June/July 1984

# ZX

\$3.95

£1.95

# COMPUTING

Britain's Best Magazine For The Sinclair User

**Over 130 pages of information and programs for the ZX Spectrum, ZX81 and ZX80**

**Follow Slogo - Logo at a snail's pace!**

**Education and domestic programs for your ZX81 and Spectrum**

**Get technical with our 3D graphics program**

**Learn BASIC the professional way**

**Going abroad? Cash in on our currency conversion**

# DOWN AND DOWN AGAIN

The deeper you dive, the deeper the danger. Through cavern after cavern to find the pearls and the treasure. (It's different every game!) Sharks, octopuses and jelly fish are everywhere; and look out for your oxygen level! Staggering graphics, fantastic colour – a true arcade adventure.

Another great quality game from the house which brought you **"Harrier Attack!"** and **"Jungle Trouble!"**

## CONTENTS

### Welcome . . . . . 8

I say, I say, I say . . . and so do you!

### Ack Ack Attack . . . 13

Show your mettle in C Stock's all action airborne game for the Spectrum.

### Gamesmanship . . 17

Expert advice from Tim Hartnell that will put your programs one above the rest!

### Technical Drawing 20

Machine drawing made easy for student, expert or general use thanks to this excellent program from Martin Clayton.

### Spectrum Lessons 24

Words of wisdom from Mike Edmunds who gives us his professional opinion of some more educational software.

### Escape . . . . . 28

Get yourself out of a tricky situation in Lynne Rollinson's graphics game for the ZX81.

### Safecrack . . . . . 32

A program from S Parry to provide a challenge to students of any age.

### Wall Walk . . . . . 35

A great Spectrum arcade game from Tat Tang.

### Quicksoft . . . . . 38

Some of the more unusual Spectrum packages assessed by Clive Smith.

### The 1K Corral . . . . 39

In which you will find a multitude of mini masterpieces for your unexpanded ZX81.

### Touchdown . . . . . 42

Especially for ZX Computing — a program to teach as you type it in from Mike Richardson of Durell Software.

### Data Store . . . . . 46

A very handy program with some great features programmed by Dr R G Shillito — it's just what the doctor ordered!

### Beetle . . . . . 51

A traditional dice game brought up to date and given a new lease of life on the Spectrum by Colin Gooch.

### ROM Routines . . . . 55

A Marsh shows how to enhance your own programs by using what's built into your Spectrum.

### Readers' Reviews . 58

Personal opinions and considered comment: the Editor accepts no responsibility . . .

### Club Corner . . . . . 61

Looking for someone who shares your interest in computing? Check out our list of local, national and international computer clubs.

### Racer . . . . . 62

A racing game from David Price that could drive you round the bend . . .

### Slogo . . . . . 66

LOGO in BASIC? David Nowotnik reveals all in the first of a fascinating new series.

### Zappo and Zip . . . 71

Two sound programs to help you explore the capabilities of your Spectrum from E French and David Mold.

### Life and Death . . . 74

A comprehensive implementation of the classic simulation, written for the Spectrum by John Elliot.

### Escape from Omicron . . . . . 78

Sean Morley sets the scene for this challenging ZX81 graphics game.

### Bookshelf . . . . . 82

Resident book reviewer, Patrick Cain, assesses three new books relevant to the Sinclair user.

### Light Screen Designer . . . . . 86

Toni Baker makes a welcome return with the first in a machine code series that pushes the Spectrum to the limit.

### Editor's Project 2 . 90

In which we bring you further revelations on the battle to produce a better Llist.

# COMPUTING

ZX Computing is published bi-monthly on the fourth Friday of the month. Distributed by: Argus Press Sales & Distribution Ltd, 12-18 Paul Street, London EC2A 4JS. 01-247 8233. Printed in the UK by: Garnett Print, Rotherham and London.

## Competition . . . . . 93

What's a jumbogram? Find out and win yourself some software in our free entry, mind-boggling competition!

## Mozart c1984 . . . . . 94

Who said the Spectrum's beep was useless! You'll be amazed at this program from Chi-Yeung Choy that will bring a little culture to your computer. . .

## News . . . . . 97

Keep upto date with the recent developments in hardware and software with our regular round-up.

## Sinclair Snooker . 103

Pot the black in this ZX81 simulation game from Tim Blewitt.

## The ZX81 Soft Selection . . . . . 108

There's life in the '81 yet! Nick Pearce tries out some of the latest releases.

## ESP . . . . . 110

On television recently a thought control system was demonstrated — ZXC keeps you right up to date with this mind expanding program from D Barraclough.

## Cool and Calculating . . . . . 111

Turn your Spectrum into an effective (and expensive!) calculator courtesy of B McIntosh.

## 1K Disassembler . 115

Disassemble your ZX81 in just 1K? A real challenge from H M Tucker.

## Data Handling . . 120

If you have always wanted to write that ideal utility, K Williams gives some tips on how to go about it.

## Mind Games . . . . . 122

Greg Turnbull, regular contributor and adventure expert, looks at one of the latest games releases — for those who like their software on the cerebral side.

## Debugger . . . . . 123

Before throwing your computer at the television set when that program doesn't work, check here — then throw it!

## Conversion Tips . 124

Handy hints from David Nowotnik for those who think the grass is always greener. . .

## Currency Conversion . . . . . 126

Going abroad this summer? K Rider's useful program will make sure you get your money's worth in lire, drachmas, francs. . .

## ZX81 Goes Forth . 128

Peter Shaw takes a look at a new variation on an old theme.

## Snake Trap . . . . . 129

Peter Cooke produced this reptilian nightmare. Can you cope with the snakes in the grass?

## ZX Designer . . . . . 132

Chris Timson provides a program to help you make the most of your Spectrum's designing facilities.

## Semaphore . . . . . 134

A brilliant idea and some advanced programming from P Jennings.

## Parlez-vous Micro-PROLOG? . . . . . 137

Our reviewer has taken a look at an up and coming language for the Spectrum.

## Follow Me . . . . . 138

An offer you can't refuse from S Procter!

## Youth Club . . . . . 142

The Revd Simon Springett has written a strategy program with a difference. Could you successfully run a youth club?

## Bar Charts Revisited . . . . . 146

N Brooks presents a versatile program with many possible applications.

Please note that Sinclair, ZX, ZX80, ZX81, ZX Spectrum, ZX Microdrive, ZX Interface, ZX Net, Microdrive, Microdrive Cartridge, ZX Printer, and ZX Power Supply are all registered trademarks of Sinclair Research Ltd.

Subscription rates: UK £12.70 including postage. Airmail and other rates upon application to ZX Computing, Subscriptions, Infonet Ltd, Times House, 179 The Marlowes, Hemel Hempstead, Herts HP1 1BB (Tel: 0442 48432)

ZX Computing is constantly on the look-out for well-written articles and programs. If you think that your efforts meet our standards, please feel free to submit your work to us for consideration for publication.

All submitted material should be typed if possible; handwritten work will be considered, but please use your neatest handwriting. Any programs submitted should be listed, a cassette of your program alone will not be considered. All programs must come complete with a full explanation of the operation and, where relevant, the structure; Spectrum programs should be accompanied with a cassette of the program as well as the listing.

All submissions will be acknowledged and the copyright in such works which will pass to Argus Specialist Publications Ltd will be paid for at competitive rates. All work for consideration should be sent to the Editor at our Golden Square address.

# "THE BEST AND FASTEST SERVICE ON THE SOFTWARE MARKET"

(B. Strasser, Jordan)

CONFUSED by the vast choice of Spectrum programs? We can help. We've played hundreds to choose the best (some are on this page). Full details in our catalogue, free with your order. It's the only catalogue to describe the best, omit the rest and quote all the reviews!

All games work with keyboard control and with joystick as shown. Of course, we have the classics, too, like BLACK CRYSTAL (48K: £7.50), JET-SET WILLY (48K: £5.95) and PHEENIX (16K: £5.50). All games are in stock - and tested by us - BEFORE they are advertised.

WE TRY TO SEND YOUR PROGRAMS THE SAME DAY WE GET YOUR ORDER. Access/Visa card holders call 01-789 8546, 24 hrs, from any country where your own laws allow this.

**HUNTER-KILLER** "AN EXCELLENT SIMULATION." (PersCompNews). Captain your own S-Class sub as you hunt down and kill the enemy sub! 18 control keys (PROTEK stick helps); dive, surface; chart your course; watch through your 3D periscope as your torpedoes run towards the target. Quick-kill practice mode. Full-screen control room; chart room; periscope view. Very good graphics. **48K Protek £7.95**

**DUNGEON BUILDER** This amazing program contains 15K of pure machine-code to teach you to **WRITE YOUR OWN GRAPHIC ADVENTURES!** It was two and a half years in the making, but now you can easily learn to write - and illustrate - machine-code adventures. 100-page manual helps. NO STIX. **48K Dream £9.95**

**PAINTBOX** "If you've been looking for a Spectrum graphics aid, this seems like one of the best." (PopCompWkly). As they claim, even a child can use Paintbox to define up to 84 User Definable Graphics, draw all of them on-screen, save them for your programs; then there's the 2-speed hi-res drawing program and the 28-page manual ... the most useful utility we've ever used. KEMPSTON/CURSORS STIX **48K Print&Plotter £7.70**

**FIGHTER PILOT** "A superb simulation ... as a piece of programming it's impressive, as a game it's not to be missed." (CompChoice). "THE FLYING IS THE BEST I'VE COME ACROSS." (PCGames). 3D cockpit view, 3D air-to-air combat, stunning instrumentation. 7 Options include landing practice, flight training, combat practice, actual combat. 4 skill levels. KEMPSTON, INTERFACE 2, AGF STIX. **48K Digital £7.95**

**DENIS** "Rapid-response, superbly complex game ... great fun to play ... excellent." (PopCompWkly). Funny, friendly text adventure. As Denis Thatcher you travel up to 95 locations, seeking peace in the pub. You must find a drink every few moves, while dropping in on the Royals, the MPs and maybe the Pope (wearing a truss and carrying a lawnmower). Written with THE QUILL (£14.95). NO STIX **48K Applications £5.50**

**LORDS OF TIME** "Some of the most intriguing puzzles ... if you enjoy text adventures, this is not to be missed." (HomeCompWkly). Defend history against 9 evil Time Lords, from the Ice Age to the Space Age. 200+ locations; 200+ vocabulary. NO STIX. **48K Level 9 £9.90**

**SKULL** "The best, smoothest and cleverest maze game I've ever seen ... the skulls are wonderful." (Crash). Brilliant 3D maze with 9,999 levels as you search for treasure, avoiding the wandering skulls! SAVE OR PRINT OUT HI-SCORE TABLE. NO STIX. **48K (Games Machine) £5.95**

**THE TRAIN GAME** "An excellent game ... original, well thought-out and full of action; absorbing and amusing." (S. User). Run your own railway! Change the points to avoid crashes; watch out for irate hijacking passengers. 30 command keys; 2 track layouts; 7 skill levels, 14 sub-levels. Demo and Pause while you strike! NO STIX **16/48K Microsphere £5.95**

**SCUBA DIVE** "FABULOUS UNDERWATER WORLD ... if you fancy settling back for a long nail-biting adventure, SCUBA DIVE is very special." (S. User). Dive overboard and seek your fortune; the way the fish move is incredible! Beautiful full-screen animated graphics; but you'll need strategy as well as tactics to get past all the octopuses! ALL STIX. **48K Durell £5.95**

**WHEELIE** "EXCEPTIONALLY GOOD GRAPHICS ... smooth, very detailed, with loads of animation." (Crash). "The crash sequence is a little too graphic." (S. User). Jump buses and cars on your SuperDream bike; avoid hedgehogs, but find the ghost rider. Will you beat him? Demo mode. Great sound, too. ALL STIX. **48K ONLY Microsphere £5.95**

**TRASHMAN** "Technically, the game is superb with smooth scrolling and movement ... wonderful." (PopCompWkly). The most playable game ever from Malcolm Evans. For 1 or 2 players. Collect the bins - and the tips - avoid the grass - and the dogs! Superb animated graphics. KEMPSTON/PROTEK/INTERFACE 2. STIX. **48K New Generation £5.95**

**BLUE THUNDER** "SUPERB GRAPHICS and smooth pixel-scrolling through six screens ... hugely exciting and very frustrating." (Crash). Take off from a destroyer, fly your helicopter to a remote island. You will only rescue your comrades if you discover how to destroy the nuclear reactor! 5 skill levels. KEMPSTON STIX. **48K Wilcox £5.95**

**GO TO JAIL** "EXCELLENT GRAPHICS are used to make a very impressive display indeed ... highly recommended." (ZXComp). The best computer version of the famous game. From 2 to 5 players, including the Spectrum if you wish. It's ruthless, but honest. Every original feature faithfully reproduced; helpfully scrolling screen display. NO STIX. **48K Automata £6.00**

## SPRING SUPER SAVERS

# Welcome

Friday 1.15pm

Decided to come home to write introduction — too many distractions at the office.

Stare at blank wordprocessor screen.

"Hello, good evening and welcome.

No good, someone else has already used it.

Phone rings. Answer it, reminder from Fiona that introduction is due, return to blank screen.

Wife brings cup of coffee, put it on desk.

"Well, here we go again."

Corny, reach for coffee, spill it over notes.

Get cloth, return to find cat paddling coffee over desk.

Eject cat, mop up mess.

Friday 2.05pm

Screen still blank, like mind. Muse on emptiness of existence.

Youngest child enters clutching *Postman Pat* book, demands it be read to her. Eject child, child sobs, reproachful look from wife. Read *Postman Pat* to child followed by *Mr Men* and *Goldilocks and the Three Bears*.

Friday 2.55pm

Return to blank screen.

"What a great issue we have this time!"

Sounds too false, mustn't patronise readers.

Knock on door. Neighbour and friend, also computer nut, wonders if I'd like to see latest program? Possible source of inspiration! Accompany him to his abode. Spend time admiring space invaders program in BASIC, reluctantly agree that program too slow and not suitable for publication, yet another friend lost.

Friday 3.45pm

Return to own computer. Son has arrived home from school.

"There was nothing on the screen so I loaded my program that I can't get working, can you help?"

Eject son; woeful looks from son, disapproving looks from wife.

Oh well, just a quick look.

Friday 4.25pm

Son departs to play on bike, phone rings. Fiona asking how the introduction is going, wonders if hysterical laughter is the sign that I've finally cracked. Return to Spectrum, daughter with friend of indistinct sex playing *Hobbit*. Decide to go for walk.

Return to fold after "just popping into the shop for a few things as you're going out."

Wonder if I've going out."

Wonder if I've got a hernia.

Friday 5.10pm

"Once again the indust. . ."

"Tea's ready, its getting cold, You've been in there all day."

"Yes dear."

Friday 5.55pm.

Cat returns to house proudly presenting us with a mouse.

Mouse not dead. Mouse very much alive. Mouse escapes.

Children, cat and Editor try to encourage mouse from under fridge. Mouse not stupid. Wife refuses to wash up with a wild animal in the kitchen. Do washing up, anything for a peaceful life. Wife not stupid.

Friday 6.30pm.

Where was I? Why didn't I become a mountaineer or something else relatively sedate? Muse on alternative employment.

Friday 7.45pm.

Woken by children asking if I've fallen asleep, reply "just resting my eyes".

Try to prove it by typing "thr quijk bron foz" ego suffers from gales of youthful laughter.

Decide to watch TV for inspiration.

Friday 11.05pm

Les Dawson, The Friday Film and Match of the Day all fail to mention computers. Decide not to pay TV licence.

Back to the empty screen.

Friday 11.50pm

Screen still empty. Go to bed.

Unfortunately this month there is no introduction due to technical problems beyond my control.

## A matter of form

Thank you all for the massive response to the questionnaire in the Feb/Mar issue. I had hoped to process them and print the results of all your opinions, but they are still arriving even as we go to press with this issue so, hopefully, all will be revealed in the next edition.

I have read many of them and my thanks to those readers who sent long detailed letters, I have read and digested them even though I may not have been able to reply personally.

One comment that a few readers have made is that *ZX Computing* is too patronising. This is certainly not intended; indeed, most contributors are of a standard where they could patronise me. My regard for ZXC's readers is high indeed, and one error brings many letters. The only thing I ask you take into account is that we have a large number of readers of different nationality, so I tend to write in as clear and simple a form as possible.

## ZX81 revival!

I recently moaned about the lack of new ZX81 programs. I did mean commercial programs — the amount of readers' ZX81 submissions in the office is as great as for the Spectrum.

I'm therefore pleased to see that Softchoice Ltd of 52 Platts Lane, London NW3 7NT have

entered the market with a range of ZX81 and Spectrum programs. The company is a subsidiary of a Canadian organisation and all their programs are well packaged and have been on sale in Canada and in the USA for some time. I wish them every success — anyone who supports the '81 deserves it! Several other producers of ZX81 tapes also sent samples along, my thanks to all of you and I'll try to keep our readers informed of your products either through Nick Pearce's reviews or the News columns.

## Contributions

We are always on the lookout for good programs and articles for future issues of *ZX Computing* and where better to look than to our own readers. If, when reading through the magazine, you think you can write programs as well, or better than our present contributors, then let's hear from you.

All contributions are paid for at very competitive rates, so if you've got your eye on a new ZX add-on or you'd just like to supplement your pocket money, then get writing! It is vital, though, that all the programs you send to us are totally original and not 'borrowed' or 'adapted' from other magazines or books. (When Tim Hartnell was Editor, he even received 'original' contributions he himself had written for his own books!)

The more original the program, the better chance it has of being accepted. Just another space invaders/duckshoot/frogger-type game, however good, is obviously not as appealing as a totally original idea. Any kind of program (business, domestic, educational or just fun) will be welcomed but particularly those which incorporate machine code or use ZX BASIC in clever or efficient ways or employ routines which can be re-used in other programs.

All submitted material should be typed if possible; handwritten work will be considered but please use your neatest handwriting. Program listings are vital, along with a clear explanation of how the program is constructed, what it does and what the user can expect to see when the program is RUN (Screen

dumps are particularly valuable in this respect). Please send a cassette of the program as well as the listing as this will allow us to check the program before publication and so eliminate errors.

All work for consideration should be sent to the Editor or our Golden Square address.

## And now, the end is near...

(I'm not called 'Old blue eyes' for nothing!) I hope this issue of ZX Computing gives you hours of enjoyment and helps you to get the most from your ZX micro. Read on...

Ray Elder

## A plea from the heart

Dear ZX Computing  
I am twelve years old and in desperate need of a pen pal. I have a 48K Spectrum with a printer (what more could I want!) and would like to swap ideas with someone in my area. Can you help?  
Yours faithfully

Jonathan Grimes  
17 Little Strand Street  
Skerries  
Co. Dublin

## Ingenious!

Dear ZX Computing  
I recently purchased a ZX Printer. I was, at first, pleased with the print quality until I

started getting Greek with French accents and UFO shapes among other things. I took it back to the shop and replaced it only to find that this one also gave me stretched and squashed characters.

There is a solution. I took a couple of small pieces of toilet tissue and fixed it onto the hubs which go into the roll of paper. The quality of the print is now super. There is, for those who believe otherwise, little need to even touch the paper while the printer is running.

I hope that I may have solved the problems of printer owners all over the country.  
Yours faithfully

James McKay  
Prestwick  
Ayrshire

## Out for a duck?

Dear ZX Computing  
As a relative newcomer to personal computing (though I have done a fair amount of programming on mainframes, and have even done such naughty things as play real-time, two-player Submarines on a time-shared line) I find your magazine very enjoyable and helpful. It is certainly more user-friendly than most other magazines I have seen, and I say this having only read your February issue in any depth (and no, I have no shares in Argus Press!)

ZX Computing certainly helps someone like myself, who feels the limitations of memory and speed of small computers very acutely after mainframes, get the most out of the Spectrum. The games you select, however long and tedious the keying-in may be, usually prove worthwhile and exciting.

I would, however, like to point out a few shortcomings in Duck Shoot (page 142). It contains some bugs and some inelegant points, that I think can be sorted out. To stop the gun falling off the screen and aborting the run (which it did in my

implementtion) add the following lines:

```
72 IF e = -1 THEN LET e = 0
74 IF e = 27 THEN LET e = 26
```

Lines 20 and 107 seem unnecessary; also 96-99 are never called! Line 109 announces "out of bullets" too late, ie when the extra bullet is attempted. It is better to do this as soon as the last bullet has reached the ducks: do this immediately after checking for 10 hits, like this:

```
109 LET l = l + 1
568 INK 2: IF l = 135 THEN
FLASH 1: PAUSE 30:
PRINT AT 10,7: "OUT
OF BULLETS!!!": BEEP
3,-18: GO TO 600
```

The pause is to allow you to see whether you have hit that last duck!

There is a severe problem (as the program stands) with repeating the game (it seems to send you back to the last score). The following lines should do the trick:

```
3 LET x = 0 (flag for replays)
5 LET a = 0: LET c = 10: LET
e = 10: LET f = 9: LET s = 0: LET
l = 0
21 IF x = 1 THEN GOTO 1012
604 IF INKEY$ = "" THEN
GOTO 604
605 IF INKEY$ = "y" THEN IN-
VERSE 0: GOTO 5
610 CLS: INK 2: PAPER 7:
PRINT AT 10,12: "END": Stop
Yours faithfully
```

John Kinory

*We occasionally use a 'less-than-perfect' program with the intention that readers will learn by modifying them themselves. We do try to make sure that they work though! Ed.*

## With all the trappings

Dear ZX Computing  
I refer to your article, Trap It, by Mr D Pope on page 37 of your Feb/Mar 1984 issue.

In his machine code routine, it was necessary to load the DE register pair with the address of

the start of the routine. This is achieved by the two instructions starting at label 'PUSH'. The startup routine dynamically modifies this first instruction and Mr Pope quite rightly points out that this is messy, but sees no alternative. There is, in fact, a 'clean' way to achieve the desired end.

The following simple piece of code can always be used to ascertain 'where we are' in storage. It hinges round the fact that a 'CALL' instruction pushes the absolute address of the instruction following it onto the stack.

```
CD5200 CALL82:CALL a RET
instruction that is located in ROM
3B ADDRDEC SP;'Re-expose'
the last entry on the
3B DEC SP:stack.
E1 POPHL;Now HL will
contain the address of 'ADDR'.
```

Of course, the address of the RET instruction in ROM location 82 would probably be different for a ZX81, but any RET instruction will do.

Incidentally, if one merely wishes to disable the BREAK key, but do not require the sophistication of Mr Pope's routine, this may easily be achieved by inserting the following statement into the program:

```
LET anyvar = 23613: LET
anyvar = PEEK anyvar +
256 * PEEK (anyvar + 1):
POKE anyvar,0: POKE
(anyvar + 1),0
```

After this statement is executed, any report message (eg BREAK, STOP, O.K. etc.) will cause a system restart (equivalent to switching off and on). Obviously, one should only insert this statement when testing is complete!

I hope the above will be of interest to your readers, as well as Mr Pope.  
Yours faithfully

Essex

## Incredible

Dear ZX Computing  
Back in the dark days at the beginning of December, I could joyfully have murdered anyone who mentioned the word 'IN' even if it wasn't computer connected. I'm much better now though — honest.

You see, at the end of November my Spectrum packed in and it was replaced. I had bought it in June and it must have been a series 2. The new one I now know to be a series 3.

Do you have any idea what effect it can have on you when a program which you know to be OK suddenly won't work? It was Earth Attack which appeared in your Oct/Nov edition and the control keys use 'IN' statements.

When I RAN it on the new Spectrum, the three Smart Bombs went off on their own, the lasers kept firing till they ran out, I got blown to bits and scored zero - I just sat there stunned because I hadn't touched a single key.

It took me four solid nights work of listing and re-listing the program until I finally narrowed it down to the main loop. At that time I knew nothing about 'IN' statements or how they worked but I realised that instead of waiting for input the computer was actually calling sub-routines on its own.

The rest is history as they say and through trial and error I found that in series 3 Spectrums, the In Ports have a value of 191 when no key is pressed but on series 2 machines the number is 255. Now if I had not found this out I would have sent you a letter complaining about this and asking why it took so long for you to warn people in your magazine.

Instead may I offer you my thanks - I mean it - for in solving this problem on my own I have learned more in a couple of weeks about programming than I did in the 16 months after I bought my Spectrum.

I have enclosed a list of values for series 3 which should be read in conjunction with Chapter 23 of the Spectrum Manual. They might be of assistance to anyone still struggling with the problem.

**Value True When**

- 191 No key pressed
- 191 Any key in 1/2 row pressed
- 190 1st key in 1/2 row pressed
- 189 2nd key in 1/2 row pressed
- 187 3rd key in 1/2 row pressed
- 183 4th key in 1/2 row pressed
- 175 5th key in 1/2 row pressed

Yours faithfully

Jim Thomson  
Cumbernauld  
Glasgow

**A new high?**

Dear ZX Computing  
After looking through the Dec/Jan issue, my brother decided to type in the Off the Wall program by Mr Elliston. Having finished, we set about trying to beat the top score of 513.

My brother broke this first with 517 after only getting 99 the first time but I beat him a few weeks later with 676. Nobody else has beaten this yet but I

have improved on it myself with a score of 827 - this time the screen was almost covered to start with. Since then my brother has scored 638 and my dad has been in the 500s.  
Yours faithfully

Jayne Pearson  
Scarborough  
North Yorks

*I don't want to print pages of readers' high scores but this one looked good. Ed*

**Loads of code**

Dear ZX Computing  
As all Spectrum owners know the display file of the Spectrum is organised in a very complicated way. This makes PEEKing and POKEing to the display very difficult.

People who understand machine code will know that the only way to create fast flicker-free games is to POKE the display. This short machine code routine will calculate the address of any of the 5600 points on the display, therefore allowing users to PEEK and POKE anywhere on the screen.

