo decisions.
860-880	Pokes "score store" bytes to character zeros.
900-992	Draws over and thereby erases old screen with a new one.
1000-1070	Select different strings containing draw instructions for screens 1-6
1100-1160	Extracts print co-ordinates from strings and passes these to draw subroutines.
2000-2480	Draw routines: 2010 draws whatever is in P$, 2030 draws a "channeller", 2090 draws a "rollover target", at 2400 there is a separate routine to draw all of screen 3 — bonus screen.
3000-END	Autosave /Initialisation/ presentation screen/machine code data, and loader. ■

MICROPRIDE LTD.

ORIC JOYSTICK

Suitable for use with Commodore 64, Vic 20 and Atari **£9.95**
Top Fire Button and Side Fire Button Fast Action
Interface for Oric 1/Atmos **£11.50**
Interface for Spectrum ZX81 **£7.95**

TRACKBALL

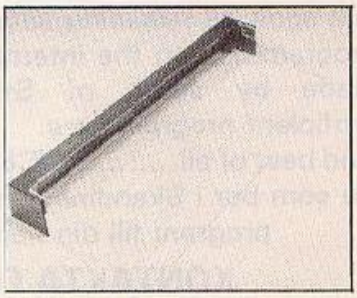
Improve your scores and skills with the Computek Trackball. Suitable for use with Commodore 64, Vic 20 and Atari **£17.95**
Interface for Oric 1/Atmos **£11.50**
Interface for Spectrum ZX81 **£7.95**

COMPUTEK JOYSTICKS

For use with the BBC Computer. Metal shaft, 2 fire buttons **£12.95**

PM C16 CASSETTE DATA UNIT

Designed for use with Commodore +4, Commodore 64 and Vic 20. This cassette unit is a device for storing and recalling computer programs on ordinary cassette tapes. It can be used for saving programs you have written and want to recall for later use. It can also be used to read pre-recorded programs that you have purchased. **£24.95**



DUST COVER

Clips onto the back of the Commodore 64. Pivits up to allow use of keyboard, fully moulded, clear plastic dust cover. **£7.95**

ORIC AND SINCLAIR COMPUTERS

Oric 1 computer 48K £85 (£82) £92. Oric Atmos computer 48K £171 (£158) £168. Oric colour printer £134 (£123) £149. Sinclair flat screen TV £113 (£105) £116. Sinclair Spectrum Plus Computer £182 (£178) £187. Sinclair QL Computer £406 (£385) £410. Sinclair Spectrum 48K £131 (£131) £143. Microdrive £51 (£50) £60. RS232 Interface 1 £51 (£50) £60. Special offer: Microdrive + Interface 1 + 4 cartridges £102 (£100) £120. Blank microdrive cartridges £5.50 (£6) £7. Standard floppy disc interface for Spectrum £102 (£92) £112. (See Cumana disc section for suitable disc drives) Fuller FDS keyboard for Spectrum £82 (£74) £82. Fuller master unit £56 (£56) £52. Interface 2 £20-£45 (£20) £24. 32K memory upgrade kit for 16K Spectrum (issue 2 and 3 only) £31 (£28) £30. Spectrum Centronics printer interface £51 (£47) £52. ZX printer has been replaced by the Alphacom 32 £71 (£69) £82. 5 printer rolls (state whether Sinclair or Alphacom £13 (£16) £21. ZX computer £45 £44) £54. 16K ram packs for ZX81 £26 (£25) £30.

COMMODORE COMPUTERS

Commodore Oric Starter Pack £145 (£142) £162. Commodore Plus/4 £305 (£281) £301. Commodore 64 £222 (£215) £235. Convertor to allow most ordinary mono cassette recorders to be used with the Vic 20 and the Commodore 64 £9.75 (£9) £11. Bargain package: cassette convertor + compatible cassette recorder £37 (£38) £44. Commodore cassette recorder £43 (£44) £50. Printer interfaces for Vic20 and the Commodore 64 Centronics £45 (£41) £46. RS232 £45 (£41) £46. Disc drive £233 (£209) £231. 1520 printer/plotter £165 (£149) £156. MP3801 Printer £235 (£20) £245. Light pen £29 (£29) £33.

ACORN COMPUTERS

Electron £133 (£179) £199. BBC Model B £404 (£357) £387. Kenda double density disk interface system £149 (£131) £141. See below for suitable disc drives.

CUMANA DISC DRIVES

To suit disc interfaces of Sinclair Spectrum, BBC B and Videogenie. Single: 40 track single sided £178 (£158) £178, 40 track double sided £218 (£195) £215, 80 track single sided £207 (£186) £206, 80 track double sided £224 (£209) £229. Dual: 40 track single sided £299 £280 £329, 40 track double sided £395 (£353) £393, 80 track single sided £372 (£334) £374, 80 track double sided £437 (£390) £430.

PRINTERS

Oki Microline 80 £138 (£135) £161. Brother HR5 £162 (£146) £170. Shinwa CT CP480 £237 (£228) £259. Canon PW1080A £382 (£344) £374. Epson RX80 £277 (£251) £282. Epson RX80F/T £314 (£286) £316. Epson FX80 £399 (£356) £388. Combined matrix printers and electric typewriters: Brother EP22 £173 (£166) £186, Brother EP44 £258 (£235 £260. MCP40 Oric Colour printer/plotter £134 (£123) £140. Interfaces to run the above printers from Vic and the Commodore 64 £45 (£41) £46. We can supply interfaces to run the above printers from Sharp computers £58 (£52) £55.

UK101, SUPERBOARD AND VIDEOGENIE

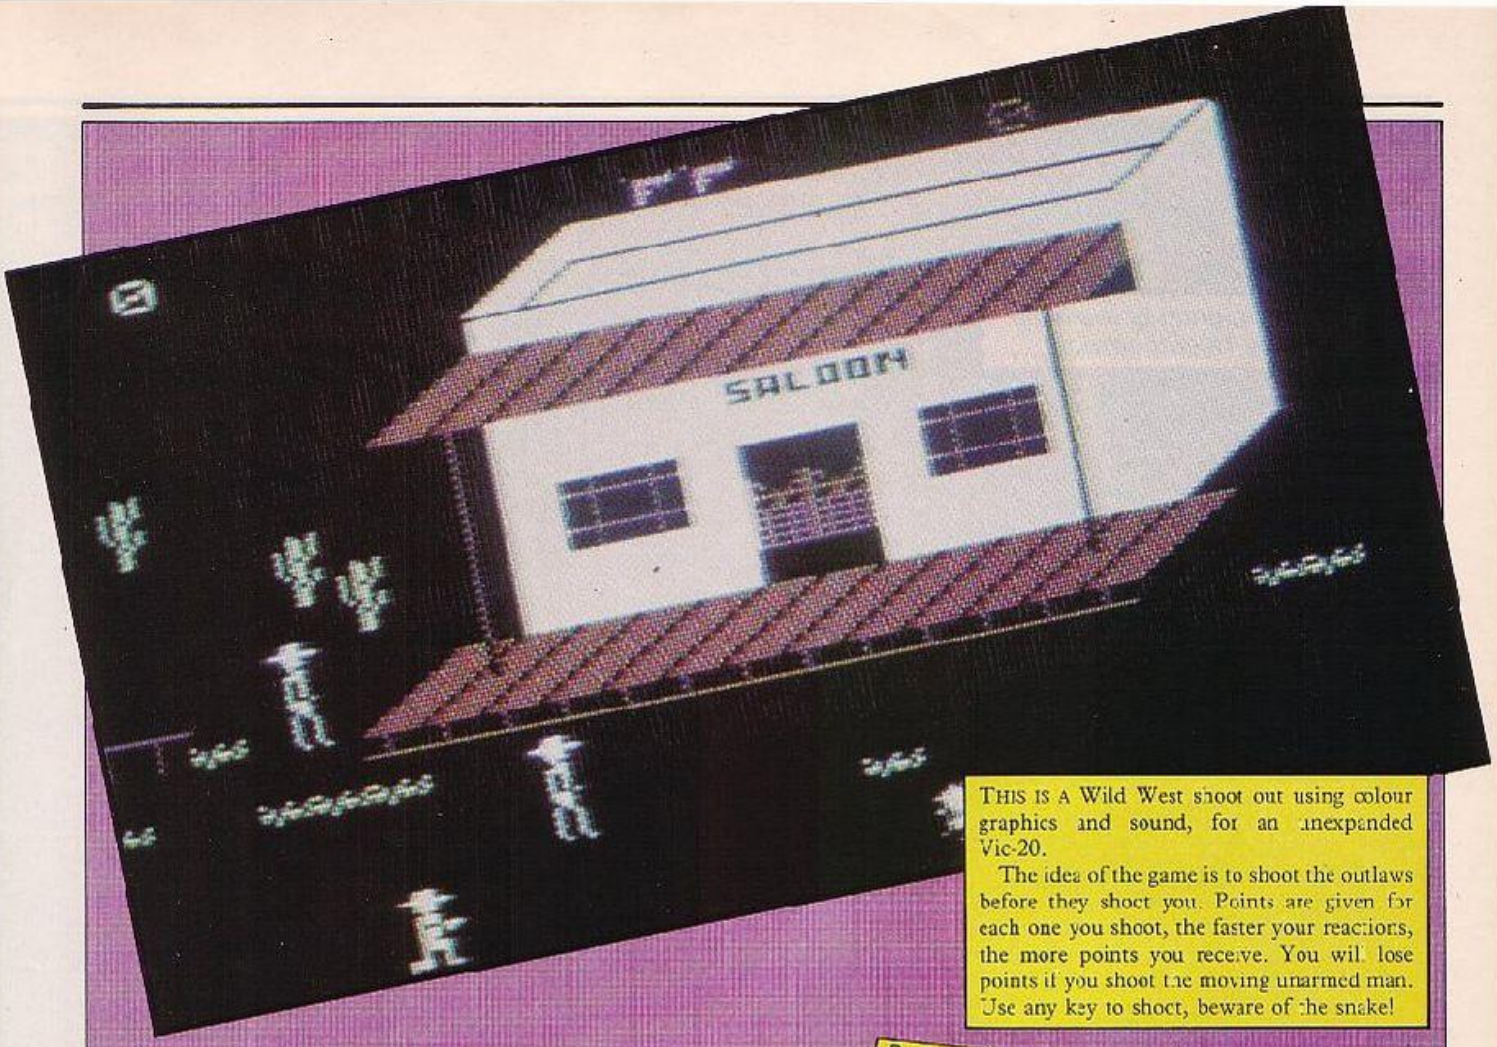
We still support these Computers. Write for our list.

COMPUTER REPAIRS

We offer a world-wide repair service. Write for a quotation.

SWANLEY ELECTRONICS
The Computer Export Specialists.
Dept YC, 32 Goldsel Rd.. Swanley, Kent BR8 8EZ, England.
Tel: SWANLEY (0322) 64851.

Official orders welcome. UK prices are shown first and include post and VAT. The second price in brackets is for export customers in Europe and includes insured airmail postage. The third price is for export customers outside Europe (including Australia etc) and includes insured airmail postage.



VIC GUN FIGHT

THIS IS A Wild West shoot out using colour graphics and sound, for an unexpanded Vic-20.

The idea of the game is to shoot the outlaws before they shoot you. Points are given for each one you shoot, the faster your reactions, the more points you receive. You will lose points if you shoot the moving unarmed man. Use any key to shoot, beware of the snake!

This program is available on the Telsoft service.

Julian Wood, with the help of an STS, rids the Spectrum of bugs — the creepy crawly kind.

SOMETHING I'VE always wanted is my very own Spray Test Simulator or STS. Having waiting for over two years for one to be released on the Spectrum, I decided to write one myself..

This particular STS is equipped with three different sprays designed to eliminate three different types of creature, plus another spray which disintegrates TNT. Your aim is to give these sprays the fair test they deserve. Your score will indicate whether you have the skill to become a professional STS operator — a score of a million is just about good enough! Spraymania runs on any ZX-Spectrum, and features smooth, colourful animated graphics and a lot of sound.

To enter Spraymania, first type in the Basic header program in listing 1, and save it using:

SAVE "SPRAYMANIA" LINE 0

In case you were wondering the

RANDOMIZE 51707

statement is essential. Also, the Border 1 statement is important.

Then type in the machine-code loader program in listing 3 and Run it. Enter each byte as shown in listing 2, taking care to check the checksum after entering each line. If you make a mistake in a line, enter 999, and a beep will sound, and you can enter that line again. If you enter a byte which is obviously wrong (less than 0 or greater than 255 — another tone will sound, and you can then enter the correct byte. When you have entered all the machine-code, and the checksum is correct, save the code after the leader program, using

SAVE "C" CODE 25000, 3400

Rewind the cassette and load the game.

On running, the program goes into demo mode, during which brief instructions — including the control keys — scroll smoothly across the screen. On pressing a key, the game starts with your spray-can appearing at the centre of the screen. At the bottom of the screen are the various sprays, and a bonus box in which the bonus appears every so often. To collect a spray, or the bonus, simply move your can over the relevant box.

- Whirlers (bounce around the screen like balls) = 50
- Gruesomes (vertically-moving faces) = 10
- Globules (move horizontally) = 25
- TNT = 100
- Bonus = 250

Unlike the moving creatures the TNT doesn't kill on touch but gradually changes colour until it becomes white and explodes.

For a copy of Spraymania on cassette, send a cheque or postal order for £1.90, to: Mr J.R. Wood, 22 Denver Hill, Downham Market, Norfolk, PE38 9BE.

FIRST AID

for your 64

Computers, like people, are fallible. They need the right combination of code and care to perform effectively in the business or the home. And that requires first hand knowledge from you to create a healthy operating environment for your Commodore 64.

Knowledge about machine language, about the lesser known qualities of the 64, about the disc drives, graphics, and about the tricks and tips to keep your 64 on line. That's why First Publishing has now launched in the UK a series of high quality books and software packages to provide a complete health care kit for your 64. Commodore 64 users throughout Europe have already found it a tonic. We think you will, too.

For a brochure on all the Commodore 64 books and software packages available from First Publishing, please fill in the coupon and send to: Amanda York, First Publishing, Unit 203, Horseshoe Road Horseshoe Park, Pangbourne, Berkshire.

MARS BUGGY

Get out of the rut with Vahid Azodi's machine code ride.

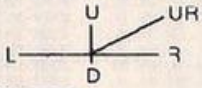
MARS BUGGY is a totally machine-code written game for the Commodore 64 and includes the following features:

- Raster interrupt driven smooth scrolling.
- Multi coloured sprites.
- Very fast and flexible control of buggy — space ship.
- Score and high score feature.

If you have not seen the game in the arcades here is a brief description. You control a buggy which can jump and fire bullets in horizontal and vertical directions.

The game is played on a scrolling screen which scrolls from right to left you have three lives at the beginning of the game and one life is deducted every time you fall into a ditch or hit a rock or get hit by a bullet from the space ships — enemies. The object of the game is to stay alive as long as possible.

You control your ship with a joystick only. Sorry keyboard freaks. The controls are:



F1 Pause the game.
F2 Restart game from the middle of another game.
' When the game is paused you restart the game by moving the joystick.
U Makes the buggy jump upwards.
UR Makes buggy jump up and forwards.
R Keeps buggy steady on the screen.
L Makes buggy go quickly to the left.

If the buggy is made to jump it will not be able to jump up again straight away so don't panic.

So always bring the joystick to the neutral position — n — after every jump If you don't, the buggy's wheels will lock and will not be able to jump.

Entering the game is very simple, just type in the program like a Basic game. Then remember to save it before you run it. When run the program displays the title screen and asks you to wait a while for the game to load. Be patient because it's a long wait. The instructions on the screen telling you to wait will change to — press fire to start. Put the joystick into port 2 and press the fire button and hey presto — the game starts.

If you don't want to type in the program there is a cassette available for £3.00 inc. postage and packing from: Mars Buggy, 22 Lorton House, West End Lane, London, NW6.

(continued on page 71)

You'd expect one of the best-selling home computers in Japan to have a specification list as big as its memory.

But the Toshiba HX10 doesn't just limit itself to that.

It was developed along with other Japanese home computers to operate on one language: MSX. You can swap programs, games, cassettes, even peripherals like disk drives, printers, and joysticks: they're all compatible with every other MSX computer.

All of which makes MSX the system of the future.

So if you want a computer that won't be obsolete in a few years, buy an MSX. If you want one of the best-selling MSX computers in Japan, buy a Toshiba HX10.

TOSHIBA MSX

FOR MORE INFORMATION ON THE TOSHIBA HX10 CONTACT TOSHIBA (UK) LTD., TOSHIBA HOUSE, FRIMLEY ROAD, FRIMLEY, SURREY GU16 5JJ. TEL: (0276) 681691.

Are you brave enough to enter the savage world of mighty Conan?

You've experienced his barbaric world in movies, novels and comics. Now Conan is ready to spring to life in your home.

So flex your muscles and prepare to do battle.

Your mission is to slay Conan's wicked rival and bring home a bounty of gems. Blocking your way are fire-breathing dragons, poisonous scorpions, vicious bats and other deadly adversaries.

If that wasn't enough, you also have to fight your way through dark caves and dangerous dungeons, while looking out for mysterious creatures waiting their moment to attack!

EPROM PROGRAMMER

AT LAST! for the Spectrum user. Put your programs, utilities, Assemblers into EPROMS for instant load from the unique ROM-SP

ROM-SP for Spectrum
Ingenious unit for Spectrum, with 2×28 pin sockets and a Reset button allows up to 16K of Basic or M/C program to RUN or LOAD instantly from EPROMS. Cabled connector and full extender card. NOTE: Does not disable Sinclair ROM £29.95

PROMER-SP for Spectrum
A brand new Spectrum programmer for 2764/128. Zero insertion force socket & software on tape. £29.95

PROMER 81-S for Spectrum
The very popular PROMER-81 for the ZX81 has been adapted to the Spectrum and the price kept low. NEW PRICE £24.95

ROM-81
Provides two 24 pin sockets for up to 8K of EPROM memory in the 8-16K area. Can use 2516/32 or 2716/32 £14.95

PROMER-81
A low cost reliable programmer for 2516/32, 2716/32 EPROMS. Requires 4×PP3 batteries NEW PRICE £24.95

DHOBI 1 UV ERASER
Compact. Mains powered. Safe. Fully cased. Up to 3 EPROMS £18.95

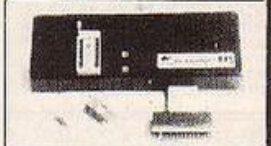
DHOBI 2 With automatic timer £22.95

CRAMIC-SP NEW for Spectrum
Ingenious software raged 16K non-volatile CMOS RAM to co-exist in the same area as Spectrum ROM. Easy storage and retrieval of BASIC, M/C or DATA on a 48K Spectrum £29.95

PRINT-SP NEW for Spectrum
Centronics Interface with standard centronics Cable. Plus free introductory offer SP WRITE text processor. £51.25

NIKE NEW for Spectrum/ZX81/ATMOS
Simple to use, rechargeable nickel-cadmium back-up power supply unit providing OVER 30 minutes extra life in the event of mains failure. £17.35

BLOPROM-SP
A uniquely sophisticated EPROM PROGRAMMER



STATUS NO. OF SYSTEM —HEX
EPROM TYPE —27-28
RAM START ADDR —4000
EPROM ST. ADDR — 0000
JOB LENGTH — 4000
TASK — CHECK

WHICH TASK DO YOU WISH TO DO
0) CHECK THAT EPROM IS CLEAN
1) READ THE CONTENTS OF EPROM INTO RAM
2) BLOW AN EPROM WITH DATA FROM RAM
3) VERIFY THAT EPROM DATA IS THE SAME AS IN RAM
Q TO QUIT R TO RESTART

FAST CODES AVAILABLE
D H PDR WOZ

Eprom programmer for the 2516, 2716/32/32A/64/64A/28/128A, yes even the 64A/128A from Intel. Check, Read, Program & Verify all or part of Eprom.
So immensely user friendly you'll hardly need the manual. Designed for the beginner but includes a single key entry route for the professional. Supplied as firmware, the m/c driver routine alone is worth more than the price of BLOPROM-SP. No Personality Cards or other additions, just a Spectrum. Several inbuilt safety features. On-board Vpp generation. 28pin ZIF socket. Cabled connector and extender plug. ABScase. £89.95

BLOPROM-81
As above but for ZX81. Programs 2516, 2716/32/32A,64 & 27128 £79.95

MAIL ORDER PROTECTION SCHEME

If you order goods from Mail Order advertisements in this magazine and pay by post in advance of delivery, *Your Computer* will consider you for compensation if the Advertiser should become insolvent or bankrupt, provided that:

(1) You have not received the goods or had your money returned; and

(2) You write to the Publisher of of *Your Computer* summarising the situation not earlier than 28 days from the day you sent your order and not later than two months from that day.

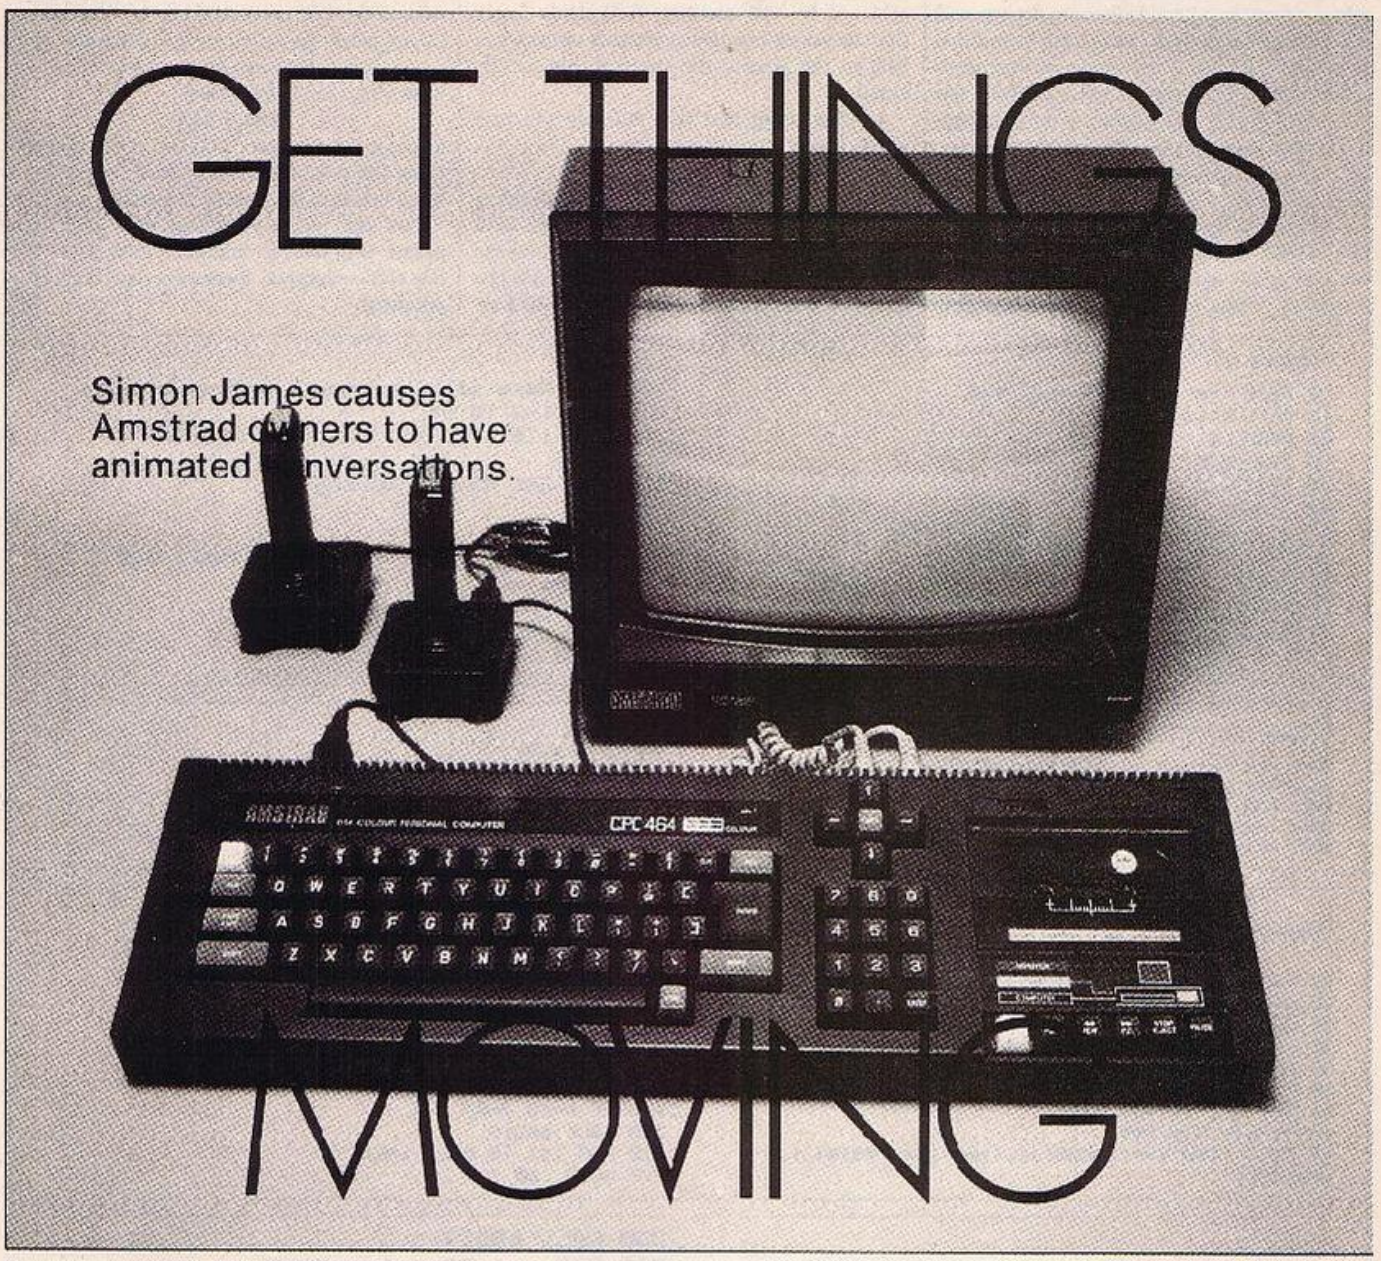
Please do not wait until the last moment to inform us. When you write, we will tell you how to make your claims and what evidence of payment is required.

We guarantee to meet claims from readers made in accordance with the above procedure as soon as possible after the Advertiser has been declared bankrupt or insolvent.

This guarantee covers only advance payment sent in direct response to an advertisement in this magazine not, for example, payment made in response to catalogues etc., received as a result of answering such advertisements. Classified advertisements are excluded.

GET THINGS MOVING

Simon James causes Amstrad owners to have animated conversations.



AN INTERESTING and very useful feature of the new Amstrad computer, is its Ink command. This enables you to redefine the colours available in any mode to those which suit you. The User Guide explains it by reference to pens and ink. For instance, in mode 0 there are 16 colours available, from a palette of 27 colours. This is like having 16 pens and 27 ink pots available and the ink in any pen can be changed. It is something like VDU 19 command on the BBC micro. As an example type in:

'Reset' (Press 'Ctrl' and 'Shift' and then 'Esc', holding all three down) INK 1,9 'Enter)

You will see that all the writing on the screen has changed colour — or shade if you have a green monitor. This is because when you switch on or Reset the computer, pen 1 is being used, and is set to colour 24, bright yellow. The above Ink command told the computer to change the ink in pen 1 to number nine, green. Try other numbers, for instance,

INK 1,15 (changes the ink in pen 1 to orange) until you get the hang of it.

This command can be used to produce animation — movement — on the screen. It is done by redefining all the available colours to the background colour, and making one colour at a time visible. Type in listing 1 and run it. You will see at the start, the screen being filled up with multicoloured vertical lines. Then most of them disappear, and a few start to move across the screen.

In actual fact, nothing is really moving. What happens is that lines are drawn using the 16 different pens. These pens are defined as various colours after a Reset or switch on. You can see what these colours are by reference to pages F3.2 and F3.4 in the manual. The program then changes the ink in all of these pens to black — the background colour — so the lines appear invisible. Then each pen in turn is filled with bright white, and the effect of movement is achieved.

Program 2 is the part of the program that actually changes the colours. Study carefully how it works and then type it in and save it. It can then be merged — see Ch.8 page 27 — into any programs you write which use this technique.

Program 3 shows the spectacular effects that can be produced by this useage of the Ink command. 15 circles are drawn — using Sin and Cos, see page F3.13 — using different pens, and each one illuminated in turn.

This method can also be a lot faster than other ways of animating, because all that is required is a few lines of Basic, and several objects at once can move, where other methods would have to deal with each in turn — and would therefore be slower. Program 4 is a good example of this. Pens 2 to 15 are used for the movement, pen 0 being the background colour, and pen 1 the pen used for the writing, and the boxes. If pen 1 was used in the animation sequence, the boxes would flash on and off. Note that this effect could be quite useful, but was unecessary in this program.

Another point to note is that in programs 1, 3 and 4, if you break, using (Esc) (Esc), and Run them again, the initialisation sequence

(continued on next page)

(continued from previous page)

where the multicoloured lines are drawn, will be invisible since all the pens have been filled with black ink, and are being written onto black paper. So do not assume something has gone wrong with the program if nothing happens for a few minutes. This is most noticeable in program 3 with the circles, in which the circles take a while to draw.

In programs 3 and 4 I have included a delay loop which can be altered by changing the variable 'delay' defined at the beginning of the programs. If you remove the loop altogether, you will get some idea of the speed that can be achieved by this method. And don't forget that no matter how many moving objects you had on the screen, the speed would be the same!

Another thing that was put into the programs was:-

CALL &BD19

This is a call to the machine operating system which makes the computer pause until the next frame, — i.e. until a full sweep of the screen is finished by the mechanism inside the monitor. Each frame takes about 1/50 of a second, so this does not slow down the program noticeably, but prevents some strange effects taking place. As an example of what can happen without this instruction, remove line 205 from Program 1, by typing:

205(Enter)

and run the program. You will see that sometimes there are two vertical lines close to each other crossing the screen, sometimes just one.

You can now try writing your own programs — if you feel confident enough! — using this technique, because it has enormous potential. ■

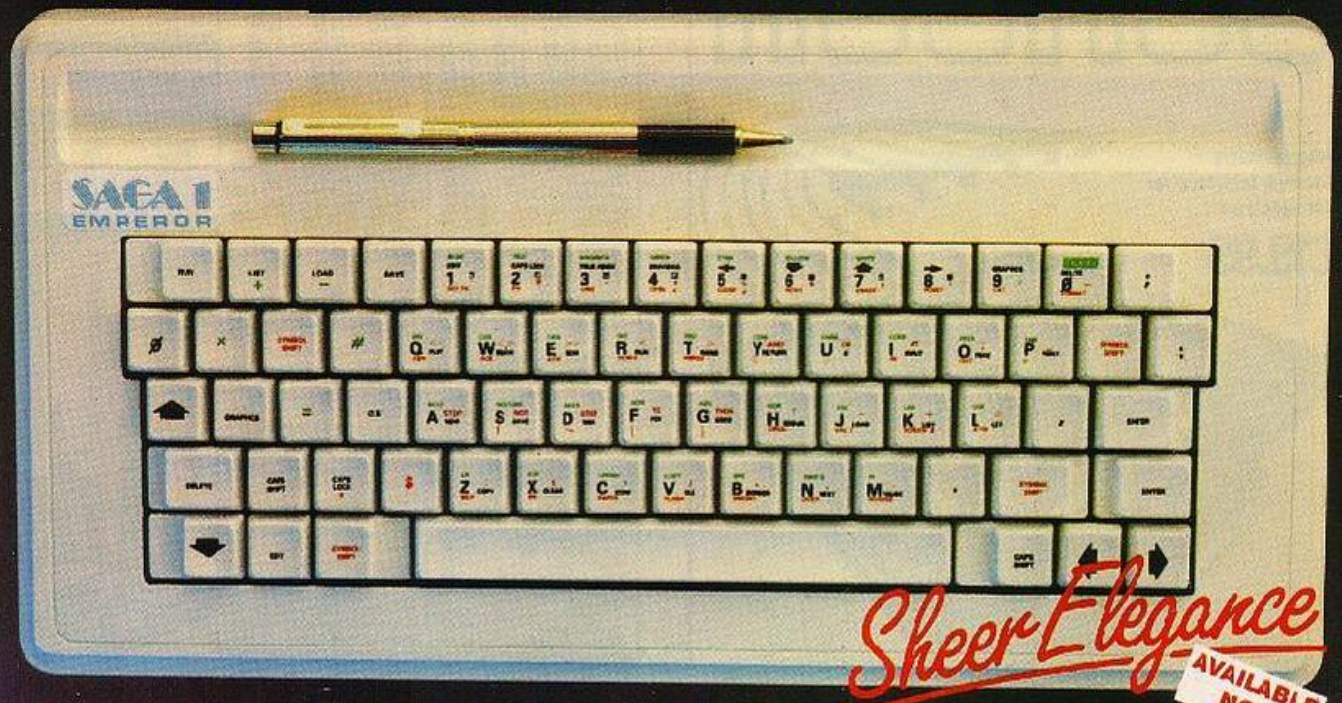
SAGA 1 EMPEROR



Sheer Elegance

AVAILABLE NOW

THE KEYBOARD FOR ZX SPECTRUM COMPUTERS

- **EASY FITTING**
- **PLEASURE TO USE**
- **LONG LASTING**

The Saga 1 Emperor, equipped with 67 keys, is a carefully designed replacement keyboard incorporating many special functions for the popular Spectrum Computer. For business or pleasure, the Emperor will make your computing time more productive and enjoyable. The SAGA 1 Emperor will enable you to use the Spectrum as a powerful programming tool easier and faster.

The style is easy:- for your benefit, the SAGA 1 Emperor has been designed to ensure that available Spectrum Peripherals will fit in the usual manner.

The assembly of the keyboard is simple — and fast. No soldering required, so that within just 5 minutes you can replace your current ZX Spectrum with the new SAGA 1 Emperor.

AND ALL THIS FOR JUST £54.95 (inc. VAT)

SAGA P.C.!
Your very own Personal Carrier, partitioned to neatly accommodate your Spectrum, Saga 1 Emperor and peripherals; Tape Recorder, Power Supply, Cables, manuals and cassettes. Of solid and attractive construction the P.C. is ideal for storing and transporting your computer accessories. The case uses a strong double stitched and bound Black Calf Vinyl with a tough thick ABS inner compartment, leather buckles and a strong handle. Only **£26.95** (inc. VAT).

DUSTCOVER
Another top quality product, this expertly produced long-lasting bound and sewn dustcover has been specifically designed for the SAGA 1 Emperor, which will keep everything looking neat and dust free. Only **£4.95** (inc. VAT).

SOUNDBOOST
Hear that keyboard click
with a SAGA SOUNDBOOST
The SAGA SOUNDBOOST is a tiny electronic circuit which considerably enhances the sound volume and quality of the Spectrum sound output. Adjustable from a whisper to a roar, the SOUNDBOOST provides added realism and excitement for games players and security for programmers (Hear that Keyboard Click!). No cutting, no soldering — just connect.
Only **£9.50** (inc VAT).

FLEXICABLE
Developed to relieve your Spectrum from the pressure of life, to fit your Spectrum and your add-ons taking the load with ease. By popular demand we now have two versions of the 9 inch FLEXICABLE available to suit your needs.
Male-Female FLEXICABLE — £12.45
Female-Female FLEXICABLE — £9.50
Convertor PCB — £2.95

THE COLLECTION

The latest addition to Saga's vast range is The Collection, providing you with three money saving action packed specials containing quality products — an ideal gift.

COLLECTION 1 — SAVE £10.00!!
rrp £53.95
Our special price **£43.95**
includes: Saga Personal Carrier **£26.95**
Soundboost **£9.50**
Dustcover **£4.95**
Flexicable (M-F) **£12.45**

COLLECTION 2 — SAVE £20.00!!
rrp **£100.00**
Our special price **£80.00**

COMCON

Programmable Joystick Interface for the Spectrum

£19.95

Extension port for Currah Micro speech unit. Combine joystick with sound and speech for ultimate arcade action.

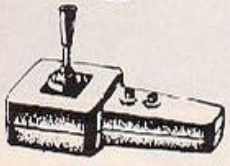
Simple and fast programming. Plug the six function connectors into the required Spectrum key positions – Ready!

Compatible with all Atari type joysticks including Quickshot II (without rapid fire action).

Two independent fire actions Photon Blasters and Neutron Bombs at the touch of your fingertips.

Interface operates joystick parallel to keyboard. Joystick action compatable with any add-ons including Microdrives.

QUICKSHOT 2+2 JOYSTICK modified to incorporate 2 independent fire actions and no rapid fire option **£13.95** incl. VAT and P & P



FLIGHTLINK JOYSTICK with 2 independent fire actions **£10.50** incl. VAT and P & P

CURRAH µSPEECH UNIT fits into COMCON extension slot **£29.95** incl. VAT and P & P

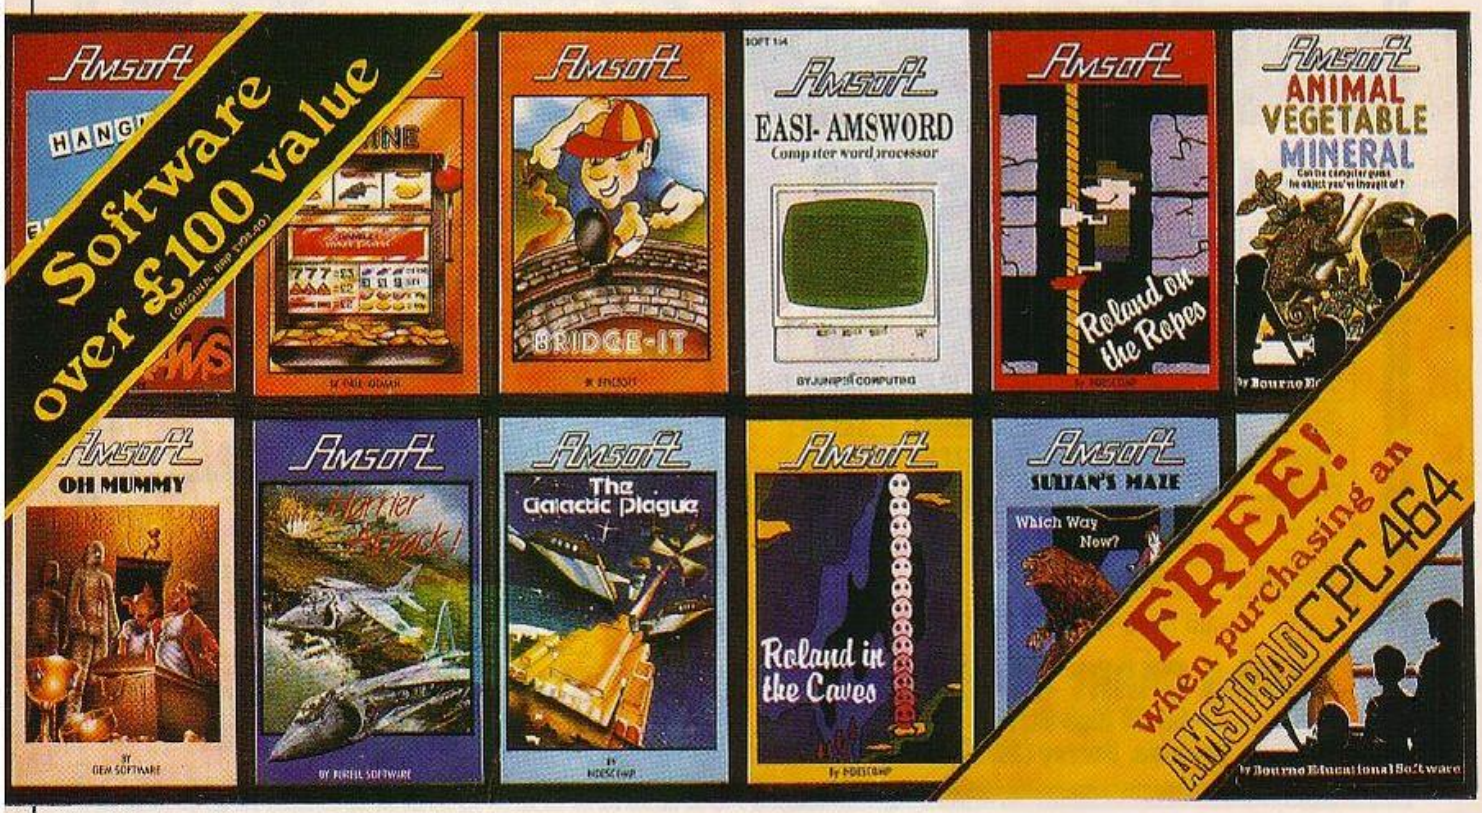
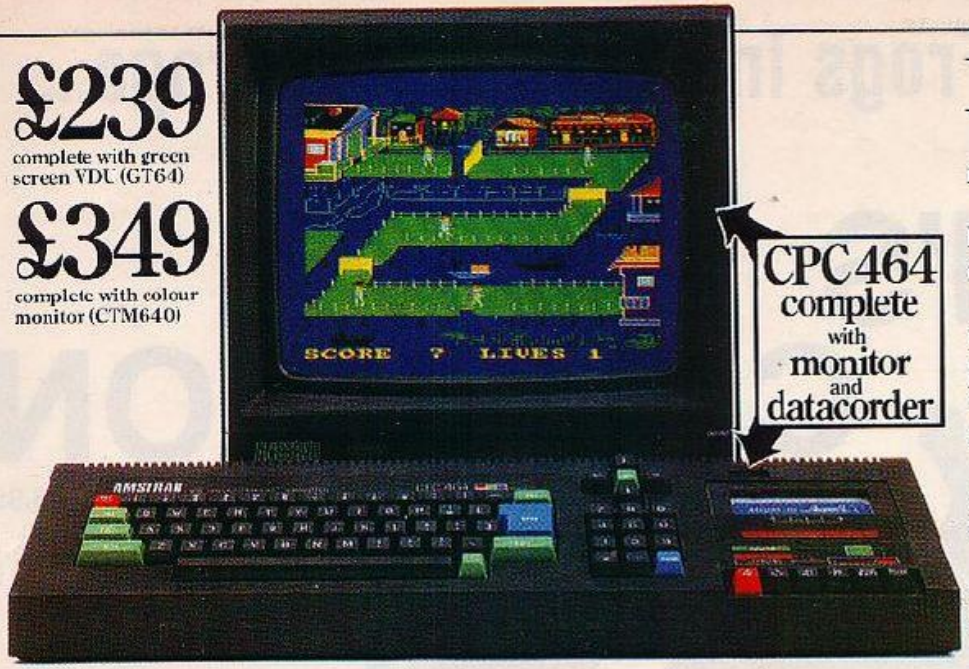
Phone for very latest low prices

Now Amstrad gives you over £100 to play with.



£239
complete with green screen VDU (GT64)

£349
complete with colour monitor (CTM640)



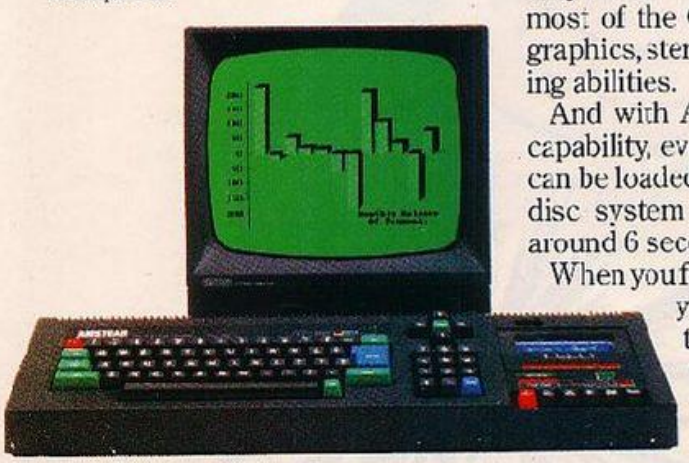
CPC464 complete with monitor and datacorder

Free software worth over £100 is the name of the game.

Along with your new CPC 464 (colour monitor or green screen VDU) you'll receive a software starter pack of 12 (yes, twelve) cassettes absolutely free.

There's something for everyone. From Roland-on-the-Ropes to Easi-Amsword word processing.

That's *one* good reason for making Amstrad's CPC 464 your new home computer.



CPC 464 green screen VDU (GT64)

Here are the others.

The CPC 464 comes complete with its own colour monitor or green screen VDU and built-in cassette data recorder. (Optional disc drives are now available with CP/M* and DR. LOGO* supplied as standard.)

It has a typewriter-style keyboard and numeric keypad. 64K of RAM, 32K of ROM and a very fast extended BASIC with real time features.

And it costs a great deal less than the price of a comparable system.

The CPC 464 can handle the trickiest computer games (if you can), revision for exams, cataloguing and budgeting.

And it comes complete and ready-to-go.

Amsoft. A ton of software.

Yes. Now there are over 100 titles from Amsoft and independent publishers. And the list is still growing.

Arcade games, educational programs and business applications – they're all designed to make the most of the CPC 464's impressive graphics, stereo sound and processing abilities.

And with Amstrad's *speedloading* capability, even complex programs can be loaded quickly. The optional disc system will load a game in around 6 seconds.

When you feel the need to upgrade your Amstrad system to disc drive, just send your favourite Amsoft cassettes to us and we'll send you back the same Amsoft programs on Amsoft disc for just £4.95 per cassette, the price of a blank disc.

Join in the fun.

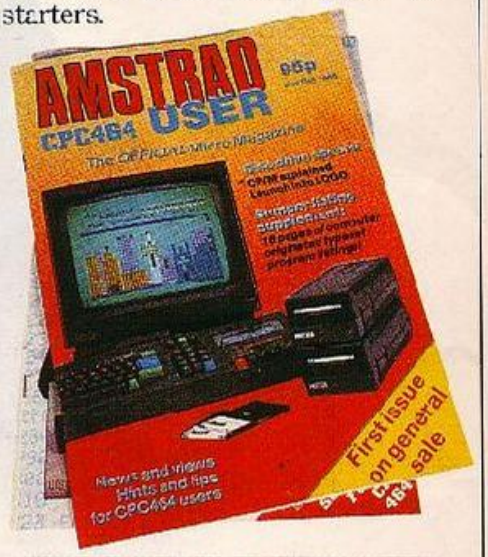
Our CPC 464 User Club is a must for all owners.

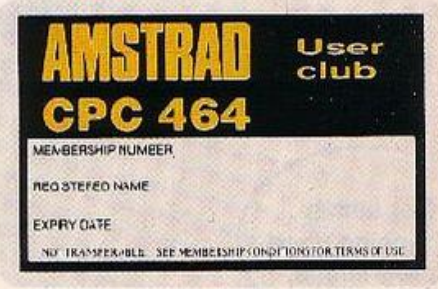
As a member, you'll be the first to know about the additions to the range. Hardware and software.

We'll provide you with your own privilege card and send you free, a year's subscription to the Amstrad User magazine packed with programs, features and information.

You can enter competitions for valuable prizes and keep up with all the latest Amstrad developments.

And with the free software pack, we think that's pretty good for starters.





AMSTRAD

HERO ZERO

Hard times at the space port. Float off with Jonathan Richards.

LIFE IS HARD at the spaceport, especially if you're the pilot of a balloon hopper, and especially now the spaceport has had a refit. What with the new intake of cargo and new processing techniques, it's a wonder I don't bite the spacedust more than I do

Way back in September 1983, there was a short program published in *Your Computer* called Balloon Hopper, by Andrew Foord. This well-presented little game had lots of potential and all it needed was someone to expand and develop the game. This all machine-code version for the Oric-1, called Hero-Zero, is the result.

Anyway, the control keys are Z and X — left and right — and ' and / — up and down. Drifting from left to right are various objects ranging from dustbins to ice-creams. At the bottom of the screen are cargo boxes sitting on swampy ground — yes, I know, there's no ground in space, but remember this is only a game. Located at each side of the screen are two sets of pods or conductors. These "arc" across at regular intervals and remain on for the same amount of time as they are off.

At the centre of the top of the screen is a type of homebase. This is where Hero-Zero needs to go in order to collect the points from the cargo. In each corner of the screen are spikes which deter movement around the perimeter. In the centre of the swampy ground is a button. The idea is that you can stop the arcing of the pods by picking up a seed from the cargo area, taking it up to the homebase then pressing down the button. On levels 1 to 4 this gives 17 seconds relatively free movement and on level 5, 10 seconds and level 6, eight seconds.

Just to remind you, the idea of the game is that you control Hero-Zero around the screen picking up cargo and taking it to the top of the screen.

16K Oric owners cannot use the program unless serious modifications are carried out. Even so, a 16K version is available on tape if you specify this.

The hexdumps shown consist of the data code — #8000 to #9050 — and the game code — #9F00 to #AC30. To start entering in the hex you can use the hexloader shown or alternatively, you can use what I used. This was to enter the disassembler and save it to tape, then add the following lines:

```
20000 FOR I = start TO finish
20010 PRINT HEXS(I), INPUT A:POKE ,A
20020 NEXT I
```

I would then Run 20000, and then start or continue typing in the hex, stopping at regular intervals to check for errors using the hexdump or disassembler

Once the data has been typed in you can save it to tape using:

```
CSAVE"DATA",A#8000,E#9050
```

Again, once the code has been typed in you can save it to tape using:

```
CSAVE"CODE",A#9F00,E#AC30
```

If you think it's relatively bug free now, then you can start the game by typing:

```
CALL#8FF5
```

As usual, tapes are available for £3.00 which contain Hero-Zero, the disassembler and the hexloader. A leaflet is also supplied giving details of the Oric Rom routines and how to use them.

Make cheques or postal orders payable to Jonathan Richards, and send them to Prosoft, 12 Mendip Close, Great Sutton, South Wirral, Cheshire L66 4SE.

Table 3.

#8FF5-Startup — Loads the character set and the titlescreen. Waits for space bar to be pressed and starts initialisation, then jumps to main routine loop.
#9F00-Mainloop — Calls service routines and monitors timing for aliens and arcs.
#9FE1-Movement — Detects key press and moves HZ around the screen.

(Table 3 continued on next page)

(Table 3 continued from previous page)

Uses # 208 for reading keyboard.