To enter it, simply enter the LOADER program below and type in the numbers underneath. When you have finished, type NEW and save the program on tape using:

```
SAVE 'code' CODE
32500,100
```

Here is the LOADER program and the numbers to type in:

```
10 CLEAR 32499
20 LET N = 32500
30 INPUT I
40 POKE N,I
50 PRINT N,I
60 LET N = N + 1
70 GO TO 30
```

```
1,0,0,120,230,248,31,31,
31,87,230,24,198,64,103,
122,230,7,15,15,15,129,
111,122,23,23,23,95,120,
147,254,0,40,4,36,61,32,
252,68,77,201
```

When you have finished type STOP. Now, enter PRINT USR 32500 and if all is well you should get the answer 16384, if not, or if the machine crashed, reload the program using:

```
LOAD "CODE 32500,100
```

and check each byte of the program carefully. The way to use the program is as follows:

```
POKE 32502, LINE NUMBER
(Between 0 and 31)
POKE 32501, COLUMN
NUMBER (Between 0 and 175)
```

If you now enter PRINT USR 32500, this will give you the address of the LINE/COLUMN coordinates that you POKEd into the 2 addresses. When POKing in the LINE number, 0 is the top of the screen and 175 is the bottom.

The code can be stored as long as you change the LINE/COLUMN addresses appropriately.

Here are two programs illustrating exactly how the program works:

```
10 FOR N=0 TO 175
20 POKE 32502,N
30 FOR M=0 TO 31
40 POKE 32501,M
50 POKE USR 32500,255
60 NEXT M
70 NEXT N
```

This fills the screen, starting at the top left hand corner.

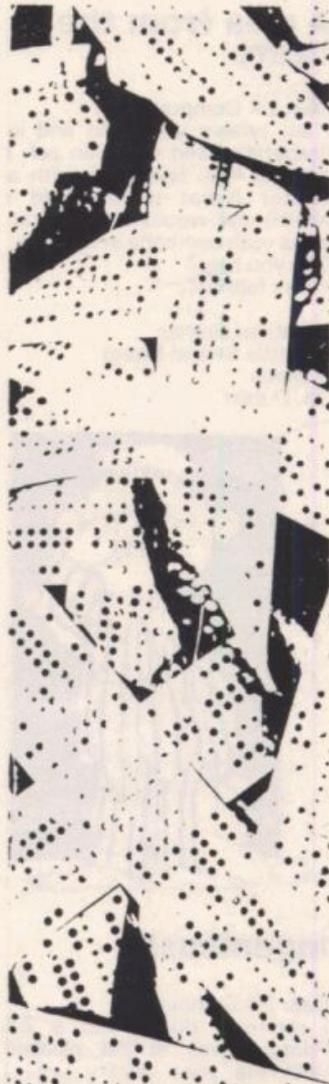

```
10 LET LINE=0
20 LET COLUMN=0
30 POKE 32501,COLUMN
40 FOR N=0 TO 7
50 POKE 32502,LINE+N
60 POKE USR
32500,USR"a"+N
70 NEXT N
```

This prints the user-defined graphic A at position LINE/COLUMN on the screen.

I hope you can include this short article in a future issue of ZX Computing as I am sure it will be of use to all Spectrum owners.

Yours faithfully

Richard Wright  
Richmond  
Surrey.

## The Editor strikes again

Galactoids, in the April/May edition of *ZX Computing*, was created as I explained by a program which created the DATA lines by PEEKing the machine code.

Unfortunately, over confidence got the better of me and I made a silly error by allowing for 16K of memory but forgetting that by CLEARing 30999 I had effectively created a 16K machine on a 48K. Needless to say, the computer won't let you do it and reports RAMtop no good.

However, the solution is simple; create the machine code higher in memory, NEW the DATA and then transfer it back down to its rightful place. To put it in simple stages, in Listing 2a, change:

```
2000 CLEAR 50999:
RESTORE
2010 FOR i=51000 TO
52417
STEP 10: LET c=0
and in line 2030, change
30990 to 50990
```

Now RUN the program (with all the DATA lines in of course).

Should you get an 'integer out of range' report, type PRINT i-50990 and press Enter. You will find that you have left a number of out of the DATA line printed on the screen.

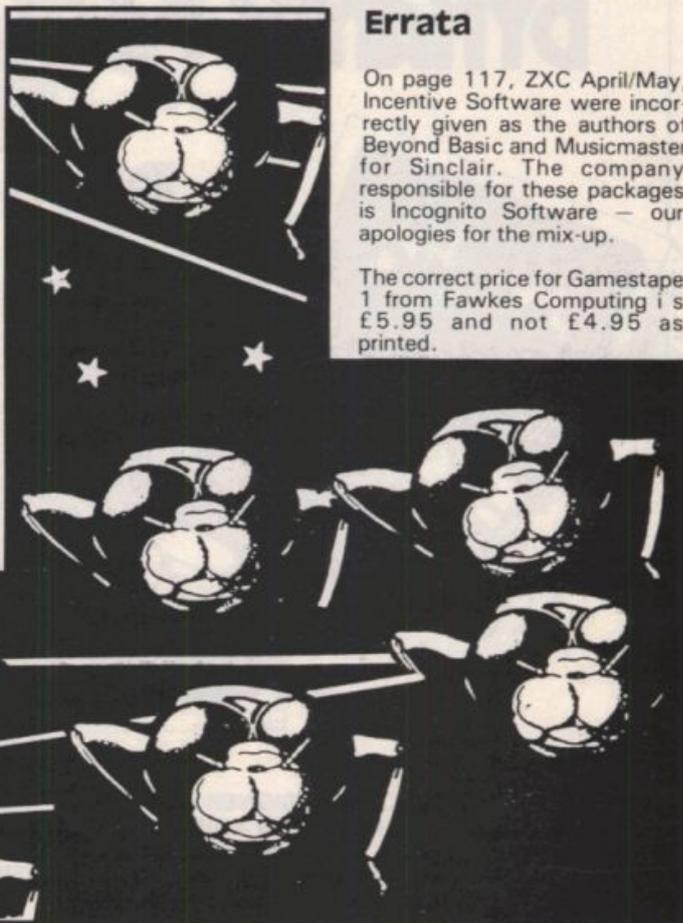

Once the program has run successfully and reported O/OK then NEW it and Enter this line:

```
10 CLEAR 30999: FOR
i=31000 TO 32417: POKE i,
PEEK (i+20000): NEXT i
```

and RUN it. Finally, enter Listing 3 and save and continue as per the instructions printed.

My humble apologies to everyone who attempted Galactoids and especially to Gavin Smyth whose program I nearly ruined, and my thanks to Mr Redman for all his help.

Ray Elder

## Errata

On page 117, ZXC April/May, Incentive Software were incorrectly given as the authors of Beyond Basic and Musicmaster for Sinclair. The company responsible for these packages is Incognito Software — our apologies for the mix-up.

The correct price for Gamestape 1 from Fawkes Computing is £5.95 and not £4.95 as printed.

# THE FIRST IN DYNAMIC PACKAGES FROM PROCOM

## WHAT IT IS

Whether you are a beginner or an experienced programmer it will make no difference with the DYNAMIC GRAPHICS package from Procom. You will be able to program professional looking graphics on your Spectrum. DYNAMIC GRAPHICS comes in two cassettes at the price you would normally pay for one. But do not let the low price put you off. DYNAMIC GRAPHICS is by far the most unique and much needed software aid on the market today.

**£14.95**

inc. VAT and P&P

*JUST LOOK  
AT WHAT  
WE HAVE  
IN STORE FOR YOU!*

## TAPE 1

THIS IS A CHARACTER DESIGNER WITH A DIFFERENCE \* FULL SCREEN ANIMATION OF SPRITES \* 27 FUNCTIONS INCLUDING SPRITE HANDLING 96 CHARACTERS WHICH CAN BE SAVED ON TAPE TO USE IN YOUR OWN PROGRAMS \* EASY METHODS OF INCLUDING CHARACTER DESIGNS IN YOUR OWN BASIC PROGRAMS \* NO KNOWLEDGE OF MACHINE CODE NEEDED \* SCREEN SAVING \* SPRITES MAY BE TREATED AS SUPER LARGE CHARACTERS (4 x 4). THE LIST IS ENDLESS. YOU WILL BE ABLE TO DESIGN LITERALLY THOUSANDS OF DIFFERENT CHARACTERS FROM PAC MEN TO SPACE MEN OR SPACE SHIPS TO BATTLESHIPS.

## TAPE 2

THIS IS THE ULTIMATE UTILITY FOR COMPOSING HI-RES GRAPHICS ON YOUR SPECTRUM. AS WELL AS ESSENTIAL HAND DRAW CURSOR CONTROLS (OR JOYSTICK) THERE ARE MANY ADVANCED FEATURES, SUCH AS FAST FILL AND RESCALE. THERE ARE IN ALL OVER 50 COMMANDS. A CONSTANTLY UPDATED STATUS DISPLAY. GENERATED PROMPTS ARE FULLY DISPLAYED. NOW YOU CAN DESIGN SCREENS AS GOOD AS THE SOFTWARE COMPANIES.

- 1 DYNAMIC PROGRAMMING
- 2 DYNAMIC ANIMATION
- 3 DYNAMIC SOUNDS
- 4 DYNAMIC FILING
- 5 DYNAMIC EDITOR & ASSEMBLER

Package for the ZX Spectrum now!  
(Also for the BBC, Electron and CBM 64)

## EASY TO USE

DYNAMIC GRAPHICS is the one that everybody will understand. The instruction manual is simplicity itself. No more strained eyes — the manual has large 10 x 8 pages with plenty of diagrams to make it easy for you.

## YOUR TICKET TO RICHES?

Use DYNAMIC GRAPHICS to make up your own program, and if it's good we will market it for you and maybe make you rich.

# Ack ack attack

**Here's your chance to prove that you're a hero!  
Join the Dam Busters with C Stock of Chelmsford.**

The enemy are on the offensive. Troops, guns, shells and tanks are pouring down into the enemy position along a single, heavily defended railway line. The only chance is for a single, daringly piloted mosquito plane to fly down the valley and destroy the railway bridge.

You have been selected and briefed for this task and victory or defeat rests with you.

The valley is randomly generated before the start of the game — this takes approximately 17 seconds but speeds up the running of the game. Four strings are defined, two

for the valley and two for the guns.

Your plane appears at the top of the screen and the valley scrolls upwards toward you, as you go you must destroy the guns which are firing at you — 26 points — until you reach the bridge at the end of the valley.

When you drop your bombs the birds eye view changes to a side view of the valley and the trajectory of the bomb is shown followed by the results of your attempt. 100 points are awarded for a hit on the bridge, but beware, 100 points are lost if you miss the

bridge, crash or are hit by the guns. If your score falls below — 300 then the game is over — you failed to halt the attack and all is lost!

There are many variations on the "scrolling screen" game but type this one in and I'm sure you'll agree with me that this is one of the best.

## Down the lines

48- 80	UDG s.
100- 180	Random valley.
1020-1195	Main loop of the program.
1085-1105	Checks if Ack Ack guns are in range, each gun has two shots at the plane.
1130-1190	Draw next line of the valley.
1200-1310	Ack Ack Guns.
1600-1670	Bombers cannon.
1800-1990	Bomb.
2001-2300	Finish.

## Football Manager

Designed by Kevin Toms

This outstanding game of skill and strategy is now widely available and you can join the many thousands of satisfied customers who have purchased the game. This is no five minute wonder – you will be playing this game for hours over many weeks (we know – our customers tell us!).

Kevin Toms

Some of the features of the game:–

- ★ Matches in 3D graphics
- ★ Transfer market
- ★ Promotion and relegation
- ★ F.A. Cup matches
- ★ Injury problems
- ★ Full league tables
- ★ Four Divisions
- ★ Pick your own team for each match
- ★ As many seasons as you like
- ★ Managerial rating
- ★ 7 skill levels
- ★ Save game facility

# Addictive

Comments about the game from press and our customers

"FOOTBALL MANAGER is the best game I have yet seen on the Spectrum and my personal favourite of all the games on any micro... To the ordinary person it is an excellent view of what can be done in the field of computer games... The crowning glory of this game is the short set pieces of match highlights which show little stick men running around a pitch, shooting, defending and scoring... It is a compulsive game but people who cannot take game sessions of 9 hours or so, which happened on one happy Sunday, will be grateful to know that there is a 'save to tape' option. FOOTBALL MANAGER has everything it could... The

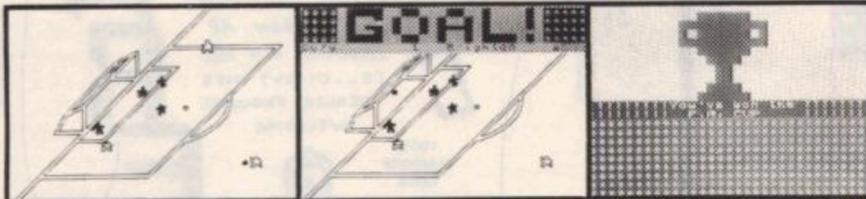

originator, Addictive Games, certainly deserve the name." Rating: 19/20 (Practical Computing – August 1983).

"When I first received this game I spent the best part of the weekend playing it. Since then I have returned to it more often than any other. The truly addictive quality of this game is the remarkable way it mirrors the real football manager's problems..." (Personal Computer Games – Summer 1983)

# Gamesmanship

Be one up on your friends with some excellent advice from Tim Hartnell on how to improve your programming.

It is very easy to generate startling graphic displays on the Spectrum as you well know. A few natty user-defined graphics, a flash or two on the border, and you're well on the way to producing a great game.

However, the very ease of producing superb displays on the Spectrum can be quite a trap on the road to producing worthwhile programs. If you're like me, at one time or another you've probably seen a great game at an arcade and immediately rushed home with the idea of writing the same game (or something similar) on your Spectrum. You have a pretty good idea of what the screen looks like when the game is underway, and you immediately start to re-create the screen display.

This is the trap. While it is fairly easy, given a little patience, to recreate an arcade-game screen fairly faithfully on the Spectrum, even when working in BASIC, it is far from easy to then produce a game which is worth playing. I suggest that you may consider working, from now on, the other way around.

If a game is to be any good on a computer, it must fulfil a number of criteria. A superb screen display is of little use if the game behind it is so poor that it rapidly becomes boring. Far better a game which just uses text output, or chunky graphics, rather than complex user-defined graphics, if the text program is actually worth playing. Far better that you write an intriguing game with a merely adequate display, than write one which looks good but which has little intrinsic merit. May I suggest that you try writing the game first, without concentrating at all on the graphics (simply using a non-defined graphic 'A' and so on) until you get a game which is fun to play, even without colour, BEEPs or user-defined graphics. Then, when you add these, a good game will be made even better. And, more to the point, all your energy when you are fresh and starting a program, will have gone into making the game worthwhile, rather than make your

aliens look more ferocious. Get your program working first, and then dress it up.

## The important points

Towards the end of this article, I'll give you a number of short routines which you can use for dressing up programs. However, first I would like to expand on my earlier statement that there were a number of criteria which determined whether or not a computer game was going to be any good.

You can probably add a few to the ones I'm going to outline from your own experience. Think about the arcade games you most enjoy playing. What makes them so enjoyable? It is highly likely that others will enjoy games for the very same reason you do, so if you can analyse the reasons for one game's success, you may well be able to use that knowledge to improve your own programs.

The objective of the game must be clear to the player. It might be to blast away all the weeds on the screen with your can of weedicide, or to find the Holy Grail, or to move from the left to the right of the screen without being blown up or whatever. The purpose of the game should be clear fairly quickly to the player and, in general terms, a means to that goal should also be clear. One thing that held the Tron arcade game back in its early days was that it was pretty difficult to work out what to do and, even when you had, to many players it hardly seemed worth the trouble. So, an early step in game development is to work out exactly what the player is supposed to do to win the game.

The path to be followed to that goal must also be reasonably evident. Although the purpose of the game should be clear, it is much more important that once a player starts playing a game, he or she should be developing skill at it. I cannot stress how important this aspect is. A game should be sufficiently hard to ensure that it

cannot be mastered the first time it is played, but should not be so difficult that the player gets no positive feedback at all. However, the player should be developing games skills while playing, so that the next time he or she approaches it, a better score is likely. Would you tackle Pole Position over and over again if you didn't even qualify after fifty attempts at the game?

To ensure that your game includes factors which the player can become skillful at manipulating, you need to minimise the random element of the game. I do not mean that you should *not* have random factors in a game, to ensure that each game is different from the preceding ones, but that the randomness should be used carefully.

For example, the flight of a mother ship across the top of the screen could be triggered randomly, but the effect of pressing the 'F' (for fire) key should not be random. How could you master Ant Attack if you could never be sure how far you could lob a grenade?

So, the first element in developing a game with which the player can develop playing-skill is careful use of randomness. In adventure programs this is particularly important. The map you develop as you work your way across the Doomed Land should relate to a stable environment or the Adventure degenerates into a 'game' of randomly-triggered PRINT statements. Aliens which die only some of the time, or a 'rotate' command which only swings your craft around every so often is a certain way to produce a game which will not encourage repeated plays.

The rewards of playing should be clear, and worth the effort. It is unfortunate that the widely (and justly) acclaimed Microsoft Flight Simulator (plus several not-so-famous ones, including few for the Spectrum) uses up so much memory controlling the game that there is nothing left at the end except the pathetic word CRASH in the middle of the screen (or YOU HAVE LANDED SAFELY, if

you're skillful). Let the screen break out in technicolour rainbows and make the most of the feeble little BEEP when someone wins a game, so their effort will be worthwhile.

Added to this is the use of high scores. These are very easy to include and are perhaps the simplest way to maintain interest as a player goes back time and time again to try and beat his or her previous best effort.

## This way up

I have repeatedly advocated that games should be written in a top-down manner, calling the whole program from a series of subroutines which lie within a loop. Part of this 'structured' approach is to have the initialisation material at the end of the program, so that the start of the game looks like this:

```

10 REM      WHIZ-BANG
    ALIENS
20 GOSUB   9000:REM
    INITIALISE
30 GOSUB   1000:REM
    PRINT SCREEN
40 GOSUB   2000:REM
    MOVE ALIENS
50 GOSUB   3000:REM
    PLAYER RESPONDS
60 GOTO 30
  
```

In the section from line 9000, you include the line LET SCORE=0. To include a high score feature, you add before line 20 the following:

```
15 HISCORE=0
```

Now, wherever you are within the program when it ends, you include the following (the line numbers are, of course, arbitrary):

```

500 IF SCORE > HISCORE
    THEN LET
        HISCORE = SCORE:
    PRINT "THE NEW HIGH
        SCORE IS ";HISCORE
510 PAUSE 500
520 GOTO20
  
```

As you can see, the GO TO 20 sends action to the subroutine call for the initialisation routine

again, but does not hit line 15, which originally set the high score to zero. This means that the whole program begins from scratch, except the value of the high score. (By the way, if you're running this on a non-ZX computer, you may have problems in redimensioning arrays so they may well have to be before line 20 as well.)

Finally in this article, I'd like to share with you a number of routines developed by David

Perry of Donegore, Northern Ireland, which can you can add into functioning programs to make them more attractive, useful or efficient.

The first one (Fig 1) is a circle routine, which uses the sine/cos equation at an amazing speed to draw a circle in much the same way as the Spectrum's circle command does. X is the X co-ordinate, Y the Y co-ordinate and R the radius:

```

1 REM DRAWING CIRCLES
2 REM (C) DAVID PERRY 1984
10 LET X=120: LET Y=85: LET R=
50
20 LET OA=X+R*COS (0): LET OB=
Y+R*SIN (0)
30 PLOT OA,OB
40 FOR N=.3 TO 6.39 STEP .3
50 LET A=X+R*COS (N): LET B=Y+
R*SIN (N)
60 DRAW A-OA,B-OB: LET OA=A: L
ET OB=B: NEXT N
    
```

(Fig 1)

The next one (Fig 2) allows you to paint in the contents of a circle within a BASIC program. The variables are as in the first program.

```

1 REM CIRCLE FILL
2 REM (C) DAVID PERRY 1983
3 CLS
10 INPUT "X-CORDINATE (0-255)
";X
20 INPUT "Y-CORDINATE (0-175)
";Y
30 INPUT "RADIUS ";R
35 CIRCLE X,Y,R
40 FOR N=0 TO R
50 LET Z=R+2: LET ZZ=N+2
55 LET XX=50R (Z-ZZ)
60 LET YY=Y+XX: LET XY=2+XX
70 PLOT X+N,YY: DRAW 0,-XY
80 PLOT X-N,YY: DRAW 0,-XY
90 NEXT N
100 PRINT AT 21,0;"PRESS ANY KE
Y": PAUSE 0: RUN
    
```

(Fig 2)

Our next program (Fig 3) allows you to rotate a user-defined character clockwise. This means, for example, you would only need to define one ship for a game like Asteroids and then get the routine to rotate it.

```

1 REM ROTATE CHARACTER
2 REM (C) DAVID PERRY 1984
5 CLS: INPUT "CHARACTER TO B
E ROTATED (A-U)"; LINE A$
6 IF A$<"a" OR A$>"u" THEN GO
TO 5
10 LET A=USR A$: LET C=A
20 LET Q=1: LET W=8
40 DIM Z(8,8): FOR D=1 TO 8
50 LET X=128: LET B=PEEK A
60 FOR F=1 TO 8
70 IF (B-X)>=0 THEN LET B=B-X:
LET Z(Q,W)=1
80 LET X=X/2: LET Q=Q+1
90 NEXT F: LET Q=1: LET W=W-1:
LET A=A+1: NEXT D
100 FOR X=1 TO 8: LET A=0: LET
    
```

```

B=128
110 FOR Y=1 TO 8
120 IF Z(X,Y)=0 THEN PRINT " ";
: GO TO 140
130 LET A=A+B: PRINT "■";
140 LET B=B/2: NEXT Y: POKE C,A
: LET C=C+1: PRINT : NEXT X
150 PRINT : PRINT "LOOK AT THE
NEW GRAPHIC ";A$;"-!"
    
```

(Fig 3)

This program, (Fig 4) which shows how to scroll any string of more than 32 characters, would make a very impressive 'YOU HAVE WON' frame, or a good start to a game. You'd probably have to slow it down a bit. As you'll see, it happens very, very quickly, so it is difficult to read the demonstration program.

```

1 REM SCROLLING A STRING
2 REM (C) DAVID PERRY 1983
3 CLS
10 LET A$=""
THIS IS AN EXAMPLE
PROGRAMME TO SHOW HOW FAST THE Z
X-SPECTRUM CAN ACTUALLY SCROLL A
STRING ACROSS THE SCREEN. IT I
S SO FAST THAT YOUR BRAIN GETS M
UDDLED UP UNTIL YOUR EYES BEGIN
TO HURT. IF YOU LOOK
AT THE PROGRAMME TO DO THIS YOU
WILL FIND THAT YOU CAN HAVE ANY
STRING OF CHARACTERS IN A$ AS L
ONG AS THERE IS MORE THAN 32!. H
APPY PROGRAMMING!!!!!!!!!!!!!!
20 LET X=1: LET Z=LEN (A$)
30 PRINT AT 0,0,A$(X TO X+31)
40 LET X=X+1: IF (X+31)=Z THEN
STOP
50 GO TO 30
    
```

(Fig 4)

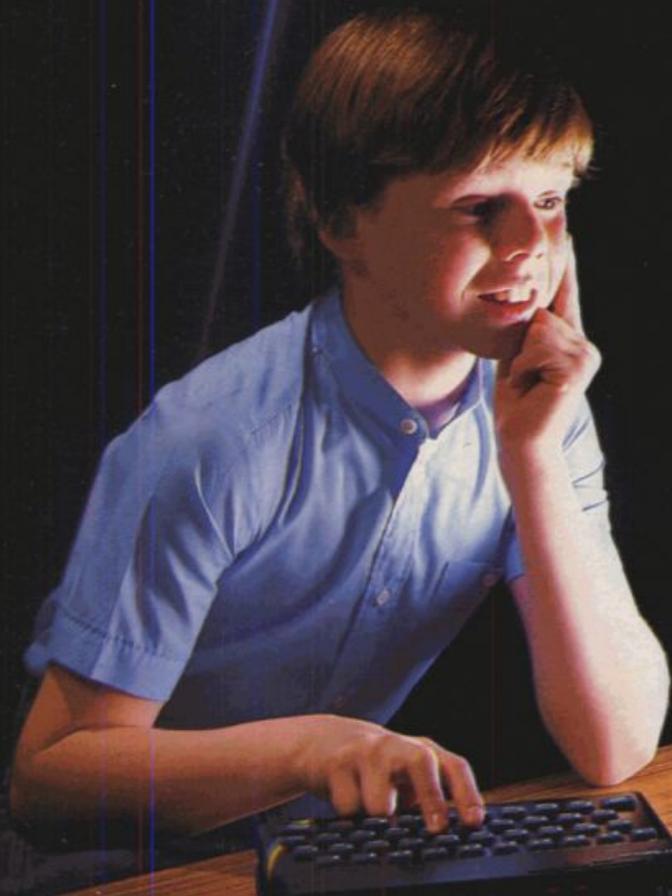

Finally, here's a program (Fig 5) which accepts a string of characters and then prints them out sideways on the printer, either eight or sixteen times larger than normal. The people who make printer paper love programs like these!

```

1 REM BANNER PRINTER
5 REM (C) DAVID PERRY 1984
6 REM
10 INPUT "WORD (MAX 32 CHARACT
ERS)"; A$
11 LET L=LEN (A$): IF L>32 THE
N PRINT "SORRY TOO LONG": GO TO
10
15 INPUT "SIZE (1 OR 2)"; S
16 IF S<1 OR S>2 THEN GO TO 15
17 LET T=1: IF S=2 THEN LET T=
.5
30 INPUT "0: NORMAL & 1: INVERSE
"; I
36 IF I<0 OR I>1 THEN GO TO 30
37 LET A=2: LET B=0: PRINT AT
0,0: INVERSE I:A$
40 FOR X=0 TO (L*8)-1 STEP T
50 FOR Y=166 TO 175 STEP T
60 IF POINT (X,Y)=1 THEN LPRIN
T AT A,B;"■";
70 LET B=B+1: NEXT Y: LET B=0:
LPRINT : LET A=A+1: NEXT X
80 CLS : GO TO 10
    
```

(Fig 5)

# Sneak into a mainframe with your Spectrum...

## Craft drawings can be viewed in several ways with this program from Martin Clayton of Knaresborough.

When you have entered this program and first run it, a brief explanation of how it works is given. To get the most effective displays from it however, a few moments of preparation is necessary.

The shape must be a prism although the cross section can have any number of points. Curves are not allowed — even VU-3D, one of the best drawing programs on the market, has problems with curves.

You must enter the co-ordinates of your shape as DATA in line 9000. These are relative co-ordinates as used in the DRAW statement and start at the bottom right corner to allow several views to be drawn on screen at once.

A possible shape section is shown in the diagram and the co-ordinates are given. To use this in the program you would produce a DATA line as follows:

```
9000 DATA -50,0,-10,20,
40,20,20,-40,1000
```

Note that 1000 is a 'rogue' value to signal the end of the DATA to the computer. Once the required shape DATA has been entered, then the program can be RUN.

After the title page you are asked to input the depth in pixels of the shape. The program then moves through four separate display modes.

**1 ROTATIONAL** The shape is moved through 90 degrees in a series of steps specified by yourself.

**2 WORKING DRAWING** Technically known as 1st Angle Orthographic Projection, the front, side and plan views are drawn in position.

**3 OBLIQUE** Where all the front facing planes are displayed in full and all the other horizontals are at 45 degrees.

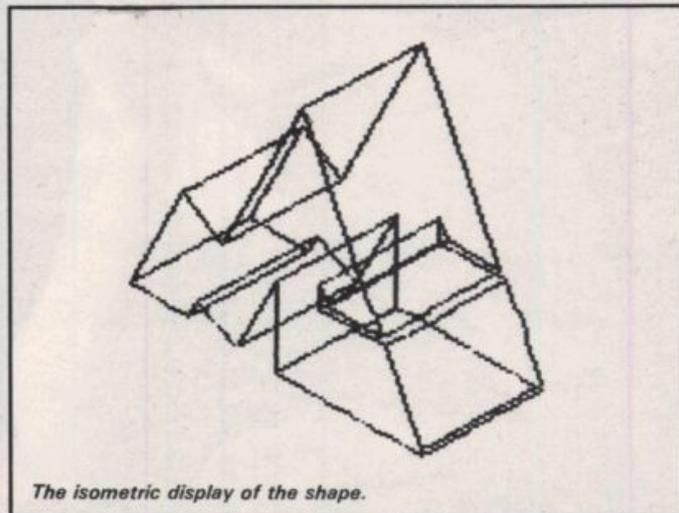

**4 ISOMETRIC** All sides are displayed equally with all horizontals at 30 degrees.

All the angles in this program are produced by a trigonometrical formula which was carefully and painstakingly worked out by Martin. At each stage of the display, an option to make a copy with the ZX printer is offered.

The DATA included gives the shape that we have used for the screen prints, try running the program with this to get an idea of the way the program works.

Games

Travel

Simply by connecting your Spectrum to the telephone line, via the award-winning Prism VTX 5000 communications modem, you can get to all the information, games and communication facilities held on viewdata mainframes.

So, you can link into a variety of services, including Prestel and Micronet 800. Access hundreds of software programs – many completely free. Talk to fellow users. Keep up-to-date with all the latest national, international and micro news. Play on-screen games. Check sports results. Book travel and entertainment.

Learn a language.

The choice is simply vast. Plus, your Prism VTX 5000 allows you to communicate directly with other Spectrum owners.

And now, our special offer means that you can do all this for just £11\* a month. So complete the coupon and send it to us today, and we will let you have full details of our unbeatable offer.

\* All prices quoted refer to domestic use only. For business use the Prestel annual standing charge is £66. Therefore business users will be billed £44.50 per quarter.

# Spectrum lessons

**Mike Edmunds continues his quest against ignorance and assesses some of the latest educational software packages.**

Educational software has, to date, been of a very mixed quality, with often only a limited use in the classroom. Now, with the advent of material such as the Dudley Programs, we find software intended for use right across the curriculum.

The programs, all with the theme of travel, have been designed specifically for use in schools by a team of 24 teachers and advisers from Dudley Metropolitan Borough, in conjunction with Five Ways Software.

Each of the four titles; Punctuation Pete/Wordfinder, Car Journey, Special Agent and Ballooning is a complete package

in itself or can be used in conjunction with the other titles to provide a really comprehensive series of resource materials.

Each package comes in an A4 folder with a detailed guide/workbook which not only outlines the aims of the program but also suggests numerous associated activities to be carried out using either the program or the workbook material. There is also a set of keyboard overlays, a summary of instructions and a 'run card'. Loading is straightforward and the pupil is greeted by an illustrated title screen detailing loading time. As with the workbook, the programs are colourful and visually

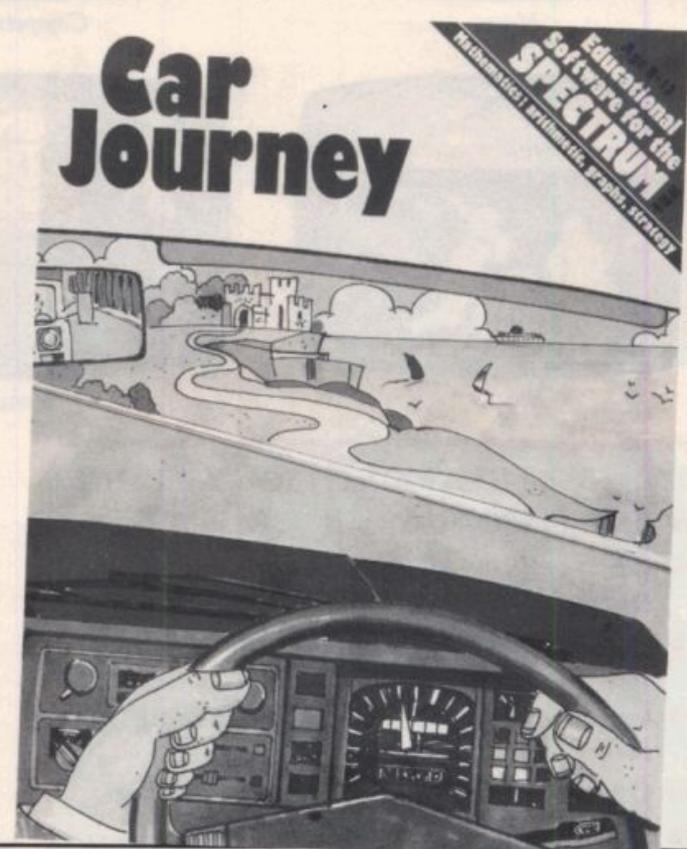

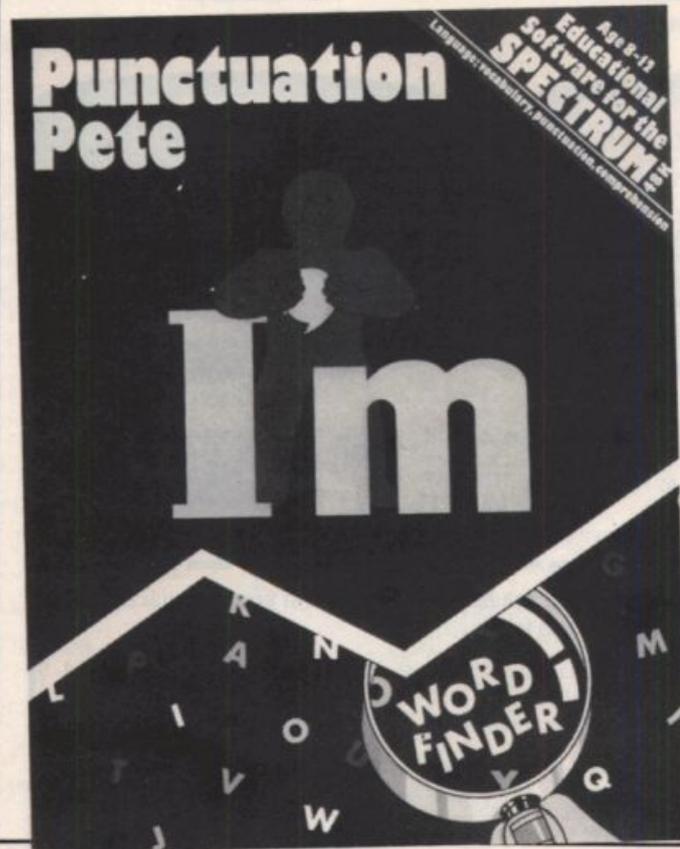

attractive, good use of graphics being maintained throughout the series.

## Punctuation Pete Wordfinder

The first package, Punctuation Pete/Wordfinder, is really two for the price of one. Pete lives inside your computer and it is his job to keep everything tidy. Your job is to help him sort out sentences that have lost their punctuation. Although this type of program has been around for quite a while, this version is a step ahead of the others by virtue of its graphics. A delightfully

animated Pete is guided around various texts to correct the mistakes (often physically kicking them into submission it seems!)

This is aimed at reasonably able readers and provides various texts, chosen at random from a large bank, all on the theme of travel. The child can choose his own level, beginning with Junior Scribe (full stops and capital letters). If he can master this level he may wish to aim for higher status, where the exercises are correspondingly more difficult. Mistakes by the child are indicated by Pete and a second try is invited. Continuing errors are eventually corrected

by the computer.

Wordfinder, the second half of the pack, provides an extensive thesaurus on the travel theme, its aim being to develop vocabulary. Words can be selected from a comprehensive list and all linked possibilities then examined. This is a novel idea and it would be nice to think of this program 'sitting' at the back of a classroom available for constant referral as a source of vocabulary, stimulation and ideas, especially for subjects such as creative writing, topic work etc.

### Car Journey

The second package, Car Journey, involves travelling around the main roads of England and Scotland and combines geography and mathematics with logical thinking and evaluation. Four levels of skill are provided and the child first has an opportunity to get acquainted with the vehicles and conditions in the Driving School. Here, selection of vehicle, route planning, cost analysis and fuel consumption all prove to be important decisions which the child needs to

make. The correct choice makes the journey easy!!! Having passed through the Driving School, the child should be well equipped to tackle the hazards of everyday motoring. As an added bonus here you can also opt for driving with hazards, anything from radar traps to snowstorms!

This program is realistic in approach and the child soon learns to tackle the tasks systematically in order to achieve good results. This is an excellent way of applying decision making and logical thinking to an everyday 'real-life' situation.

### Special Agent

In Special Agent you are recruited by M16, your job being to catch an enemy spy. This is a maddeningly frustrating program — sometimes the spy can be tracked down quite quickly, at other times you can spend weeks (or even months) chasing him around the cities of Europe. Continued lack of success might spoil this program for some children but it can also be very addictive! The strategies required are soon discovered and the various countries and cities involved quickly become

familiar. (It is a decided advantage to have several atlases on hand!)

The program also gives practice in the workings of train and airline timetables . . . all this whilst trying to understand intelligence reports and decipher codes! As a program for older primary children upwards, this is an ingenious way of encouraging quick, logical, decision making based on a wide variety of information. As an alternative to the normal procedure it is also suggested that the game be played with either limited time or limited money!

### Ballooning

Ballooning, the final title in the series, is a simulation program which encourages children to investigate and explore the science of lighter-than-air flight. There are several levels and initial tuition is gained in the Flying School. This is an essential duty before undertaking your Flying Test and eventually your Live Mission. If you pass your test you are assigned a score and your subsequent activities are influenced by the rank you have been given.

You are then ready to embark upon a solo flight with specific tasks to perform. These are not at all straightforward—I'm afraid I left the vet stranded on a hillside miles away from the sick sheep! The program and activities suggested within the package introduce children to various scientific principles and seem an ideal way of combining learning with enjoyment.

### To conclude

Taken singly, each of the programs in this series is excellent. Put together, as a complete resource package, they are outstanding — each having the right blend of interest and skill to ensure continued usage. The programs are well written and overall presentation is of a high quality.

As a theme package they test the child's abilities in all areas. Marvellous — fun whilst learning!

*Each of the packages reviewed above costs £9.95 and is published by Heinemann Computers in Education Ltd, 22 Bedford Square, London WC1B 3HH.*

AZ 1441

One of the few graphic adventure games that we have received, Escape provides a real challenge to would be Alcatraz fugitives!

To escape you must first climb the ladder using key '7'. Once at the top you must try and avoid the guard, for, if caught you will be promptly dragged back to the top of the ladder and thrown back to the bottom! This is a very effective routine and I often allowed myself to be caught just so that I could watch it!

Assuming that you eventually scale the ladder and sidestep the guard, you must now make your way along to the top escape hatch and wait

until it is in line with the lower hatch. When the two are aligned then jump! If you have judged your leap correctly you are free and your successful escape will be recorded on the display. Oh, one last thing, just to make life a little more difficult you are given a limited amount of time in which to accomplish all this. The amount of time you have left is displayed on a clock on the screen. Note that "time", "escapes" and "0" in line 10 and 20 are INVERSE characters.

This is a very well written program and extra speed was achieved by using POKES to the display file (screen) rather than the command PRINT.

### Variables

- ES The number of successful escapes the player has made. At the start of a game it is set to 156 (code for an inverse 0) but this is increased for each escape.
- P Used as a flag in lines 320 to 400 and is an indicator as to whether the player is on the ladder or not. It is also used to blank out the old asterisk after a move.
- A\$ Used to erect the ladder.
- B Used to alter the extent of the guard's movement, an inverse asterisk.
- Z The start of the display file.
- X The player's position. X is added to Z to give the current position of the player on the screen.
- T The time which remains to the player — set at 165 (code for an inverse 9) at the start of each escape.
- F Usually used in FOR/NEXT loops.
- G Used either for a flag when the time runs out or if a successful escape has been made. If the time runs out whilst you are on the ladder then you will slide back down; if you have reached the top and both escape hatches are in line then you will have escaped.
- L Used in line 815 as a delay.

### Along the lines

- 10-150 Build the scenery and initialise the variables.
- 160-310 Main program loop. This is left when your time runs out, an escape is made or you are caught.
- 320-380 If the player is still on the ladder, set P to 22 (loop to show player falling). P=22 if on the ladder, and 0 if jumping down the escape hatch.
- 420-640 Caught by guard routine, drags player to top of ladder and then jumps to L320.
- 650-680 Shows when the player has been caught.
- 710-740 Shows that an escape has been made.
- 750-770 Increases escape counter, check for end of game.
- 800-820 Scroll clear screen.
- 830-980 Introduction.

# Safe crack

This is not just another code-breaking game but a simple maths program for use in primary schools involving addition, subtraction and multiplication. There are fifteen boxes, each occupied by a red question mark (?) and every correct answer replaces the question mark with a blue pound sign (£). The object is of course to fill all the boxes with pound signs — if anything will attract and occupy the minds of children, it's money! Every wrong answer loses a pound sign but the computer will keep on asking questions until someone wins. Filling all the squares with pound signs will give a large fanfare of sound and a colourful screen display.

The program runs by first calling the subroutine at 8900. This draws a colourful screen with accompanying sound and a sum is randomly devised in lines 7000 to 7050. To do this, line 7020 chooses whether addition, subtraction or multiplication is to be performed and line 7030 makes sure that if multiplication is chosen then the numbers are kept within the range of 1 to 12. Line 7040 chooses two numbers and the value 100 can easily be chang-

## Answer the questions and break into Stephen Parry's Southampton safe.

ed if smaller numbers are wanted. Line 7050 ensures that no negative numbers result from subtraction and then line 7060 builds the sum itself.

After answering the question from a series of screen prompts, the child is immediately told the

answer which is worked out in line 7120. Having compared the child's answer with that of the computer, the program either jumps to a fail message which replaces the pound sign with a question mark or to line 7700, which places a pound sign in the

next box. If the variable tot reaches 15, meaning that all the boxes have been filled, the subroutine at line 8000 is called which displays a win message and the usual 'do you want another go' question is asked.

# Wall walk

Can you escape from the nasties chasing you? Tat Tang has sent us this superb game.

Based on a well-known arcade game, this program has your little character running along several layers of walls, climbing ladders and generally being chased silly by vicious green meanies. In order to survive you will have to destroy all the aliens by digging pits and luring the unsuspecting nasties into them. Once the alien is in the pit, you must beat him about the head until he dies.

## What a gas

Unfortunately, things are not all in your favour — you only have a limited amount of oxygen, so that excessive movement or taking too long will lead to your demise. Needless to say, if you are captured you will lose a life.

Superb graphics, colour and sound all combine to make this an exciting game — it will have you sitting on the edge of your seat, but keep calm and don't panic!

## Program details

Type in program 1 to set up the UDG's and RUN it. Now type in the rest of the program and save it by GOTO 9999, the program saves in two sections, one after the other, so don't forget to press a key after the first section has saved. VERIFY both sections by VERIFY "": VERIFY "" CODE and press newline.

An interesting method of keeping the high scores is used, the program POKEs them into the UDG area so that if the program is re-run the high score is kept.

CONTROLS: 5 moves left

## Microsoftware Magazine — Infinite Software

You may well ask yourself, why is a magazine reviewing someone else's magazine? No, they haven't got anything to do with Argus Specialist Publications! Microsoftware magazine comes in cassette form and really is not in direct competition with the printed mags so, as we are nice kind people, we decided to review it.

The tape is made for the 16 and 48K Spectrum and there's something in it for everyone. I must admit I do tend to be critical when reviewing but will give credit where credit is due. I found this magazine informative, interesting, fun, educational, graphically exciting and very well formatted. Everything that appears on screen can be run out on your printer and if you are rich and own a Currah speech chip, it will talk to you as well.

The magazine contains such things as games, utility programs, competitions, readers' letters and amazing things that you could do with your Spectrum (in the best possible taste!) In Issue 5 there is the start of a 'basic' training course for the newcomer to computing, and a "Machine Code Corner" for the more experienced amongst us.

It is very well written and an enormous amount of energy is put into each user-friendly magazine. At £2.99 it's reasonably priced.

*Infinite Software can be found at 73 Alcester Road, Moseley, Birmingham*

## Auto Data — ERC Computer Services

Auto Data is produced by ERC Computer Services for those of us who like to tinkle with our cars on a Saturday afternoon. The program helps you diagnose the faults we all seem to have.

On loading you are given a menu which lists 1 Engine; 2 Transmission; 3 Braking system and so on. If you have trouble with your suspension (and who hasn't) you press the corresponding number and it displays a sub-menu. The next menu covers all the faults you can get with suspension. Once you have recognised your fault it then moves to another sub-menu and tells you what to do to rectify it.

What it won't do is tell you how to repair your car. If you're no mechanic then there's no

# Quicksoft

## Clive Smith reviews some of the more unusual programs on the market.

point in buying the tape. If you are a mechanic, you'll probably know all about diagnosis and so it's not for you either! As I said earlier, if you want to know what to do if your car won't start and don't know what bit to look at but would like to try and repair it yourself, then try the tape.

The tape covers all parts of your car but not diesel engines or hydro-pneumatic suspension. It cannot list every fault possible as you would need a mainframe to handle that program, but it covers most of the common faults.

*ERC Computer Services are at 53 Thurso Crescent, Menzieshill, Dundee, DD2 4AS.*

## Cut Your Heating Bills — Brane Software

Ever since the 'Save it' campaign, there have been many ideas on the market to help us reduce our heating bills. Well, it's finally come to your computer via G Timms of Brane Software. This tape is ideal if you are a heating engineer or you are just about to install central heating into your house. Once loaded, the computer will ask you for a lot of details about your house; size of room, thickness of walls, type of floor covering, whether your house is draughty or not and so on. Once you have all these details you then find out the price and type of fuel you intend to use; electricity, coal, gas, wood, etc and feed this into your computer. With all these facts and figures it will then work out your running cost for the winter.

The beauty of this program is, if you were thinking of putting loft insulation into your house, you can work out the advantages in sterling without laying out a lot of money. Nothing in this program has been left to guesswork or chance; as long as you take the time and trouble to feed all the information in correctly (and there's a lot of it) you will find this tape a useful tool. To give you some idea, it has a

list of 38 different building materials your house could be made of! Cut Your Heating Bills comes supplied with a comprehensive guide which tells you exactly what the program is capable of and the benefits you can gain.

*Brane Software is at Myrtle Grove, Brane, Sancreed, Penzance TR20 8RE.*

## Paintbox — Print n Plotter Products

I must admit I've never had so much fun with a utility program as with this one. Paintbox enables you to make up your own UDGs with ease, plot and draw by simple cursor movements, fill in your drawings and save screens for use in your programs. It is written by Joe Gillespie for the 48K Spectrum and is supplied with an easy to follow instruction booklet.

It won't make you an artist overnight but after a couple of hours of loading the tape and reading the instructions I managed to draw this picture...

As you can see I'm no Picasso! Paintbox does, however, have more serious applications than drawing funny pictures; as an

aid in drawing graphs or in technical drawings and so on.

Once you have loaded the tape, you are presented with a menu. From there you can view the available UDG bank; there are up to 84 user-defined characters in store.

If you don't like the available choice, you can invent your own by calling up the drawing board. This enables you to plot your shape on a 8 x 8 grid by using a cursor. Once made, you then store it in one of the four banks.

Another facility on the menu is "Sketch pad". Here you can practice building up a picture using UDGs before entering them onto your main picture. To build up your picture you first hit the 'Precision Plotter' key. Now the fun bit starts.

You are presented with a blank screen apart from a cursor which can either be moved via the keyboard or a joystick. In the bottom right hand of the screen you are given an X and Y co-ordinate of the cursor. To draw a line you move the cursor to where you want the line to start and press the PLOT key. Moving the cursor to the place where you want the line to end and pressing the DRAW key will instantly produce your line.

Paintbox has facilities to draw circles and arcs and in radial mode, will return the cursor to the start of your line; ideal if you are drawing a spoked wheel. Once you have outlined your picture, you can shade in any of the parts with different ink colours. Finally, you can put on your UDGs to complete the picture.

If you make a mistake you can edit your last command. As you build up your picture it can be stored in memory and recalled at any time. Your picture can then be stored on tape and reproduced either as a screen\$ or as memory bytes. It's possible to store up to five screens and this will leave you with about 6K of memory.

To give you some idea what is possible with this program, have a look at one of the colour adverts in your magazine and take a close look at some of the drawings. With a little practice you will find that it's quite possible to draw pictures of that standard.

The tape costs £7.50 and I think you'll find it's the best £7.50's worth you have ever spent. Print n Plotter products also sell some support hardware to go with it such as key overlays and a jotter pad.

*Print n Plotter Products are at Dept ZX, 19 Borough High Street, London SE1 9SE.*

# 1K Corral

This is where we put our brand on the best of the mini masterpieces available!

Although the 1K user is in the minority nowadays, the programs in the 1K Corral should be of interest to all programmers as they demonstrate an economical approach to pro-

gramming and provide skeleton programs for development. Many of the Spectrum programs we receive (especially 48K) tend to be needlessly lengthy and use a lot of repeated code. In

a way it's a pity there is so much memory available but a few lessons in efficiency can be learned here.

All the programs will run as printed but the CHR\$ form has

been substituted for the ZX graphic characters. If you prefer, substitute the respective graphics for the CHR\$, for example: PRINT CHR\$ 128 PRINT "inverse space"

## Robbery David Webber

The jewel phantom strikes again! Here's the plan: sneak past the guard and half inch the jewels. Just to check that you've got what it takes, try this simulation first. You are the thief (inverse<) and the guard (inverse 0) tries to catch you by

patrolling the top and left of the vault (pound sign).

To move, use the cursor keys 5,6,7 and 8 but be warned; if you are caught or stray from the playing area then you will be put back to the beginning and your aim is to get the jewels in the quickest time. David's best is a pretty fast 5; mine is a dismal 9. This is one game where flashing characters are used deliberately to increase the difficulty level!

```

## Chemistry S O'Duyer

This program calculates the percentage composition by mass for a given formula. For instance, NaCl (common salt) works out to be 39.3% sodium and 60.7% chlorine. The user

inputs the symbol of the element or compound and its relative atomic mass (which will have to be looked up in a chemistry text book). Three common compounds are stored for instant use by the computer but if you have 16K and the time, all the other information could be stored.

```

5 PRINT AT 0,0;"ENTER SYMBOL

```

## Catch and Digger Scott Ford

You know the song, 'Catch a falling ball and put it in your bucket!' That's the general idea although random cross winds do make your life a little more difficult. After each failure press Newline to try again. Warning — once the game has started, the only way of stopping is to catch a ball. Keys 5 and 8 move the bucket.

In Digger, you (inverse X) are trying to escape from the pursuing checked square. If it catches you then you expire. You are given some chance though, you can dig a hole by pressing 0 into which you can try to lure your prosecutor.

You can dig more than one hole but only the most recent is fatal to your enemy. And don't think you can hide in your pit for safety — if you are caught in it then you will have dug your own gravel!

```

## Outer Space Ian Rogers

Deep in the far reaches of space, a solitary spaceship is in peril. Yes, another dodge-the-scrolling-blobs-type game, but

there are some first rate techniques used in this version; going into fast before clearing the screen for instance!