- # A15E-Pickup – Checks to pickup something and prints it below HZ.
- # A25F-Movealien – Prints four aliens in 2 by 3 format at various positions around the screen. Collects data for characters from HZ buffer — # BFE0 – # BFFF.
- # A450-Window – Checks for HZ moving off the screen in the four directions. Copes for HZ with cargo.
- # A600-Printarc – Prints arcs onto the screen.
- # A60D-Wipearc – Wipes arc from the screen.
- # A640-Setup – Initialisation routine that puts HZ variables and characters into memory locations
- # A723-Arckill – Checks when HZ crosses the arc boundary.
- # A742-Inc50 – Increments the score by 50.
- # A752-Inc100 – Increments the score by 100.
- # A762-Plus1 – Increments the score variables by 1 in BCD. Used by Inc50 and Inc100.
- # A77EE-PrntSC – Converts score from BCD to ASCII code and prints this to the screen.
- # A7C4-Compare – Determines whether current score is higher than the high score.
- # A804-PrntHI – Prints high score onto the screen and uses the same techniques as PrntSC but for a different part of the screen.
- # A8CA-Dwnlcchr$ – Down loads the new character set.
- # A8E6-Dwnldtitle – Down loads the title screen.
- # A902-Dwnldgme – Down loads the game screen.

Hex dump. Game data.

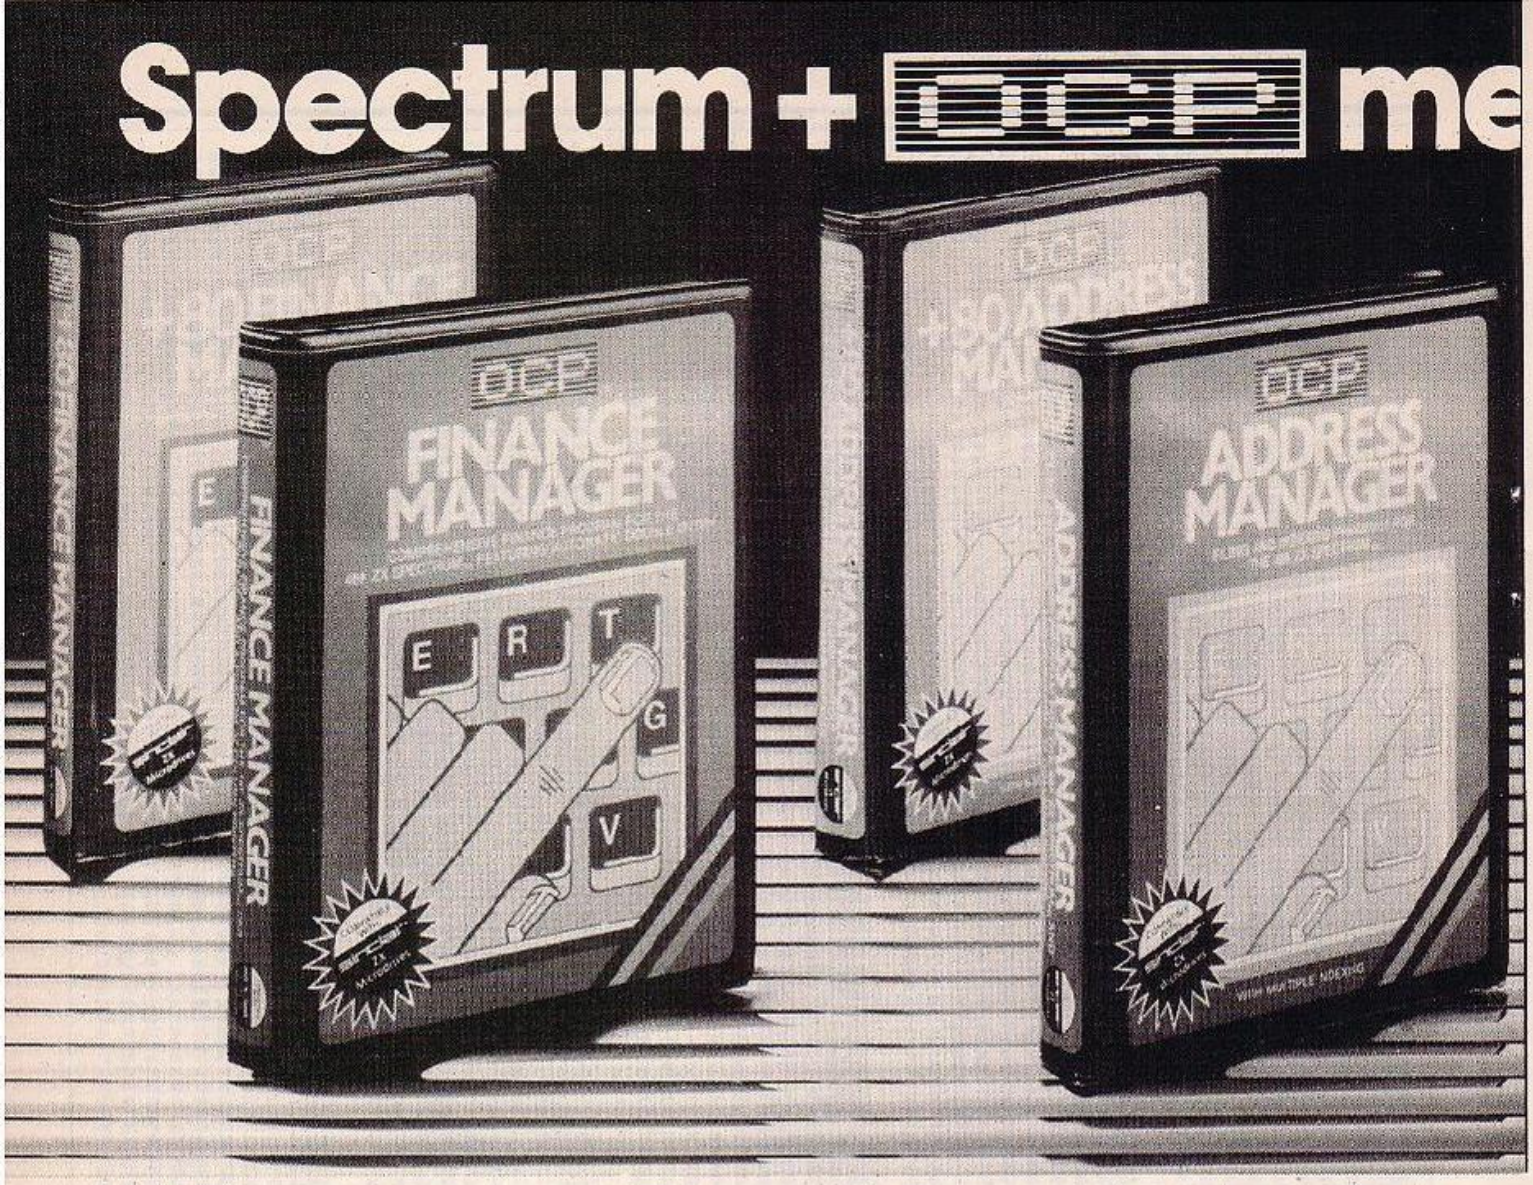
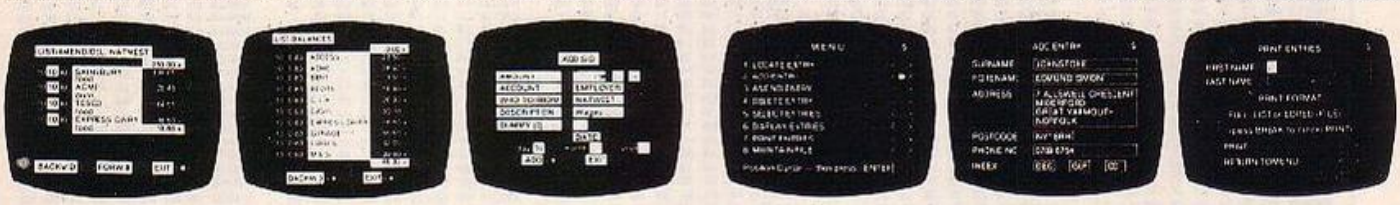
(continued from previous page)

Main code.

Spectrum + OCP me





If you've got a 48K Spectrum™ and accounts to manage, OCP will make the job easier and faster.

All our business and utility programs are Sinclair Microdrive Compatible, and the Plus 80 versions are versatile enough to drive full size 80 Column Printers through most Centronics and RS 232 Interfaces including the ZX Interface 1. However, our standard programs (except Stock Manager) only work with ZX and Alphacom 32 Column printers.

The magic of MACHINE CODE has enabled us to produce the very latest "on the page" presentation which lets you enter and edit data naturally, as if filling in a form.

FINANCE MANAGER £8.95 PLUS 80 £19.95

Voted the best in its class by the Sinclair Users Annual, this easy to use program is a powerful and flexible aid to practically all domestic and business accounting applications. Show up to 255 separate accounts with running totals, and review standing orders as you scroll back and forth through your accounts. But that's not all, this program automatically raises a corresponding debit or credit for every entry, and will even open a new account if an entry features an unrecorded account name.

Having all your finance records so neatly stored is the height of efficiency! The program is entirely menu driven for ease of operation, yet the facilities are so extensive you'll soon wonder how you managed without it.

ADDRESS MANAGER £8.95 PLUS 80 £19.95

A very useful MACHINE CODE application program with limitless applications at work and at home.

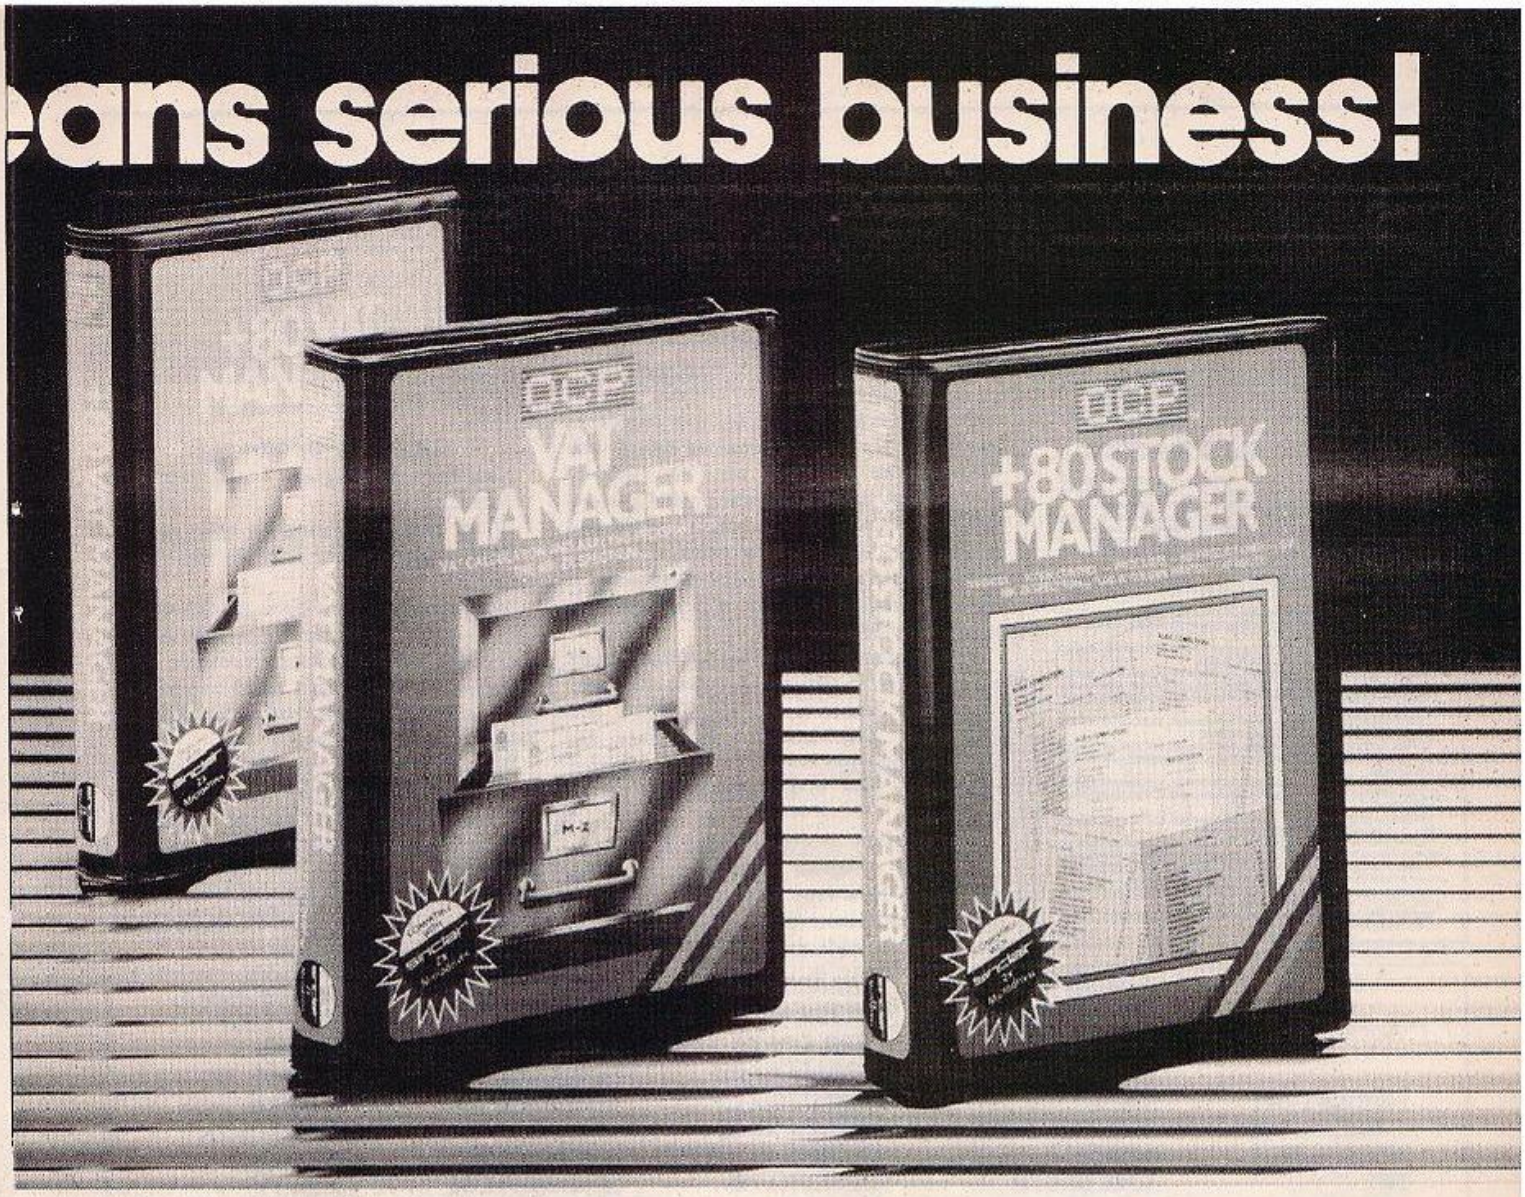
Manage your address book with efficiency and speed! Address Manager stores up to 350 names, addresses, and phone numbers – depending on their length. Or up to 1200 individual names/titles/references. The Plus 80 version also embodies a comprehensive Label Printing routine.

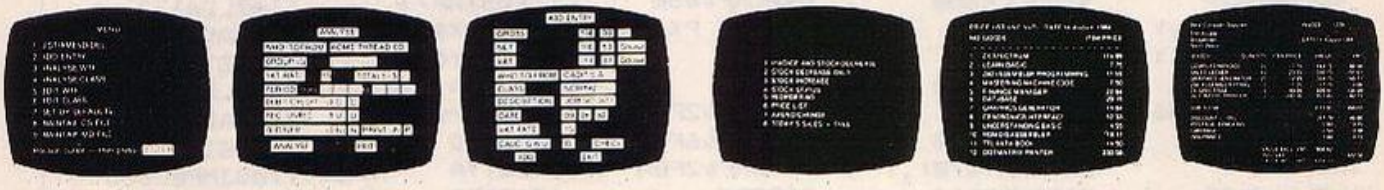
In the office, Address Manager can store internal phone directories, store and analyse customer's records, and much much more.

If you've already got Finance Manager and/or Address Manager but in non-Microdrive format, and you'd like to update them, we'll give you a £3 rebate towards the cost of a Microdrive Compatible 32 Column, or £5 off the Plus 80 version. This offer is available via mail order only.

The OCP range includes: VAT Manager, Address Manager, Finance Manager, Stock Manager (80 Column only).

eans serious business!





VAT MANAGER £8.95 PLUS 80 £19.95

Your VAT 100 return need no longer be a headache! Simply key in the Gross or Net values of all the period's sales and purchase invoices and VAT Manager will check, analyse and total all the relevant details. Available in 32 Column or Plus 80 versions, VAT Manager will check all calculations automatically, and will even work out details of exempt totals where the trader is not required to pay VAT. This is performed with its CLASSIFY feature for types of transactions and GROUP feature for more detailed analysis.

PLUS 80 STOCK MANAGER £19.95

Provides a controlled stock environment for up to 600 different product lines.

The program has facilities for the production of invoices, sales totals, price lists, and shows stock status, stock adjustment and re-order requirements.

No business should be without this crucial Microdrive program. Now you can compute your entire stock balances all on one program – Stock Management has never been so easy! Coupled with a suitable printer it will take advantage of the 80 column width printout to produce quality hard copy.

Now the most helpful aids to business efficiency are as near as your local software stockist. Call in soon and see the latest in OCP's exciting range of business software. Available from larger branches of WHSMITH or mail order direct.

For instant purchase contact the OCP Hotline with your details. Telephone: 0753 889 055

sinclair, ZX, ZX SPECTRUM & ZX MICRODRIVE ARE ALL TRADEMARKS OF SINCLAIR RESEARCH LTD.

Simply The Best

4 High Street, Chalfont-St-Peter, Bucks SL9 9QB

Our Utilities include: Machine Code Test Tool, Editor/Assembler and Master Tool Kit.

Program 2.

Program 1.

THE IDEA OF this game is to cross the screen and collect the bags of swag and return with them to the get away car. You will be hampered by falling bombs and aided by stone defences. Each level more bombs will fall and after a specified number of points either one or two blocks will be renewed. Also on each level the program will play a new tune — it knows four different ones.

The program is in three parts, though there are four parts to type in. The first part loads the others and sets up the UDG's and Envelopes. The second part makes the machine code and stores the multi-coloured characters. The final part is the Basic program.

Typing in the program is done as follows:

Type in program 1 and save it as "Holdup". Now type in program 2, Run it, type New and enter program 3 and Run it. Now save the code made by these programs with:

*SAVE Hold-Up 2981 2FFF

Now type in program 4 and save it as "Hold-Up".

When loading the program make sure the DFS is disabled as the program sets Page to &D00.

Storing high and low bytes for the machine code is made easier and quicker by directly accessing the resident integer variables. These variables are stored from &400 onwards and each one takes up four bytes. So A% is at &400, B% is at &404 and so on.

When the game isn't being played the computer will show either the high score table or the instructions. These will be flicked between when the scrolling message at the top of the screen is finished. To toggle between them at any time press Escape.

To change the difficulty of the game press C on one of the above screens.

Program 3.

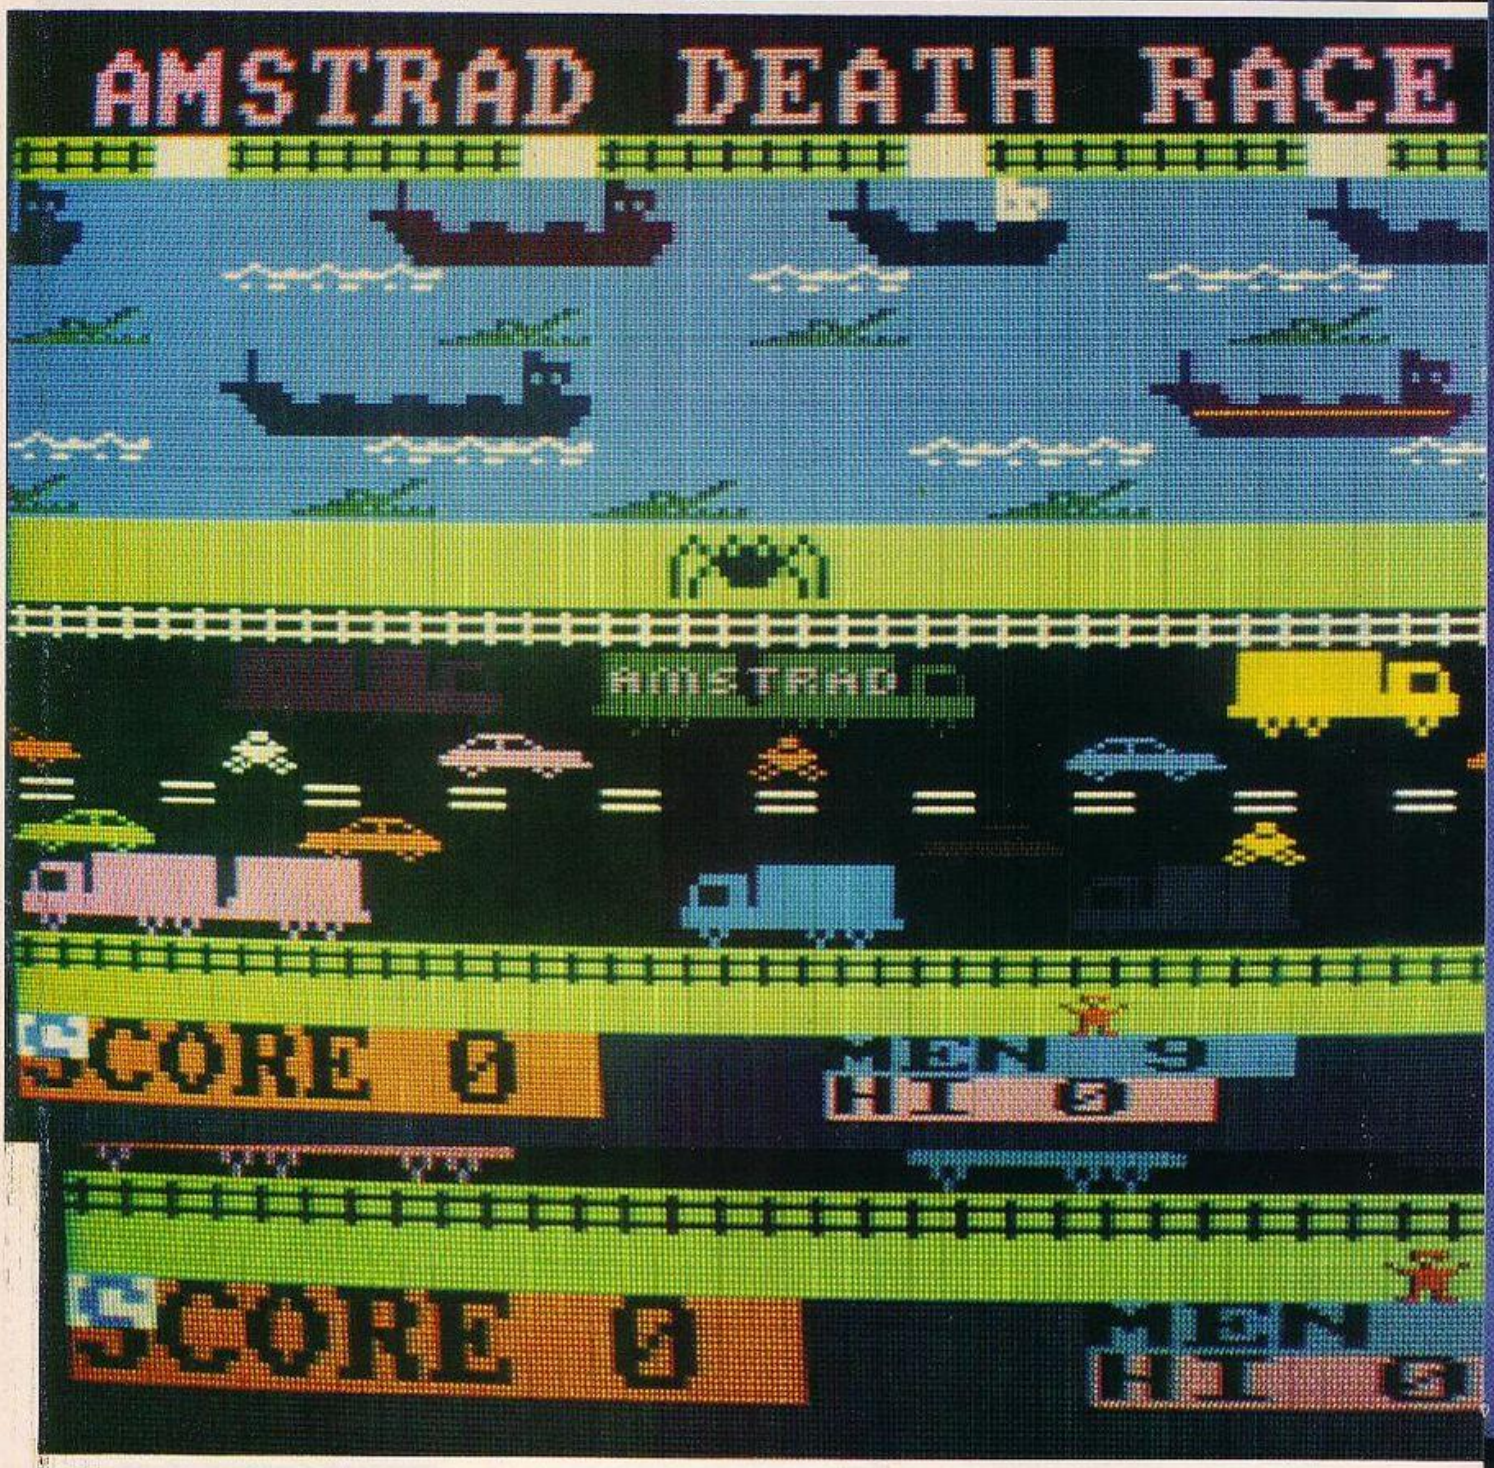
AMSTRAD DEATH RACE



DEATH CHASE STARTED as a straightforward conversion attempt on a Spectrum program published by *Your Computer* some time ago. In the process some of the internal goings on of the Amstrad were revealed and the result is a playable and colourful game. This article gives the finished program and also details of screen display configuration and how to add extra commands to your Basic — lateral scrolling, enlarged printing and screen character reading.

In converting Spectrum Cross to Amstrad Death Race there were three fundamental problems to be faced. First the different size of the text screen, second the way the screen start moves around in memory, and third the way colour is mapped.

The Amstrad has three screen modes. Mode 2 is the high definition, two colour mode. Mode 1 is medium resolution with 40 columns of text in four colours. Mode 0 is the multi-colour mode with 20 column text. I decided to reduce the number of cars and lorries on the road to enable me to make the most of the colours.

Although the number of columns would be less than the Spectrum's, the number of lines available was more — 25 instead of 22. Since a double height printing routine has long been one of my favourites, the answer was obvious.

The screen display occupies the area of memory from hex &c000 up and is composed of 25 lines each with eight rows of 80 bytes. Some arithmetic tells you that there is a little memory left over at the end of the screen.

This fact, coupled with hardware scrolling of the screen when for example listing a program, means that the byte with address &c000 may not in fact be expected top left-hand corner. It could be anywhere, even off the screen altogether. However, after a mode change the screen is reset so that solves many of the problems.

Now supposing the top left hand corner is &c000 then we might expect the byte underneath to be &c050, but as on the Spectrum that is the top byte of the second line — pixel row nine. Thinking again and given that 25 lines times 80 bytes = &7d0 we might expect that second byte down to be &c7d0. In fact it is &c800. This tidy figure is arrived at by simply tagging roughly half a line on after the bottom of the screen.

Colour mapping is at its simplest in Mode 2. Here the eight pixel width of a character is matched by the eight bits in one byte. Hence 80 characters per line means 80 bytes across

(continued from page 89)

Rem statements when typing in the graphics. In addition you may find it easier to enter the machine code if you first enter Key 138,"," to change the decimal point on the numeric pad to a comma.

Finally, since the user graphics do not allow you to make the most of the Amstrad's colour, three different ways of going this have been introduced in the screen construction routine. They may be omitted if preferred since they slow down the screen printing.

To slow down the game increase the value of the pause used at the end of the main loop — set at line 160 — or to make it much easier remove some of the traffic. Every time you get four men home you will find extra spiders added and the speed will increase.

You can avoid the chore of typing in the program by sending £3 with your name and address to Death Race, 12 The Bassetts, Cashes Green, Stroud, Gloucestershire GL5 4SJ. Please make cheques payable to C J Leigh. ■

The imaginative pen of top 'Fighting Fantasy' writer Steve Jackson brings you the complete computerised, role-playing adventure package.

Your 'Game Pack' will consist of a full length adventure story and the most intriguing, complex and exciting computer program yet to be released.

As the adventure unwinds you will become 'The Swordmaster', it will be up to you, and you alone to overcome every diabolical adversary sent against you. You'll experience combat routines of such excellence you will have to gain more and more experience to delve deeper into this compulsive adventure.

Dare you enter 'The Swordmaster's' realm? . . find out in February '85. For the Spectrum 48k, Commodore 64, plus most other popular micros'.

STEVE JACKSONS SWORDMASTER SERIES

Adventure INTERNATIONAL™

85 New Summer Street, Birmingham B19 3TE Tel: 021-359 0801

POOLSWINNER

THE ULTIMATE POOLS PREDICTION PROGRAM

Boxed, with detailed instruction booklet

- **MASSIVE DATABASE** Poolswinner is a sophisticated Pools prediction aid. It comes complete with the largest database available – 23000 matches over 15 years. The database updates automatically as results come in.
- **PREDICTS** Not just SCOREDRAWS but AWAYS, HOMES and NO SCORES.
- **SUCCESSFUL** SELEC guarantee that Poolswinner performs significantly better than chance.
- **ADAPTABLE** Probabilities are given on every fixture – choose as many selections as you need for your bet. The precise prediction formula can be set by the user – you can develop and test your own unique method.
- **SIMPLE DATA ENTRY** All English and Scottish team names are in the program. Simply type in the reference numbers from the screen. Or use FIXGEN to produce fixture list automatically (see below).
- **DISC/MICRODRIVE COMPATIBLE** All versions (except Apple and IBM) are supplied on tape, with simple instructions for conversion to disc/microdrive operation.

(This season's results are supplied with the package so that predictions can start immediately.)

AVAILABLE FOR Spectrum (48K), Commodore 64, VIC 20 (+16K), AMSTRAD CPC 464, BBC B, Atari (48K), ZX81 (16K), Dragon, Apple II, IBM pc

PRICE £15.00 (all inclusive)

NEW

FIXGEN 84/5 AT LAST: No more struggling for hours to get the fixture list into the computer. FIXGEN has been programmed with all English and Scottish fixtures for 1984-5. Simply type in the date, and the full fixture list is generated in seconds. Fully compatible with Poolswinner.

POOLSWINNER with FIXGEN £16.50 (all inclusive)
Fixgen alone £5.50

COURSEWINNER V3
THE PUNTERS COMPUTER PROGRAM

Coursewinner is designed to allow you to develop and test your own unique winning system. Being information from daily newspapers or 'Sporting Life' the most important factors can be input and analysed. The program is supplied with a database detailing best trainers and jockeys, and effect of the draw for all British courses. (Flat & National Hunt.)

AVAILABLE FOR Spectrum (48K), Commodore 64, BBC(B), Dragon, Atari (48K), Apple II

PRICE £12.50 (all inclusive)

AVAILABLE (RETURN OF POST) FROM. . .

VISA phone 24 hrs

SPECTRUM

THE MACHINE CODE SYSTEM

£8.50 INC VAT, P&P

£7.50 INC VAT, P&P

* ". . . one of the all too few jewels of Spectrum programming . . . deserves a place in every serious programmer's library'
(Simon Springett—Popular Computing Weekly—June 1984)

* ". . . the whole package is very friendly and easy to use . . . can be highly recommended for those who are just about to start programming in Machine Code."
(Phil Holliday—Your Computer —May 1983)

* Fully compatible with MICRODRIVES/NETWORK/RS232 (with Interface 1) and most popular Centronics interfaces for 80 col. printout.

AMSTRAD

THE MACHINE CODE SYSTEM

* Both programs in one package
* Many NEW FEATURES
* Compatible with CASSETTE and DISC

AVAILABLE SHORTLY

PICTURESQUE

* Send S.A.E. for fully detailed leaflet
* Available from many computer shops, or by FAST mail order by sending a cheque/P.O. to:—

Dept YC, Picturesque, 6 Corkscrew Hill, West Wickham, Kent BR4 9BB

TELSOFT

A reminder of how to use the Telsoft service.

THE PROGRAMS given here will enable Spectrum and BBC owners to download via *Your Computer's* Telsoft service. First type the hexloader for your machine — figure 1 — and then enter the machine code — figure 2. On the BBC you call the service by entering

CALL &6A00

while Spectrum owners must type

RANDOMIZE USR 60000

So far OE Ltd's Telemod 2 and VTX 5000 modems have been tested with the service, but it also works with a number of other makes.

To find out what is available on Telsoft and how to receive software dial up Colchester (0206) 8068. This audio recorded information line will also advise you which telephone numbers to ring for the 300 and 1200 bit/s services.

When a program you want to download is available, make sure your modem is set up and dial the number appropriate to your modem's speed. As soon as you hear the modem tones switch the modem to line and replace the receiver. Select Option 1 from the menu — Receive. After a block of data is received, you will see "OK" printed if there were no errors, otherwise the program will wait for the blocks to come round again.

When the "Program loaded OK" message appears return to the Telsoft menu and select Option 5. You can now save and run the program.

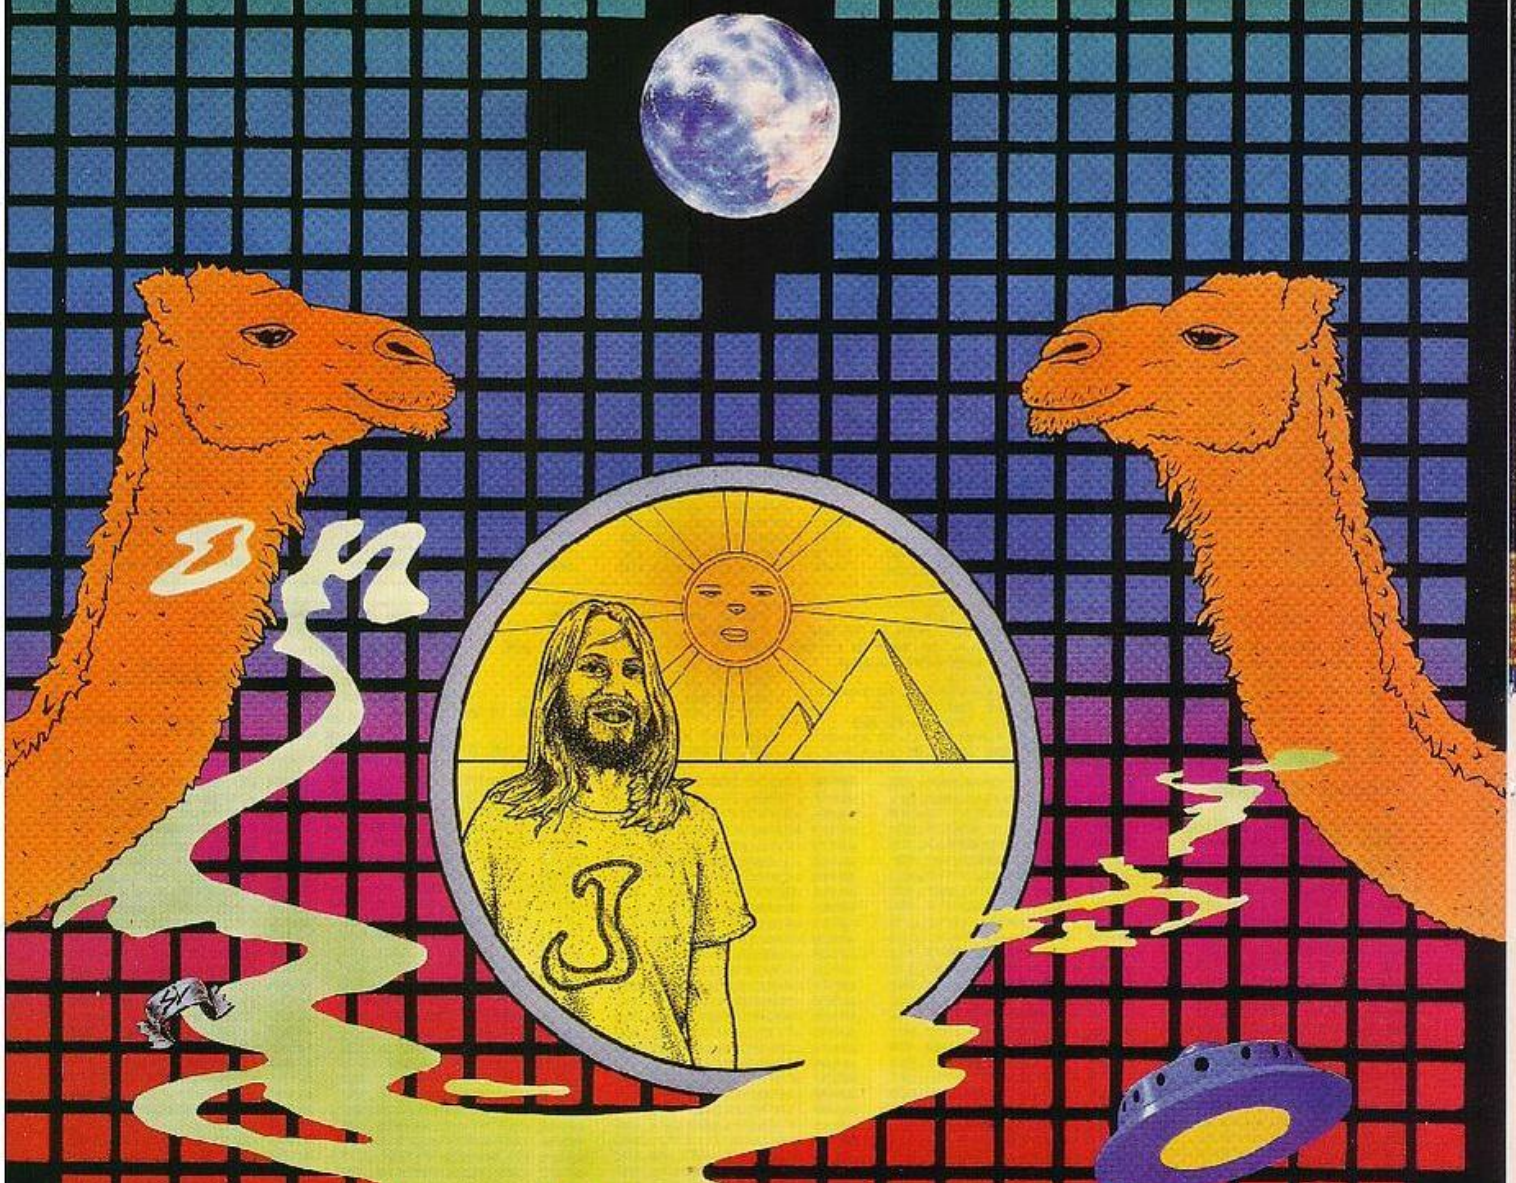
PSYCHEDELIA

A Light Synthesiser



LlamaSoft

Figure 2.

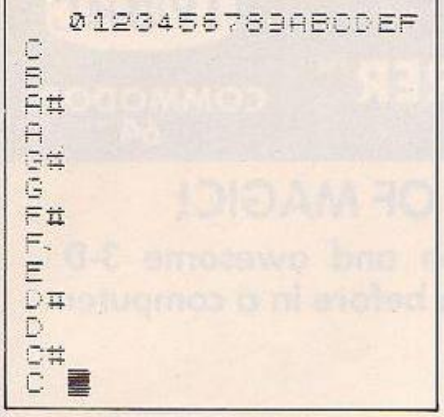


Figure 3.

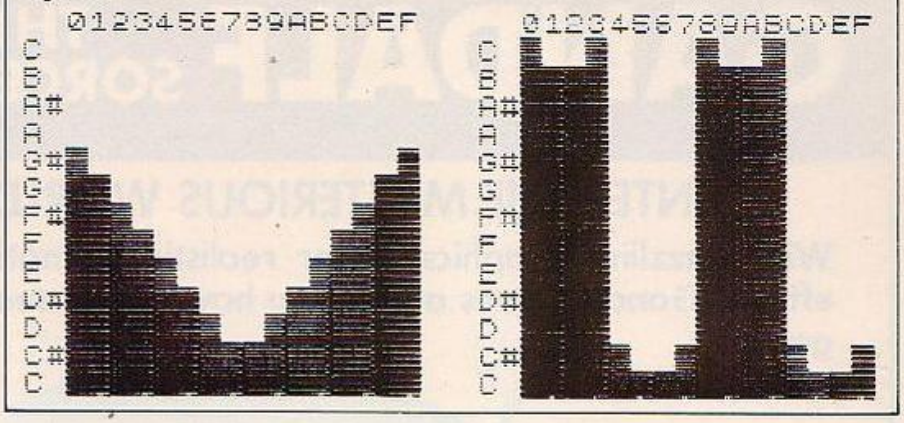

SYNSOUNDS

Tim Closs provides a useful facility on a machine not noted for its sound potential — the Spectrum.

THIS PROGRAM converts the 48K Sinclair ZX Spectrum into a versatile electronic keyboard. Up to 100 different sound effects can be synthesised by the user, any 10 of which can be accessed instantly while playing a piece of music. In addition, seven riffs can be stored in the memory and incorporated into the performance at the touch of a key.

Facilities on a main menu

All the facilities offered are obtainable from a main menu displayed at the start of the program:

- Play.
- Synthesise sound effects.
- Assign sound effects.
- Compose riffs.

Play: When this option is selected the screen is cleared and the computer keyboard is arranged as in figure 1. The labelled keys in the middle two rows are set out like a piano and can be played in a similar manner. However, three octaves are available since pressing Octave Down will lower all notes by one octave and Octave up will raise them. Hours of fun can be had from this basic electronic keyboard, even if your musical talent is strictly limited. But there's much more to come.

Synthesise sound effects: The essence of a synthesiser is to alter the kind of sound produced without altering the musical pitch of the notes themselves. On the Spectrum this can be achieved by causing a rapid change of frequency as the note is played: the particular "frequency waveform" governs the character of the sound emitted. In this program the user is able to invent as many as 100 unique frequency waveforms as follows.

On choosing menu option 2 you are first required to enter the number of the sound effect you are about to synthesise. This should be within the range 0-99. Having done this two axes will appear on the screen — see figure 2. The horizontal time axis covers the duration of the note, and is divided into 16 sectors, while the vertical axis represents frequency.

Beep returns you to menu

To draw out your frequency waveform keys 6 and 7 are used to move a bar up and down each sector and key 0 enters the desired level

(continued on page 97)

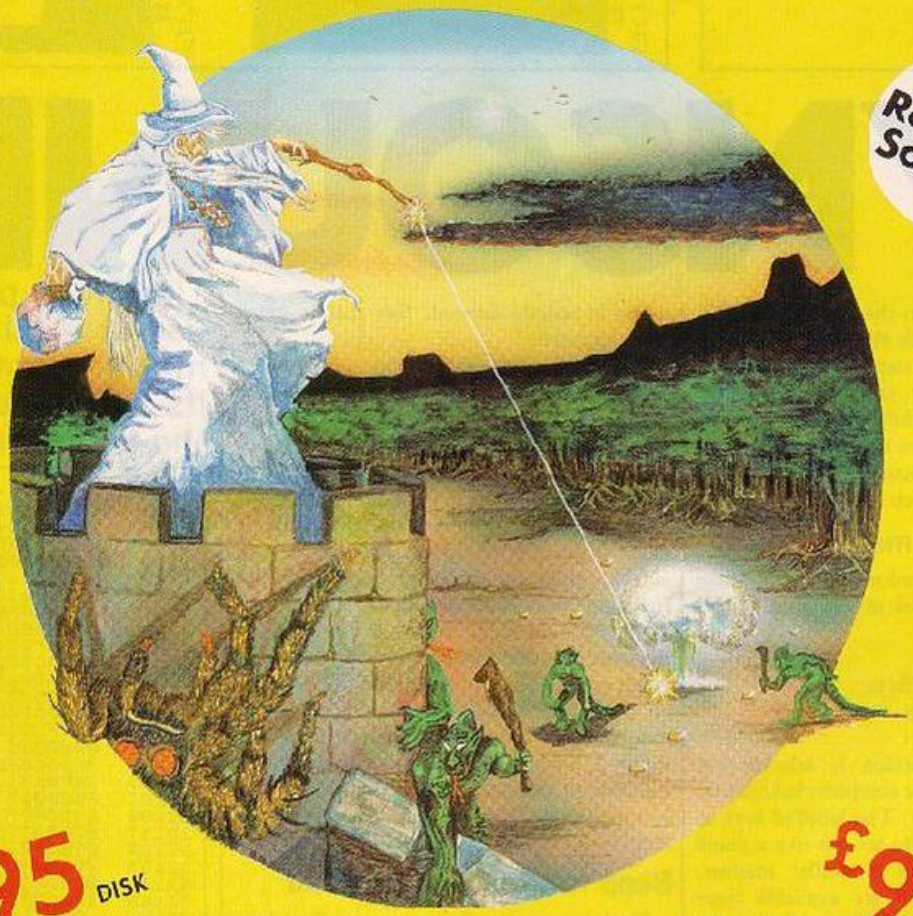
With dazzling graphics, super realistic animation and awesome 3-D effects. Gandalf gives action you have never seen before in a computer game.



Realistic Sound!

£14.95 DISK INC. VAT

£9.95 TAPE INC. VAT

A Super Action, 3-D Effect, Arcade Game

Gandalf, a one-player, 3-D simulation is part of TYMAC's GAME series. Fast arcade action combined with dazzling, high resolution graphics and sound effects puts you right in the game with an impact you never thought possible!

A man's home is his castle, but to you, Gandalf the Sorcerer, your castle is sacred. Or so you thought until the scalytailed lizardmen took a fancy to your treasure which is protected by an ancient spell.

Your castle is under seige. From the distant forest come waves of attacking slimy creatures, all bent on abducting your apprentices and holding them for ransom. If the lizardmen get all three apprentices, you must yeild to their greedy demands and release the spell on your treasure. You cast your power bolts, annihilating the attackers with a blast of fire, but still more come. Your magic power drains and you climb the tower to draw more from the shining star. But beware the deadly spider. If the lizardmen finally break down the castle door, you must battle them throughout the castle. And if they do kidnap your assistants, you must chase them through the woods before the creatures drag them, kicking and screaming, to Lizard Lair.

(continued from page 95)

when it is reached. After levels in all 16 sectors have been defined in this way, a short beep returns you to the main menu.

Some examples of waveforms are depicted in figure 3, but you will obviously want to experiment with your own ideas.

Assign sound effects: From your bank of frequency waveforms produced in menu option 2 any 10 can be chosen for instant recall at the touch of a button. Simply type in a number from 1-10, followed by the number of the waveforms. When you now play the piano keyboard, each note will take on the "flavour" of the sound effect chosen. Pressing another of the keys 1-10 will change to a new sound effect without interrupting the flow of music.

Play sequence of notes

Compose riffs: It is often necessary to play a short riff — sequence of notes — which is repeated many times and may be complicated or fast. Synsounds allows up to seven riffs to be stored simultaneously and then replayed by pressing a single key. It is thus possible to give a creditable musical performance with a minimum of stamina and skill. On the computer keyboard in figure 1 the keys labelled (i) to (vii) in the bottom row refer to these pre-programmed riffs.

After entering the number of the riffs you wish to compose (0-6), the Spectrum will draw up a chart of all the notes playable — three octaves. Each note has a number 0-36 — 0 for the lowest C and 36 for the highest, and it is this number that you must enter to place the desired note in the memory. Up to 16 notes can be entered in a single program, but if less than this number are required then typing 255 will complete the riff and return you to the main menu.

Longer notes can be entered by repeating the note several times.

Listing 2.

```
   5 REM  spectrum hex loader
  10 DEF FN h(h$)=16*(CODE h$(1)
-48-(7 AND h$(1)>"9"))+CODE h$(2
)-48-(7 AND h$(2)>"9")
  20 INPUT "start ";s
  30 INPUT "finish ";f
  40 FOR n=s TO f STEP 8
  50 LET tot=0
  60 PRINT n;" ";
  70 INPUT h$: PRINT h$;
  80 FOR b=1 TO LEN h$ STEP 2
  90 LET z=FN h(h$): LET tot=tot
+z
 100 POKE n+b,z
 110 LET h$=h$(3 TO )
 120 NEXT b
 130 PRINT " = ";: INPUT t: PRIN
T t
 140 IF tot<>t THEN PRINT "input
 error - try again": GO TO 50
 150 NEXT n
 160 REM Enter STOP to stop
```

Note that the riff will be played in the current waveform, so the 'flavour' of the riff can be altered by pressing any of the keys 1-10.

Sound produced only by the Spectrum's internal speaker will rarely be of sufficient volume, so amplification can be achieved by connecting the mic socket on the tape recorder to the mic socket on the Spectrum and push down the record button on the recorder.

Entering synsounds

To enter Synsounds, I advise the following method:

1. Enter the Basic program from listing 1. Save it by typing: SAVE "SYNSOUNDS" LINE 5.

2. NEW the program.

3. Type in the Basic program from listing 2. Type in Run.

4. Enter the code from listing 3-work from left to right and from up to down.

5. Save the code directly after the first Basic program by typing:
SAVE "CODE 1" CODE 31965,204: SAVE "CODE 2+3" CODE 32768,1922.

6. New the program.

7. Load the finished program by rewinding the tape and typing: LOAD "SYNSOUNDS".

...LET US BROADEN YOUR HORIZONS

SPECTRUM

Digital Sound Sampling Technology. NOW Available on your Spectrum

Complete unit and Software Package

£49.99 POST FREE

• Digital Sound Sampling has only previously been available for huge mono sound and costing at least 10 times the amount. • The Sound Sampler allows you to record 'Digitally' any sound into memory and instantly replay it at any pitch, forwards, backwards, ascending scale, compressed, expanded, with echo, endlessly looped etc. • Supplied complete with Software package to 'facilitate' the above operations, plus on screen 'Voice Prints' + Frequency Plotting. • Write on screen keyboard + drum featuring 8 Bit D to ADC converters as used in Digital equipment now sweeping the music world... • Although the unit's not a toy, giving truly astounding results for the musically inclined, we have incorporated a games interface to allow you to use Sound Sampling in your own games etc., so the Sound Sampler would be of interest to everyone.