I also liked Ian's concept of "sticky stars" which you have to dodge by moving left and right with keys 5 and 8 and there is even a score and high score.

```

# A NEW, IMPROVED ZX81 KEYBOARD AT THE SAME OLD PRICE. £9.95.

There's only one thing wrong with the ZX81. Its keyboard.

Or rather its lack of one.

Since it's flat your fingers don't feel as if there's any response to the pressure put on the keys.

ZX81 KEYS

FILESIXTY KEYS

In other words, you're not quite sure which keys you've pressed until the screen actually tells you.

Our new, improved push button keyboard changes all that.

It matches the ZX81 perfectly. And the keys give a real calculator-type feel.

To set it up all you have to do is peel off the adhesive backing and stick it on top of the ZX81 touchpad.

Because no tampering or soldering is involved the guarantee is not affected. And it will last for up to 3½ million operations.

Filesixty Ltd., 25 Chippenham Mews, London W9 2AN, England. Tel: 01-289 3059. Telex: 268 048 EXTLDN G 4087.

But our keyboard doesn't just come loaded with features. With it comes a separate overlay and a set of coloured stick-on labels to make game playing easier.

It's yours for the original price of £9.95.

Whichever way you look at it, we think you'll agree that it's a keyboard that's quite outstanding.

Orders to Filesixty Ltd., FREEPOST, London W9 2BR.

# Touchdown

## A lander game that will improve your programming from Mike Richardson

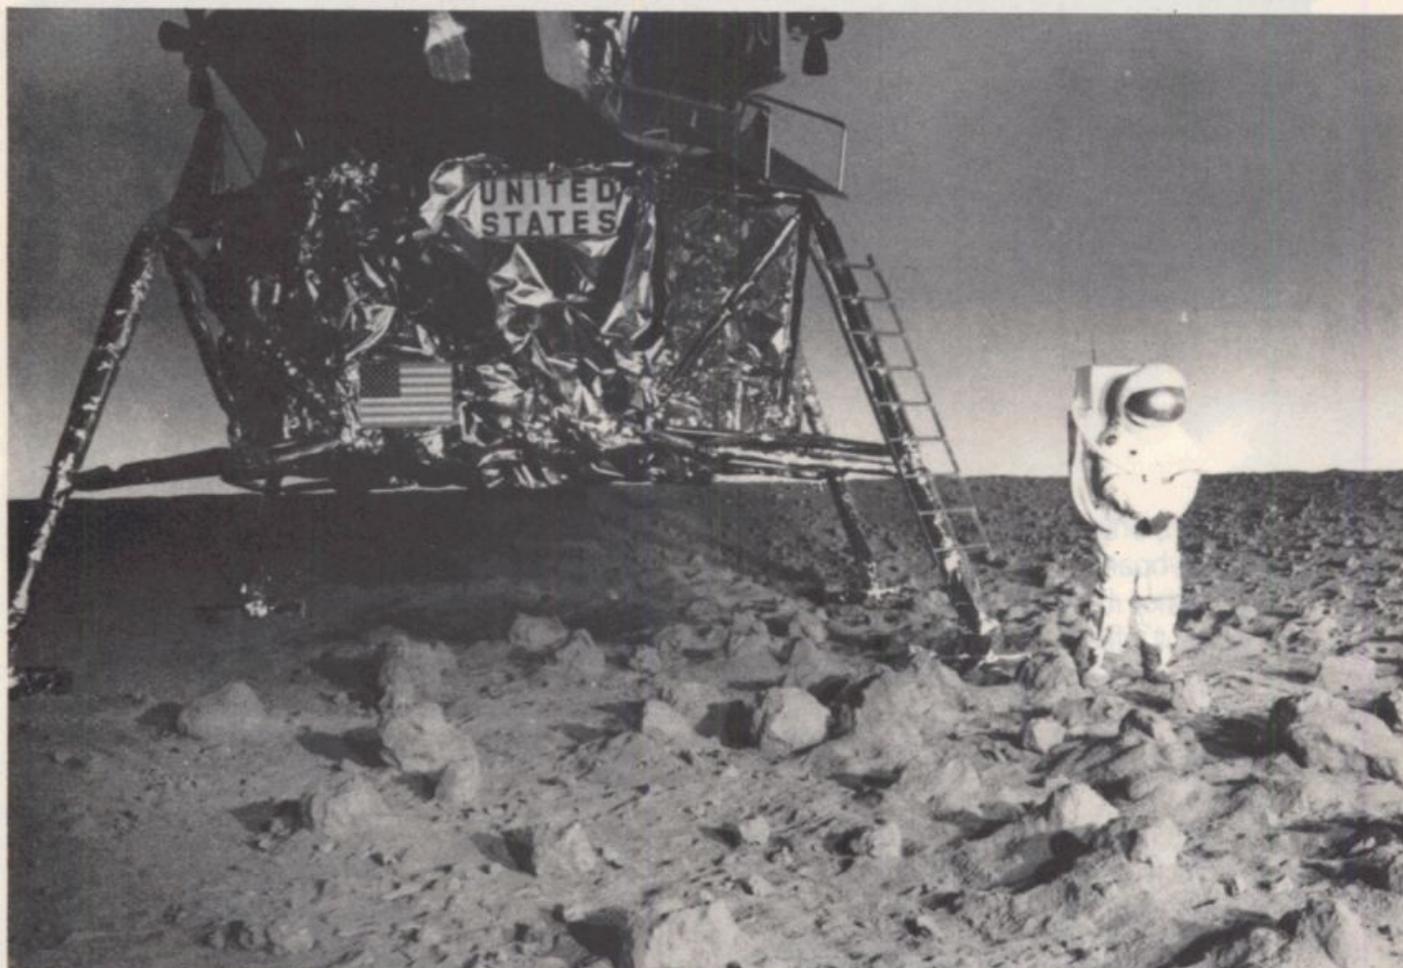

When I talked with Durell Software recently, Robert White explained that their first release, Lunar Lander for the Oric, was written in BASIC with the intention that purchasers *should* break into it. It was also REM-

med to the hilt to enable the user to understand how the game was constructed.

It didn't take a lot of persuasion to get the other leading light and main Spectrum programmer of Durell, Mike

Richardson, to provide us with a Spectrum version. Mike wrote the Spectrum version of Durell's best seller, Harrier Attack, created Jungle Trouble and produced their new winner, Scuba Dive.

So here we are privileged to present a program which demonstrates how the professionals would go about writing a BASIC program. Of course, the software Durell market is all in machine code, but Mike says that he enjoyed the exercise of writing in BASIC again. About half the program is REMs, you can leave these out if you wish and still have a great game to play, but the main intention is for beginners to learn by example.

```

90 REM initial entry point

# Britain's Best Magazine For The Sinclair User

Don't be disappointed — make sure you get every issue of ZX Computing!

Just £12.70 will ensure that the next six issues will be lovingly wrapped and posted to you. Just fill in the form below, cut it out and send it with your cheque or postal order (made payable to ASP Ltd) to:

**ZX Computing Subscriptions,  
Infonet Ltd,  
Times House,  
179 The Marlowes,  
Hemel Hempstead,  
Herts HP1 1BB,**

Alternatively you can pay with your Access or Barclaycard: simply fill in your card number, sign the form and send it off. Do NOT send your card!

Make the most of your ZX Computer with ZX Computing — bi-monthly!

Cut out and SEND TO:

**ZX Computing Subscriptions,  
Infonet Ltd,  
Times House,  
179 The Marlowes,  
Hemel Hempstead,  
Herts HP1 1BB,**

**SUBSCRIPTION RATES**

(tick  as appropriate)

£12.70 for six issues UK

£14.20 for six issues overseas surface mail

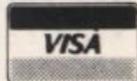

£25.00 for six issues overseas airmail

**Subscription Order Form**

Please commence my subscription to ZX Computing with the very next issue.

I am enclosing my (delete as necessary) cheque/Postal Order/International Money Order for £:..... (made payable to ASP Ltd) OR

Debit my Access/Barclaycard\* (\*delete as necessary)

## A superb general purpose program for storing data from Dr R G Shillito in Essex.

As it stands, this program is set up as a general purpose data store for general practitioners! However, for those of you who are not members of the medical fraternity, it is very easy to amend, alter and adjust to suit your own individual needs.

Full instructions are given for

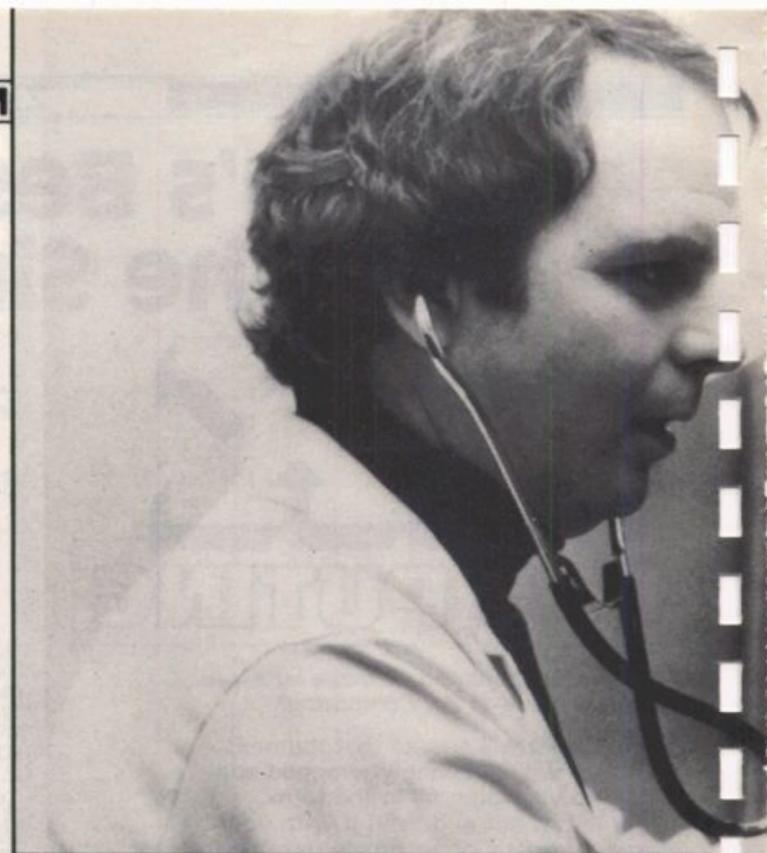

the operation of the program as it was written and I am a firm believer in encouraging programmers to adapt programs themselves rather than hand everything to them on a plate.

So here it is, modify it as you will . . .

```

## HISOFT PASCAL DEVPAC

### Quality System Software

#### HISOFT PASCAL 4T

"... I haven't seen any other compiler that could match Hisoft's Pascal" ... *Using Spectrum Micro — Autumn 1983.*

"This is a very impressive product... of benefit to any Spectrum programmer" ... *David Bolton ZX COMPUTING Aug/Sept 1983.*

Just two comments from full length reviews of our powerful and virtually full implementation of Standard Pascal. The advantages of using the Pascal language are many: fast, self-documenting and truly structured programming — many schools and universities insist on a good knowledge and understanding of Pascal for their Computer Studies courses.

Now you can learn and use Pascal on your home micro; Hisoft Pascal is available for a wide range of home computers, including the 48K Spectrum. Typically, compiled programs run 40 times faster than their interpreted BASIC equivalent — and sometimes up to 1,000 times faster!

Hisoft Pascal supports all the Standard Pascal data structures and statements: INTEGERS, REALs, CHARacters, ARRAYS, SETs, RECORDs, POINTERs, Enumerated types, FOR... DO, REPEAT... UNTIL, WHILE... DO, CASE... OF and many pre-defined Procedures and Functions (e.g. SQRT, TAN, SIN, COS, INLINE, PEEK, POKE etc. etc.) — it is **not** a Tiny Pascal but a powerful educational and development tool which allows the user to develop true high-level language skills, while attaining execution speed close to that of machine-code.

*Hisoft Pascal for the ZX Spectrum now comes complete with ZX Microdrive support (anything you can do with tape you can do with Microdrive) and a Turtle Graphics package which allows easy creation of complex graphic programs.*

#### HISOFT DEVPAC 3

"... DEVPAC is most highly recommended. The documentation is first class" ... *Your Computer — May 1983.*

"... it is impossible to recommend any other development package for the Spectrum over DEVPAC." ... *Adam Denning — ECM April 1984.*

Need we say more? DEVPAC 3 is a very powerful assembler, editor and disassembler/debugger. Forget about buying lots of separate packages for your machine-code development — it's all in DEVPAC 3. A full Z80 assembler with conditional assembly, all standard directives, full arithmetic (\*, /, +, -, OR, XOR, AND, MOD), many assembler commands for controlling object code generation, listing, printing etc., full line editor with advanced facilities like search/replace string, 'include' facility that lets you assemble from tape (or Microdrive) without taking up memory for your source text **AND** a superb disassembler/debugger with 'front panel' display of Z80 registers and flags with commands like search for string of bytes, copy memory, disassemble memory (to an assembler textfile, if you wish), list memory in ASCII, set multiple breakpoints, and, above all, single-step through machine code programs, one instruction at a time, **EVEN IN ROM!**

DEVPAC comes complete with a 45 page user manual.

On the ZX Spectrum, DEVPAC fully supports the ZX Microdrive, allowing assembly from microdrive, saving of text to and from Microdrive and saving of object code to Microdrive — DEVPAC still fully supports tape as well.

Prices:

**Hisoft Pascal 4T** (ZX SPECTRUM) £25 inclusive  
(NewBrain, SHARP MZ700 etc) £35 plus VAT  
**Hisoft Pascal 4D, many disk formats £46 inc.**

**Hisoft DEVPAC 3** (ZX SPECTRUM) £14 inclusive  
(NewBrain) £25 inclusive

# HIRE SPECTRUM SOFTWARE

## CHOOSE FROM OUR VAST RANGE

FREE 26 page CATALOGUE with full details of our range of over 280 different programs for the ZX SPECTRUM. All hired with the consent of the publishers. Whether you prefer to ZAP aliens, get lost in an ADVENTURE game, EDUCATE your children, CALCULATE the family finances or COMPILE machine code programs WE HAVE THE RIGHT TAPES FOR YOU TO HIRE.

### FAST SERVICE

We stock up to 60 manufacturers' original copies of each tape (over 3000 tapes in stock), and can normally despatch your tapes the day we receive your order, and we always use first class post.

### LOWEST PRICES

We believe our prices are the lowest of any library, yet we offer the LARGEST range of titles. Hire up to 3 tapes at a time, for 2 weeks, for only £1.07 each (inc. VAT & p&p).

### FREE TAPE HIRE

For a limited period, we will send your first tape (your choice) FREE, so join our library now. You can't afford NOT to! If you've tried another library and are wary of our claims send a stamp and we'll gladly send you a copy of our catalogue - we're confident you'll join when you see it!

## NATIONAL SOFTWARE LIBRARY

200 Mulgrave Road,  
Cheam, Surrey SM2 6JT

I enclose cheque for £6.00 for LIFE MEMBERSHIP and I understand that my first tape hire will be FREE. If, within 28 days, I'm not delighted with your service you'll refund my membership fee.

## FLOPPY DISC SYSTEM FOR SPECTRUM

### FLOPPY DISC SYSTEM FOR SPECTRUM

Our new model - BETA DISK is even better than ever. Some of the main features:

- \* Disc Operating System in EPROM
- \* Uses ONLY 128 bytes of Spectrum Memory
- \* Locates below BASIC programs
- \* Uses Spectrum Keywords
- \* Supports up to THREE disc drives
- \* Compatible with 40, 80 single or double sided drives
- \* Up to 400K storage for 80 tracks, double sided drive
- \* Random access is provided
- \* BASIC programs can be merged
- \* Duplicated Spectrum connector is provided
- \* Password protected.

£83.00 ex VAT

£1.00 p&p

Technology Research Limited  
Unit 18 Central Trading Estate,  
Staines, Middlesex

# SOFTWARE

## SINCLAIR ZX-Spectrum

### LOGO

The new educational language with Turtle graphics. Logo is an excellent tool for practically exploring designs and patterns giving experience of lengths, directions, angles, radii and colour

Runs on a 48K Spectrum **£9.95 inc. VAT**

Kuma Computers Ltd

**HOME BUDGET** — Helps you save money by planning your cash for the year ahead then displaying your accounts on useful bar charts utilising spectacular 3D graphics. A professional program for those who like to plan ahead. **£6.95 inc. VAT**

See us on PRESTEL \* 2473222 #

**SUPERCHESS 3.0** — The strongest chess program yet for the Spectrum Computer. Unlike other programs it employs artificial intelligence techniques to allow deeper searching along the main lines of play. **£8.95 inc. VAT**

COMET: KUMA TELECOM GOLD: KUM001

**MAP OF U.K.** — A large scale 75 x 60 mile scrolling map is now available on the 48K Spectrum. It is easy to use and extremely fast. The program also includes a game using a drifting hot air balloon. Educational and entertaining. **£11.95 inc. VAT**

Telex 849462 TELFAC KUMA

**HISOFT PASCAL** — Virtually a full implementation of the language allowing the user to develop true high-level language skills while attaining execution speed close to that of machine code. Complete with 30 page manual. **£25.00 inc. VAT**

Unit 12, Horseshoe Park, Horseshoe Road, Pangbourne, Berks RG8 7JW

**ZEN EDITOR/ASSEMBLER** — Zen enables you to write, assemble, edit and run programs in Z80 Assembly language. These operate faster and take up considerably less memory space than Basic programs. A must for the serious beginner. **£12.50 inc. VAT**

**HORSE RACE FORECAST** — Uses past and present races and information to forecast the chances of a horse winning. Can you afford to be without this program. **£15.00 inc. VAT**  
and many more send for catalogue

# Spectrum ROM routines

## A guided tour of some of the Spectrum ROM by Adrian Marsh of Clanfield.

The Spectrum ROM holds many secrets. The most interesting are the monitor routines and in this article I shall outline a few of these routines, and explain how they may be used.

### On screen printing

There are a number of ways of transferring information to the screen:

- 1 Hex address: 0B24-0BDA. This is the PRINT-ANY

character subroutine. On entry the HL register pair holds the pixel address of where the character is to be printed; the BC register pair holds the current line and column values and the A register holds the character code.

This method is complicated so it may be easier to use the second method.

- 2 This subroutine is contained within another, therefore the whole routine begins at

0D68 and ends at 0EAB. At the present the reader is interested in location 0DD9. This sets the printing locations to BC:

- i) Load the BC register pair with the appropriate values.
- ii) Call CL-SET and Call 0DD9 which enters required values.

BC is equivalent for a position AT a,b; the B register holds the line (hex) 18-a and the C register

holds the column (hex) 21-b. Therefore, a routine to produce an equivalent to PRINT At 11,15; would be:

```
01 13 0D LD BC,0D13
CD D9 0D CALL 0DD9
3E ?? LD A,(character)
D7 RST 0010
C9 RET
```

- 3 The routine PR-STRING can be used to print any string. The monitor routine consists of:

PR-STRING address 203C

```
(label) PR-STRING
LD A,B,
OR C
DEC BC
RET Z
LD A,(DE)
INC DE
RST 00010
JR PR-STRING
```

Any string of characters can therefore be printed by:

- i) Loading the start address into DE
- ii) Loading the length of the address into BC
- iii) Call the PR-STRING at address 203C

### Clearing the screen

The B register holds a value in the range of (hex) 01-18. Therefore, (hex) 18 would clear the whole screen.

The CL-LINE routine begins at 0E44 and is very short:

```
06 18 LD B,18
CD 44 0E CALL CL-LINE
C9 RET
```

This will clear the entire screen whereas if B were loaded with

17, all but the top line would be cleared.

## Sound

There are two routines in the ROM for producing sound, the BLEEPER and the BEEP.

- The hex address for the BLEEPER is 03B5-03F7. On entry the HL register pair hold the pitch and the DE register pair holds the duration. The duration value has to be increased as the pitch value is decreased. The pitch for middle C is 0666 and the duration for a second is 0105 so a routine for BEEP 1,0 would be:

```
11 05 01 LD DE, 0105
21 66 06 LD HL, 0666
CD B5 03 CALL BLEEPER
C9 RET
```

- The hex address for the BEEP routine is 03F8-046D. This routine uses the calculator to change the duration and pitch into appropriate values for the DE and HL register pairs.

## Using the keyboard

The main routine is the KEY-SCAN.

- Hex address for the KEY-SCAN is 028E-02BE. On leaving the routine, DE is returned with a key value. The zero flag is reset if more than one key is pressed at the same time. The D register indicates which shift keys are being pressed and the E register contains the key number (hex) 00-27.
- At location 02BF-03B4 are found the KEYBOARD sub-routines. These handle the repeat facility and decode the key-value to give the required character code. If the code is accepted then it is placed in the system variable LAST-K and bit 5 of the FLAGS is set.
- At location 10A8-111C there is the KEYBOARD-INPUT routine. This routine copies the value from LAST-K and depends on bit 5 of the FLAGS. It then returns with the carry flag set or reset if the code is printable.
- The subroutine at location 15D4-1651 literally has the effect of a PAUSE 0 or 'waiting for a key to be pressed'. So, a pause 0 in machine code would consist of:

```
CD D4 15 CALL 15D4
```

## Loading and saving

The whole routine starts at 04C2 and ends at 09F3.

- SAVING** This subroutine begins at 04C2-053E and passes the DE bytes by starting at the (IX) location and continuing to the cassette recorder with the initial marker byte and parity byte. An example of this is:

- The amount of bytes to save is 255 (FFh)
- The block is stored at location 25000 (61A8h)

Therefore:

```
3E FF LD A, 255
DD 21 A861 LD IX, +START
11 00 01 LD DE, +COUNT
C9 RET
```

This routine saves 255 bytes starting at 25000. However, these bytes are saved without a header, and can only be loaded if the count is known.

- LOADING** This subroutine begins at 0556-0604 and

loads the DE bytes and the IX register pair points to the first location. When loading the carry flag must be set, but if it is reset then VERIFY can be used. Therefore:

```
(37) (SCF loading only)
3E FF LD A, FF
0D 21 A861 LD IX, START
11 00 01 LD DE, COUNT
CD 56 05 LOAD ROUTINE
C9 RET
```

This routine loads 255 bytes into 25000.

I shall now continue to shed some light on the RST commands or restart commands.

- RST 0 (0000-0007h)**. This does a number of things in this order:

- Disable the maskable interrupt
- Clears the A register
- Loads the DE register pair with 65535 (FF-FFh)
- Jumps forward to 11CB

At 11Cb are the initialisation routines (equivalent to NEW).

- RST 8 (0008-000Fh)**.

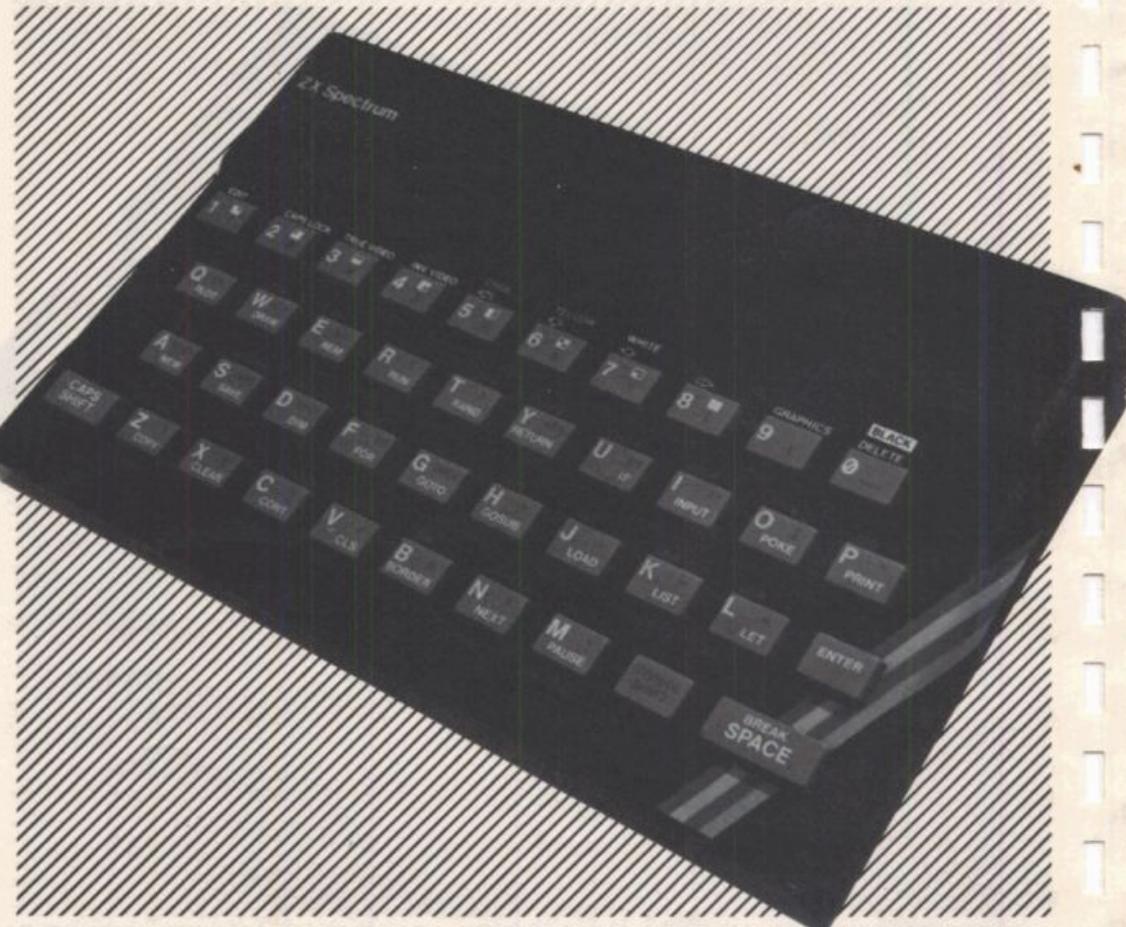

These are the error routines. There are two outcomes of this:

- The stack will be cleared.
- The appropriate report is given.

- RST 10 (0010-0012)**. This is the PRINT A character routine. A jump forward to location 15F2 is made.
- RST 18 and RST 20 (0018-0024h)**. This fetches the current character pointed to by the CH-ADD routine.
- RST 28 (0028-0029h)**. This jumps forward to location 335B which is the first address of the calculator.
- RST 30 (0030-0037h)**. This is the BC-SPACES and jumps forward to 169E to make a space in the work space.

A useful routine at 11DA is the RAM-CHECK routine. All locations from RAMTOP to 4000 are tested. The HL register pair holds the address of the last location of memory available.

By now the reader should have a good idea of the monitor programs in the ROM. Although I have only outlined a handful, they are sure to come in useful in writing new machine code routines.

# Readers' reviews

Once again we throw caution to the wind and air your opinions on the software currently available for the ZX machines.

## Bridge Player CP Software S Datto

If you are a keen bridge player and have sometimes been stuck at making up a foursome, then I can recommend CP Software's 'Bridge Player' for the 48K Spectrum. Unlike some other bridge games software on the market which basically consist of bridge tutors with pre-determined hands and play, Bridge Player allows you to actually bid for your contract, as well as play each hand as you see fit.

On loading the program, you are greeted by a very cleverly designed title, making use of the four suits. You are then asked to wait while the computer shuffles, deals and sorts the cards. Following that you are given the option of either playing the game properly, so that only your hand is revealed and the bidding for the contracting commences, or alternatively you may 'cheat' and see all four hands and then decide on the contract.

The play then begins with the lead from East or West, depending on who is declarer, after which dummy's hand goes down. You are always South.

As far as the bidding goes, the computer uses the standard ACOL system and also understands and accepts BLACKWOOD and STAYMAN conventions. It will not however, generate bids using these conventions, but will only respond to them.

Apart from the 'table' in the centre of the screen and declarer's and dummy's hands, the display shows the hand number, the dealer, whether any pair is vulnerable and the contract. The number of tricks won by each pair is shown at the bottom left of the screen, and a flashing indicator on the bottom right shows the winner of the last trick.

The faint-hearted have the option of quitting if they find they have entered into an impossible contract. This is done by entering the word "next" instead of a

card, and the Spectrum goes on to the next hand. If you play the wrong card when you should follow the suit being played, the Spectrum will forgive your "faux-pas" and revoke the trick without penalty.

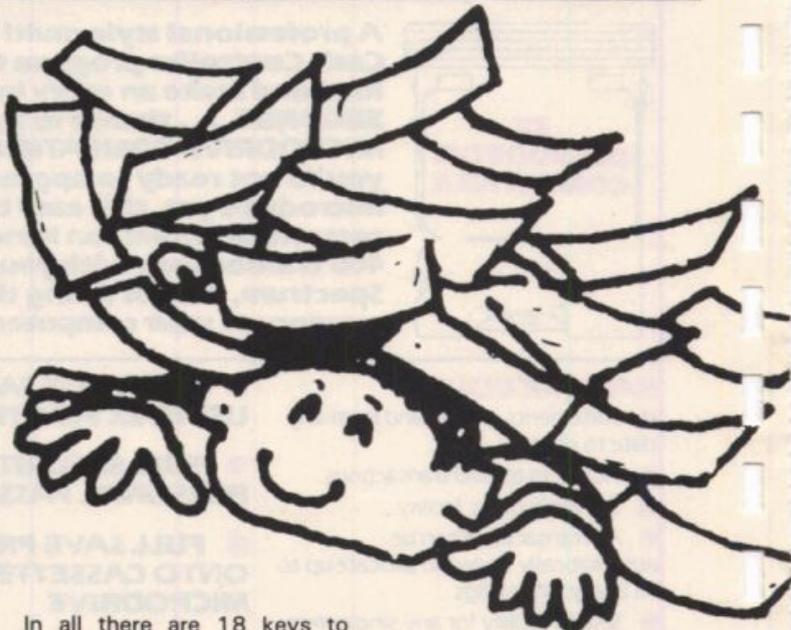

When the hand has been played, the display changes to a score card and here a nice little touch has been added. If the contract has been defeated you will be commiserated with a few bars of "The Funeral March" but if you have won the rubber, the Spectrum will play some of Cliff Richard's "Congratulations". You will also be told how much you have won if each point is worth one pound!

The only criticism I have of the program is that you always have to play the contract as declarer and dummy and East/West are always the defenders. You may certainly, during the bidding stage, leave East/West in a contract but you will be informed that you and your partner have the majority of points between you. You will then be asked if you wish to rebid or play the next hand, without the computer having to play as declarer/dummy as well as your partner. It would improve the program immensely if the opposition could also play as declarers.

## Hunter Killer Protek L Tout

Imagine you're the commander of a British "S" type submarine on an important mission off the coast of Germany and that you have to hunt and destroy enemy submarines. Well this is exactly what you do, if like me, you have bought Protek's submarine simulation program, Hunter-Killer.

On loading an impressive picture showing a submarine launching a torpedo is drawn. You are then asked if you would like a quick practice shot at a submarine. Because the program is a simulation, there is a lot of cunning strategy involved.

In all there are 18 keys to master, which I found did not take long although finding the enemy took a little longer owing to some confusion over bearings, but they soon disappeared.

Your craft has two engines; one diesel and one electric. On the surface you should use the diesel engine but because this needs air to run, the electric engine is used under water. However, if the submarine stays down too long you won't be left with enough power to surface and recharge, so an eye must be kept on the battery charge indicator. The speeds for the diesel and electric engines are 16 and 9 knots respectively, so it's better to use the diesel engines to reach the enemy more quickly.

To make the submarine dive, the ballast tanks must be flooded using key N, and the hydroplane angle altered, using key 6. To stop diving and remain at a constant depth, the hydroplanes must be horizontal and the ballast tanks emptied. Surfacing can be accomplished by blowing the tanks (key B) and raising the hydro-planes (key 7).

Every submarine has to have a periscope and this one is no exception. Key p raises and lowers it and key V lets you look through it.

The water level is shown (which corresponds to your depth) and the enemy, if in visual range. Along the bottom of the screen are shown the periscope angle, your heading (so many degrees from North), the distance to the enemy and the torpedo count. Key O turns the periscope clockwise and key I, anticlockwise.

To help with navigation there are three types of radar; long range (22 miles), short range (4 miles) and an echo sounder which gives the familiar, hollow echo sound, when the submarine is below 15 feet in depth.

There are three high resolution screens shown. All the gauges and dials are shown in the control room which is scrolled sideways on pressing key C, to take you into the Chart Room. The other screen is your view from the periscope. In the Chart Room a map shows the area which you are in and part of the German Coast. Also shown are a tide indicator which tells you its strength and direction, the enemy's last reported position, your position and places where there are mines lurking.

Once the enemy is in range (three miles) and is dead ahead, pressing T will prime the torpedos and fire the first one.

Second and subsequent torpedoes are then fired using key F. Their speed is 45 knots and when you peer through the periscope, a bubble track can be seen heading towards the enemy submarine (or not as the case may be). If your aim is true, the submarine can be seen exploding.

Since you are in enemy waters you also encounter aerial attacks. Through the periscope a plane can be seen and heard and then a klaxon sounds. If this happens you have roughly two minutes to dive below 30 feet before you see the screen shake due to the shock waves from the depth charge dropped by the plane. If you fail however, there is the sound of rushing water and which ever room you are in slowly fills up with water. The sound effects are brilliant.

Hunter-Killer has five levels of difficulty and a manual is supplied with the program. A unique feature of this game is to let you play against a friend, each hunting the other but alas, this can only be done if you have a Microdrive to link both Spectrums. One other drawback is that it takes a long time to reach the enemy but this is because it's a simulation program and Protek have based your submarine on a British "S" type craft with true speeds of 9 and 16 knots, nevertheless, this is a very small snag in an excellent program.

I have only given you the bare facts of how to play the game, but there are many more factors which contribute to the need of intricate strategy. This in itself gives the game millions of variations.

Hunter-Killer is for the 48K Spectrum and is priced at £7.95.

### The Alchemist Imagine J Richards

The Alchemist is not just another boring adventure game that takes hours of typing and frustration, it is a truly excellent arcade-type graphic adventure, similar in style to Hunchback.

The 48K program LOADED first time, taking about five minutes. There's a SCREEN\$ and once LOADED you are greeted with quite a catchy tune, very well matched to the program which is set in the distant past. There's a menu with a good selection of keyboard or joystick options — a joystick certainly makes the game easier to master but using the keyboard is not so bad. There's

a wide range of key combinations available and it is quite easy to work out a pattern that suits you.

After making your selection, off you go! The idea of the game is to find four pieces of the 'Spell of Destruction', find the Evil Warlock and cast the spell. You are the Alchemist, with a bit of magic of your own and you are on this great mission to destroy the Warlock. The story-line sounds familiar but the program is well written. Of course, it isn't an easy game: there are 16 rooms, which sounds disappointingly few, but each room takes up two screens and there's plenty to go at. As you move through a room, the background scrolls effectively and on going through a doorway the screen changes to put you in another room.

As the Alchemist you are a very stately figure on the screen. One of your tricks is the ability to transform yourself into an eagle (at the press of a button). This is done well in graphics and as an eagle you can fly to areas the Alchemist could never reach in human form. Learning to fly takes practice but you flap your wings nicely and automatically lower landing gear when necessary!

You have a permanent on-screen record of your vital statistics, namely Spell energy and Stamina, along with a record of which object and/or spell you are carrying. You also have an hour glass and a space ready to deposit any of the parts of the 'Spell of Destruction' you have found. The hour glass tells you how much time you have left in a room before the Warlock locates you and starts sapping at your stamina. This is very dangerous and unless you evacuate the room quickly, will probably be fatal!

You have to keep up your strength by eating food which is scattered around. Spell energy is constantly replenished but is used up every time you cast a spell. Spells and other useful objects are scattered about the lair but are invariably guarded by nasties such as ghosties, skulls or other strange creatures. Combat is almost inevitable, and this saps at your strength.

The game is well thought out and needs dexterity as well as brain power. Although I completed the adventure within three hours, I still find it very enjoyable indeed. The colour and graphics are excellent, particularly because the objects are large and easy to identify. Sound is not used a great deal, but is effective.

Any complaints? Only two. The first is that it is far too easy

to accidentally abort the game by pressing "1" in the excitement; the second is that there is no 'hold' feature. I expect this would make the game a bit too easy.

If you're after an adventure that you have a fair chance of completing, without being bored in the slightest when you *have* managed to do it then this is the adventure for you. Priced at £5.50 it's value for money, and certainly a great deal of fun to play.

### Computacalc ZX Silicon Tricks Darren - John Norbury

In the world of the commercially-used computer, where the large mainframe machines produced by such companies as IBM and ICL reign supreme, the price paid for a decent business program could buy a good family micro. Luckily, Sinclair programs come a little cheaper than this. In a seemingly games-dominated market it is good to see that the utility program has not been neglected.

Such a program is Computacalc ZX, produced by the software company Silicon Tricks. The purpose of this program, in general, is to provide a table from which data can be stored and manipulated. To use a simple example: in a commercial setting, sales and costs for a company could be entered into two separate boxes for each month and the computer will calculate the profit which it will display in a third box. The above is a very simple example. The possible uses for this program are really limitless.

Calculations are made using formulae entered by the user, but formulae in the simple form of, say, let the contents of box 3 = the sum of boxes 1 and 2 (which would actually be written as F0203 + 0303, assuming that box 1 is at grid reference 0203 and box 2 is at grid reference 0203).

The table which forms the display is actually much larger than the screen area itself so by a little dexterous wizardry on the part of the user, certain areas of the table are scanned.

Computacalc ZX gets full marks from me as a household, scientific and small business utility program. The only disadvantage I can find in the package lies in the seven pages of instructions. If you are a fairly new computer user then you may be a little overwhelmed at the com-

pllicated way in which the instructions are laid out. However, once deciphered — never forgotten!

Computacalc ZX is available in some branches of W H Smiths and computer software shops.

### Readers' hardware reviews

Not content with reviewing software, two readers have branched out and reviewed some ZX hardware.

### ZONX-81 Bi-Pak Semiconductors MD Brunt

Last December I decided that it would be nice to have some sound for my ZX81. Of the three sound synthesisers that were on the market, the ZONX was the cheapest, just, and it was a self contained unit, the others required an amplifier and a speaker although they did have two I/O ports.

My decision made, I sent off and prepared for a Sinclair style wait. I need not have worried. Although it was less than a month till Christmas the ZONX arrived in less than one week! I quickly tried to fit the ZONX to my ZX81, only to discover that my full size keyboard got in the way. The problem was that there is a small volume control on the front of the ZONX and it was this that prevented the ZONX from fitting. My solution was to fit a new control into the top of the ZONX.

I opened the ZONX to find a speaker and several chips, all soldered very neatly I might add, and the AY-3-8912. The volume control turned out to be a preset pot, which is not really designed for a lot of use, and I would suggest that it should be moved as little as possible to reduce wear. I replaced it with a standard 'volume control' which I mounted through the top of the ZONX.

The manual for the ZONX is small (5½" by 4") and only twenty pages long, but it is fairly clear and it explains what each of the AY-3-8912's thirteen registers are for and how they are used. The ZONX resides in the I/O area of the Z-80's memory and so a short (9 bytes) machine code routine is needed to access it. The routine is held in a REM statement and can be typed in directly from the keyboard. The manual also contains eight short programs in-

cluding one which turns the top row of keys (1-0) into an electronic organ.

The 16K RAM pack connects to the ZX81 through the ZONX, the edge connector of the ZX81 being duplicated on the ZONX, which is just as well since a simple explosion takes up twenty-five lines of BASIC.

The main disadvantage of the ZONX, or any sound synthesiser, is the time needed to develop a given sound — in most cases done by trial and error. Since neither Bi-Pak nor any other software company that I know of, markets any software for the ZONX, you will have to work on them yourself. The results can be worth it though. The other problem is with speed, most sounds are built up from BASIC loops and so they must either be run in fast mode or they sound far too slow. To use sound in games, therefore, will require some simple machine code programming.

I have had a lot of fun with my ZONX and I would recommend it to anyone, provided that they are prepared to spend a lot of time with it. If not, then they would be wasting their money. The ZONX units cost £25.95

for the ZX81 and Spectrum. (An extension board is required for the Spectrum at £6.80).

## Memotext Memotech J Lowther

Clive Sinclair's 12 oz piece of modern technology that all the 'big boy' computers used to laugh at has been made to do some pretty amazing things by clever software and additional hardware, but word processing?

The functions in Memotext include keyboard input at normal speed, justification to left only (as in a letter) or left and right margins (as in ZX Computing) search/exchange/move groups or single words, lower case, headings, page numbers, saving files, pre-entered dates, prompts before printing and so on.

For instance, if you run a newsagents, you might set up data files of customers' names and what they owe you and then get the computer to print a set letter saying, basically, "can I have my money please?" You would insert the relevant names, addresses and amounts

due each time. You could then use another text file (ie set letter) and use prompts to enable you to print orders for the wholesalers according to which special offers you've spotted in the "Newsagents Weekly"!

The Memotext is well documented although it took me about four days to get the hang of all the functions. Now I can type as badly as I like, check for spelling mistakes (on the screen) and correct or change any words that don't seem right at the press of a button, move around sentences so that they follow a logical sequence and then print out as many 'personalised' copies as I like, marked for the relevant people.

To be of use, you would really need a proper printer interface (Centronics or RS232) and access to a printer. This means that the 16K '81, Word Processor, and interface together would probably set you back about £130. For comparison, a 16K BBC with interface and wp would cost perhaps £330 and a commercial wp package probably little short of £1000.

The Memotext, like all the Memotech range, comes in a firm aluminium case that plugs

directly into the ZX81 without wobble and fits between your RAM pack and '81. This means that you don't waste time loading the program.

Obviously, there are limitations: the '81 can't display the 60-80 characters a line commonly used in letters and reports so the Memotext uses a clever "word-wrap" feature which means you never lose words at the line ends but you have to visualise the final document rather than see it straight in front of you. Also some of the symbols and lower case letters make entering the text a bit complicated.

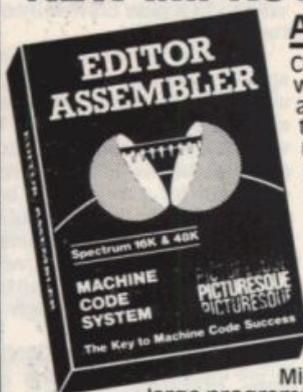

The Memotext is £29.90 (including VAT and p&p). This compares with about £8 for some cassette-based systems (eg Tasword or Contrast Software's Text, £6). The buyer must judge (a) whether they really need word processing on their '81, (b) whether they would use it often (printers will often do wp at about £2 a sheet — if you only want say one a month, it might be cheaper) and (c) whether they need the extra speed, convenience and general 'slickness' of a ROM-based system.

## The Key to Spectrum Machine Code Success.

Picture's MACHINE CODE SYSTEM is used and recommended by professional software writers, yet the excellent documentation and the friendly, easy-to-use programs have been highly recommended for beginners.

You will only buy one Machine Code System, so buy the best, the one the professionals use.

### NEW IMPROVED PROGRAMS — MICRODRIVE COMPATIBLE

#### ASSEMBLER

Completely self-contained with its own line editor, giving an easy-to-read 40 column tabulated listing. Auto line numbering, line renumbering and auto tabulation make this one of the fastest and easiest Assemblers to use. 5-character label names. Decimal, Hex or ASCII constants. SAVE/LOAD/VERIFY both the listing and Machine Code to cassette/MICRODRIVE/NETWORK. Assemble from cassette or

Microdrive into memory for very large programs. Customise to most Centronics printer Interfaces, or RS232 (with Interface 1) for 80 column printout. FAST ASSEMBLY — 1k of code in 7 seconds. Assembler Directives:— ORG, END, DEFB, DEFW, DEFM, EQU, DEFL. (Microdrive and Centronics facilities only operate with 48K machines.)

**£8.50**  
INCL. VAT & P&P.

Programs supplied on cassette with option to Save onto Microdrive (cartridge not supplied)

Existing owners can obtain the new programs by returning the cassette only to Picturesque, along with a cheque/PO for £1.50 per program (inc. VAT & P&P). New cassettes will be supplied by return of post.

Available from the "SPECTRUM" chain of stores, branches of John Menzies and all good computer shops, or by mail order by sending cheque/PO to:  
PICTURESQUE, 6 Corkscrew Hill, West Wickham, Kent, BR4 9BB. Send SAE for details.

#### MONITOR

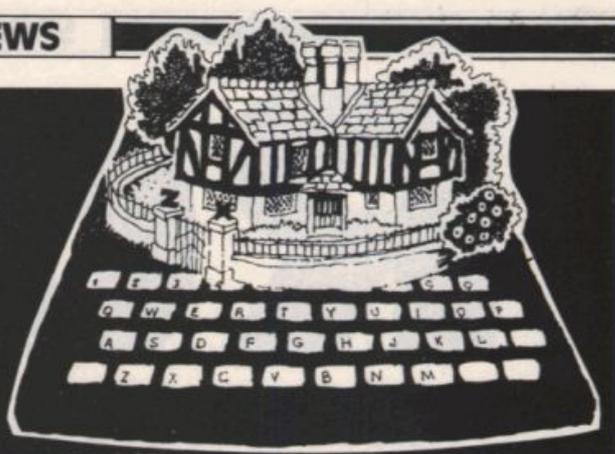

The ideal tool to help the beginner get started, yet it contains all the commands for the experienced programmer to run and de-bug machine code programs. Inspect and alter memory contents in Hex or ASCII. Breakpoints and full Register display. NOW WITH SINGLE STEPPING through RAM or ROM. Disassemble any part of memory, RAM or ROM. Dec-Hex-Dec number converter. Printer output to ZX

printer or via RS232 (with Interface 1) or customise to most Centronics printer interfaces. General memory management commands include Hex dump, Insert, Delete, Fill and Move. Can reside in memory with the Assembler (48K machines only) to give a complete Machine Code programming system.

**£7.50**  
INCL. VAT & P&P.

## South African Computer Club

Dear ZX Computing  
I would be pleased if you would publish this letter in your magazine. I am the European representative for a South African based computer club (ZX Computers). We are a world wide club and have members in Australia, Europe and, of course, South Africa.

Although we are a big club in South Africa, and have members in Britain and Portugal, we would like some more members in Europe where the response so far has been relatively poor. We would also like some American members. Anyone interested should write to the address below and I shall send them further information. Yours faithfully

J. Jones  
European Representative  
House 14  
Anglo Alpha  
PO Box 15  
1725 Roodepoort  
South Africa

## Australian ZX Users Association

Dear ZX Computing  
The Australian ZX Users Association has been in existence since late 1981 when we first supported the ZX80. Since then we have expanded to be one of the largest ZX groups in Australia and now support all the Sinclair machines. We produce a bi-monthly newsletter of some twenty pages and organise local users meetings around Australia. By rights we should be called the International ZX Users Club as we have many members from around the world.

A subscription to our newsletter and the other facilities we provide costs A\$9 pa for Australian members and A\$15 for international membership.

For further information write to the address below enclosing A40 c stamp or three International Reply Coupons.  
Yours faithfully

David Vernon  
Secretary AZUA  
19 Godfrey Street  
Campbell ACT  
2601  
Australia

## Anglo French Computing?

Dear ZX Computing  
Can you help me? I'm a French 48K Spectrum owner who would like to exchange ideas and programs with British users. Are there any clubs or groups that correspond with European users?

If so, please write to the address below as my Spectrum is thirsty for programs.  
Yours faithfully

Patrick Dardour  
18 Rue du Borrego  
75020 Paris  
France

## Turkish ZX Club?

Dear ZX Computing  
I'm Turkish and live in Istanbul and I own a 48K Spectrum and a ZX Printer. I would like to become a member of a ZX club but unfortunately there isn't one around here that I know of.

I would like, therefore, to start a new club: I have a few supporters (aged 17 to 18) but we would also like to have pen pals who would be interested in becoming members of such a club. We would appreciate it if you would publish this letter and help us with our idea.  
Yours faithfully

E dip Uras  
Mühürdar cad No 91 /4  
Kadikoy  
Istanbul  
Turkey

## The Midweekly Spectrum User Group

Dear ZX Computing  
I would like to tell your readers about the Midweekly Spectrum User Group. We meet every Wednesday (or Thursday if Wednesday's date is odd) at 8 Linnet Close, Gloucester anytime after 7pm. Naturally, as there is no charge, members are invited at their own risk.

Members may bring their own Spectrum and cassette recorder to the meeting and use of the televisions is on first-come-first-served basis, as is the light pen and tape to tape facility.

The aim is to have a congenial evening, with a mutually rewarding exchange of ideas and knowledge, so age, experience or gender is unimportant. For more details, telephone me on Gloucester 23186.  
Yours faithfully

Barry Ledbury

## ZX Club Bangalore

Dear ZX Computing  
I am writing to inform you of our ZX Club in Bangalore. This is a newly formed club with around 16 members owning Sinclair computers. We meet every week on Sundays between 3 and 5pm to exchange news, software and ideas. I am subscribing ZX Computing for the club as it is very informative for ZX users.

I would very much like to exchange news and ideas with other ZX users and groups and would be grateful for any information that could be sent to us at the address below.  
Yours faithfully

B S Srinivasan  
No36 First Main Road  
NR Colony  
Bangalore 560019

## Acocks Green Computer Club

Dear ZX Computing  
The Acocks Green Computer Club meets every third Thursday in the month at St Mary's Church (kitchen vestry) at 7 pm.

I also run a computer users group that meets every Monday at 7pm at the Stonehall Adult Education Centre during term time. Because the meetings are held in an educational establishment, no restriction is put on the machine but obviously Spectrums abound.

Please contact me at the address below or at either venue for further information.  
Yours faithfully

Mike Bedford-White  
16 Westfield Road  
Acocks Green  
Birmingham  
B27 7TL

If you run, or are a member of a user club which caters for the Sinclair user, why not get your group on the map by writing to us at:

Club Corner,  
ZX Computing,  
1 Golden Square,  
London W1R 3AB

All you have to do is to send us a letter with details of your club's activities (times of meetings, addresses of who to contact etc.) and we'll do the rest. If you publish a newsletter or club magazine, we'd very much like to see that too.

And if you don't see a club in your area, why not start one up by writing to ZX Computing and seeing if any like-minded enthusiasts wish to join you.

# Racer

Move into top gear and try your hand at Grand Prix racing courtesy of David Price of Cardiff.

"Well, here we are at the start of the Spectrumapolis 500 where of course the hot favourite is .....". (Insert your own name here.) Type in this game and you'll soon be driving round and round the course and through the chicanes trying to finish in the best possible time. Crashing into the barriers tends to be slightly fatal.

The sound and graphics capabilities of the Spectrum are

put to good use in this game and, as there is a "best time" feature, it becomes quite addictive as well as fun to play.

Well then, get typing, put on your crash helmet and push your foot to the floor. Instructions and controls are included in the program. NB. To qualify for the championship you will have to beat David's best score of 32 seconds, yours truly only managed 37!

Then do it with

## TRANS-EXPRESS

TRANS-EXPRESS is the most comprehensive package of four m/c utilities for transferring Spectrum programs. They are user-friendly, simple to use, reliable & very efficient. They go much beyond where similar attempts failed, enabling you to transfer any kind of programs up to the full 48.0K length - provided you do not infringe copyright. TRANS-EXPRESS is an essential microdrive companion and an invaluable software back-up utility.

We are offering the entire package for **£ 9.95** or a combination of TAPE TO MICRODRIVE & MICRODRIVE TO MICRODRIVE for **£ 7.50**. You can also buy each of the four programs separately for **£ 5.50** only.

## TAPE TO TAPE

Please send me a copy of TRANS-EXPRESS ① ② ③ ④ Please tick where applicable

I enclose cheque/PO for \_\_\_\_\_ (Please add £1.00 for orders outside UK) ZX

Name \_\_\_\_\_

**ROMANTIC ROBOT** 113 Melrose Ave, London NW2

## Wizard Software FOR THE 48K SPECTRUM NEW

### BUGS £5.95

A 100% machine code, multiple screen, arcade game presented in high resolution graphics. Direct BUGS to mend the printed circuit board inside a computer. Watch out for the demon hardware bugs or they will fry you.

### SPECTRUM CRICKET £5.45

Play either test match or limited over cricket. Select your teams from the 6 available or choose your own players. Enjoy all the features of a real game of cricket including three types of bowler delivering a variety of balls, batsmen running between the wickets, umpires making appropriate signals and many more. 72 field positions available. Score board continually updated during game. Good moving graphics.

### TIME PORT 1 £6.95

The first in a series of five adult strategy adventure games. Direct your robot and acquire the object that the Keeper will ask for and bring it safely back to the Time Port.

### EVICTOR £5.95

An original Arcade game with machine code for extra zip. Evict the aliens from their self re-generating and defended base. Features bombs, lasers, phasors and alien spacecraft. 5 skill levels.

### FRUITA £5.45

A de-lux fruit machine featuring:- 4 drums, Spin, Respin, Hold, Gamble, Collect, Nudge, Bounce, Blind, Cancel and Jackpot. New drums manufactured for each game.

All prices inclusive, mail order, cheque or postal orders to:

**Wizard Software, Dept ZX, PO Box 23, Dunfermline, Fife, KY11 5RW.**

Also available from software retailers world wide. Send large SAE (7in. x 5in.) for full program catalogue. Royalties paid for machine code Spectrum software.

## The Complete Printed Circuit Workshop

### Easy Add-ons for ZX Spectrum & ACE

**NEW**

17 exciting electronic projects to build and run your own micro.

- LIGHT PEN
- PICTURE DIGITISER
- KEY PAD
- MODEL CONTROLLER
- WEATHER STATION
- + OTHER EXCITING & INTERESTING PROJECTS

A newly released book by well known author Owen Bishop, published by Bernard Babani, describes in detail 17 projects to build (using low cost materials) to bring your micro into the real world.

The most complex component (the DECODER) is supplied in kit form ready to assemble with all components and plated through PCB

Order ref HB 2000 "EASY ADD-ONS" BOOK + DECODER KIT	<b>£24.00</b>
Order ref HB 2001 "EASY ADD-ONS" BOOK ONLY	<b>£3.00</b>
Order ref HB 2002 DECODER KIT ONLY	<b>£22.00</b>
Order ref HB 2003 DECODER PCB ONLY	<b>£8.00</b>

Please state computer when ordering

## Micro Interface Kit

Professionalise your add on projects. Kit comes complete with attractive black ram pack style case, pre-etched & drilled double sided PCB, 28 way 0.1 pitch connector, 9 way D output plug & extender card. Suits Spectrum, ZX81, etc.

Order ref. HB/2090 £9.50

## ZX81 Hi Resolution Graphics Kit

Improves screen resolution to 256x176 pixels enabling superior graphics to be easily programmed. Plugs directly into ZX81 ROM socket & is complete with extensive software tape.

Order ref. HB/2070 £22.00

## ZX/Spectrum Intelligent Joystick I/F

\*Treble your game scores overnight!\* Suitable for Atari type joysticks. The kit provides an interface to enable ALL games programs to be played with joystick control. Tell it once & the keys for that game are remembered forever.

Spectrum Kit & Joystick HB/2061 £27.31 less joystick £20.80

ZX81 Kit & Joystick HB/2060 £27.31 less joystick £20.80

## Computer Cables & Connectors

We now offer an extensive range of computer cables & connectors including a Spectrum user port extender cable. Send for new cable & connector price list.

## Spectrum Extender

HB/2069 £8.85\*

Overcomes those interconnection problems! Six inch double ended extender & male PCB plug. Also available as single ended with 9" of ribbon cable HB/2068 £4.76\*

Prices inclusive of VAT, carriage 60p in U.K. Overseas orders please add extra carriage. Newly published full catalogue £1.50 (Refundable with first order over £10.) Please quote REF. ZX/6.

# Slogo

David Nowotnik presents the first of a three-part series on a fascinating language.

In the last issue of *ZX Computing*, Tim Hartnell presented an excellent article introducing the programming language of LOGO. I'm sure many readers will now want to try LOGO on their Spectrums. But, if you've tried to find some commercial software which allows you to use LOGO then you might well have been disappointed; there isn't much available. As a remedy to that situation, I shall be presenting, in a series of three articles, a BASIC program which simulates LOGO. Don't worry if you missed Tim's article, as I'll be going over the principles of LOGO again.

In each part of the series, you'll get a BASIC program to type into your Spectrum, and instructions on how to use the program. And, in using the program, you'll be using LOGO. So, by the time the series is complete, you should have a good understanding of the language. The program I'll be presenting next time must be added or MERGED to the program in this

issue, then the one in Part 3 added to the other two. So, while this month's program will fit a 16K Spectrum, you'll need a 48K Spectrum to accommodate the final version.

Ideally, a LOGO translation program should be written in machine code for a fast operating speed. I've written my version in BASIC as it's easier for me to write it, and easier for you to type in. But in using BASIC, speed is lost — that's why I've called my version of this language SLOGO!

Once you have entered the listing in Fig.1 and SAVEd the program on tape, you are ready to start. But before we begin typing in our LOGO commands, it might be useful to consider the background and principles of this language.

Fig. 1. The program listing

LOGO was designed to provide children with an early introduction to computer programming and to develop their abilities in logical thinking. The commands of LOGO are simple to understand, yet LOGO encourages a good programming style by virtue of its structure. LOGO is best known as a graphics language, enabling still (and animated) pictures and patterns to be drawn. More powerful versions of LOGO have facilities for text handling as well as graphics but my version, in common with most, deals with graphics only.

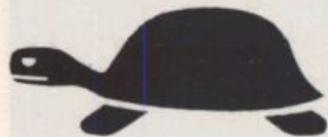

You'll find LOGO a very useful language if you have young children, if you want a versatile graphics routine or if you want to move on from BASIC, LOGO is an easy language to learn, yet

it introduces you to structured programming, as used by more powerful languages such as FORTH.

Drawing with LOGO makes use of a turtle — but before you rush off with complaints to the RSPCA, these are only imaginary animals! Imagine you had precise control over the movements of your turtle; instructing it to go forward or back, turn left or right, all by specified amounts. Your turtle carries a pen which you can instruct to be lowered onto a sheet of paper, so that, as the turtle moves, a line is drawn. Using combinations of the four movement commands (forward, back, left, and right) drawings and patterns can be created.

Some versions of LOGO ac-

tually make use of a robotic 'turtle' which is interfaced to a computer. LOGO commands are transmitted to the turtle, creating shapes on a sheet of paper placed on the floor. More often, the monitor or TV screen forms the paper and an electronic turtle is drawn and is moved, on the screen. This is how my version works.

RUN the program and you'll see the turtle on the screen. It is represented by the '^'; the

point is its head and this indicates the direction of the turtle. You'll see that the turtle's starting point is at the centre of the screen, heading directly up the screen.

At the bottom of the screen you'll see 'W;' and a flashing cursor. This tells you that the computer is waiting for you to enter a command. At this stage, this LOGO program will accept only 8 commands as shown in Fig 2. Note that all commands are entered in capital letters (CAPS LOCK mode is automatically set by the program) and for some commands, a two letter abbreviation can be used instead of the full word. Before you use any command, I'll describe what each one will do.

- HOME This moves the turtle from anywhere on the screen back to its starting position at the centre of the screen, heading directly up the screen.
- DRAW This clears the screen, then moves the turtle HOME.
- FORWARD The turtle is moved forward a specified amount. To complete the command, you have to tell the turtle how far to move forward, eg FORWARD 20 (or FD 20). The unit of distance is one pixel; remember, the screen is made up 256 pixels across, and 176 down.
- BACK The turtle is turned head-to-tail, then moved in the same way as FORWARD (eg BACK 25).
- LEFT The turtle's head remains in the same place but its body will swivel so that its direction rotates to the left. You have to tell the turtle how far to turn. As do FORWARD and BACK, the command LEFT requires a number added to it to complete the instruction, to tell the turtle how much to turn. This number is the angle of turn in degrees. If you've forgotten that 90 degrees makes a right angle, then use Fig 3 as a guide when using the LEFT (or RIGHT) command. Angles should be whole numbers between 0 and 360.
- RIGHT This is the same principle as LEFT, but, of course, the turtle turns right instead of left.
- PENUP This command raises the pen from the paper so that the turtle can be moved without a line being drawn.
- PENDOWN The pen is placed on the paper.

Now, lets try a few examples. Type in:

FORWARD 40 (or FD 40), and press enter. You'll see the turtle disappear, a line 40 pixels long will be drawn, and then the turtle reappears. To enable the program to work as quickly as possible, our turtle will always disappear when in motion and will only reappear when all instructions are complete and the 'W;' symbol comes back on the screen. Also, notice that when the program starts, the pen is in the down position, enabling a line to be drawn.

Now, lets turn the turtle 90° to the right. Type in:

RIGHT 90 (or RT 90) and press enter.

Then to move forward again:

FD 40.

If you continued entering alternatively RT 90 and FD 40, you would end up with a square. As it is cumbersome to type in one command at a time, LOGO allows you to string commands together. Let's see how. First, clear the screen, and reset the turtle using the command DRAW, then enter:

FD 40 RT 90 FD 40 RT 90 FD 40 RT 90 FD 40 RT 90 and enter.

Leave a single space between each command and number. This, again, draws a square. You may have noticed that we are

COMMAND

TWO LETTER ABBREVIATION

DRAW  
HOME  
FORWARD  
BACK  
LEFT  
RIGHT  
PENUP  
PENDOWN

FD  
BK  
LT  
RT  
PU  
PD

Fig. 2. The LOGO commands featured in this issue

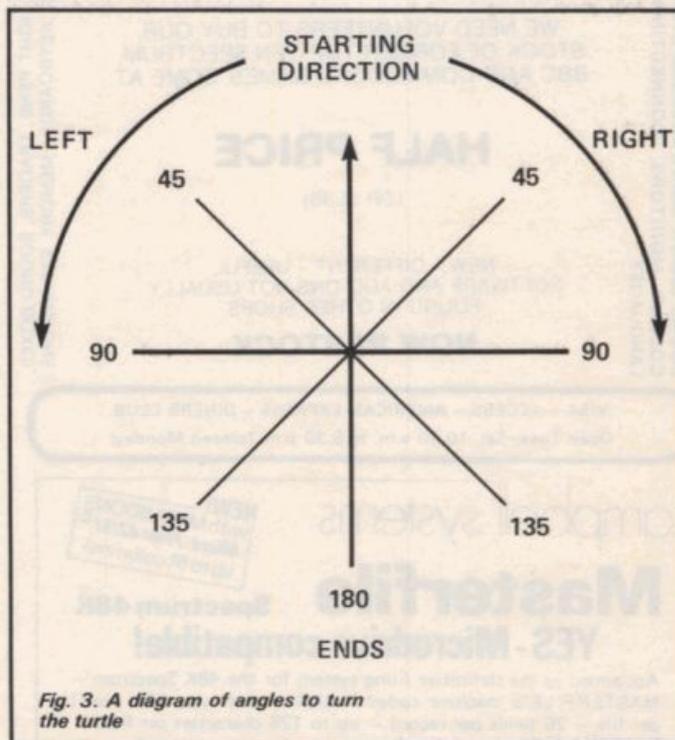

Fig. 3. A diagram of angles to turn the turtle

repeating the same two commands four times. Fortunately, LOGO allows repetition of commands to be simplified and it's one of the things I'll be dealing with next time.

What should happen if the turtle goes off the screen? Let's find out. Clear the screen with DRAW, then enter:

RT 10 FD 2000.

The turtle is turned slightly to right, then moves forward 2000 pixels. As it disappears off the edge of the screen, our turtle reappears on the other side. This feature is called wrap. It is useful to draw special patterns and means that you won't get an error message if you accidentally go off the edge of the screen.

Another feature of this LOGO program is that the specified number used by FORWARD, BACK, RIGHT and LEFT can be

replaced by a random number. As an example, try:

FD RANDOM 50

The turtle will move forward by an amount somewhere between 0 and 50.

That's enough of the theory of LOGO for this time. Try making up some drawings, patterns, or shapes for yourself. The program has an error trapping routine, so if you make a mistake, you should get a reasonably friendly error message. In the next issue of ZXC, you'll notice a quantum leap in the power of this LOGO translator.

# REGARDEZ

LANGUAGE LEARNING AIDS FOR FRENCH, GERMAN & SPANISH

FOR BBC(32K) · ELECTRON SPECTRUM (48K)

As used in numerous schools and colleges these programs provide a highly successful aid to modern language learning. Each cassette contains a sophisticated control program and a comprehensive series of vocabulary lessons which can be used in a variety of self-paced learning and test modes. Words, phrases etc are displayed with all necessary accents and special characters, different colours are used for masculine, feminine and neuter words to assist gender learning.

The programs are suitable for beginners, 0-level and beyond as simple commands enable new lessons in vocabulary or grammar to be created by the user, edited as required, then permanently saved for later use. Invaluable for homework and exam revision!

Two cassettes are available for each language, together these contain a vocabulary of thousands of words; Level A provides 16 lessons in general subjects; Level B provides a further 16 lessons including adjectives, adverbs and fully conjugated verb lists.

## Drawmaster Spectrum 48K

DRAWMASTER is the ultimate DRAW AND PAINT utility for the Spectrum - compose your own HI-RES pictures with 8 direction 2 speed hand draw keys - fast fill - enlarge/reduce facility for all or part of the screen plus all the Spectrum colours and attributes - over 50 commands in all.

With detailed instructions £6.95

## DLAN DISPLAY LANGUAGE Spectrum 16/48K

DLAN ('dee-lan') DISPLAY LANGUAGE is a powerful machine coded interpreter for generating DYNAMIC TEXTUAL DISPLAYS for advertising and education - all commands are single letter or symbol - with 4-way scroll of 11 type-faces through user-defined windows.

With detailed manual £7.95

All programs mailed 1st class by return.  
Prices include VAT and postage within Europe. SAE for full list.

# Zappo

Use this program by E French of Lancaster to get super sounds for your games.

Anyone who has tried to write their own games on the Spectrum will have found the BEEP command very limiting and many people have bought add-ons to raise the Spectrum's sound to that of the BBC micro in versatility as well as volume. However, for most people £20-£30 is a high price for such a simple task.

Fortunately, there is a compromise solution which uses software rather than hardware to achieve special effect sounds such as explosions at negligible cost.

There is, of course, the inevitable snag. Unlike the better add-ons, execution of the program stops while the sound is being generated. However, the program does contain three pre-defined sounds:

- 1) A Zap
- 2) A Machine gun shot
- 3) An Explosion.

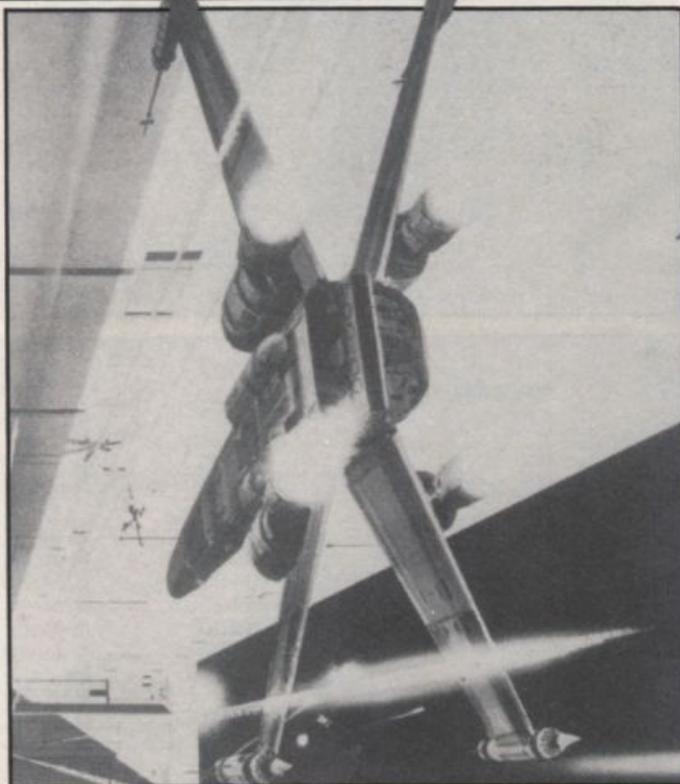

As it stands the program occupies ¼ KByte which is normally reserved for the printer so as to conserve memory.

The program is in six parts: the first contains two subroutines which can produce white noise (for gunshots and explosions) or tones (for sirens and zaps). The second, third and fourth parts produce the pre-defined sounds. The two remaining routines play the first with white noise (a kind of rushing sound) and the other with tones.

## User defined sounds

The BEEP command produces a neat regular waveform reminiscent of an electric organ which is not very useful to the games programmer.

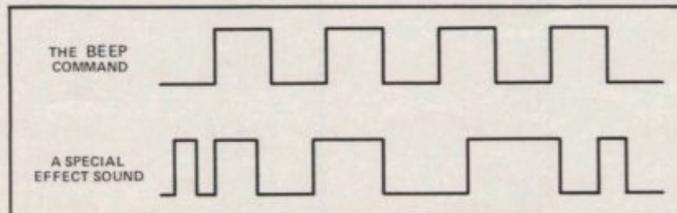

Special effect sounds are not so simple and require more information in order to be produced. With a BEEP command it is necessary to provide only two figures or parameters: the

first indicates how long you want the sound to last for and the second indicates the pitch of the resultant sound. A special effect sound can best be thought of as a succession of BEEPs one after another:

are to be produced, successive BEEPs will not suffice. Such sounds are produced with white noise which on its own gives a rushing noise.

Now to the practicalities: THERE IS NO NEED FOR THE

However, special effect sounds cannot be produced by the BASIC BEEP command because the interval between individual BEEPs is too great.

This, thankfully, is not an insurmountable problem, because by using machine code routines the delay between BEEPs becomes negligible.

If sounds such as explosions

USER TO KNOW ANYTHING ABOUT MACHINE CODE. All that is required is to follow these instructions:

1. Type in listing one.
2. RUN it.
3. Type SAVE 'Sounds' CODE 23296,256 & enter.
4. Rewind the tape and

VERIFY''''CODE & enter.

5. If you get the message "Tape loading error" then go to stage 3.
6. The BASIC program has now done its job and it is safe to NEW. To recover the machine code routine use: LOAD '''' CODE.

If you have an assembler you should type in listing 2, assemble it and SAVE the code.

The next thing you will want to do is to listen to your new sounds. To do this simply enter the following:

- ```
10 PAUSE 0: REM waits for keypress
20 LET (an unused variable)=USR 23375; REM make a ZAP
30 GO TO 10: REM do it again
```

When this is RUN it turns your Spectrum into a ray gun. By changing line 20 to:

- ```
20 LET (an unused variable)=USR 23386
```

Now your Spectrum is a machine gun. And making line 20 read:

- ```
20 LET (an unused variable)=USR 23398
```

Now whenever you press a key your Spectrum happily explodes!

So to sum up:

- ```
LET (an unused variable)=USR 23375 produces a Zap.
LET (an unused variable)=USR 23386 produces a machine gun shot.
LET (an unused variable)=USR 23398 produces an explosion.
```

The more skilful will want more than just these three and impressive sounds can be custom made. However, take great care: if you go wrong on this section you might have to wait several days before your machine has finished your sound.

So, to produce your own effects you must tell the computer the length and pitch of the eight beeps which make up the sound you want to produce. You must also tell it how many times to play each beep. Thus, for each beep there are three parameters: length, pitch and the number of times you want each beep to be produc-

ed. So in total there are 24 parameters. The procedure to tell these to the computer is:

```

10 DATA (length of 1st),
    (pitch of 1st),(No. of
    times), (length of
    2nd),(pitch of 2nd),
    (No. of times).... up to
    .... (length of
    8th),(pitch of 8th),
    (No. of times)
20 FOR a=23300 TO
    23323:READ d:POKE
    a,d: NEXT a
    
```

The length of each beep is a number from 1 to 255 and the longest note is 0.

The pitch of each beep is a number from 1 to 255 where 1 is the highest pitch (but 0 is the lowest).

Similarly the multiplier (how many times) goes from 1 to 255 (again 0 gives 256 cycles).

This program as it stands resides in the printer buffer

which for most people is unused. However, if you enter any of the printer commands: LLIST, LPRINT or COPY then the sound will generate a delay followed by NEW, so take care.

Once you have provided the machine with the data you will need to know how to play the sounds. For this there are two commands:

LET (an unused variable)

=USR 23410  
this will play your sound with tones (an unused variable)=USR 23432  
this will play your sound with white noise.

Another slight snag encountered with this routine is that when the sounds are produced the border goes white. If you use an assembler to write

in this program you can change it to suit your needs.

## Hints

It is a wise idea to make the sounds last for as short as possible because it is then less obvious that the program stops to produce the sound. Also, the volume of the sounds is increased by resting the machine on a hard flat surface such as a desk or table.

# zip!

**A shorter and less powerful program than Zappo, but easy to use and very effective. From David Mold in Hertfordshire.**

This is a m/c program which produces a much more interesting sound from the Spectrum speaker than its usual 'beep'. It can be called very easily from BASIC and the sound produced can be varied by using DEF FN. The program

the address of the corresponding bytes, the second shows the decimal codes of those bytes and the third shows the Z80 opcodes.

It should be entered to the address 32500 using this short program:

```
10 CLEAR 32499
20 DATA 42,11,92,17,4,0,25,78,25,25,70,58,
72,92,203,47
30 DATA 203,47,203,47,238,16,211,254,81,
21,32,-3,13,16,-11,201
40 FOR N=1 TO 32: READ a
50 POKE 32499+n,a: NEXT n
```

was written for 16K Spectrum and could easily be run on a 48K model, although the addresses should really be changed to put it higher in memory on the 48K version.

The listing of the m/c is in three columns: the first shows

The code can then be SAV-Ed using:

```
SAVE "beep" CODE
32500,32
```

and when it is required for use with a program — existing or

## Beep Routine

32500	42,11,92	ld hl, (DEFADD)
32503	17,4,0	ld de,4
32506	25	add hl,de
32507	78	ld c,(hl)
32508	25	add hl,de
32509	25	add hl,de
32510	70	ld b,(hl)
32511	58,72,92	ld a,(BORDCR)
32514	203,47	sra a
32516	203,47	sra a
32518	203,47	sra a
*32520	238,16	xor 16
32522	211,254	out (254),a
32524	81	ld d,c
@32525	21	dec d
32526	32,-3	jrnz @
32528	13	dec c
32529	16,-11	djnz,*
32531	201	ret

to be written, it can be loaded from tape thus:

```
CLEAR 32499:LOAD "beep"
CODE
```

and then used in conjunction with the program as described previously.

To call this routine from a program, first

```
DEF FN b(x,y) =USR 32500
```

then, when the beep is required use

```
LET 1 = FN b(N,N)
```

where N,N represents two numbers you can specify which, very broadly, set the duration & pitch respectively. They should both be between 0 & 255 inclusive. Experiment to find the effect of varying the two factors. Also, try