SPECTRUM

NOW! You can connect your Spectrum to a full sized printer...

ONLY **£34.99** POST FREE

• The Datel Interprinter is a Centronics Interface which allows the Spectrum to be connected to a whole range of full sized printers. • Comes complete with connecting cables and 36 way plug to fit most printers including Epsons, Seikosha, Star, Tandy, Shinwa etc. • Complete with software to generate text copys plus additional software to facilitate hires screen dumps. • Available Now! • The Interprinter plugs straight into the expansion port.

SPECTRUM

ONLY **£34.99** POST FREE

THE ULTIMATE SPEECH SYNTHESIZER Plus built in Joystick Interface

• Easily program any word from a unlimited vocabulary. • Joystick Interface accepts any standard type (Kempston compatible) including Rapid Fire. • Also boosts Spectrums sound through your TV. • All in one unit, no messy wires. • Available Now!

COMMODORE

NOW for the Commodore 64 The COMMVERSA © SPEECH SYNTHESISER CARTRIDGE

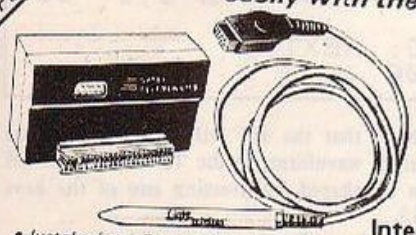
£24.99 POST FREE

PRICE BREAKTHROUGH.

• Simply plug into the exciting world of Speech Synthesis. • The Commversa has an unlimited vocabulary using the now standard Allophone System. • Programming is so easy and sentences can be made up in minutes! • Comes complete with full instructions + Free Demo Tape. No extras required. • Available Now!

SPECTRUM

Now you can create Superb Graphics easily with the New Lightwriter



ONLY **£16.99** POST FREE

Lightpen comes complete with Interface & Software

• Just plug in the Datel Lightwriter and draw circles, squares, rectangles, make superb hand drawings, paint, fill, erase, choose inks, paper, colours. • Save your results into memory (48K) and use in animation or save onto tape to use in your own games. • All functions selected from screen menu with the lightpen. • Unbeatable value. • Nothing more to buy.

SEND NOW AVAILABLE FOR IMMEDIATE DELIVERY

SPECTRUM

NEW ALL SYSTEMS GO!! SWITCHABLE JOYSTICK INTERFACE

With built in Sound Booster for "On Screen" sound

ONLY **£22.99** POST FREE

UNBEATABLE VALUE MULTI-FEATURE UNIT!

The TURBO ACE gives maximum joystick compatability by simply switching through all systems ie, Kempston , Cursor , Interface 2.

• The all in one unit also features an Amplifier which delivers the sound from your games etc., directly through your T.V. Also gives keyboard click which helps when typing data etc.. • These features make the TURBO ACE the number one add on for the games player. • Accepts any 'Atari' compatible joystick. • Available now.

SPECTRUM

The ultimate add on for the keen games player!

Joystick Interface Plus Spectrum Soundbooster

Actually Amplifies through your TV Speaker

ONLY **£17.99** POST FREE

FEATURES INCLUDE

• Joystick interface compatible with a huge range of games (Kempston system). • Compatible with any Atari type joystick including auto rapid fire models. • Amplifies Spectrums 'Beep' into a roar through your TV speaker! (fully controllable). • Stylish all in one unit, no messy wires. • Available Now!

SPECTRUM

At last, the first joystick that puts the firing button where it should have been in the first place.

TRIGA COMMAND IS HERE

THE TOP AMERICAN JOYSTICK IS NOW AVAILABLE IN THE U.K....

£19.99 ONLY POST FREE

• Including Interface to plug straight into the Spectrum. • The first Joystick to give you "Arcade" feel and control. • "Jet Style" heavy duty, diamond cut grip. • Fire Trigger placed under your index finger... the finger with the fastest reflex action. • Self centering, 360° action. • Compatible with most of the latest Software (Kempston system).

Also available for Commodore/Atari **£9.99**

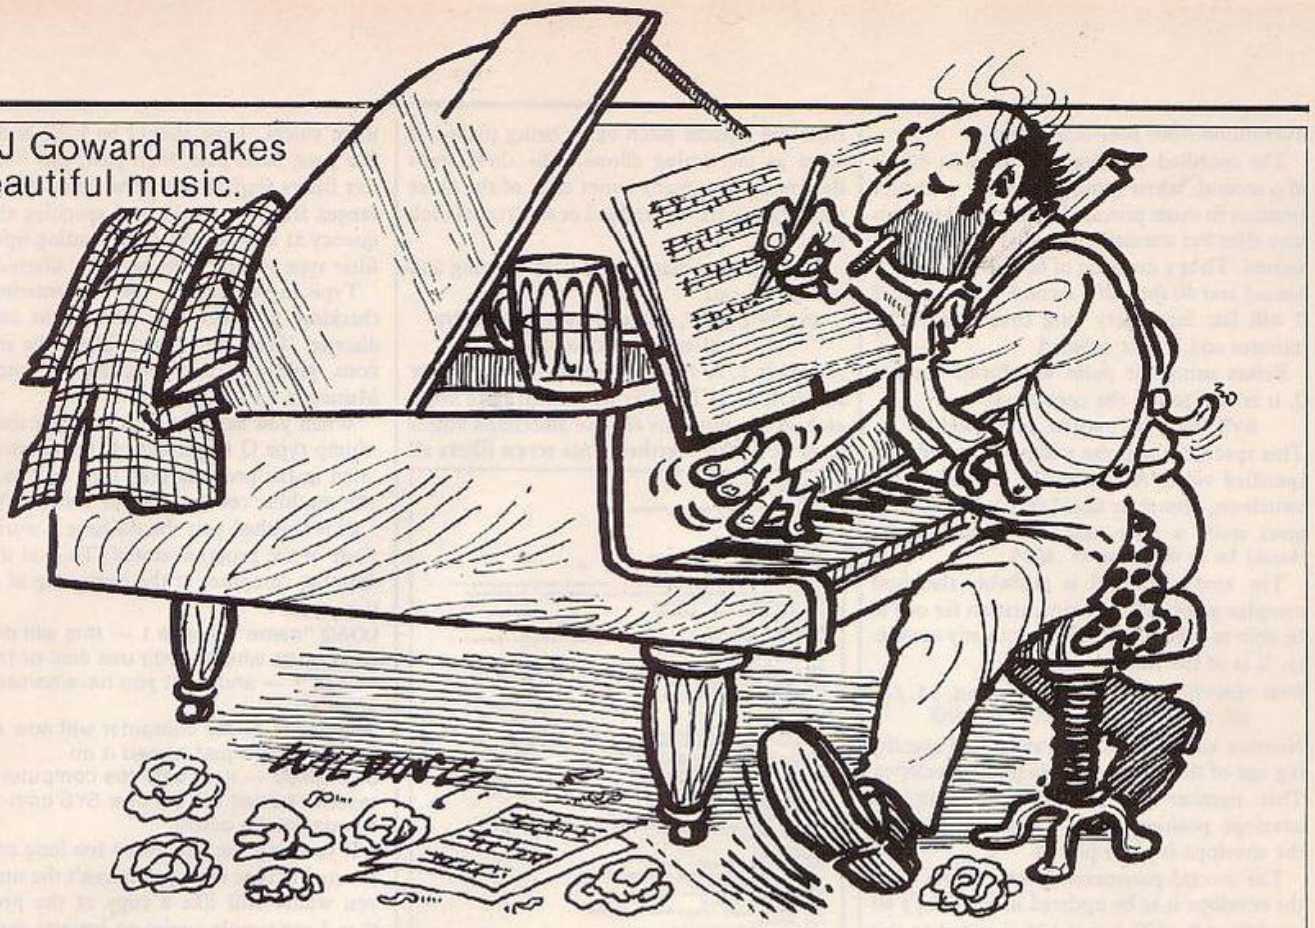
P J Goward makes beautiful music.



CBM COMPOSER

HAVE YOU EVER tried to make a sound using the Commodore 64? If you have then you will obviously have experienced much of the frustration caused by the bewildering array of Poke commands required to activate its powerful SID chip. Even making a feeble beep is no simple matter, requiring a minimum of four pokes, that is, of course, if you can underatand the poor cocumentation provided with the machine.

If you are one of the many people that have parted with the £50 required for Simon's Basic then you will have no doubt been disappointed with the very poor sound commands which will only allow music to be played in one voice. However, for the rest of the Basic I have few complaints.

All sounds have one main command to activate them, to relieve complications that could otherwise arise, and also, since all sound generation is controlled by microprocessor interrupts, basic programs will still continue to be executed while the sound is played. Facilities are provided for harmonies to be played in all three voices, and each voice allows four notes to be buffered and subsequently played.

Thus a duration must be specified for each note eliminating the time delays required by some computers for their sound. The commands allow for all of the musical waveforms and modulations of the chip to be used as well as the programmable filter. The width of the pulse waves generated by each voice may also be programmed.

All of the commands are of the form of an extended SYS statement, here 380Z users will notice a similarity with RML's Call command. The routine works by redirecting every SYS statement just before it is encountered by the basic interpreter, and then, if it is of the form of an extended statement, it redirects the SYS call to the appropriate sub-routine.

A simple example is

SYS "VOLUME", 15

which sets the total output volume for all three voices, it's parameter should bein the range 0 . . 15 where 0 is silence and 15 is maximum volume, any value given that is greater than 15 or negative will be scaled into the correct range. After setting the volume, and before any notes may be played on a particular voice, a SYS "ADSR" must be made. This is of the form: -

SYS "ADSR", voice, attack, decay, sustain, release

and determines the volume envelope for any note following on the specified voice.

Voice should be in the range 1 . . . 3, a larger value will be scaled into this range but a zero will give an error. Attack specifies the rate at which the sound reaches it's maximum volume, while decay governs the rate at which the note decreases in volume after its attack sequence sustain specifies the volume level at which the note is then maintained, and finally release governs the rate at which the note falls to zero volume after its duration has ended.

Thus

SYS "ADSR",1,0,9,0,0

will set for voice 1 the familiar harpsichord — type envelope, while

SYS "ADSR",1,0,0,15,0

will set for voice 1 an envelope which instantly reaches its maximum volume and when the note has finished it will instantly decay to zero volume. Each of the final 4 ADSR parameters should be in the range 0 . . .15.

Once a voice has had its ADSR envelope set any number of sounds may be played on that voice with the command:

SYS "SOUND", voice, wave, envelope, frequency, duration

Voice may take the values 1. .3, 5. .6, 9. .11, 13. .15. 1. .3 do, as you might expect, just play on that specified channel. Five and 6 work for voices 1 and 2 respectively, and allow synchronisation of two notes on these channels.

Thus after a channel of five has been specified this note will not be played until a command to channel 6 has been executed and then these two notes will be played together. Channels 9. . 11 have a similar function but synchronise three-note chords together on all three channels, 13. . 15. before they play the note specified, flush the sound buffer for their respective voices, 1, 2 and 3, and the note will be played disregarding any previous note on that channel. Wave sets the sound wave to be used: 0. .3 are triangle, sawtooth, pulse, and noise waveforms.

The envelope parameter may take the values 0. .3, 0 specifies a pure note while 1. .3 are reserved for the pitch envelopes — see "envelope" command. Pitch may be varied in the range 0. .65535 in increasing frequency.

(continued on next page)

(continued from previous page)

The specified duration should be in 60th's of a second, when using alternative interrupt routines to those provided by the machine this may alter but normally it will be in 60th's of a second. Thus a duration of 60 will last for one second and 40 for half a second. A duration of 0 will last for a very long time: approx 18 minutes and is best avoided.

Before using the pulse waveform, number 2, it is best to use the command:

SYS "WIDTH", voice, pulse width

This specifies the pulse width to be used by a specified voice. A width of 0, the default on switch-on, cannot be heard very well but 2500 gives quite a nice tone. The pulse width should be in the range 0..4095.

The next command is probably the most complex and needs experimentation for one to be able to predict it's effects with any certainty. It is of the form:

SYS "ENVELOPE", number, timing, p1, p2, p3, stepsin1, stepsin2, stepsin3

Number should be in the range 1..3 specifying one of the three available pitch envelopes. This number should also appear in the envelope position of the sound command if the envelope is to be played.

The second parameter specifies how often the envelope is to be updated in 60th's of a second from 0..127 but if 128 is added to this number then the envelope will automatically repeat itself once the 3 steps have finished, otherwise it will complete the sound with the final pitch played. Then the next three values determine what is to be added or subtracted from the current pitch value being played as often as the timing allows. The three steps determine how many times each of the three pitch values are to be added or subtracted each step.

The final command deals with filtering and is of the form:

SYS"FILTER", voice(s), type, cutoff frequency, resonance

Numbers 1, 2, 4 each correspond to the three voices 1, 2, 3. To filter more than once voice each of the numbers for the associated voices must be added together, thus seven filters all three voices. Type should be 1,2,4 and 5 for low pass, band pass, high pass, and notch reject filters respectively. The cutoff frequency ranges from 0..65535 and specifies the frequency at and around — depending upon the filter type — which the sound is filtered.

Type in program 2, the hex entering and checking program and save it to tape or discette. Then run it and follow the instructions given in the program to enter the Musicode 1.1 hex. dump.

When you have finished entering the hex. dump type Q to get out of the current section in the program then type in 2 to save the machine code on disc or cassette. When all is finished you should have a working copy of the program stored. To load it back into the computer at the beginning of a session type:

LOAD "name", device 1 — this will depend upon whether you use disc or tape — 8 or 1 — and what you have named the program.

SYS 58260 — the computer will now reset as if you have just turned it on

SYS 51680 — now until the computer is reset or turned off the new SYS commands will be active

If you find the hex dump too long or complicated to type in or you haven't the time and you would still like a copy of the program then I can supply copies on cassette complete with a program that will transfer the program to disc if you send a cheque or postal order to the value of £2.50 to the following address: Mr. Philip J. Goward, 28 Trueway Rd., Evington, Leicester LE5 5UG. ■

Program 1

Musicode 1.1 hexadump.

TAPE TO MICRODRIVE

Colin Carruthers' easy conversion program

THE INTRODUCTION of the Sinclair ZX Microdrive system offers many users fast access to programs and data. Programs which once took several minutes to load can now be available in a matter of seconds. In fact, anyone who has used a Microdrive may be discouraged from using cassette-based software.

However, there are very few commercial programs available for the Microdrive due to the difficulty in duplicating large numbers of cartridges. Few software houses seem prepared to release details on how to convert their own programs for use on Microdrive for fear of escalating the piracy problem.

This is a weak argument since anyone with two cassette recorders and a blank tape can copy any program they wish. Several houses do release details, particularly publishers of serious software such as Tasman (Tasword), Campbell (Masterfile) and Hisoft with its series of compilers and assemblers.

Why should loading material from tape and saving on Microdrive cartridge present a problem? To answer that, we need to consider certain aspects of the operation of a Microdrive. If you examine the diagram in Chapter 24 of the standard Spectrum manual showing Ram allocation, you will see that there are two areas labelled "Microdrive Maps" and "Channel Information".

Whenever any Microdrive operation is invoked, these two areas grow by 32 and 595 bytes respectively. The Map holds information about the distribution of the 512 byte long blocks on the cartridge, while the Channel contains a 512 byte buffer along with details such as file name and type — see Microdrive and Interface 1 manual, Appendix 3.

In operation, consecutive blocks are passed via the buffer from the cartridge to memory or *vice versa* — depending on whether we are loading or saving. The main point is that the Basic program and variables must be moved up by 627 — ie, 32 + 595 — bytes. To make matters worse, Interface 1 appends 58 new bytes to the existing System Variables area. Thus, the Basic program resides at an address which is some 685 bytes higher up in memory when using the Microdrive.

So, why does this present us with a problem? Well, blocks of machine code which once loaded into the free space just above the Basic area might now overwrite part of the Basic program or, worse still, part of the Microdrive Map or Channel. Either way, the system is likely to crash with the Microdrive running, leaving us no option but to unplug the Spectrum and risk corrupting the material stored on the cartridge.

Programs can be divided into three categories. Those which are easy to convert to Microdrive — by the virtue of the addresses used, those which can be loaded into a higher memory address and copied down to their proper target address before being executed, and those which need to be divided into two smaller blocks and moved around after loading.

The first category includes programs written entirely in Basic — simply break into them and save auto-start on cartridge — and programs that have machine-code blocks which start at high addresses. Any block which starts above 25000 would normally fall into this category, but this does depend on the size of the Basic loader program. Program 1 gives lots of useful information about material stored on tape such as auto-start line number for Basic programs along with length and start address of machine-code blocks.

To use, simply run it and play back the relevant tape at normal load volume and tone settings. For each block in the program you wish to convert, note down all the details or dump the screen onto a printer.

Typical output from program 1 might look like:

```
Name    : Superzap
Type    : Basic
Start   : 10
Length  : 132 bytes

Name    : Screen
Type    : Bytes
Start   : 16384
Length  : 6912 bytes

Name    : Superzap
Type    : Bytes
Start   : 32768
Length  : 32768
```

This is a fairly standard format, ie, Basic loader, title screen and main code block. Type New and Merge in the Basic loader. It might look something like this:

```
10 CLEAR 32767
20 LOAD "" CODE: LOAD "" CODE
30 PRINT USR 35000
```

It is probably best to forget the title screen. They are designed mainly to keep people amused while the main code loads. Besides, space on a cartridge is relatively expensive. Edit the program to make it load the main code from Microdrive thus:

```
10 CLEAR 32767
20 LOAD *"m";1;"Superzap c" CODE
30 PRINT USR 35000
```

Note that we have had to change the name of the code block since we cannot have two files with the same name on the cartridge. Save this on Microdrive to auto-run from line 10. Now do:

```
CLEAR 32767 : LOAD "" CODE
```

to load in the main code from tape. Save this to cartridge by typing in, for example:

```
SAVE *"m";1;"Superzap.c" CODE
32768,32768
```

Reset the system by typing Print USR 0 and try loading in the program from Microdrive. Should there be any problems, check carefully that all addresses were typed in correctly.

We need to adopt a different strategy for programs with machine-code blocks which start below about 25000. For example, imagine a situation where the main block was 900 bytes starting at address 24000. Clearly, this would overwrite the Microdrive Channel and Basic program if we were to load it in from Microdrive to this address.

The solution is to load the code into a high address and use program 2 to generate a machine-code routine to copy it down to the correct place in memory. Program 2 does this by using the powerful — not to mention fast — LDIR instruction. To continue the above example, we would start by loading in the code from tape to — for example — 30000. Run Program 2 and enter the following values:

```
Block Start      : 30000
Block Length     : 9000
New Address      : 24000
Execute Address  : 24000
```

The execute address can be found by examining the Basic loader for that program. Program 2 places a 14 byte copy routine at "start + length", 39000 in this case. Save this

(continued on page 105)

New - the official Spectrum Upgrade!

Turn your Spectrum into a Spectrum+ for just £30

- Professional full-size keyboard – includes 17 extra keys.
- Responsive typewriter-style action.
- Accepts all current Spectrum software and peripherals.
- Complete with 80-page User Guide and Companion Cassette.

Here's some exciting news for 48K Spectrum owners ... the official Spectrum Upgrade Kit.

The £30 Kit has everything you need to turn your Spectrum into the stylish new Spectrum +. You don't even need an understanding of electronics, just the ability to solder a few wires together! The leaflet in the kit gives clear, step by step instructions.

If you're not sure about doing it yourself, don't worry. Simply return your 48K Spectrum to Sinclair and for £50 we'll upgrade it for you.

Whichever you decide on, you'll also receive the new 80-page User Guide and Companion Cassette.

The bigger, better Spectrum keyboard

The Spectrum + measures 12½" x 6". It has a large typewriter-style keyboard, with hard, moulded keys.

You'll find the new keyboard has a smooth, positive action – idea for touch-typing, word processing, simulation programs, and extended programming sessions. Two retractable legs give a perfect typing position.

There are 58 keys in all, including 17 new keys. Programmers will be pleased to see dedicated punctuation keys, a space bar, and separate shift keys for graphics and extended modes. And a reset button allows you to clear a program from your computer's memory without disconnecting the power supply.

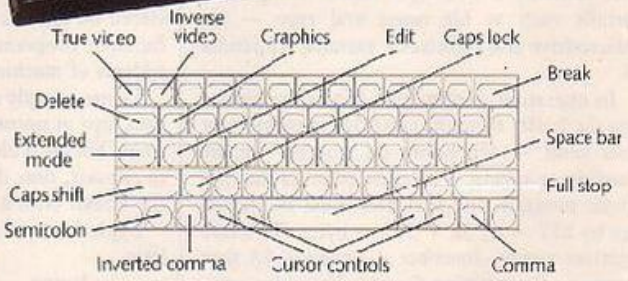
The official Spectrum Upgrade

Naturally your upgraded computer will accept all the peripherals in your Sinclair system - Interface 1, Microdrives and so on, as well as all Spectrum software.

Just as important, new Spectrum software and peripherals will be designed with the Spectrum + in mind. So the Sinclair upgrade adds stylish looks, new capabilities ... and new potential for the future.

Included – the new Spectrum + User Guide and Companion Cassette

The new User Guide has over 80 pages of information, including a handy BASIC dictionary. The Companion Cassette provides an interactive tour of the new keyboard, and includes three entertaining arcade games.



TO ORDER BY MAIL:

When ordering the Upgrade Service, send off your 48K Spectrum to the address below, carefully wrapped, together with the completed coupon and appropriate payment. (Please do *not* return the mains adaptor, manual or other ancillaries.) Your upgraded computer will be despatched to you within 10 days of receiving your order.

When ordering the Upgrade Kit, simply complete the coupon, enclosing the appropriate payment and post it to us at the address below. Please allow up to 28 days for delivery.

BY PHONE: Access or Barclaycard holders can call Camberley (0276) 685311 for personal attention, 9am to 5pm Monday to Friday. Only the Upgrade Kits can be ordered by phone.

Please note: the upgrade offer applies to working 48K Spectrum models in the UK only.

To: Sinclair Research Limited, Upgrade Dept., Stanhope Road, Camberley, Surrey, GU15 3PS.

All prices include VAT, post and packing, User Guide and Companion Cassette.

☐ Please send me the Spectrum + Upgrade Kit. I enclose payment of £30 OR

☐ Please upgrade my 48K Spectrum for me. I enclose my computer together with payment of £50.

I enclose a cheque/postal order payable to Sinclair Research Limited for £_____

OR

Please charge my Access/Barclaycard no.

sinclair

(continued from page 103)

to cartridge with something like

```
SAVE *"m";1;"File Name" CODE
      30000,9014.
```

Note that the length has been extended by 14 to save both the code and the copy routine. Change the Basic loader to load in the machine-code from Microdrive, and the execute address — Print USR nnnnn — to be the start of the copy routine. Save this auto-run on Microdrive, reset the system and try it out.

But what about machine-code blocks which are too large to re-locate using the above technique? For example, say we had a block which was 41535 bytes long starting from location 24000. This block fills the memory from the top right down to address 24000, and does not leave space for any Microdrive operations.

What we need to do here is split the block into two, load the high address part into its proper location, load the low address part into the display file and then use the copy routine provided by program 2 to move the low block up to its correct address after all Microdrive operations are over. To continue the above example, first type:

```
CLEAR 23999 : LOAD "" CODE
```

Copy the bottom 1000 bytes into the display file using a short program such as:

```
10 For x=0 TO 999
20 POKE 16386+x, PEEK (24000+x)
30 NEXT x
```

and save this block to a temporary file on tape with

```
SAVE "temp" CODE 16386,1000
```

Now do a Clear 24999 to make space for the Microdrive system and save the top part to Microdrive cartridge with

```
SAVE *"m";1;"High" CODE 25000,40535
```

Reset the system, load in program 2 and then the temp code file from tape back into the display file. Start program 2 — by typing Go to 10, not Run which would clear the display file — and enter the following values:

Block Start	: 16386
Block Length	: 1000
New Address	: 24000
Execute Address	: 24000

Save this to Microdrive using

```
SAVE *"m";1;"Low" CODE 16386,1014
```

noting once again that the length must be increased by 14 to include the copy routine.

Finally, alter the Basic loader so that it loads in "High" and "Low" from Microdrive before doing a

```
PRINT USR 17386
```

Save this on the same cartridge, reset the system and take a deep breath before trying it out.

One word of warning. In all cases, think carefully where the stack is — if this is overwritten by anything a system crash is certain. The position of the stack is controlled by the Clear statement so many problems like this can be avoided.

With the help of the ideas presented in this article, it is possible to convert most programs to load from Microdrive. The time spent waiting for programs to load becomes negligible which means that the Spectrum owner can spend more time playing games and less time sitting around with nothing to do.

It is probably a good idea to have a menu program on each cartridge called "run" which lists the programs available. Program 3 gives an example of the one I use, and reduces program loading to three key presses — Run, Enter and n where n is the selected program.

Program 1.

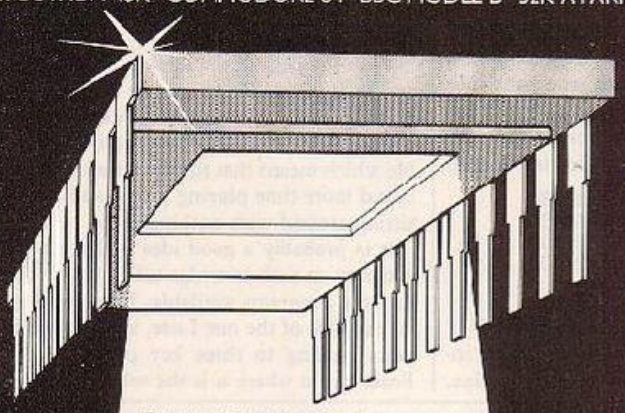
The Complete

Machine Code Tutor

SPECTRUM 48K · COMMODORE 64 · BBC MODEL B · 32K ATARI



Trust New Generation to strip the mystery away from Machine Code. Now the Complete Machine Code Tutor makes learning machine code simpler so there's never been a better time to discover the really great benefits of machine code programming – see what the press says:

"A colourful, clear, interactive computer teaching package – the best I've come across in any field. Jan Watterson – **Popular Computing Weekly**"

"This pair of tapes forms a worthy addition to the range, giving a thorough exposition from the most elementary level of machine code programming on the BBC Micro. **Which Micro & Software Review**"

"The best machine code tutor and no serious Spectrum programmer should learn machine code without it. **Crash**"

"By far the best attempt comes from New Generation Software who has recently issued its Complete Machine Code Tutor for the BBC and the Spectrum. **Popular Computing Weekly**"

"New Generation have got a very nice product here. It's well thought out, easy to use, aesthetically pleasing, and (as far as I could tell, bug-free and crash-proof" . . . "Overall then, an excellent idea, well executed. **Computing Today**"

Supplied with full notes, this package teaches machine code the way it should be taught – at your own pace and actually from the microcomputer, not from a book. You learn programming the professional way, plus a few tricks of the trade. Available from all good computer stores at £14.95.

YC

NEWS-MONGER

Hear the latest from Franf Zym and his ZX-81.

NEWSMONGER IS a menu-driven program for the ZX-81 15K to show a text in giant letters. The menu has nine options:

- Character size 8 by 8.
- Character size 16 by 16.
- Character size 16 by 24.
- User-defined graphics.
- Fill character.
- Speed.
- Input text.
- Top line number.
- Save.

The almost entirely Basic program uses a machine-code routine held in line 0. The machine code is only 576 bytes long. The text may contain unshifted characters, inverse — shifted — function — and graphics.

The function characters plus the shifted character H represent the lower case characters. The shifted characters A, S, D, F, G, W, E, R, T, Y, 2, 3 and 4 are reserved for user defined graphics — UDGs. You can define eg., the character "!" and its inverse, which do not belong to the standard character set. When you don't like the lower case character set, you are also able to alter this.

In total you have 26 + 13 UDG's. You can't alter the "shifted" character Q because this character is used in string input. When you are not familiar with UDG's, read the article in *Your Computer* April 1984.

The data of the standard ZX-81 character set begin in the Rom at address $1E00 (7680 dec.) and end at address $1FFF (8191 dec.) Only the data of the characters with code 0-53 are in the Rom.

The data of the UDGs begin at address 16760; it starts with the data of the "shifted" character Q — code 192. Then the data of the "function" characters with code 193-215, followed by the "shifted" characters with code 216-229. The data of the "function" characters M, B and T with code 64-66 are placed after the "shifted" characters.

You have the option to alter the fill character of the giant letter, the speed and the top line number. The fill character can be a "unshifted" character, a inverse — or a graphic. Address 16690 holds the code.

```
PEEK(16751)/2-1
```

gives you the speed on a scale 0-9; 0 is fast, 9 is slow. 5 is the most "readable" speed. The top line number can vary for option 1 from 1-17, for option 2 from 1-9 and for option 3 the top line number will be 1. The program checks for invalid values.

There are different ways to save text. First you can run the program and enter your text in option 7:

```
"TEXT" N/L Z$
```

holds your text. Returning to option 7 and typing new text the old text is rubbed out. To prevent the loss of the old string variable Z$, you have to break out during input mode by

(continued on next page)

Hexdump.

```

(continued from previous page)

rubbing out the first quote and then press "shifted" A N/L. Then you type:

LET A$ = Z$ N/L

and the old text is saved in the variables area. You return to the Basic program by typing:

GOTO 0 N/L

Do not use the command Run because this command will also clear the variables area, and that is what you don't want!

Second: you can break out during input mode to enter different string variables. You can use the string variables A$-X$ and subscripted string variables with no limitations.

You can rub out the quotes

Do not use Y$ and Z$ because the program uses these string variables. You can type eg.:

LET A$ = "TEXT" N/L, LET B$ = "TEXT" N/L, DIM A$(10,10) N/L, LET A$(1) = "TEXT" N/L

You return to the menu by typing:

GOTO 0 N/L

When you return to option 7, you can rub out the quotes and type eg.:

A$ + B$ N/L

strings which you have entered before. Z$ holds then

A$ + B$

You can also type: Text, jump over the quote and type:

+ A$ N/L

Z holds then

"TEXT" + A$

When you want to save on tape the string variables or your UDGs, option 9 gives you the opportunity. After typing: 9 N/L during menu mode, the program waits for pressing a key. It gives you the time to set up the tape recorder.

When you want to break out the machine code routine during option 1-3, just press a key a while. It is advisable not to use the "break" key because then you also break out the Basic program. Then it is a habit to type: Run N/L, but then you will clear the variables area. Use always the command Goto 0, and you will get the menu again with the variables still present.

Before you can enter the machine code, you have to make a line with a Rem containing at least 576 bytes. To create this Rem first enter line 1 with a Rem containing 91 dots. Check the number with

PEEK(16511) + PEEK(16512) × 256

The number must be 93:

REM + 91 dots + N/L

Then using the Edit alter the line number so that you become 6 lines with 91 dots. Then type:

POKE 16514,118 N/L
POKE 16515,118 N/L
POKE 16510,0 N/L
POKE 16511,66 N/L

and you have created line 0 with a Rem containing 567 bytes.

PEEK(16514 + 576)

must be 118, check this! Then enter the Basic program hexload. The startaddress is 16514, the endaddress 17089. Save the program on tape after entering the hexadecimal numbers. Then enter:

LET Z$ = "TEXT" N/L, LET L = USR 13524 N/L

and the program should run. Pressing a key a while will bring you back to Basic. When the program doesn't work, check the addresses 16514-17089. ■

Hexloader.

ONLY
£129.95
INCLUDING
4 FREE
WAFERS

ROTRONICS WAFADRIVE FOR 48K SPECTRUM/ SPECTRUM+

Dual 128K storage. Fast access. Centronics and RS232 interfaces. And now FOUR free wafers from SMT, including the Spectral Writer word processing package. We're now including a free 16K, 64K and 128K wafer with each Wafadrive. All this makes the price of £129.95 (inc. p & p) even more attractive.

The Rotronics Wafadrive has now proved itself as the storage system that offers more. More features, more reliability and more speed. Its micro interface, two 128K drives, RS232 and Centronics ports are all contained within one attractively-styled, compact unit. Wafadrive achieves very fast loading and saving but not at the expense of reliability, which is on a par with floppy disk.

The fully interchangeable wafers are available in three sizes – 16K, 64K and 128K. Low capacity wafers are most suitable for program development as they offer faster access. High capacity is most suited to general data storage. Loading rate is well over ten times as fast as cassette!

Software selection is ever growing – see list below for details. A full colour brochure on Wafadrive and up-to-the-minute software and accessory information is available.

Look to SMT for the best deal on all Rotronics peripherals

ROTRONICS DX-85 DOT MATRIX PRINTER

High quality and high speed. The DX-85 prints bi-directionally at 100 cps, logic-seeking. It offers a 96 character set at 10/12.5/16.5 cpi which extends column width up to 132 characters. Programmable typefaces including extended and italic. Centronics interface standard and free dust cover supplied. Options include typewriter ribbon adaptor, telex roll holder, RS232 serial interface and sheet feeder.

See our special price when bought with Wafadrive. This offer also applies to previous SMT Wafadrive customers (proof of purchase required).

ROTRONICS PORTABLE CASE

Tailored foam insert holds ZX81/Spectrum/Spectrum+/ VIC20/CBM64, with C2N/ DR2301 manuals and cassettes within executive style case. All components remain fully operational in situ.

Size 138mm x 700mm x 363mm. **ONLY £34.45 (p&p £2.50).**

PROGRAMMERS

WE ARE LOOKING FOR TOP QUALITY PROGRAMMES TO MARKET IN THE UK AND ABROAD. THE PROGRAMMES MUST BE OF TOP QUALITY AND IN MACHINE CODE WITH GOOD GRAPHICS AND SOUNDS AND ORIGINAL CONCEPT. WE ARE LOOKING FOR PROGRAMMERS TO CARRY OUT WORK ON NEW MACHINES SUCH AS THE C.B.M/16 AMSTRAD AND M.S.X. WE CAN SUPPLY THESE MACHINES TO CARRY OUT WORK FOR MIRAGE. WE ARE ALSO OFFERING £500 PRIZE FOR THE BEST PROGRAMME RECEIVED BY THE END OF FEBRUARY 1985 WHICH WE WILL DECIDE TO MARKET. WE OFFER AN OUT RIGHT PAYMENT OR 10% PLUS PAYMENT OR 20% ROYALTIES. FOR MORE INFORMATION CONTACT THE SOFTWARE MANAGER HE WILL BE GLAD TO LISTEN TO ANY QUESTIONS YOU MAY HAVE.

SOFTWARE HOUSES

WE ARE LOOKING FOR TOP SELLING PROGRAMMES TO DISTRIBUTE TO OUR WIDE RANGE OF OUTLETS THROUGHOUT THE UK AND GIVE YOU A VERY FAST SERVICE TO HELP WITH YOUR SALES AND TO MAKE THE MOST OF YOUR PRODUCTS. SEND A SAMPLE COPY OF YOUR PRODUCTS WITH RATES AND TERMS FOR A FAST ASSESMENT. FOR MORE INFORMATION CONTACT THE SALES MANAGER HE WILL BE GLAD TO HELP AND ASSIST YOU.

DEALERS AND DISTRIBUTERS

DEALERS WE HAVE THE BEST SELLERS FROM THE BEST PRODUCERS; WE ALSO OFFER VERY GOOD RATES AND TERMS TO HELP YOU AND US TO ACHIEVE THE BEST SALES AND SERVICE. FOR MORE INFORMATION CONTACT THE SALES MANAGER.

DISTRIBUTERS HAVE YOU GOT THE MIRAGE RANGE ON YOUR SHELVES, IF NOT THEN CONTACT THE SALES OFFICE FOR SAMPLES AND RATES.

SALES MANAGER

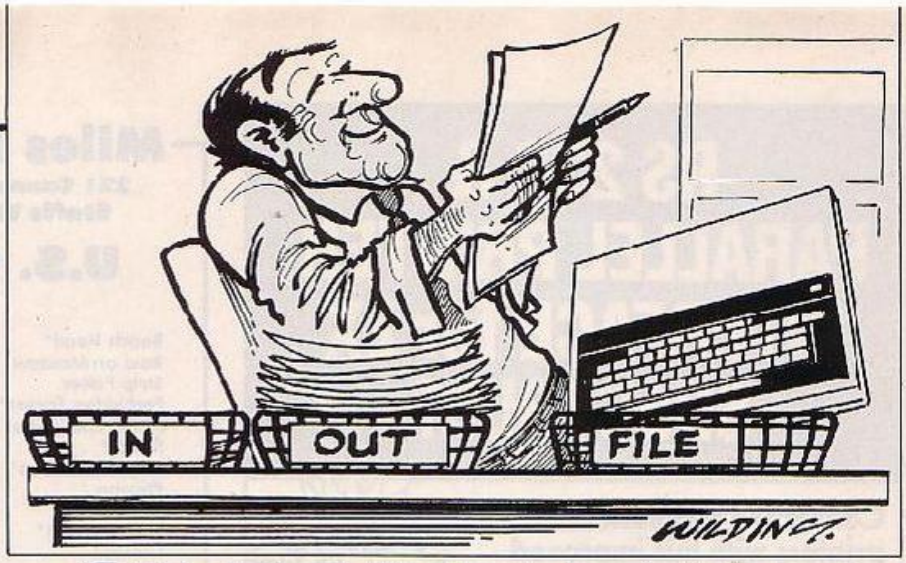
BA Naylor and DW Boyce and a BBC database.



SUPERFILE

SUPERFILE IS a versatile database written for the BBC Micro 32K model. This may be used for various applications ranging from the small home-based business to the family's video cassette library. The question is often asked what a database actually is. In short, it may be described as a computerised filing cabinet that allows rapid data collection and retrieval.

Data is stored on cassette in the form of a file, each file being split up into records, each of these records being further divided into individual items of data called fields. It is advisable to become acquainted with these terms as they are used many times in this article.

Superfile has a capacity of up to 10 fields each with up to 25 characters, allowing 65 records with this configuration, or two fields with 325 records, these being the two extremes of the system. It is obvious therefore, that the number of records is calculated by dividing 650 by the number of fields entered.

Incorporated in the system is a unique Sort which can rapidly arrange records in order alphabetically or numerically, with the user choosing the field to be sorted. Another great asset to the system is the multi function Search procedure. This allows the full use of equalities to seek a particular item in the file.

The whole system has been very efficiently designed and programmed to aid the user and process the data as quickly as possible. On

RS 232 & PARALLEL PRINTER INTERFACE for ZX SPECTRUM

Connect to professional printers with this improved and cheaper printer interface.

£34.95 cable £9.95 inc VAT

ZX Lprint III interface enables your ZX Spectrum computer (16 or 48K) to print on almost any dot matrix or daisywheel printer with RS 232 or Centronics input. Just plug in ZX Lprint III and LPRINT and LLIST commands will work. COPY works without any additional software on Seikosha 100 & 250, hi-res Epsons, Star 510, 515, STX 80 Gemini & Delta, Walters WM80, Shinwa and CTI...Plus Seikosha GP 700 in full colour. COPY on CGP115 and Microline is optional.
And because NO additional software is needed all of your RAM is free to take Tasword 2 or Kemp Business Accounts, Viewfile etc.

- WORD PROCESSING
- HIGH RESOLUTION SCREEN DUMPS
- PRINTS SPECTRUM AND USER DEFINED GRAPHICS
- JUST PLUG IN FOR LPRINT LLIST and COPY
- COMPATIBLE WITH MICRODRIVES & PRESTEL ADAPTOR

many options, output may be directed to the printer or to the screen. Only Parallel printers have been catered for in this version of Superfile. Options are accessed through a menu.

The great beauty of the database is its user friendliness, so that even the youngest member of the family may easily exploit the system.

(1) Filename: To enter this option simply press 1 on the keyboard, and immediately the computer will ask you to enter a filename. A filename is the label given to your data when it is stored on cassette.

If you have previously entered a filename, then you will be asked about whether you wish to change it. Pressing Y will allow you to input up to 10 characters for the filename. Any other key will return the user to the menu enabling them to use the options. If must be noted, however, that a filename is required if you wish to enter the options of Load (3) and Save (4).

(2) Define fields: This is the most essential option of the database, it must be entered before any data can be inputted via the Edit option. This is basically because it defines areas in memory for information to be stored, and thus is the crux of the program.

There are three main items of data to be entered in each field, these are:

- The type of data you wish to store in each field, ie., String variables — letters and numbers, integers — whole numbers — and numerics — real numbers.
- The maximum number of characters allowed to be stored in each field — with a maximum of 25 characters per field.
- The label given to each field which identifies the contents of the field when displayed. The maximum number of characters allowed is eight.

To enter these important pieces of data you can either press the relevant field number or press A to enter every field. At any time pressing the space bar will return the user to the menu.

(3) Load: This option loads the previously stored data into the computer so that it may be processed. It is essential to input the correct number of fields for the file you wish to load, otherwise the computer will not accept the file, and the user will be informed. In this case, a message is displayed that tells the user to start again via option 0, and redefine the fields to the correct value if you wish to load this particular file.

To actually enter a file, the user must press L and then the usual searching message is displayed on the screen. The normal procedure for loading a program is then observed — refer to User Guide if unsure.

When the file has been loaded, pressing the space bar will return the user to the menu.

(4) Save: Both options Load (3) and Save (4) need to have a filename entered, before you can access them, if not the 'No Filename' message will be displayed with instructions for the appropriate actions to take.

This Save option obviously stores the data on tape, and is operated by pressing S on the keyboard. After this, the "Record then Return" message is displayed, at which point a cassette must be inserted into the tape recorder. The usual procedure for saving programs is then followed.

As with most options in this database, pressing the space bar will return the user to the menu.

(listing continued on next page)

(continued from previous page)

(5) Edit file: The fifth option in the menu is the edit procedure which allows the altering and adding of data to the file. All data is initially entered via this option.

Once the user has accessed this section of the system, the fields defined will be displayed followed by the space provided for the number of characters as defined in option 2 for the field. Altering data in a particular field may be achieved by typing the field number allowing data to be entered in the space provided.

Alternatively, the whole record can be entered by pressing A. Erasing a whole record may be achieved by pressing E. To access the next record simply press N or if you wish to edit a particular record press R followed by the record number and Return. Again the space bar will return you to the menu.

(6) Sort: The sort option enables the user to put the file in order according to any of the fields defined in option 2.

If the field has been defined as numeric or integer then the order will be of the algebraic nature, otherwise the file will be ordered according to character values.

Using the sort option requires only one entry; the user must choose the field on which the sort is to be based. Once the sorting is complete the user will be able to return to the menu in the normal way.

(7) Search: This is probably the most useful facility of any database. However, Superfile has a remarkably efficient and rapid search that is enhanced by its special mixture of machine code and hybrid Basic.

Search criteria used are the widely accepted mathematical in-equalities — these are as follows:

1 > : greater than.
2 < : less than.
3 = : equal to.
4 > = : greater than and equal to.
5 < = : less than and equal to.
6 < > : not equal to.

For the "equal to" sign, the user may enter part of a string/number, and then the computer will search for all occurrences of the comparison. Only one search criteria may be entered per field, but many fields can have comparisons thus performing a multisearch function.

The number of items that the computer has found which satisfy the conditions defined is printed on the screen as they are found. These records can then be seen either on the screen or in the form of a printout on the printer. Screen and printer output are explained in options 8 and 9.

(8) Display: This option is used to print the records on the screen, these may only be displayed if they contain data. Pressing Return will allow you to view the next record. When all records have been displayed, the totals of the numbers stored in the integer and numeric fields will also be printed up.

(9) Printer dump: As explained earlier, this version of Superfile can only cater for Parallel printers. We advise that you only use this option if you have a printer connected, otherwise the computer may appear to have crashed.

(0) Start again: This option is used if the user decides to change the format of the file, or if he just wishes to clear the memory. The computer asks you whether you wish to change your mind, just as a precaution before the computer clears the entire memory. ■

BASIC LIGHTNING
WHITE LIGHTNING
MACHINE LIGHTNING
LIGHTNING STRIKES AGAIN
THREE HIGH POWERED GRAPHICS DEVELOPMENT SYSTEMS FOR THE COMMODORE 64.
OASIS SOFTWARE
Totally dedicated to writing very fast, video games, BASIC Lightning is a fully structured extension to the Commodore BASIC which adds a staggering 200 reserved words. It allows up to five tasks to run concurrently (one in foreground and four in background). Most of the commands are dedicated to games writing and the sound and graphics commands are unparalleled. Procedures and PASCAL type structured programming commands are also a feature of BASIC Lightning.
As well as the Commodore's own 8 hardware sprites, BASIC Lightning has its own software sprites. Up to 255 can be defined with user selectable dimensions. These can even be several screens wide. They can be scrolled, spun, mirrored, enlarged or inverted with phenomenal speed and smoothness.
A Sprite Generator Program (written in BASIC Lightning) is also supplied and can be used to design, edit and store all your sprites for use in your main program.
White Lightning is a complete games writing package comprising a high level, Forth based, multi-tasking games writing language, the extended BASIC (the BASIC LIGHTNING) and a powerful sprite Generator Program. Programs can even be written in a combination of Forth and Commodore BASIC and the final program, which will run independently of White Lightning, can be marketed with no restrictions whatsoever.
The Basic Lightning part of the package can be used to experiment quickly and easily before the Forth program is developed.
The speed of White Lightning has to be seen to be believed and a full demo is included. As with Basic Lightning, hardware sprites are supported, together with 255 software sprites which can be scrolled, spun, reflected, enlarged or inverted.
MULTI-TASKING Without doubt the most powerful feature of the Lightning series of languages is the multi-tasking facility. This allows two programs to be run concurrently and makes those smooth landscape scrolls etc. effortless.
The BASIC Lightning Sprite Generator Program is also included in the package.
Commodore 64 Machine Lightning is probably the most advanced games writing utility available on any micro. It comes in 4 parts:
MACRO ASSEMBLER/MONITOR/DISASSEMBLER This is probably the most comprehensive machine code development system available for the Commodore 64 with features too numerous to mention.
BASIC LIGHTNING BASIC Lightning, the multi-tasking BASIC is also provided to facilitate experimentation in preparation for later assembly.
SPRITE GENERATOR Used to develop all the graphics for the final game. The Sprite Generator has numerous functions including enlargement, rotation and reflection.
OBJECT LIBRARY This is Machine Lightning's most powerful feature. 10k of re-entrant code with more than 130 documented entry points. These are the routines that provide all the superfast graphics routines in White and Basic Lightning. They contain virtually every routine you'll ever need to write an Arcade Game and multi-tasking in Machine Lightning is covered in the comprehensive accompanying manual.

QL 68008 QL

Phil Holliday continues his course on

TUTORIAL

assembly language.

LAST MONTH I covered the programming model of the 68008 and its addressing modes. A brief introduction to the instruction set was made and this will be expanded in this article, together with a more complex program example than the one given last month.

I will describe the instruction set under eight general headings, namely data movement, arithmetic, shift and rotate, bit manipulation, binary coded decimal, program control and system control.

The basic Move instruction was covered last month. It has several variants. Move multiple registers — MoveM — allows several registers to be moved to or loaded from memory in one instruction. Move quick — MoveQ — allows an eight bit signed number — i.e. from −128 to +127 — to be sign extended and loaded to a data register.

It is called "quick" as the whole instruction, including the number, is only one word — i.e. two bytes — long. Note there are other quick instructions in the 68008 instruction set.

Move peripheral data — MoveP — transfers data between a data register and alternate bytes of memory, and is intended to simplify the transfer of data between the 68008 and 8 bit peripheral devices. I have not found this a very useful instruction for the QL so far.

Load effective address — LEA — allows an effective address to be computed and stored in an address register. This is a much used instruction and an example will help. Suppose we have opened a channel using a QDOS system call and stored the channel ident returned by the call in a long variable labelled channel. Then to actually load the channel ident into address register a0 we will need a fragment of code such as:

```
LEA channel, a0
MOVE.L (a0),a0
```

Push effective address — PEA — computes an effective address in a similar way to the LEA instruction, but pushes it onto the stack rather than storing it in an address register.

Exchange registers — EXG — exchanges the contents of any register with any other register. Note that the whole 32 bit contents of each register is exchanged.

Link stack — Link — and unlink stack — UNLK — are related instructions. Link causes the current contents of an address register to be pushed onto the stack. The address register is then loaded with the updated contents of the stack pointer and a sign-extended displacement, which is a part of the instruction, is then added to the stack pointer.

This can be used to create a stack frame in which would be stored local data etc, as used in high level languages. UNLK restores the stack and appropriate address register to its state before a Link was executed by loading the stack pointer from the address register and then loading the address register from the top of the stack.

The ADD instruction adds the contents of the destination effective address to the contents of the source effective address and the result is stored in the destination effective address. The addition is binary. As an example suppose that data register d0 contains $100 — i.e. decimal 256 — and that address register a0 points to a variable which contains $200. Then the fragment of code