```
POKE 32528,12
```

as a direct command, and experiment further to find its effect.

DRAGON/TANDY-£11.50  
SPECTRUM-£17.25 inclusive

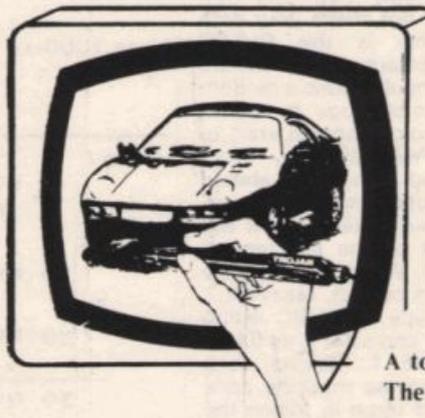

## TOP VALUE LIGHT PEN DRAGON 32/TANDY COLOUR 32K/SPECTRUM 48K

### THE NEW ADVANCED PROGRAM

for the Trojan light pens include the following facilities-

- \* DRAW BOX
- \* DRAW CIRCLE
- \* DRAW LINE
- \* DRAW PICTURES FREEHAND
- \* COLOUR FILL DESIGNATED AREAS
- \* SAVE AND LOAD PICTURES TO AND FROM TAPE
- \* FULL ERASE FACILITIES

All in Hi-Res screen in any of 4 colours for the Dragon/Tandy, and 8 colours for the Spectrum.

- \* DATA ENTRY AND PROCESSING
- \* MENU SELECTION AND CONTROL
- \* GAMES PLAYING

This is a first class program which gives hints and tips on how to write programs for the pen. Ideal for many educational uses.

A top quality pen plus a first-class program. The best value pen package available.

# Life and death

It's the meaning of life explained by John Elliot from Gloucester.

As many people who own a computer will know, Life is a simple algorithm for producing evolving patterns of cells. A grid is seeded with cells and the computer calculates and displays the growth of the colony by following simple rules; any cell which has two or three neighbours will survive, all others will die; any space which has three live neighbours will contain a live cell in the next generation.

This surprisingly simple set of rules can result in amazingly complex and beautiful patterns. These may evolve continuously, die away or become static, depending on the starting conditions.

Spectrum owners will have received a cassette from Sinclair which includes a version of Life. This is a very simple version which allows a simple programmed start colony which is then evolved continuously. Though this program does demonstrate the idea, it has a number of shortcomings which detract from the possibilities of the algorithm. In order to show the real appeal of Life, an implementation should show the following features:

- 1 It should be possible to have a random starting colony.
- 2 With a square grid, the colony breaks up when it reaches the edge. It should therefore provide a "wrapped round" screen which allows the pattern to 'fall' off one edge but reappear on the opposite edge. In this way moving patterns can be seen.
- 3 It should be possible to exit from the routine to change the positions of cells when required and then to re-enter and continue the evolution.
- 4 The routine must be fast so that the screen display does not become boring.

The Sinclair version is lacking in several of these respects so

this program was written which incorporates these features.

## Program RUNdown

The program was written in two sections; a BASIC controlling section and 408 bytes of machine code to carry out the calculations and handle the screen display.

The machine code is fully listed in Assembly for those interested, but the main sections are listed here in the order of execution rather than the order in memory.

## Entering the program

First type in the loader shown in listing 2 and *save it!* Now run it (it takes about 20 seconds to load all the data into memory). If you then type RANDOMIZE USR 30351 the screen should clear and turn yellow. If not check your data lines. This is the CLEAR routine. Entering RANDOMIZE 30088 should cause a random generation of 'bugs' to appear and the colony should start to evolve. Press any key other than 1 and 2 and there should be no pause between generations. Pressing keys 1 or 2 will break out of the program at this stage. When you are sure the data is correct, resave it.

Now type in BASIC listing (listing 1) and save it as SAVE "life" LINE 1. Having done this, reload the machine code loader and rerun it. When the prompt appears this time, save directly after the BASIC program. You should now have the BASIC "life" on tape, followed by the code. Now load "life". It will run automatically, load the machine code and display the instructions.

This is the machine code program:

- 1 CLEAR (address 30351) This section sets up the screen by printing a whole screenful of 'bugs' in the same ink and paper colour. This has the effect of clearing the screen. A jump is then made to RAND for a random start or back to BASIC for a programmed start.
- 2 RAND (address 30097) This section steps through the ATTR file and, on the basis of a randomly generated number, changes the ink colour of about 30% of the positions so that the pre-printed bugs appear.
- 3 DUMP (address 30138) This then dumps the contents of the ATTR file into memory so that the new generation can be calculated.
- 4 PROG (address 30149) This is the main part of the program. It single steps through the dump, checking each position for the new generation and then loading the appropriate position in the ATTR file with either no cell (ink and paper the same) or cell (ink and paper different). The SOUND routine at 30398 is called at each cell position. This can be turned off by POKEing 30398,201 and turned back on by POKEing 30398,197.
- 5 KBDCHECK (address 30279) This causes a pause of about two seconds at the end of each generation and checks for a keypress. If key 1 has been pressed it returns to the BASIC menu. If key 2 has been pressed, control returns to the BASIC screen alter routine which allows you to change the composition of the colony. If there is no key press the program continues with the next generation. If any other key is pressed the program continues with no pause at all.
- 6 TABLE (address 30000) This table contains the data required to calculate the displacements within the dump of the eight positions surrounding each cell. It is this data which results in the 'wrap around' screen effect.

This is the small BASIC controlling program:

- |                 |   |
|-----------------|---|
| Lines 1-2       | Clear space for the machine code and then load it into memory.  |
| Lines 3-140     | Set up screen colours and print instructions and menu.  |
| Lines 150-160   | Verifies input from keyboard.   |
| Line 170        | Runs machine code with random start.  |
| Line 180        | Terminates program.   |
| Line 190        | Runs CLEAR routine to set up screen for programmed start.   |
| Lines 200-620   | Prints cursor in the middle of screen and prompts for input. The cursor keys will move the cursor around the screen. Key 4 will enter a 'bug' at the current position. Key 9 will erase the bug at the current position. Key 3 will return to the machine code and continue evolving the colony. It is this section that control passes to from the machine code when key 2 is pressed. |
| Lines 1000-1010 | These two subroutines set up the screen for printing to the bottom two lines. It is important not to break out while instructions are displayed here as this will cause a crash.  |

To date, Atari's most astonishing game is Pole Position... If you are only going to buy one game, then this is the one you should get.

COMPUTER & VIDEO GAMES.

...Pole Position gives a very strong sense of speed as you hurtle round the track. The super-realism of the three-dimensional effect adds a lot to the game. It is a great graphics demo.

PRACTICAL COMPUTING.

Brilliant!

WHICH MICRO? AND SOFTWARE REVIEW.

...a terrific version of the arcade motor racing game...graphics are superb...sound, too is very good as brakes screech and engines rev-up.

PERSONAL COMPUTER GAMES.

Exciting, exhilarating, excellent, Pole Position takes the lead as the best Atari race game around.

PERSONAL COMPUTER NEWS.

# Escape from Omnicron

What can we say?

Sean Morley of Country Mayo challenges you to escape or die in this exciting ZX81 game.

We're overwhelmed. Though we should just add that with Atarisoft, you can now play Pole Position\* on the Commodore 64, BBC and Spectrum computers, as well as on all Atari® systems. Oh, and we're giving away free a Grand Prix kit and full colour wall chart with every game.

**POLE POSITION**  
from **ATARISOFT™**

# Escape from Omicron

**Sean Morley of County Mayo challenges you to escape or die in this exciting ZX81 game.**

The planet of Omicron, graveyard of many fearless space explorers, is about to claim another victim — YOU.

However, you have one last chance to survive — a shuttle has been sent to rescue you, all you have to do is reach it. It has landed at the opposite edge of a rocky plain that you will have to cross, so you must leave the safety of your cave and set off.

This would be an easy task were it not for the savage Crag who will give chase as soon as he sees you. You must, of course, go around the rocks — inverse Xs (these are in line 20 of the listing and have been listed as "x") — but

beware! Crag can chew his way through them!

To guide your man, "\*" use the cursor keys 5,6,7 and 8. Good Luck.

### Variables

- A Crag's vertical position.
- B Crag's horizontal position.
- X Your vertical position.
- Y Your horizontal position.
- L Level of difficulty.
- A\$ Key depressed.

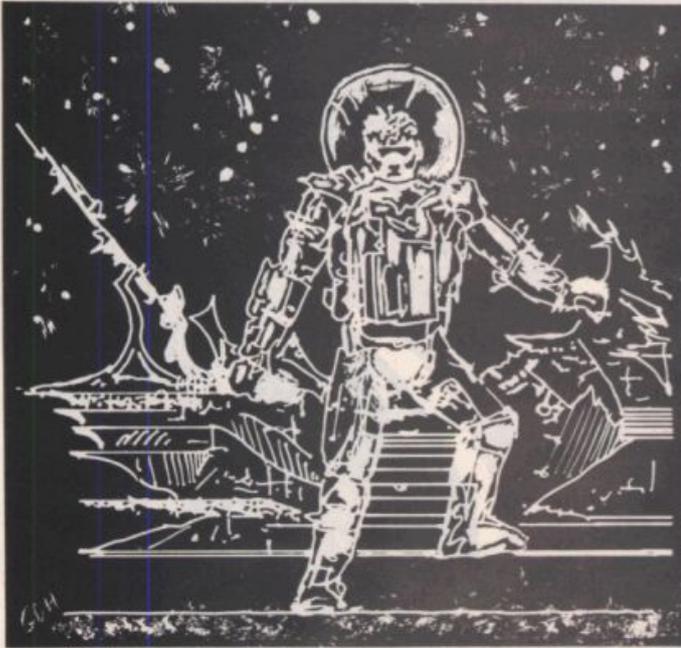

### Graphics

- In line 20 rocks are represented by inverse Xs.
- In line 55 the shuttle is represented by a graphic Q and a graphic W.

### How it runs

- 4 Goes to instruction routine.
- 5 Sets levels of difficulty.
- 6-30 Draws rocks at random positions.
- 31 Clears rocks printed around you before you start.
- 40-50 Initialises variables which hold your position.
- 55 Prints shuttle.
- 60-70 Initialises variables which hold Crag's position.
- 80 Tests for key depression.

- 81 Checks to see if you were eaten by the Crag.
- 82 Reduces Crag's movement depending on level of difficulty.
- 85-87 Calculates Crag's new position.
- 90-95 Calculates your new position.
- 100-110 PEEKS your position to make sure it's empty. If there is a rock there your move is cancelled. Cancels your move from lines 100-110.
- 120-130 Erases you.
- 134 Erases Crag.
- 135 Prints you in original position after a cancelled move.
- 136 Returns to line 80.
- 137 Prints you in your new position.
- 140 Prints a space behind you depending on which way you moved.
- 150 Checks to see if the Crag got you.
- 153 Blanks out you and Crag.
- 155-156 Goes back to line 80.
- 160 Prints end routine after you have been eaten by the Crag.
- 1000-1010 Checks to see if Y or N was pressed for new game.
- 1020-1030 Prints end routine after you have reached the shuttle.
- 2000-2020 Checks to see if Y or N was pressed for new game.
- 2030-2050 Prints instructions.
- 4000-4020 Inputs level of difficulty and checks to see that it is between 3 and 10.
- 4030-4055 Waits for 2 seconds.
- 4065 Waits for key to be pressed before continuing game.
- 4070 Clears the screen.
- 4080 Returns to game.
- 4090

# Can you meet Laserwarp's infinite Challenge?

Be a real game lord – imagine the quest for the ultimate high score!

At last – a real challenge for the arcade ace: Laserwarp, the most exciting arcade-style game around, in full, high-res graphics. It's got everything – fight your way through the ramships, space mines, homing droids, hyperspace chickens, interstellar pogos, and more, till you challenge the Master. Can you beat him? Can anybody beat him? Comes complete with Hall of Fame, coded verifiable high score – send yours in and see if you can win the £100 Mikro-Gen are offering every month (full details in instructions)

High scorers names will be published in a Hall of Fame in the computer press – and they will be invited to join in a Battle of the Champions.

NB – If you have the earlier version of Laserwarp, Mikro-Gen will replace it with the new version – FREE!

**£100**  
EACH & EVERY MONTH  
for Laserwarp  
highest score!

FOR 48K SPECTRUM

## \* Genesis II \* \*

the adventure game that understands plain English!

The colony ship Genesis II has been hijacked by space pirates – and you're the only crewman left! Only you can save the cargo – an entire forest, full of animals, destined to populate a new world. This exciting adventure game has a vocabulary of nearly 300 words, avoiding that frustrating search for the precise word command.

- ★ Nearly 100 different locations
- ★ Over 60 objects
- ★ 100% machine code
- ★ Over 500 possible actions

\* For 48K Spectrum  
**£6.95**

Just part of Mikro-Gen's great range – look out for Paradroids, Mad Martha II, Cruise Attack, Land of Sagan, Galakzions, Deffendar and many others. Available from WH Smith, Co-op, Boots, Menzies & other leading retailers, or direct from Mikro-Gen (Please make cheque/PO payable to Mikro-Gen & add 40p post & packing)

**Patrick Cain gives us his thoughts on some of the latest books available for the Sinclair user.**

## Using Your Home Computer — Garth W P Davies

It was an enquiry from a reader that brought this book to my attention: there aren't many books available for practical computer applications in the home. A short time later I came across *Using Your Home Computer*: the subtitle, *Practical Projects for the Micro Owner*, suggested that this might be a book that could fill the gap. Both Mr Davies and the publishers, MacMillan Press, might well be on to a good thing here, I couldn't wait to find out what uses all we frustrated serious applications people could be putting our minds to around the home.

On the principle that if you give a man a fish you feed him for a day but teach a man to fish and you feed him forever — Garth Davies goes further than the titles suggest and attempts to lay guidelines and establish a good working procedure for designing a variety of practical projects. To do this he can draw on his extensive commercial background in systems analysis. In fact, if this book teaches anything then it is how to set about analysing problems. The theory then is that having acquired a method of breaking down possible tasks to identify the requirements, the solving will be so much simpler and all that really is needed to make full use of your home computer is a handful of clever ideas. Without any doubt this analytical approach has proved itself well in business.

Fortunately, the text does not burden readers with theoretical planning models or jargon terms of business use, but discusses each topic with reference to realistic home examples. By adopting this method the author is able to explain the logic and highlight pitfalls with tangible examples. The result is a well written text that clearly explains the technique. Although I do not think a Christmas card list compiler (the example used in the discussion) is a terrific idea, it is

an effective example.

Later chapters offer a further selection of projects, in fact, a total of 23 topics range from a diet plan, recipes and menus, football pools forecasting to examination questions and mortgage repayments. Each project specification follows the theory already discussed. Readers who closely follow the specifications in their own projects will find themselves with the largest part of the work already done and well on the way to completing the rest.

At no point in *Using Your Home Computer* does any computer code appear: all project suggested could be applied to any machine, given that sufficient memory is available. It follows then that readers are expected to be capable of coding from the specifications arrived at, but that should not prove too difficult. The main difficulty will lie in finding worthwhile uses for your home computer. I am not entirely convinced that many of the twenty four examples included within the paperback's eighty pages fall into that category.

Whether this book will be a real aid to you will depend on the ideas you have for using your computer around the home. There is little doubt that a practical method for examining your ideas and analysing the problem to produce a workable project specification can be learned, professional systems analysts will confirm that, this book can teach these things well. Perhaps some further examination would show that few things in the domestic environment require such effort.

*Using Your Home Computer* is written by Garth W P Davies and published by MacMillan Press. ISBN 0 333 352173.

## Creating Adventure Programs on Your Computer — Andrew Nelson

Have you noticed the new brand

of superhuman that is around these days? When rising unemployment, high cholesterol levels and the likelihood of overexposure to the Olympic Games are enough for most of us, there are those of rare good sense, who, without regard to witches, ogres, trolls or their brains seek excitement in the world of adventure games. Now for those who have been gifted with more than their fair share of superhuman powers, there is *Creating Adventure Programs on Your Computer*, an Interface Publication written by Andrew Nelson: Superheroes read on.

The book itself is quite an adventure. At times I had to rely on my own superhuman skills to fathom it out. An exciting battle with the binder notes followed by skirmishes with the pages that lurked within failed to reveal for which particular computer adventures might be created, although, to be fair, the text is very general and the program listings, which were in BASIC, could easily be adapted to suit any BASIC dialect. Equally mysterious was the price; although I'm sure there must be one, there was no evidence of such, which makes it a bit tricky to judge whether the soft back and 236 pages between represent good value.

Adventure games represent a substantial proportion of the software available for home micros, while books on their creation are something of a rarity. It was refreshing to discover a text removed from the run of the mill '100 Imitations Of Your Favourite Arcade Games' type that are in such great abundance. Having recognised some uncharted or unwritten territory, has Andrew Nelson been able to set his mark on the ground he pioneers? Will the reader, as promised on the binder notes, "soon be creating magnificent Adventure Programs"; Without leading you a merry dance or on a wild goose adventure the short answer is No. Well, maybe.

If the type of adventure you seek is the picture sort, then go no further for this book is not intended to offer guidance on

graphics. Andrew Nelson's adventures are word based and rely on you to draw your own pictures. That is no bad thing for it means that the scope of the adventure can be greater than one that was restricted by graphics. It also means that the design of the game is significantly more simple and can easily be discussed in full within the book.

While any adventure game will be judged for its individuality, it is the effectiveness of its design structure — common to all adventure games — that makes it reliable. In the eighteen months that Andrew Nelson has spent 'playing, devising and programming' adventure games he has learned well the importance of structure and devised his own effective method which he introduces in the book. The three adventure programs contained, 'Werewolves and Wanderer', 'The Aftermath of the Asmovian Disaster' and 'The Citadel of Pershu' are examples of the application of his design. The text uses these to show how from an initial idea a full adventure can be built. From laying the floor plan to developing handling techniques to a final elaboration of the game, reference is made to one of these examples. By following the author's guidelines, a systematic approach to adventure games can be developed and applied to your own efforts. No book can guarantee that it will enable you to create 'Magnificent Adventure Games', but many abstract concepts have been explained and once attained the reader is empowered to create a reliable adventure base.

Unfortunately, while it was possible to recognise and appreciate Nelson's technique and indeed to learn from it well for it is not too demanding or complicated, it was difficult to follow his train of thought and I found that several readings and a fair deal of intuitive guess work were required. "All I can do is ask you to proceed on trust" is to me a rather lame request, better perhaps if the author had spent a few more months planning the book as carefully as he

had studied adventure games. I wonder if the publishers were aware of the deficiency and the need for repeated reading and made allowances for such by including pages 189-302 twice.)

Achieving magnificence is an individual thing. A magnificent adventure program depends on a reliable structure and the inventiveness of the creator; that inventiveness depends on the creator's background knowledge. Chapter 21, 'Adding Excitement', offers several pointers to features of a good game and sources of information and background. If the reader applies the technique offered by the author, he can create an adventure game; by heeding the advice on characteristics of good games, the reader will be in a position to create a better program. These are the things that this book can teach. What a pity the text is at times unclear for all the right information is included. Programmers with a working command of BASIC will understand any programming techniques used, maybe only those with adventure experience will succeed in unravelling the text.

*Creating Adventure Programs On Your Computer* by Andrew Nelson is priced at £4.95 and published by Interface. ISBN 0907563 36 8:

### First steps in BASIC — Susan Curran and Roy Curnow

The credits of husband and wife team, Susan Curran and Roy Curnow read like the glittering prizes of the commercial and personal computing world. The computer titles they have jointly and individually been responsible for total far too many to include here. Susan is a specialist in User Applications of Micro Computers as well as a director of a consultancy company. Roy squeezes being a Professor at City University, London in alongside with being an advisor to several multinationals, an IT Consultant, an author and a company director! He was also the man the BBC made responsible for structuring and developing the 'Computer Program' television series. Their pedigree alone makes their current book, 'First Steps in Basic', a Windward publication, well worthy of some attention.

As any new programmer will agonisingly testify, some computer manuals are precise to the point of being sinful; others are simply muddled or remiss. I well

remember my own frustrated attempts at mastering this 'genius level' code and recognising the need for a more patient set of instructions. It is, after all, the manual's job to detail the features of the language as applied to the machine and not to teach programming. Of course, many more resourceful people than I have recognised this need, resulting in a crock of books of varying standard, aimed at the novice computer programmer. As one might expect, this one stands out from the crowd.

It is fair criticism, I think, to say that it might have been better if the authors had chosen to devote the book to one type of computer entirely. Instead, a non-specific text using 'Micro soft BASIC' as an example caters for most computer types. An appendix details how the dialect used varies from that run on other machines, including the

Spectrum. But far outweighing any criticism must be the credit due to a well planned and thoughtful book that is aware of those 'early days' pitfalls.

The reader is not expected to have any previous knowledge of computing and no more is required of him than that he has connected the various wires and switched on. In fact, allowances have been made for readers who may as yet not be in possession of a computer, although why anyone should want to learn to program without one is beyond me. It is my opinion that a lot of heads are banged against walls as novice programmers toil with a whole new confusing world, unable to identify and recognise the many constituent parts. An introductory chapter that outlines the computer, its requirements and functions, the basic language — the reason for it and its applications and more key elements of computing

should help prevent future damage to both heads and walls.

Chapter One, 'Writing on the Screen' deals with the PRINT statement in its various forms, writing messages on the screen, positioning screen output and simple arithmetic; introducing and explaining on the way strings expressions, arguments and variables. Each topic is discussed in straightforward text, highlighting each point or instruction with an example and supporting screen illustration. Not, of course, a new approach to this subject but one that works well because the authors have identified likely areas of difficulty and developed the text accordingly. (NB: page 17: don't get too worried if your computer gives a different answer to the cosine of 43, unless the laws of mathematics have changed this is a printers error: at least that's my angle.)

Subsequent chapters build on the knowledge and expertise that has been built up in the first few pages. By chapter 2 this expertise is put to good use in writing short programs, reinforcing the theory learned so far while introducing new elements of the computer's ability, eg 'loading' and 'saving'. As throughout, the text is straightforward and unassuming, expanding and elaborating ideas to give a fuller awareness of the topic. Supporting examples are fun and interesting enough to try, while again clear illustrations compliment and highlight the text.

Further chapters take task in 'loops and branches', 'editing and debugging' and 'handling data' until a comprehensive knowledge of BASIC statements and familiarity with their applications is gained. Chapter 7, 'Writing Longer Programs', brings these statements together and sets guidelines for planning and writing more involved programs. On conclusion the reader should be familiar with BASIC statements and aware of good program structure. At this point it is necessary to develop the skills learned, a job that is beyond the scope of this book, and readers are directed to further reading material. New programmers will find that in investigation of subsequent texts they have a firm foundation as a starting point for developing their programming skills.

*First Steps In BASIC* by Susan Curran and Roy Curnow is part of the Clear and Simple Home Computing Series published by Windward and costs £4.95. ISBN 0 7112 0333 4

CheetahSoft

Soft we're not

FOR SPECTRUM 48K

# CONQUEST

**CONQUEST** A tactical game which even veteran players will find both challenging and rewarding.

Mediterranean Europe is divided into grid squares. Your aim, as Emperor, is to gain 100 squares of territory as quickly as possible – at the same time dealing with Barbarian counter-attacks, plagues, civil war and rival Emperors.

5 levels of skill, plus a continuous 'Conquest' game where all the difficulty levels are thrown in together.

**3D BAT ATTACK** An all action, 3 dimensional maze game where you gather up blocks of gold, at the same time pitting your wits against vicious vampire bats whose only purpose in life is to locate, hunt and kill you.

4 levels of skill. At each level the game gets faster and more complicated, and the vampires more dangerous.

CheetahSoft

Soft we're not

FOR SPECTRUM 48K

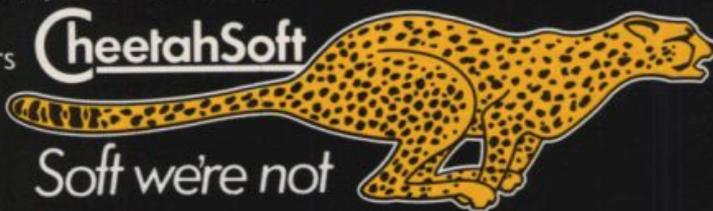

# 3D BAT ATTACK

# AFTER THESE, THE REST IS KIDS STUFF.

Are you ready for CheetahSoft?  
There's only one way to find out.  
But be warned: these vampire bats know a good meal when they see one. And our friend with the scythe has had years of experience ...

CheetahSoft

Soft we're not

So don't play unless you're ready to play the game for real. Because you'll find there's one sure thing about CheetahSoft: Soft we're not.

£6.95 at all good stores.

# Light Screen Designer

We welcome back Toni Baker with the first in another superb series on the delights of machine code.

Well, hello everyone, and welcome to the first in a brand new series of articles. Throughout this series I intend to list and explain one program — only one, mind — not one per issue but one program altogether throughout the series! Why? Well it's a bit long, that's all.

One problem you get with long programs, I've found, is that lots of errors seem to crop up in the listing, so we'll have to see what we can do about that. For those of you who've got the word processor program, WordSheep, from the Feb/Mar issue, but haven't managed to get it going yet, here are the corrections you need to make:

Page 45:	In COMPRESS:	EDB0 should read EDBO
	In ADJUST:	010060 should read 016000