```
ADD.W (a0),d0
```

will store the result which is $300 in d0. There are several variations on this instruction which are applicable to many other of the arithmetic instructions.

First, we can have Add.B, Add.W and Add.L producing byte, word and long results respectively. Either the destination or the source must be a data register — i.e. it is not possible to add the contents of two memory locations together without first moving one of them into a data register — but see AddX below.

The add address — AddA — instruction is similar to the Add instruction but the desination must be an address register — and so size byte is not allowed. Add immediate — AddI — specifies the source as immediate data, and add quick — AddQ — provides a "quick" immediate add of from 1 to 8.

Add extended — AddX — performs an add of source and destination and the extend bit. It has two versions, either add register to register or add memory to memory.

The extend bit, when affected, is set to the same as the carry bit. It is unaffected by data movement instruction. Note that this allows multiple precision arithmetic.

The subtract instruction — Sub — and all its related instructions, i.e. SubA, SubI, SubQ and SubX work in exactly the same way as their equivalent Add instructions except that the source is subtracted from the destination — and in the case of SubX the extend bit is also subtracted.

Multiplication of two 16 bit numbers to produce a 32 bit result can be either unsigned — MulU — or signed — MulS. One of the multiplicands must be in a data register and the result will be placed in this same data register.

Similarly there are two divide instructions — DivS and DivU — which divide a 32 bit number in a data register by a 16 bit number. The result is a 16 bit quotient in the lower word of the data register and a 16 bit remainder in the upper word of the data register.

The compare — CMP — instruction performs a subtraction of the source from the destination, and sets the condition codes accordingly but does not change the destination. There are also similar compare address — CMPA — compare immediate — CMPI — and compare memory — CMPM — instructions.

Negate — Neg — subtracts the operand from 0 using 2's complement arithmetic. There is also a variation of this instruction using the extend bit (NEGX) for multiprecision arithmetic.

The clear instruction (CLR) clears, i.e. stores zero in, the operand. Note that, as with most instructions in the 68008 instruction set, this instruction does not work with all effective addressing modes. In particular it is not possible to CLR and address register. It is

(continued on next page)

(continued from previous page)

often necessary to clear address register a6 as some QDOS system calls require addresses in other registers relative to a6. To do this you can instead use the instruction

SUBA a6,a6

The sign extend instruction — Ext — will sign extend a byte to a word or a word to a long number. Effectively, this means that for a byte to word extend bit 7 will be copied into bits 8 through 15, and similarly for a word to long extend bit 15 will be copied into bits 16 through 31.

The test instruction — TST — compares the operand with zero and sets the appropriate flags. The test and set instruction — TAS — tests the byte operand setting the flags accordingly, and the most significant bit — bit 7 — of the operand is set.

This instruction would normally be used in a multi-processor system for synchronisation of several processors, which does not apply to the QL of course.

The standard logical operations of bitwise and — And — inclusive or — Or — exclusive or — EOr — and invert — Not — are available for byte, word and long size of data. Either the source or the destination must be a data register. There is also a set of immediate instructions, i.e. AndI, OrI and EorI.

Shift and rotate instructions have both right and left versions. There are arithmetic shift — ASL and ASR — and logical shift — LSR and LSL — instructions. ASL and LSL are identical, causing a zero to be shifted into the right hand side as the left shift takes place.

ASR causes the most significant bit to be retained as a right shift takes place, with the least significant bit falling off the end. The LSR instruction is similar, but a zero is shifted in at the left hand end.

The number of bits to be shifted can be specified as either immediate data in the range 1 to 8 bits, or else in a data register in the range 0 to 63 bits.

The rotate instructions have both right and left versions without extend — ROL and ROR — and with extend — ROXL and ROXR. In a rotate instruction the bit which would "fall" off the end is fed back into the opposite end of the register, and also into the carry bit. In the extend version both the carry and the extend bits are affected.

Four extremely useful bit instructions are available on the 68008. The bit to be manipulated can be specified as either immediate data or as a number held in a data register.

The bit test — BTST — instruction tests the state of a specified bit in a register or memory location and reflects it in the zero flag. The bit tested is not modified.

The bit test and set — Bset — instruction tests and reflects the state of the bit in the zero flag and sets the bit to a one.

The bit test and clear — BCLR — tests the bit as in Bset but resets the bit to zero.

Finally, the bit test and change — BCHG — tests the bit and then inverts it.

Three instructions are included which operate on byte sized operands and perform BCD arithmetic. The add decimal with extend instruction — ABCD — adds the source operand and destination operand and extend bit together using BCD arithmetic, placing the result in the destination operand and if necessary setting the extend bit to allow multi-precision BCD arithmetic.

The operands must either both be contained in data registers, or else in memory locations addressed indirectly through address registers. In the case of memory to memory addition only the predecrement addressing mode is available, to facilitate multi-precision addition.

The subtract decimal with extend instruction — SBCD — subtracts the source operand and extend bit from the destination operand using BCD arithmetic. The addressing modes are the same as for the ABCD instruction.

The negate decimal with extend instruction — NBCD — subtracts the destination operand, which is of size byte, and the extend bit, from zero placing the result in the destination. Thus the instruction produces the ten's complement of a BCD number if the extend bit is reset and the nine's complement otherwise.

This month's program example produces a directory of the cartridge in microdrive one and lists the number of sectors taken by each file, something which is not provided for in the normal QL DIR command. I have kept the program down to a reasonable length so as not to obscure the structure unduly. It is quite a simple matter to extend this simple program to give other features such as directory of other

drives, selective listing of groups of files etc.

The parts of the record we are interested in are the file length, which is a long word and is located at the start of the record, and the name of the file which is stored in normal QL string format with the name length stored as a word at bytes 14 and 15 from the start of the record, and the actual name which starts at byte 16.

The program starts by opening channels first to the directory itself and then to the screen, which is the channel used for output, by using the QDOS io-open system call. The cartridge name and count of empty/good sectors is then fetched with QDOS filing system trap fs-mdinf and these details printed. The program then enters a loop.

Within this loop a check is made for the end of file marker from the directory with QDOS call io-pend, exiting if it is found as we have now read the whole directory. If end of file not found the next record is read into a 64 byte buffer. We now test to see if the file length or name length are zero, as if they are it indicates that this is an old file which has been deleted — in this case we branch back to the start of the loop.

If we have a genuine file record we calculate the number of sectors from its length and print the sector count as a decimal number using a QDOS utility call ut-mint. We now move the print position to column four with QDOS screen driver call sd-tab and print the name string using QDOS io call io-sstrg. Finally we send a line feed character to the screen with QDOS io call io-sbyte, and then branch to the top of the loop again.

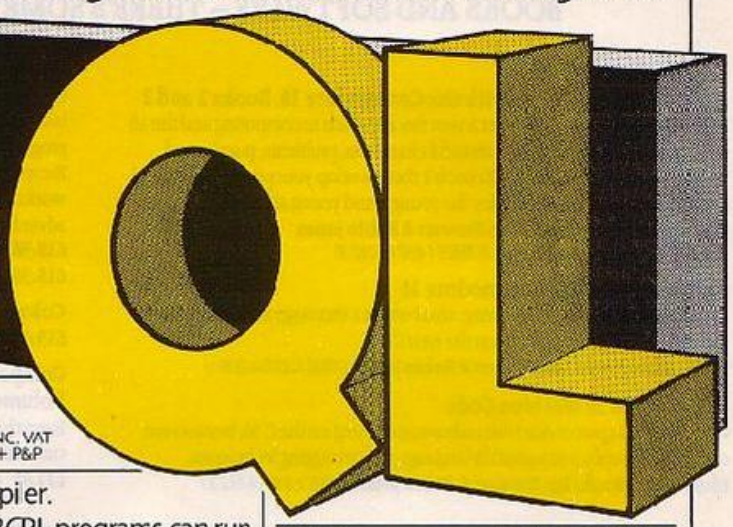
Write programs to unlock the multitasking power of your QL!

Use Metacomco's much acclaimed ***QL Development Kits*** *to create the software you need: Use* ***Assembler*** *for its speed, and for access to the QL's many features; use* ***BCPL*** *for systems programming; writing games, utilities, and applications packages; use* ***LISP*** *for manipulating data structures, and for exploring the world of artificial intelligence.*

RELEASE THE POWER OF THE QL



ASSEMBLER £39.95 INC. VAT + P&P

> Standard Motorola 68000 mnemonics.
> English error messages.
> Produces code which can be EXECed, and run as a concurrent job.
> External references allow linkage to high level languages.
> Integral linker allows assembler programs to be linked together.
> Macro expansions.
> Position independent, absolute or relocatable code can be produced.
> Conditional assembly.
> Large range of directives.
> Fully formatted listings.
> 30 character variable names and 32-bit values.

ENHANCED! NOW INCLUDES ASSEMBLER LINKER* AND NEW LOW PRICE **£39.95**

BCPL £59.95 INC. VAT + P&P

> True compiler.
> Multiple BCPL programs can run concurrently.
> Full runtime library includes interfaces to QDOS graphics, file operations, window handling, etc.
> Exception handling provides diagnostics for debugging.
> Link loader allows linkage of separately compiled segments.
> Assembler and BCPL modules can be linked together.
> 32-bit variables use the full QL address space.

LISP £59.95 INC. VAT + P&P

> Full support of QL features including window graphics, and screen handling.
> Compatible with Acornsoft Lisp for the BBC micro.
> Interpreter.
> Turtle graphics.
> Structure editor allows alteration of data structures.
> Prettyprinter displays programs in structured format.
> Tracer to aid in debugging.
> Garbage collector automatically recovers spare memory space.
> 28-bit integers and 250-character names.

Each language is supplied as a complete Development Kit which includes the software (on a Microdrive Cartridge), Metacomco's popular full screen editor, and user manual.

The QL Development Kits are available from HMV, Menzies and many other leading retailers, or direct from Metacomco.

DO MORE WITH YOUR COMMODORE

MAKE THE MOST OF YOUR COMMODORE COMPUTER WITH THESE BOOKS AND SOFTWARE – THERE'S SOMETHING HERE FOR EVERYONE.

COMMODORE 16

Gateway to Computing with the Commodore 16 Books 1 and 2
'Enter the gateway' and discover a new fun approach to computing and the 16 when you encounter a cast of colourful characters, problems, puzzles and projects. Start from scratch with Book 1 then develop your programming and other skills with Book 2. Ideal for the young – and young at heart!
£4.95 each/ Shiva Books/ Ian Stewart & Robin Jones
(Book 1: ISBN 1 85014 009X: Book 2: ISBN 1 85014 010 3)

Easy Programming: Commodore 16
Ideal for newcomers to computing, this book is a thorough and entertaining introduction to programming on the new C 16.
£5.95 Shiva Book/ Ian Stewart & Robin Jones *(ISBN 1 85014 008 1)*

Commodore 16 Machine Code
Covers every aspect of machine code programming on the C 16, from screen control and graphics to assembly language and debugging techniques.
£6.95 Shiva Book/ Ian Stewart & Robin Jones *(ISBN 1 85014 012 X)*

COMMODORE PLUS/4

Commodore Plus/4 Machine Code
Everything you need to know about machine code programming for the new Commodore Plus/4 – screen and keyboard control, moving graphics and colour – plus descriptions of all the facilities of TEDMON, the C Plus/4's built-in machine code monitor. Packed with simple programs and advice to help you develop your C Plus/4 machine code.
£6.95 Shiva Book/ Ian Stewart & Robin Jones *(ISBN 1 85014 014 6)*

COMMODORE 64 + VIC 20

Commodore Peripherals: A User's Guide
Want to add to your basic 64 or VIC system? Find your way through the peripherals jungle with this easy guide!
£7.95 Compute! Book/ Julie Knott & David Prochnow *(ISBN 0 942386 56 6)*

Compute!'s Commodore Collection Volume 2: Programs for the VIC and 64
£10.95 Compute! Book *(ISBN 0 942386 70 1)*

Compute!'s Third Book of Commodore 64
Outstanding games, applications, tutorials and utilities from Compute!'s magazine and Gazette – plus several never-before-published programs
£10.95 Compute! Book *(ISBN 0 942386 72 8)*

Gateway to Computing with the Commodore, Books 1 and 2
'Enter the gateway' and have fun with your C 64 while you learn the secrets of successful computing!
£4.95 each/ Shiva Books/ Ian Stewart
(Book 1: ISBN 1 85014 017 0 Book 2: ISBN 1 85014 035 9)

Commodore 64 Programmer's Notebook
First-time users and experienced programmers – cut down errors and ease frustration with this programmer's answer guide, which fills the gap left between the Owner's Manual and the Programmer's Reference Guide and shows you how to master BASIC on the 64.
£14.95 HRW Book/ Earl Savage *(ISBN 0 03 001294 5)*

Mind Moves: Strategic Brain Games for the Commodore 64
Tired of playing arcade games? Looking for strategy games that will challenge and entertain you and your family? Look no further! The eight intriguing games in *Mind Moves* feature strategy, words, adventure, resource management, and much more.
£18.49 dilithium Press/ Book + Disk *(ISBN 0 88056 225 0)*
£18.49 dilithium Press/ Book – Cassette *(ISBN 0 88056 228 5)*

Golden Flutes and Great Escapes for the Commodore 64
Create your own games for the 64 with this straightforward guide – all you need is a small amount of BASIC programming knowledge. Four *complete* game programs are included, ready to run on disk or cassette – Golden Flutes, Great Escapes, Mars, and Treasure Hunt – with full explanations of how everything works. Check them out – then use the book to start programming your own adventure fantasies!
£18.38 dilithium Press/ Book + Disk *(ISBN 0 88056 234 8,*
£18.38 dilithium Press/ Book + Cassette *(ISBN 0 88056 205 6)*

Colour and Graphics for the Commodore 64
£13.95 HRW Book/ Andrew Veronis *(ISBN 003 000052 1)*

Compute!'s Reference Guide to CP/M on the Commodore 64 Volume 1
Everything you need to get the most out of Commodore's CP/M package and customise it to suit your own needs.
£11.95 Compute! Book/ James Doody *(ISBN 0 942386 05 5)*

First World War Aerial Combat...
Fantastic 'Point of View' Arcade Action...

FLIGHTS OF FANTASY

ATARI 64

BLUE MAX

You're at the controls for this World War I dogfight game. Shoot down enemy planes, bomb targets, strafe tanks and gun emplacements – there's constant action on the incredible 3-D diagonally scrolling screen. At the same time, you have to keep track of altitude, speed, fuel and damage. Medals don't come easy. You must master a series of flying skills and perform them with pinpoint accuracy. One slip and you've lost it all – even your life. Happy landings, ace!

Commodore 64 and Atari.

SENTINEL

Exciting 3-D action makes SENTINEL the most realistic point-of-view game you've ever played. You're on a starship command deck with the latest in ultra-sophisticated computerised instrumentation. Use it to navigate through deadly asteroid belts, destroy enemy ships and track their battlestars through intergalactic minefields. Along the way you'll dock and refuel. It's tough duty but you've earned the command. Now can you prevent enemy forces from capturing your home planet? It's all in your hands.

Commodore 64.

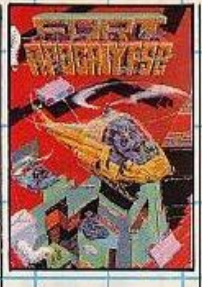
sysoft

A lively, imaginative alternative to rockets and bombs. Your Drelb builds squares, his enemies knock them down. Quick reflexes, intelligence and strategy are a must.

Commodore 64 & Atari.

One of the most challenging arcade games available! Incredible 3-D graphics, diagonally scrolling screen, super sound – all in great detail.

Commodore 64.



A multi-level extravaganza! Fire on hazards; negotiate deadly caves; rescue friends! Features superb graphics, unnerving sounds and a constantly scrolling screen.

Commodore 64 & Atari.

RESPONSE FRAME

Do you have a problem? Your manual is incomprehensible or you just cannot get the hang of that programming trick you tried — whatever it is, Tim Hartnell will do his best to answer your queries. Please include only one question per letter and mark them "Response Frame".

SECURITY SYSTEM

I own a Vic-20 and have just finished a program which returns information to the user when a password is entered. For security, I have included a line zero in the program, to disenable the Run Stop/Restore functions. This is intended to stop a user from breaking into the program while it is running. However, when someone loads the program, Run must be typed in before the program will work. This, of course, gives the "pirate" time to list the program, and discover the password. I have heard of an automatic run sequence, such as the one on Anirog's version of *Krazy Kong*, but I cannot list the program to discover the basic idea. Please can you assist?

Timothy Carson,
Rochdale,
Lancashire.

THERE IS NO simple Poke or whatever, which will give you autorun on the Vic-20, Timothy. A machine routine to do it would be some 90 to 100 bytes long. One simple thing you could do would be to 'hide' the password within the program, so it would take a lot of diligent searching to work it out. This could be done by as follows.

Don't just have a If A$ = "Password" Then line in the program. Rather, hold the password as a series of character numbers, which the computer checks element by element, comparing the numbers with the ASCII codes of the entered string.

These need not be held in the same order as the password, and need not even be in a single place within the program. Every, say, third value could be a dummy, which the computer could ignore, and so on. If you make it difficult to work out the password, from an examination of the program, you increase its security to a certain extent.

MC GRAPHICS

I have a 48K Spectrum and have been learning machine-code. Most areas of machine code are well explained in books, but I have found very little on moving graphics and sprites. Could you tell me if there are any books specifically dealing with graphics?

Mark Goodacre,
Parkland,
Northampton.

ALTHOUGH, MARK, I do not know of any books specifically dealing with the subject, I suggest the two which are most likely to be of value to you are *Supercharge Your Spectrum* by David Webb (Melbourne House, £5.95) and *Mastering Machine Code on your Spectrum* by Tony Baker (Interface Publications, £9.95). I'd be interested to hear from any publishers who have produced works dealing specifically with this area.

QL PRINTER

At present I have a ZX Spectrum, but I will be buying a QL shortly. To accompany the QL, I also intend to buy a printer. The main purpose for this is to produce a quality printout, suitable for format reports at University. However, I would also like it to be able to produce graphics. Obviously, I would need a dot matrix printer, and I gather printers such as the Brother EP44 and the Silver Reed EXD15 can produce a quality print very close to daisy-wheel quality. However, I am not sure how versatile they are with regard to graphics. Could user-define graphics be printed, for instance? If not, what kind of graphics can they print. Also, could they cope with subjects such as graphs? I intend to spend between £200 and £400.

C J Flint,
Welwyn Garden City.

I HAVE USED an Epson FX80 extensively with my QL and have had no problem reproducing anything which can be held within a program line. Note that on the QL graphics do not have the same importance as on the Spectrum. There is no built-in Basic routine for defining your own graphics, for instance. A machine-code routine is needed for this. There is also no built-in facility, like Copy, to dump the screen to the printer, although there are routines which will do this.

I often find it is better to put something like Print CHR$ (144) within a listing, rather than just a pair of quote marks with an obscure, hard-to-decipher graphic within it. To get text output to the printer from the QL, you need to open the channel to the printer — I generally use #3 — then preface the material you want with this channel number, as in Print #3, "Hello".

If program listings and straight text output form the bulk of the work you'll be doing, almost any printer will do. You can buy a very good daisy-wheel printer within your price range. Note that some printers do *not* allow you to control the *width* of the output when listing a program, which can be a major disadvantage when including listings within other material. If this is important to you, you should check this out before you decide on a particular machine.

TOO COMPLEX?

I have a program on my Commodore 64 from one of your issues which includes several machine-code routines. I am sure it is typed in correctly. When it comes to a specific line — the same line each time I try to run it — which includes SYS 38600, the program goes wrong, and the message "Formula too complex" appears on the screen. The keyboard also locks up. What is wrong?

Bjorn Sundset,
Jakobsli,
Norway.

THE SYS CALL triggers the machine-code routine starting at address 38600. As you get an error message each time from this line, it appears that there is an error in the machine-code. The error message "Formula too complex" is not significant, as machine-code errors often trigger unrelated Basic error messages.

However, the fact that you've got a Basic error message suggets the error in your machine-code program modifies something used by the Basic program. It may, for example, take something off the stack without replacing it, so the Basic program finds the wrong values when carrying out something elsewhere in the program.

AID ON AID

I own a Vic-20 and an IOIO expansion board, with a Plus 80 16K Ram, a Commodore 8K Ram, a Programmer's Aid, and a Super Expander. When I do a SYS 28681 to enable the Programmer's Aid, nothing happens. It works with the 16K Ram on its own, but when I add the other cartridges and try again, I get nothing. I would like to know if it is possible to get it to work with all the cartridges in it.

S Moore,
Hull.

THE 8K CARTRIDGE and the Programmer's Aid use memory which overlaps, so you cannot run them both at once. You should have no problems with using all the others at the same time, but the PA and the 8K cannot be used at once because of the memory overlap.

SINCLAIR LATE!

Does any reader know how to get Microdrive orders executed. I placed my order eight weeks ago, and so far have received nothing. Sinclair has not even replied to my query. I am trying to contact the Office of Fair Trading to see if they can help. Has there been any action from this body over Sinclair?

Dr A G Smith,
Beljast.

SINCLAIR RESEARCH has been the target of several approaches from the Advertising Standards Authority, mostly due to its infamous 28 days delivery promise on QL's. A spokesman for Sinclair told me that, as far as he knew, no situation had arisen which meant the Office of Fair Trading had been brought into the question.

According to the records, your order was despatched seven weeks from the date of your order. If you have not received the product by the time the letter is published, let us know, and we'll send the boys over to sort it out.

CORRUPTION

I typed in a program from an earlier issue of your magazine for the Commodore 64. I had some difficulty keying it in, due I think to there being over 80 characters in some of the lines. Eventually, I managed it, and for some time after that I played the game quite often. Then, one day, at the end of Load, "Load Error" flashed up on the screen. On listing, the program looked complete. However, the game would not run, because after typing Run, parts of some lines — and all of some other lines — were deleted, or an error message was displayed, or the machine locked up. I cannot delete nor edit the offending lines because when I press Return the listing disappears, or simply returns as it was, or the machine locks up. I have tried the tape on another Commodore 64, using another recorder, and the same result occurs. How do I play the game, without retyping the whole program.

Fred Starr,
Cheadle Hulme,
Cheshire.

UNFORTUNATELY, IT sounds as if you have corrupted your tape, either by rerecording over part of it, destroying some of the information magnetically, or by stretching, or otherwise deforming the tape physically. Short of using the "load fix" options available in some extended Basics for the CBM-64, there is nothing you can do other than type in the program again.

I suggest that, this time, you make one or more security copies of the program, which are kept on a tape which you do not generally use, so if your working copy is corrupted, you'll have another copy of the program to fall back on.

By the way, you may have noticed on the Commodore 64 that programs which include sprites, such as the one you are talking about, tend to cause more problems when loading them in than non-sprite programs. This is because the machine slows down slightly to handle the extra interrupt routines demanded by the sprites and this appears to affect the quality of the save.

RETURN OF THE RING

THE RING OF DARKNESS PART II

At last the saga continues . . .

The Guardian of Shedir is defeated, the Hell spawned hordes of the Evil Sage lie at bay. Now Ringbearer, wielder of the Four Bright Rings, must face the greatest challenge: to return the Ring Of Darkness to its creators on the hidden planet Ringworld . . . And somewhere at the ends of time the forces of evil are preparing their revenge.

After one year of development, Wintersoft are proud to present the most sophisticated game ever created for the Dragon 32. Written 100% in machine code, RETURN OF THE RING is an astounding multi program blend of superb high resolution colour graphics and advanced routines that allow you to communicate with your computer in complete sentences. You will face challenge and excitement as you and your Ringworld companions travel a mysterious planet and brave the dangers of an amazing three-dimensional forest moon. An epic adventure unrivalled for its wealth of detail and diversity.

May luck travel your path.

Please note: RETURN OF THE RING is a complete adventure. You need not buy THE RING OF DARKNESS to play it.

SPECTRUM

THIS PROGRAM allows you to print a selected range of Basic lines to either screen or printer. It simulates the facility List/LList — line number to line number — available on other computers.

The program will run on 16K and 48K Spectrums and is Microdrive compatible. To use it, type:

RUN 9950

The program should be Merged with an existing program, or loaded before a session. Both start and end lines should exist; a message will be printed if either is absent. A message will also be printed if the start and end lines are not different.

To alter the colour of the listed line number alter line 9985, which is red at present. To change the colour of the Basic within the line alter line 9987 — blue at present.

Qwakers

Christopher Roche,
Sutton Coldfield,
West Midlands.

CBM-64

QWAKERS IS a fairground shooting game. You must shoot all the targets with a limited number of shots within the time limit. There are four levels of difficulty and four different screens

Controls are: Z — left, X — right; space bar — fire.

To load Qwakers, type in listing 1 and, without running it, save it to tape. Then key in listing 2 — again without running it — and save it. Now rewind the tape and load as if it were a single program.

Qwakers. Listing 1.

Submarine

S Edwardes,
London SE19.

AMSTRAD

THE PROGRAM is an adaptation of an old arcade game in which the player — in a submarine — has to sink as many ships as possible in the time allowed while avoiding the mines dropped by the ships.

The program aims to show some of the very advanced features of the Amstrad and has been documented, within the program, in order that general principles can be seen and to allow for improvements or modifications.

The program uses the very versatile interrupt commands together with the extensive sound possibilities of this machine including multi-channel tunes and special sound effects, e.g. a "whoosh" as the torpedo is fired, explosions etc., and a fairly regular sonar bleep which is also interrupt driven.

The game is written for use with a Quickshot II Joystick but could easily be acapted for keyboard control by altering lines 210-230. All rem lines — starting with either Rem or ' — may be removed but are useful for seeing how the program is built up.

Rules are not included in the program but are very straightforward. The object of the game is to sink as many ships as possible within the given time. To do this you move the cursor left or right in order to line it up with the finishing point of each torpedo. The torpedos start from the nose of the sub which remains bottom centre of screen.

When the first button is pressed a simple trig formula moves the torpedo gradually to the position of the cursor and hopefully hits a ship.

For each ship hit you score 50 points. The ships drop mines at random which home-in on the sub. These may be stopped by a direct hit from a torpedo or may very occasionally stop of their own free will in which case a torpedo fired at them will have been a waste of time. If a mine hits the sub, you lose a life.

If you lose five lives the game ends. Lastly, right at the beginning you are asked to input the level of difficulty. This figure sets the speed at which the Every command is called and so affects the speed of the ships across the screen.

Program notes and main variables.

Lines:

15-90 Set level of difficulty.

100 Sets up main variables — see below.

110 Jumps to initial screen, array for note frequency and duration, and plays tune.

130 Useful when typing in program. Defines small Enter key to list in black on white.

150 Sets up more variables.

160 Jumps to main screen, windows, volume and tone envelopes and UDG definitions.

170-180 Interrupt commands.

190-670 Main loop.

680-1010 Interrupt routine to move ship. Also random mine generation; test for mine-hit etc.

1020-1360 Main screen, windows etc.

1390-1750 Primary screen, music etc.

1750-2270 End of game routines.

Variables.

tim = amount of time allowed. Initially 100 — about 2½ mins.

Lev = speed of interrupt routine — 1 to 5.

The Mine

F Clancy,
Manchester.

ZX-81

FULL INSTRUCTIONS on playing The Mine are included in the program. To save a copy of The Mine, first type in on line 1 a Rem statement containing at least 670 characters. Next type in the standard hex loader given. Then run this program and type in the hex code given in listing 2. Then delete the hex loader, leaving line 1 intact.

Finally enter the rest of the Basic program given in listing 3 and save the finished program by entering Goto 770.

Listing 1. The hex loader.

Extra colours

Tom Griffejoen, France.

BBC

THE DEMONSTRATION program, listing 1, shows how you can use 10 colours out of 36 on your Electron or BBC Micro in four colour modes and three out of 35 in two colour modes. The program doesn't work in Modes 2 and 5.

These colours can only be used as background colour, by filling a part of the screen with CHR$224, the two colours to be mixed being respectively the fore- and background colours. When you print any text over the coloured surface — in graphics mode after VDU5 — this text will be practically unreadable. That's why the second program is used. It enables you to print double-width characters. When these are printed over a coloured surface, they'll be more readable.

To see the demonstration, type in the first program and save it. Then type in the second one — don't forget to type New — and save it behind the first under the name "DPRINTrout". Now reload the first program, and Run it. It will load the second one and stop then. Type Run again to see the colours. If it does not start searching on the cassette after you've typed Run for the first time, try it again after having reset L% to 0. If it still doesn't work then, there probably is a bug in your program.

The second program can also be used on its own, in another program. You should then pass the mode in mode% and when you want the text to be printed at the graphics cursor, graphics% has to be True, otherwise False. To print something in double-width characters, type 'PROCDPRINT(X%,Y%, string$)', where X% and Y% are the co-ordinates of the first character, and string$ is the text you want to be printed. This is much like the command 'PRINTTAB(X%,Y%)string$'. To merge the second program with your program, type 'OSCLI"LOAD""DPRINTrout""""+STR$~(TOP-2)'. The computer should now start loading. When it has finished, type End, then List and the programs are merged.

Picasso's paintbrush

Matthew Sillett,
Dulwich,
London SE21.

BBC

THE TEXT FOR this program was published in January Software File without its listing. Here is the full program. Picasso's Paintbrush is a multi-feature drawing program for the BBC Micro. Impressive pictures can be created quickly and easily using the many built-in functions.

- ☐ Automatic circle, triangle, semi-circle rectangle and elipse drawing routines.
- ☐ Extensive colour mixing.
- ☐ Three curso' speeds.
- ☐ Three line thicknesses.
- ☐ Rubber band facility.
- ☐ Load and Save screens.
- ☐ Spray colour option.
- ☐ Print text anywhere on the screen.
- ☐ Colour-fill routine.
- ☐ Full MODE2 colour graphics.

The program contains full instructions of how to operate these functions and the keys involved — all 30 of them. There are three methods of colour mixing provided, all of which are very easy to use.

The first way is to fill the area involved in one of the two colours to be mixed — e.g., red — and then to overlay it with alternate pixels of the second colour — e.g., yellow. The combination of Red and yellow produces a very good orange.

The second way is the same as above, but to overlay with horizontal lines — e.g., a darker orange may be produced using this method. The final method is to use high GCOL values to produce "hatching". On pressing the specified key, you must enter this value — e.g., 198 produces a good brown, when the colour is set to white.

Copies of the program are available for £3.50 from: M. J. Sillett, 41, College Rd., Dulwich, London SE21.

Lander

David Hodgetts,
Tiptor.,
West Midlands.

VIC-20

LANDER IS a game for the unexpanded Vic-20 and a joystick. The game comes in six parts, the first is a loading screen, the next four are for the machine code and graphics, and the last part is the actual game.

The idea of the game is to guide your landing craft through an asteroid belt and land it safely on the pad below. To make things more difficult there is a time limit which is displayed at the bottom of the screen, try and be as fast as possible as your score is based on how much time you have left after landing your craft. As you drop the speed of your craft increases, so if you want to slow your descent you can thrust by pulling back the joystick, but you cannot go upwards.

At the start of the game there is a title page with two options, F1 for the start velocity of the landing craft, and F3 for the asteroid speed. As the levels get higher the asteroids get faster, but the start velocity of your craft remains constant.

Type in and save each of the programs, in order, one after the other, and load using shifted run-stop. Each of the data programs has a check sum to make sure that the data is correct, as if there is a mistake in the data it could cause the program to crash, so if you get a data error re-check the data and re-save the corrected version.

If there are no data errors then each program will load the next. After each part has finished loading then the border colour of the screen will change.

SPECTRUM

TOOLKIT COMBINATION is a machine-code program which allows the user of the ZX-Spectrum with only one USR instruction to get a variety of information about a Basic program as well as about one written in machine code. Several of the routines have been published before, but the disadvantage of these is that you have to keep track of a series of addresses.

Access of a machine-code instruction directly from Basic as was done in the program published in *Your Computer*, September 1983 by Gary Rees causes troubles because the Spectrum seems to dislike the IM2 instruction.

Toni Baker warns against using the IM instruction on page 102 of her book on machine code. After some time a system hang-up appears to occur. Nevertheless, Gary Rees' program is quite interesting because it gives a useable way of printing numbers on screen.

The same method has been used in this program: the program gives a menu of the options — analyse memory, the hex/dec, dec/hex converter and some smaller routines are adapted from the program Supercode by CP-Software and are published with its

(continued on page 134)

(continued from page 133)

permission. Now a short description of these options.

Analyse Memory: This gives the address you have chosen, the decimal value, the hexadecimal value and the character — where printable — in the address. You can choose the first address by Randomise not USR! — address. All the following addresses are printed until the screen is full. The Scroll? message is then printed. If you press n you are back in Basic, but it is possible to get the menu back if you have put the instruction:

RANDOMIZE USR 64360 in a Basic line

The options Memory free, Proglength, Varlength, Pro. + vars do not need any explanation. Neither does the option Ramtop. You have only to press the letter behind these options to see the value of these parameters printed on the screen.

The second option in the menu is Frames + sound. This is not a very useful routine but more something like a demonstration that Spectrum does have a clock inside.

You can get back to the menu by pressing Z. Z is also used to get back to Basic. That is the way to get into Basic without Caps Lock, because the machine-code is programmed to be used with capitals. It has other features, which I hope you will like: Paper and Border blue, Ink white and a more audible sound from the keyboard. These are permanent in Basic until you change them back. With Interface 1 connected CLS # will change the colours to black and white.

Breaking out of the machine-code with Caps Lock-Break is possible too. There are three other options which I didn't mention. Line address, UDG, and 3. The first is quite straightforward. Put the cursor in a Basic line, and L will tell you the address of the first character the cursor points to. Easy to see where a Basic program ends. UDG again uses the variable Seed. If you have your own UDGs somewhere in memory, e.g. 40000, use Randomize 40000, go to the menu and press U. To get back to the Spectrum UDGs you can use the S.

The last option is pressing 3. This is not mentioned in the menu. It sets the Microdrive variables — with Interface 1 connected — and gives a yellow flashing Border when Saving etc on Microdrives.

Now for the Basic program. The machine-code is exactly 1000 bytes long. Each Data statement is one hundred bytes. Type it in and run it. Three things can happen. You have all the numbers typed in correctly — congratulations, I never succeed in doing that. Then the program will run to the end. If on the other hand you forget a number or type more than 100 numbers in one statement you can expect the Spectrum to give the somewhat unfriendly message "Nonsense in Basic", because it is reading a numerical Data instead of a string variable. Another possibility is typing a wrong number.

The program then gives the Line in which the error has occurred. It contains no safeguards against typing two or more faulty numbers, if the sum is the same as that of the correct ones. So it is advisable to Save the Basic program before trying the machine code. Once the machine code works as expected, you can New the program, but make sure first that machine code is Saved. Never try to load the machine-code before lowering Ramtop — Clear 64359.

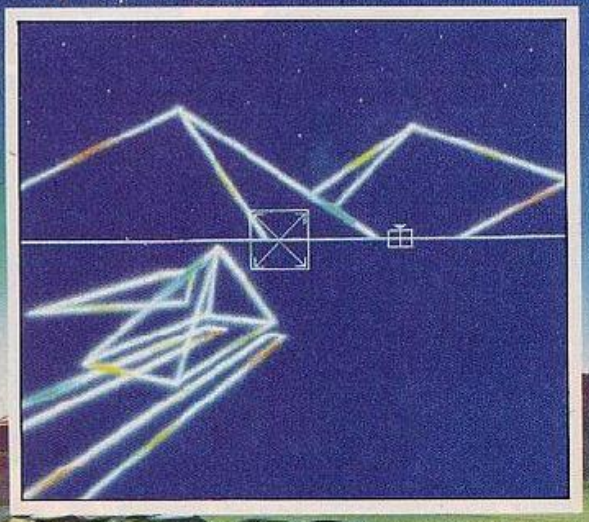
EXPERIENCE

STELLAR 7

FEATURING SUPERB 'BATTLEZONE' ACTION!

War! Gir Draxon, Supreme Overlord of the Arcturan Empire, has declared war on the Terran Empire, prompting Earth's leaders to dispatch the entire Terran Fleet to intercept the Arcturan Armada. With the fleet half-way to Arcturus, Terran Intelligence discovered the existence of the Warplink, a phenomenon permitting the transfer of matter from one spot to another. Gir Draxon was transporting an entire ground assault force to Titan, Saturn's largest satellite, as the prelude to a massive invasion of the now-unprotected Earth. Earth's only remaining hope is the RAVEN, an experimental armoured craft equipped with anti-grav pods, an inviso-cloak, and heavy weaponry. You must pilot the craft through the seven Warplinks from Arcturus to Titan, destroying the guardposts on the way, in order to clear a path for the return of Earth's forces. A suicide mission? Or Earth's only hope?



OUTSTANDING 3-D VECTOR GRAPHICS for your Commodore 64

CASSETTE £9.99 DISK £12.99

THE WAITING IS OVER!

The long awaited follow-up to FOOTBALL MANAGER by KEVIN TOMS is now available

SOFTWARE STAR

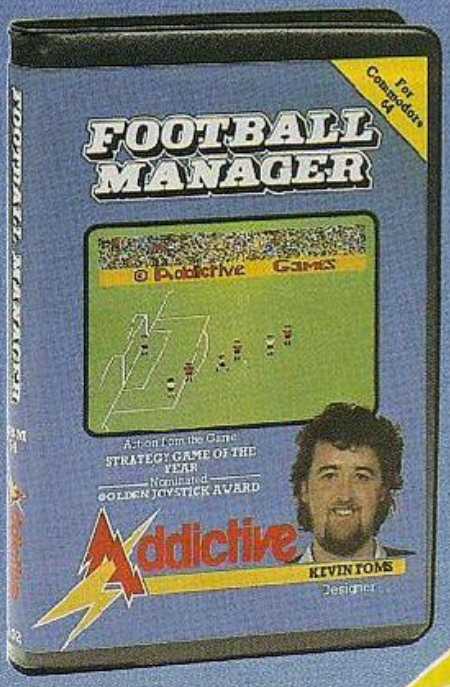
Available NOW for SPECTRUM 48K £6.95 COMMODORE 64 £7.95 AMSTRAD CPC 464 £7.95

SOFTWARE STAR is the NEW game from Kevin Toms, who designed the Software Classic – FOOTBALL MANAGER. SOFTWARE STAR allows *you* to try your hand at running a successful software company. You have to cope with staff problems, game launches, advertising, financial problems and more while trying to produce chart topping successful games. One other thing, SOFTWARE STAR has that *gripping* Addictive quality that all Kevin's games have!

NOW AVAILABLE FOR YOUR COMPUTER!

FOOTBALL MANAGER

by KEVIN TOMS



"Absorbing and realistic – Highly recommended" – *Sunday Times, February 1984*

"Completely fantastic – I want one!" – *Charlie Nicholas, Arsenal striker in Big K, April 1984*

Some outstanding features of the game

- Transfer market
- Promotion and relegation
- F.A. Cup matches
- Injury problems
- Full league tables
- Four Divisions
- Pick your own team for each match
- As many seasons as you like
- Managerial rating
- 7 skill levels
- Save game facility
- Financial manipulations
- You can even be sacked!

NEED WE SAY MORE

Addictive

FOOTBALL MANAGER
is available for the following computers:–

AMSTRAD CPC 464	£7.95
COMMODORE 64	£7.95
SPECTRUM 48K	£6.95

GSH

BOURNE HOUSE!

MSX Games Book. Easy-to-enter program listings turn your MSX computer into an arcade of electronic fun and thrills. Games to test your reflexes, nerve, logic, strategy and intelligence. This book will open the door for all MSX owners to a fascinating new dimension of computer game action and excitement.

The Complete MSX Programmers Guide is invaluable for all MSX users from novice to advanced. It's four sections are: a comprehensive self-paced guide for the beginner; a section devoted to advanced programming techniques; a detailed explanation of both BASIC and machine language, and a complete guide to the MSX Operating System.

The Complete MSX Programmers Guide is the reference book that will answer all your questions.

Supercharge Your Commodore 64 gives your Commodore the power of machine language. Without any additional effort, you can overcome the limitations of BASIC. Not only will your programs look better, run faster, and have more spectacular graphics and sound, but you will also be able to develop them in a fraction of the time. Whether you are a beginner or an experienced programmer, Supercharge Your Commodore 64 is a book you cannot be without.

Guide to BBC ROMs. At last a reference book providing 'at-a-glance' pictures of the fundamental concepts of the BBC ROMs. It lists the entry address of each ROM routine, and summarises each aspect of its function.

Guide to BBC ROMs gives you an overall view of your BBC microcomputer, showing you where to find everything you need.

It is readily applicable to all other versions of the BBC microcomputer and its ROMs – a valuable aid to all owners of BBC microcomputers.

Quick QL Machine Language explains how the 68000 instruction set and addressing modes work, and provides you with a full listing of an assembler and disassembler. In this process, the relevant features of SuperBASIC and QDOS are highlighted. This information, coupled with a line explanation of the disassembler, arms you with all the knowledge you need to produce your own assembly language programs.

MICRODRIVE TRANSFER TAPE

At last MAJORITY of your software can be transferred to Microdrive, even auto-start commercially made games WILL run as intended.

* The NEW 007 MD cassette enables you to transfer the Headerless programs as well.
* Includes an intelligent Header Reader which tells YOU if any special actions required.
* Does NOT require an additional Help tape.
* Semi-Automatic. Fully automatic systems have proved limited.

How it works: Copies Code to the Microdrive using its push-button copier. YOU make a few very easy changes to the Basic loader part. Save it to Microdrive, and magic, **INSTANT SUCCESS.**

007 MD IS JUST £5.95
(Europe +50p Other areas + £1.50)

SPECIAL OFFER: Membership of the **MICRODRIVE EXCHANGE** Newsletter club plus 007 MD for just £10. (Or or cartridge for £15.

Remploy

NEW!!

TAPE COPIER 6

Make your essential BACK-UP copies with our second generation copier package TC6. Manages virtually all programs. 48K SPECTRUM only.
* Deals with fast loaders – converts them to normal speed for drive transfer.
* LOADS in program parts CONTINUOUSLY — even when there is no sound gap, short tone leaders, false/illegal headers, etc, making the process simple and effective. User friendly.
* Copes with v. long programs (say 65000 + bytes).
* Extra features. e.g. integral header reader, pause, delete, abort, repeat copies, FULL manual.
* MINITAPE 6 (MT6 — extra program transfers Basic, Code + arrays directly to m/drive + other features.

TC6 costs £5. £6 with MT6 on same tape). MT6 £3 on separate tape (old customers old tape + SAE but £2 reduction on above prices).

MICRO/WAFA/DISC DRIVE TRANSFER

48K Spectrum owners with Micro/Wafa/Disc drives can NOW transfer the MAJORITY of their programs (inc headerless, long programs, + those with LOW addresses – say 16384).
To transfer from tape you must convert the program, and then transfer the converted bytes. MD1 (or WD1) has 5 programs *giving you the tools* to do the modifications to get them running. MD1 also has two "CAT" housekeeping programs. MD1/WD1 has a comprehensive manual with example transfers and exercises.
This widely acclaimed program (see Your Spect. No. 9 P14) is ESSENTIAL if you are going to transfer MOST of your programs to your drive. MD1 (WD1 for disc or Wafadrive owners) costs a mere £6.50.

ALL PRODUCTS CARRY OUR MONEY BACK GUARANTEE
OVERSEAS: add £1 Europe, £2 other for each product.
SAE for enquiries.

WDSoftware

Utilities for the QL (£10 on Microdrive)
This package offers single-key loading, running or deletion of files, multiple formatting of cartridges, and auto backup of files from one or more cartridges to another with optional over-writing of namesakes. In addition, a directory of 60 + files can be viewed without screen overflow. NB a VERIFY program is unnecessary – QDOS does this automatically. Now includes directory print-out and 'qprint' to print any or all files on a cartridge with optional dated titles. Owners of the earlier package can update by sending OUR cartridge and 25p.

Morse Tutor for QL £8.50
As for 48K Spectrum without speech

Current Spectrum Software

Tradewind (£5 Cassette)
Buy a ship, provisions and cargoes to trade between the harbours of the Coral Islands. Make a fortune if the weather and pirates let you live long enough to master seamanship and economics. A strategy-adventure game with graphics for 48K.

Jersey Quest (£5 Cassette)
Following an accident, you are stranded in the labyrinth of time and must find your own way back to the present with the aid of persons and objects from Jersey Folklore. Meet the Black Horse of St Quen, the Dragon and Knight of La Hougue Bie, the Black Cat of Carrefour a Candre, the Witches of Rocquaburg and many others. A text-only adventure for 48K in machine code (Quilll).

Morse Tutor (£4 Cassette)
The one has it all! 4-19 words/minute, variable spacing, variable number of groups of random letters, numbers or mixed, random sentences, own message, single characters (including punctuation), variable pitch, FEEDBACK via screen, printer or SPEECH (phonetic alphabet via Currah u/Speech or 48K version only), and repeat facility. Takes you to and beyond RYA and Amateur Radio receiving standards. 16K and 48K versions on one cassette. 48K only on Microdrive cartridge.

Spectrum Programs on Microdrive
All the above are available on Microdrive cartridges at a price of £4.50 for one cartridge + the price of each program as shown above. E.G., a cartridge with Tradewind and Morse Tutor would be £ 3.50. As a bonus, Gavin Monk's Indexed Loader is included free with each cartridge.

STOP—REVEAL

A unique cassette for the 48K Spectrum. Genuinely lets you:
1. STOP virtually all programs, BASIC, MACHINE-CODE and even HEADERLESS-FILES protected or not.
2. REVEALs the hidden Basic in Machine-Code programs. (Could be clues in adventure games).
3. LISTS actual Machine-Code on your video.
Now you can STOP, LIST, MODIFY, STUDY most Spectrum programs at your leisure. (And cassette is Microdrive compatible).
Includes a DISSASSEMBLER so can even study Sinclair ROM etc plus the most Advanced HEADER-READER ever written, plus pages of SECRETS OF THE TRADE explaining professional methods used to hide lines/programs, etc.
YOU CANNOT GET A MORE POWERFUL CASSETTE
(Even STOPS/REVEALS programs which are a genuine 48K long).
POST £5.95 FREE
(Europe add £1. Other areas add £2)
KERR, 1-2 HIGH STREET, KING'S LYNN, PE20 1EX.

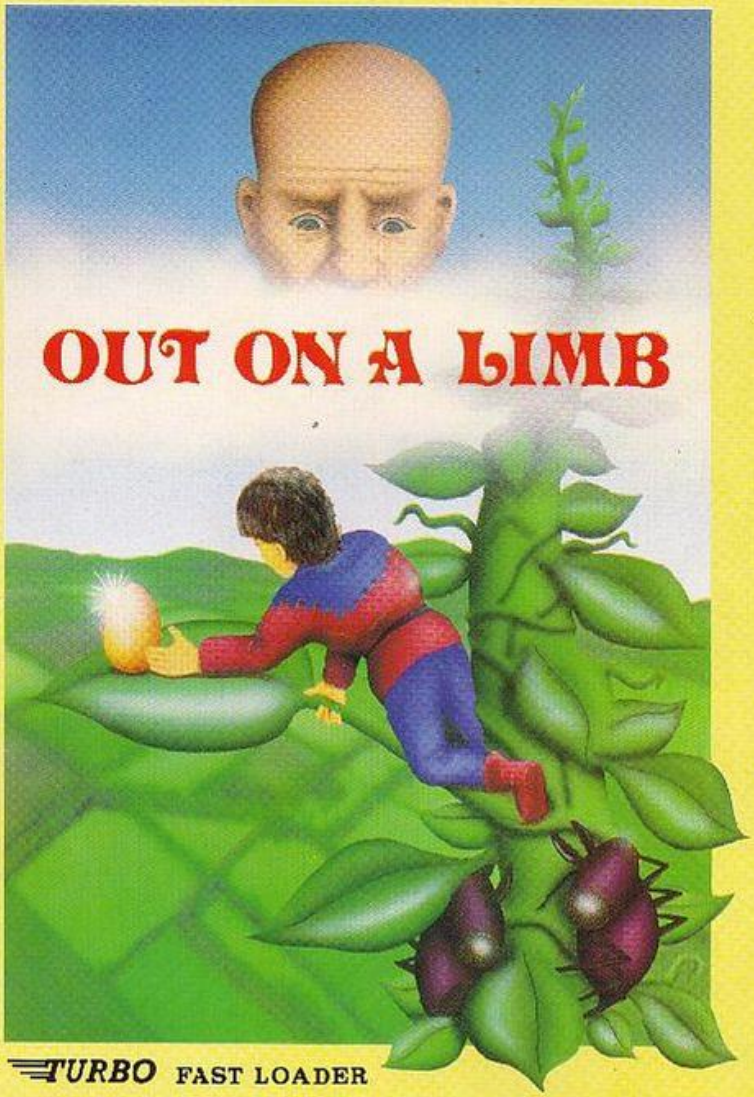
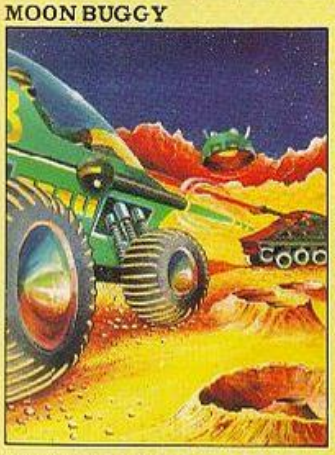
COMMODORE C16 AND PLUS 4

LAS VEGAS

ZODIAC



MOON BUGGY



3D TIME TREK

FLIGHT PATH

SKRAMBLE

TURBO FAST LOADER

LAS VEGAS Las Vegas brings all the challenges of a deluxe arcade fruit machine direct to your fingertips. Many exciting features include, gamble, cancel, collect, nudge and number options, with a three row display and maximum payout of 20$.
K.B. Only C.16 £6.95

ZODIAC This is an enthralling arcade adventure in which the evil powers of hell have scattered the signs of the Zodiac in the four hundred chambers of the abyss. Struggle to collect these signs and at the same time try to annihilate everything in your way. How long can you stay alive?
J.S. or K.B. C.16 £6.95

PETCH Race Petch around the screen, moving ice blocks to alter the maze, however, beware of the nasty monsters who are constantly chasing Petch as you attempt to collect the bonus cherries. Also if you can touch the edge of the maze the monsters will suddenly burst into flames, but look out they'll soon be back!
J.S. or K.B. C.16 £6.95

MOON BUGGY You must skillfully manoeuvre your jumping patrol vehicle over dangerous moon craters as well as large boulders and cunningly placed mines. Not only this but avoid the hovering alien spaceship as it bombards you from above.
J.S. or K.B. C.16 £6.95

3D TIME TREK As sole survivor of the planet "Corillian" your quest is one of anger and revenge. The starship you are flying is full of the latest inboard computers and extra powerful sensors. Also included are full 3D graphics, to add unbelievable realism to this fantastic journey through time itself, and beyond.
J.S. and K.B. C.16 £6.95

SKRAMBLE Earth has been overrun by the Cobrons and its up to you to battle through the six ferocious and testing sectors. Adversaries include meteors, UFO's and deadly fireballs. Fly through an armoured city, then an elaborate maze and finally the command base itself.
J.S. or K.B. C.16 £6.95

FLIGHT PATH Flight Path is without doubt the best flight simulator on the C/16 and Amstrad. The many elaborate features include; Altometer, flaps, directional headings, crosswinds, fires, ground warning lights and reverse thrust to name but a few. Also included are smooth graphics as you take off, cruise over mountains, and land once again.
J.S. and K.B. C.16 £6.95

OUT ON A LIMB This is a fantastic and in parts outrageously funny game. Based on the fairytale of Jack and the Beanstalk, Out On A Limb is full of the most strange and eccentric characters you are ever likely to meet. Firstly, climb the stalk and jump onto the clouds, then enter the giant's castle searching for treasures. However, watch out for vacuum cleaners, musical notes, televisions and potted plants, all of which chase you round the many and elaborate rooms of the castle. Once the treasure is collected the single exit will be opened, and then.....?
J.S. or K.B. C.16 £6.95