Page 46:	In A_RANDOM:	20FD should read 30FD
	In TRANSFER_U:	013080 should read 010380
	In WIPE:	23 should read 13
Page 47:	In DELETE	MISSING INSTRUCTION: C9 (RET) from end of subroutine.
Page 48:	IN PROCESS:	2100EA should read 21COEA
Page 49:	In REFORM:	MISSING INSTRUCTION: 09 (ADD HL,BC) between 2AAF5C and 012000

Anyway — back to the present. Light Screen Designer is for people who've got 48K knocking around inside their Spectrum. If you've only got 16K then bad luck — you can't use this program — not because it isn't relocatable, but because you just haven't got enough memory — this really is a long program!

It's a program to help you design pictures on the screen, a grand artwork program incorporating just about every feature you could possibly desire to help you draw pictures. You can do straight lines and curves and various geometrical shapes. In fact the program will even do the colouring in for you once you've drawn the outline — in any colour too!

If you hunt around these pages you'll soon come across a picture labelled Fig. 1. You have to MAKE one of these. It's a keyboard overlay and tells you what each of the keys do when the program is running. To make an overlay, get a piece of card the same size as a Spectrum keyboard, cut holes out for the keys to go through, and write all the appropriate words above the holes. Alternatively, if you can't be bothered to do all that, just keep a copy of Fig. 1 handy by your Spectrum when running the program and refer to it as and when you need to. I shall explain what each key actually does later on, when we actually get down to writing the individual parts.

Let's get down to it then shall we? The memory used by the program starts at address C000, although the program itself doesn't actually start until we reach address DB42, so here's what's what:

C000-D7FF	DFC	Display File Copy — used to record pictures.
D800-DAFF	AFC	Attributes File Copy — used to record pictures.
DB00-DB41		System Variables used by the program.

You don't have to worry about *any* of this for the time being. Now for some work. The addresses from DB42 to DB8F store a table of subroutine addresses. The table will be called CMD\_\_ADDRS. Since *no* subroutines exist at present then you should, for the time being, set every entry in this table to 0052 (an address in the ROM at which a RET instruction is stored). To do this you must POKE 52h into address DB42, 00 into DB43, 52h into DB44, 00 into DB45, ... and so on up to ...,52h into DB8E and 00 into DB8F. Got all that? Right, now for some more data — a table called INP\_\_TABLE. Feed this in:

59 CE 38 31	INP__TABLE	ORG DB90
80 OD 39 38		DEFM "Y", "N", "*", "8", "1"
37 36 35 34		DEFM "O", "*", "enter", "9", "8"
33 32 31 80		DEFM "7", "6", "5", "4"
		DEFM "3", "2", "1", "O", "*"

It won't make a lot of sense to you at present, but all will become clear in a moment, so don't go away. Note that some of the bytes have 80h added, and so I've marked these with an asterisk in the right hand column. Some more data coming up next, but in a slightly different form. What we have are eighteen messages which will later need to be printed at the bottom of the screen.

Each message is followed by a coded byte which will tell the program if anything needs to be input. To enter this, note that the first column contains the address to which the message is to be written, the second column contains the text of the message which must be loaded character by character from the specified address, and the third column contains one byte of data which must be POKEd immediately after the text of the message (note that this data is given in *hex*).

ADDRESS	TEXT	DATA BYTE
DBA0	Light Screen Designer	80
DBB6	Paint Colour	96
DBC3	WARNING — Screen Memory Wipe	90
DBE0	Store Memory	95
DBED	Recall Memory	95
DBFB	Clear Screen	90
DC08	Number of Radians? <i>space</i>	80
DC1C	Now in Text Mode	80

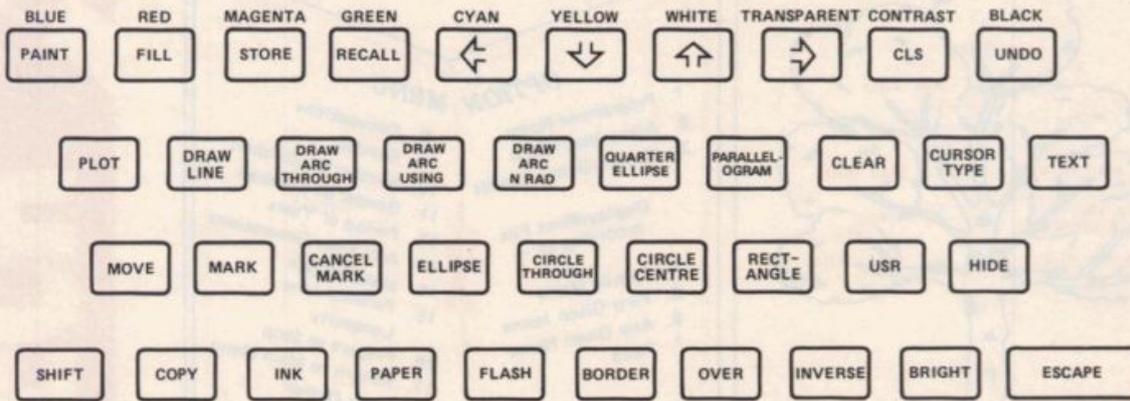

Fig. 1

DC2D	Machine Code Address? space	80
DC44	Copy	90
DC49	Ink Colour	96
DC54	Paper Colour	96
DC61	Flash Status	92
DC6E	Border Colour	98
DC7C	Over Status	9E
DC88	Inverse Status	9E
DC97	Bright Status	92
DCA5	Return to BASIC	90

Now so far I haven't really given you anything useful except a lot of promises for the future, so I'd now like to implement just two subroutines in the program. The techniques involved are quite clever, although not difficult to follow, so I imagine you should be able to learn from them. Firstly, we have a subroutine called GET\_CHR which merely waits for any key other than "CAPS SHIFT" to be pressed, and then returns with DE containing a current keyboard scan.

CD8E02	GET_CHR	ORG DCB5 CALL 028E,KEY_SCAN LD A,E CP 27 JR Z,GET_CHR_2	DE: = keyboard scan. Jump if "caps shift" only pressed.
3C		INC A	
20F5		JR NZ,GET_CHR	Jump unless no keys at all are pressed.
CD8E02	GET_CHR_2	CALL 028E,KEY_SCAN LD A,E CP 27 JR Z,GET_CHR_2	DE: = keyboard scan. Jump if "caps shift" only pressed.
3C	INC A		
28F5		JR Z,GET_CHR_2	Jump if no keys at all pressed.
C9		RET	

Notice that there was not one but two loops in the above routine. The first loop waits *until* either "caps shift" only or no keys at all are pressed, and the second loop then waits for any key or key combination *other* than "caps shift only" or no keys at all. The purpose of having two loops instead of one is that the first loop waits until the human finger is removed from the previous key depression and the second loop waits for a new key. If this were not one you would have an awfully fast "repeat" facility (not desired).

In order to understand the subroutine below, I ought to explain what the data bytes in the message table were all about. 80 means "no input is required", 90 means "input Y or N" (for YES or NO) 92 means "input 0, 1 or 8", 95 means "input any digit or enter", 96 means "input any digit", 98 means "input any digit between 0 and 7", and 9E means "input either 0 or 1".

The subroutine below must be called in a rather special way — CALL MESSAGE/DEFB — where xx is a byte between 01 and 12. The choice of byte determines which message is printed. Here's the subroutine:

AF	MESSAGE	ORG DCCC XOR A	A: = 00
CD0116		CALL 1601,CHAN_OPEN	Use Stream number zero (lower part of screen).
E1		POP HL	HL: = address of data byte.

46		LD B,(HL)	B: = number of message to print.
23		INC HL	HL: = subroutine return address.
E5		PUSH HL	Re-stack return address.
219FDB		LD HL,MESSAGES-1	
7E	ME_SEARCH	LD A,(HL)	
23		INC HL	
FE80		CP 80	
38FA		JR C,ME_SEARCH	Find start of next message.
10F8		DJNZ ME_SEARCH	Search to find appropriate message.
7E	ME_PRINT	LD A,(HL)	A: = next character of message.
23		INC HL	
FE80		CP 80	
C8		RET Z	Return if data byte 80 found.
3003		JR NC,ME_INPUT	Jump if other data byte found.
D7		RST 10	Print character.
18F6		JR ME_PRINT	
6F	ME_INPUT	LD L,A	
26DB		LD H,INP_TABLE high	HL: points to allowed inputs.
3E3F		LD A,"?"	
D7		RST 10	Print a question mark.
E5	ME_I_LOOP	PUSH HL	
CDB5DC		CALL DCB5,GET_CHR	Wait for key to be pressed.
CD1E03		CALL 031E,KEY_TEST	Convert to character code.
E1		POP HL	
FE20		CP 20	
2811		JR Z,ME_EXIT	Jump if "ESCAPE" pressed. (Note that the stack is deliberately unbalanced).
E5		PUSH HL	
4F		LD C,A	C: = character just input.
7E	ME_CHECK	LD A,(HL)	A: = one of the allowed characters.
23		INC HL	
47		LD B,A	
E67F		AND 7F	Disregard bit seven.
B9		CP C	
2807		JR Z,ME_EXIT	Jump if allowed character was input.
CB10		RL B	
30F4		JR NC,ME_CHECK	Jump if there are more characters to check.
E1		POP HL	
18E3		JR ME_I_LOOP	Try again.
E1	ME_EXIT	POP HL	Balance the stack.
C36E0D		JP 0D6E,CLS_LOWER	Clear lower part of screen and return.

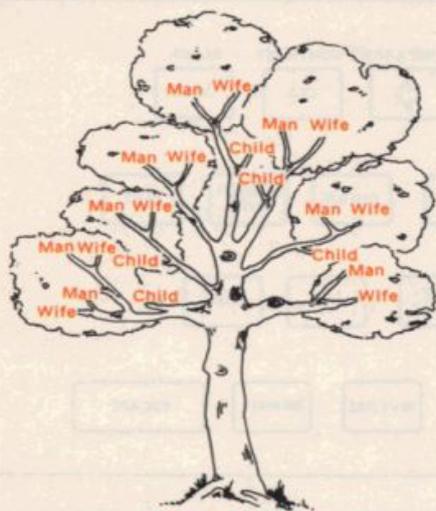

You can test this program out by writing the machine code CALL MESSAGE/DEFB ??/RET to any address and then calling it. If you put a PAUSE 0 instruction after the USR instruction then you will see the message at the bottom of the screen for as long as you need. Notice that "Light Screen Designer", "Number of Radians?" and "Machine Code Address?" will stay on the screen during PAUSE 0, but all the others will have been erased by the machine code as soon as the correct input was made.

In the next installment of this program I shall actually start doing something useful in the way of drawing pictures. Till then, SAVE all the material we've covered so far and we'll add to it with each new installment.

## Joystick and Interface

for Sinclair Spectrum with these features to give you endless hours of enjoyment.

1. Super positive response fire button.
2. Firm suction cups for stable one hand operation.
3. Snug fit hand moulded grip.
4. Additional fire button.
5. Extra long 4 ft lead.

The interface supplied with the Quick Shot <sup>TM</sup> has a two joysticks facility.

The first port simulates 6789 & 0 keys. The second port simulates in [31] command. It will run any Software.

1. Using keys 6, 7, 8, 9 and 0.
2. Having redefinable key function.
3. Using in [31] i.e. Kempston.
4. Any Software you write yourself.

# A New Dimension in Spectrum Hardware

## Light pen

The LIGHT PEN enables you to produce high resolution drawings on your own TV screen simply by plugging into the ear socket of your Spectrum. The controlling software supplied with the light pen has 16 pre-defined instructions. You can change colour (Border, Paper, Ink), draw circles, arcs, boxes, lines and insert text onto the screen at any chosen place, you can also draw freehand. There is a feature to retain the screens and animate. On the 48K Spectrum you can retain 5 screens. You can also use the machine code on its own in your own programs, for selecting out of a menu etc. The LIGHT PEN is supplied with a control interface, to adjust the sensitivity/pen alignment.

£19.95

£22.95

## Keyboard for use with a Spectrum or ZX81

Our cased keyboard has 52 keys, 12 of which form a numeric pad. The 12 keys comprise 1-9 numeric plus full stop and shift keys, all in red, to distinguish from the main keyboard keys which are in grey, the keys contrast with the black case to form a very attractive unit. The case has been designed to take a ZX81 or Spectrum computer. 16K, 32K or 64K can also be fitted to the motherboard inside the case (81 model only). The case is also large enough for other add-ons like the power supply to be fitted, giving a very smart self-contained unit with which other add-ons e.g. printer etc. can still be used. Our ZX Professional keyboard offers more keys and features than any other model in its price range making it the best value keyboard available.

£45.00

## Spectra-Sound

The so-called speaker in your Spectrum is really on a 'buzzer'. With the DK Tronics "SPECTRA SOUND" you can generate fully amplified sound through the speaker on your TV set. SPECTRA SOUND is a very simple but highly effective add-on. This means that you no longer have a faint beep but a highly amplified sound, which can be adjusted with the TV volume control. The SPECTRA SOUND fits compactly and neatly inside the Spectrum case and is connected by three small crocodile clips.

When I completed last month's project I thought perhaps a few lines to tie up the loose ends may be needed in this issue; as it happens, a whole new article is required.

For those deprived of the joy of our last issue, may I just mention that the Editor's Project stemmed from a desire to improve the print quality of our listings. From these humble beginnings a whole avalanche of peripherals descended upon my unwary head.

Being thus deluged, it soon became obvious that I needed somewhere to keep all these items. Having purchased my own portable TV and the Shinwa CP80 printer purely for producing the magazine (Taxman please note!) the pressure from the rest of the family to let them eat on the table now and then was becoming irritating.

### Cabinet member?

After reading many publications, I ordered a computer cabinet from Marcol Cabinets. This arrived four days late but an apology was sent in good time and I had no hard feelings — I'd waited longer for my computer with no apology at all! Marcol have since assured me that the delay problem has been solved. Marcol make four varieties of cabinet priced from £39.99 for a basic open unit to £185.00 for a traditional English style (old fashioned) cabinet with real wood veneer finish. For reasons of price and family harmony I opted for the £79.95 model.

It arrived as a "flat pack" which meant that I had to put it together myself. For someone who equates 'Do it Yourself' with 'First Aid', the future did not bode at all well.

It pleases me to say that after spreading all the pieces out and enlisting the help of the entire Elder household, construction was pretty straightforward, and despite some of the bits being incorrectly labelled, its simple system of screws and blocks meant that it was soon installed.

Constructed of veneered chip, the cabinet is sturdy and looks a lot better than my previous system of spaghetti leads. There is plenty of room for most of my bits and pieces, tapes and books and when I've finished the doors keep it all out of sight. I particularly like the design of the sliding shelf which is just right for sitting comfortably when working. It is a bit on the large size, — 32.5" high, 36" wide, 16.75" deep but holds all my bits. The picture will give you a better idea of its looks

# Seriously now. . .

## More useful devices for the Spectrum and ZX81.

than my descriptive powers.

A friend Dave, a DIY fanatic, produced a cabinet for his computer at a cost of about £17 but for anyone not into DIY I'd recommend this as a unit for your consideration.

### Spectrum Interfaces

1 Morex Peripherals supplied me with their unit for testing complete with detached connector cable. This unit is different from the others as it has an RS232 interface as well as the Centronics that I needed.

There are two versions of their driver software V1 and V2; V1 is their standard program and V2 is the new improved all sing-

ing all dancing. . . Well anyway, it's a lot more user friendly and performs many of the setting up functions of an option program. Although still under test and not yet released, I was unable to cause it to crash or malfunction.

The instruction booklet/leaflets supplied were extensive and very detailed, but written for the experienced user rather than the beginner. The information includes all relevant details including pin connections and the interface is compatible with 'professional' programs such as Tasword II, Masterfile etc. As well as having the RS232, this was the only interface to feature a through port so that other units could be added on afterwards.

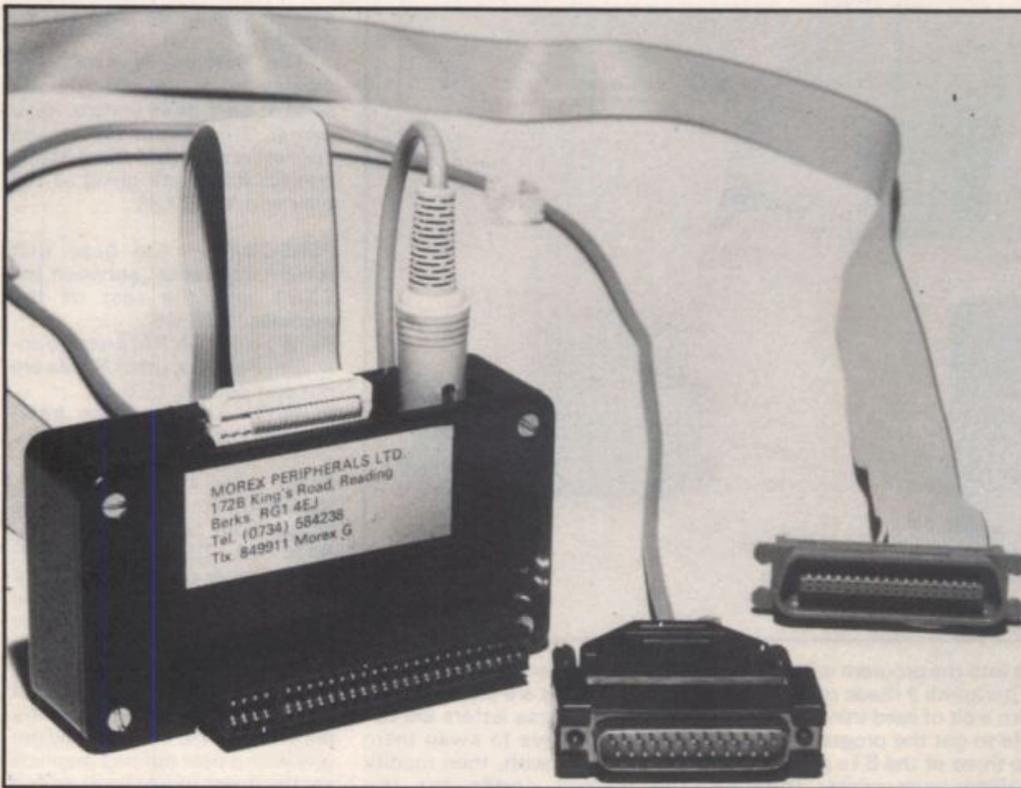

The Morex was the largest of the units that I tried, the case

was roughly cut to accommodate the RS232 socket and the insides fitted loosely. Fitting the ribbon connector caused me a few headaches as I was loathe to use as much force to push it in as it eventually needed.

Now came the test. Software V2 loaded and ran without any problem and the manual gave full instructions for altering the codes which would be sent for UDGs and the Sinclair block graphic set. I had to write a short program to set up these codes to suit my printer, I'm sure this could have been included in the V2 set up program, the default value of all these is 32 — a space.

Working with Tasword II there was no problem, producing screen dumps was easy both

in normal and double size and 80 column listings were simply a case of entering LLIST. Using the 32 column option on LLIST caused a slight problem as certain Keywords seem to cause a line of 31 characters, but this is only really a problem if you are trying to produce listings for a magazine. . .

I admit I know nothing about RS232 except that some printers and peripherals use it so I took it to the local expert. "Oh, a Morex" he said, "I use one to connect to my Beeb". The remainder of the evening was incomprehensible and I wished I'd brought an interpreter along. All I can report is that it worked and he was enthusiastic due to "full handshaking" capability — sounds like a Masonic ritual. If you require more details I suggest you contact Morex Peripherals Ltd at 172B Kings Road, Reading, Berks RG1 4EJ (Tel: 0734 584238)

2 The ZXLprint III dropped through the door just in time for me to give it a good try out before writing this article and I'm very glad it did!

Supplied with a built in ROM instead of the usual software tape, the unit is small and the only one to lie flat, the others stand up on end. The cable is separate and connects to a set of pins exposed at the back. Next to these pins are a set of RS232 pins, but I really didn't get a chance to get expert help on this unit.

The instructions are brief but concise and simple, the printer can be controlled from one of the built in routines (most are catered for even the CP80!) or from external software. The latter is useful if you want to send special printer codes. It works with all the usual business software mentioned elsewhere. All the usual functions work perfectly, to get 32 characters per line a simple POKE will set it up. So why am I so impressed?

Well, options exist within the ROM to allow free use of LPRINT and LLIST as do the others, but COPY also is recognised and a screen dump is produced easily — all the others demand you call a machine code routine via USR.

This is useful but not exceptional, the real power lies in the fact that when it is put in graphics print mode, any time you LPRINT or LLIST a line with block graphics or UDGs the interface recognises them, shifts the printer into dot print mode, builds up the character on the paper in correct size relation (at least on the CP80) then changes back into text mode and continues with the line. This means that I can now reproduce ALL the Spectrum character set on listings.

There's only one thing that makes it less than perfect, but I must point out that ALL the interfaces have the same fault (or at least the ones I've tried) and that is that after the keyword THEN an extra space is printed,

throwing the line one character out of sync with the screen.

I know that many readers like their programs to be printed in 32 character form so they can compare the screen with the listing; as you can see we have used this form and we will continue to do so. I'm sure that the intrusion of the extra space will not cause too much trouble. I will keep looking for the perfect interface but in the meantime I'll use the next best thing — the ZX Lprint III available from Euroelectronics, 26 Clarence Square, Cheltenham, Glos. GL50 2UJ.

### Sometimes life gets tedious!

Having just written the above, yet another interface arrived. This one was the latest from Kempston and guess what? It performs exactly the same as the ZX Lprint III. Access to the Eprom is slightly different; the ZX Lprint is via a set of CHR\$ codes, the Kempston Centronic E uses COPY:REM?

The Kempston stands upright and is in their usual sturdy case with a lip at the top. Both will produce screen dumps in normal or double size, but the Kempston builds it up sideways on the paper. Quite honestly, there is nothing between these impressive units in the operation of a Centronics printer, but the ZX Lprint has the added benefit of the RS232 connector.

Kempston Micro Electronics Ltd can be contacted at Unit 30, Singer Way, Woburn Road Industrial Estate, Kempston, Bedford MK42 7AF.

### Softly softly. . .

Mentioned briefly last issue but now well tested is a print utility from Microdot Software of 30 Hazelmere Court, 26 Palace Road, Streatham Hill, London SW2 3NH. This was written and designed to be user friendly, and especially to be relocatable. Often a routine set at a particular area of memory gets in the way of other code but written in two parts, a text print and a screen copy routine, both or either of which can be relocated, this program solves the problem.

Primarily intended for the Cobra RS232 interface, it will work on most RS232 or Centronics interfaces with most of the popular printers. Written as compactly as possible to take up as little of the RAM as necessary, it has many features: unfortunately, sending user modified graphics and UDG codes is not included. Although not suitable for my applications, this is a neat and useful program, especially if you write a lot of long programs or need a lot of RAM for wordprocessing etc.

The instructions are very lengthy and very technical, an expert would find in it a wealth of detail, I found it confusing. Nevertheless, I was able to use it with only the minimum of head scratching due to the on screen prompts. Even so, Kempston and ZX Lprint have rather eliminated the need for this program.

### And finally

Lurking in a dusty corner of the office was a set of boxes, further investigation revealed a full Basicare system and a unit marked PERICON C Centronics interface.

Clutching my prize I rushed off and connected it to the ZX81 only to find there was no cable or instructions! A few calls to Basicare Microsystem Ltd at 5 Dryden Court, London SE11 4NH and a very helpful Mr Grimsby soon replaced the missing items.

All the ZX81 listings in this issue are produced by the Memotech interface which is completely hardware controlled but has so far functioned adequately. The Basicare unit is software controlled so I was excited by the thought that I could modify the program to send

specific graphic printer codes. This system is predominantly an enthusiast's product and so a mass of technical information is supplied. Suffice it to say that although it is complex, it is written in such a way that I was able to make sense of it.

Sure enough, I was able to

get into the program with the aid of printouts it made of itself and with a bit of hard thinking, I was able to get the program to print the three of the 81s graphic set available on my printer. The way it is set up is awkward for making listings but sensible if you are printing a lot of text — surely a

ZX81 wordprocessor is pushing it a bit! Letters are printed lower case and inverse letters are upper case. I have to swap them over to start with, then modify the output codes for the graphics and set the line length to 32 by DIMming B\$(33). I couldn't get it to print a pound

sign though (code 129 on my printer).

The Basicare is a real enthusiast's set up and you will need at least three units to run a printer. I list them below and cannot recommend them highly enough if you are going all the way with the ZX81.

**PERSONA** — the base unit which 'interfaces' between the ZX81 and the rest of the modules. £30.25

**RAM 16** — 16K RAM usable only with Persona, other RAMs are not compatible. £26.75

**PERICON C** Centronics Interface described above £41.75

Other units include **RAM 08**, **MINIMAP** (to extend address space from 64K to 1M byte) **RAM 64**, **DROM**, **TOOLKIT**, **PERICON A & B** (input/output devices). It is interesting to note that neither ZX81 units suffer from the intrusive 'space after THEN' problem.

So that is the present state of affairs, I'm limited by my printers graphic set. If I could get one with a user defined graphics set the quest would be at an end and listings would be perfect!

All donations gratefully received...

## NEW FROM BELLFLOWER SOFTWARE FOR THE 48K SPECTRUM

**IF YOU THINK YOU KNOW YOUR POP MUSIC, STUART HENRY'S READY WITH A CHALLENGE!**

# Competition

Unscramble the 'jumbogram' and win yourself some software!

## The problem

As I was compiling a list of software houses on my trusty Spectrum, there was the ominous flicker of lights that indicates a power fluctuation and usually the end of my program. However, this time the result was unexpected. The computer continued to function but when I recalled the list of names, the result was as you can see in Fig. 1.

Inspiration struck and I thought "what a good idea for a competition!" The task, therefore, is to find all the names of the software houses in the jumble of words. Each letter must only be used *once* and all the software companies mentioned sell software for the ZX81, Spectrum or both.

To enter, unscramble the jumbogram and write the names on the form below. Fill in the coupon with your name and address and send it, in a sealed envelope, to our Golden Square address marked 'Names Competition'. Please do not forget to write on the back of the envelope the number of companies that you have deciphered, without this your entry will not be considered valid. Best of luck to you all and don't forget to indicate which machine you have when you enter!

## The prizes

To please both Spectrum and ZX81 owners, the prizes this issue consist of forty sets of software, twenty for each machine, from Durell Software and Protek Computing Ltd.

Durell Software have kindly supplied us with twenty sets of each of their best selling programs, Harrier Attack, Jungle Trouble and the widely acclaimed, Scuba Dive. All these programs have been or are in the best seller charts and are definitely worth adding to your collection.

For ZX81 owners, the prizes have been donated by Protek, a company that has acquired a good name for itself by selling quality software for both the ZX81 and the Spectrum as well as a joystick interface. To the winners Protek are offering twenty sets of their superb ZX81 arcade games, UFO and Byter.

## The rules

● This competition is open to all UK and Northern Ireland readers of *ZX Computing*, except employees of Argus Specialist Publications Ltd, their printers and distributors, employees of Durell Software, Protek Computing Ltd, or anyone associated with the competition.

● As long as the correct coupon is used for each entry, there is no limit to the number of entries from each individual.

● All entries must be postmarked before July 31st, 1984. The prizes will be awarded to the first forty entries picked at random which have the correct answers, the decision to be made by the Editor of *ZX Computing*. No correspondence will be entered into with regard to the results and it is a condition of entry that the Editor's decision is accepted as final.

● The winners will be notified by post and the results will be published in a future issue of *ZX Computing*.

## Results

Thank you for all the entries we received to the Electronic Stars Competition in the Feb/Mar issue of *ZX Computing*. Unfortunately, there is only one prizewinner, but *someone* has to win!

Congratulations to Ms Suzi Yann of Dudley in the West Midlands who is the lucky winner of the Alphacom printer kindly donated by Dean Electronics. Thank you again for all the entries and better luck next time!

# Mozart c1984!

Chi-Yeung Choy of Ruislip flexes his fingers and performs this musical masterpiece.

The Spectrum's oft maligned beep has been considered too feeble for any reasonable musical application in the past, but now we present a program which will make you think again!

Instead of the usual selection of sound effects or brief burst of barely recognisable tunes, Chi-Yeung has successfully programmed a computer version of the first movement of Mozart's piano sonata in C Major K545. What is even more amazing is that it is written all in BASIC and fits into the 16K machine!

A great deal of thought and attention to technical detail has gone into this program for instance, the subroutines have been put at the start of the program to get every ounce of speed from the computer.

Chi-Yeung tells us that his greatest problem was fitting it into the 16K due to the amount of DATA required and that he almost gave up. Type it in and then give your fingers a rest and your ears a treat. Play on maestro!

## Program breakdown

Lines 30-230      Subroutines.  
Lines 240-520      DATA statements containing pitch of notes.  
Line 1000          Set up variables for note duration.  
Lines 1010-2070   Main program consisting of FOR-NEXT loops.

**Spectrum 48k**

**MAKE YOUR OWN TV FILMS!**

WITH **LIVE ANIMATION**

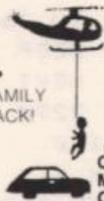

**& MUSIC**

**SAVE them...**

& AMUSE FRIENDS AND FAMILY  
 WHEN YOU PLAY THEM BACK!

Make us walk  
& talk!

ORDER: **£7**

ORDER: **MACRO CONSTRUCTION & ANIMATION CASSETTE MCA**

- **SPECIAL MACRO-PROGRAMMING TECHNIQUE** allow you to:
- Call up any member of cast, including UFO, Helicopter and a host of 'Personnel' in a choice of nearly 30 'Calls'! Make each any colour - large ones can be in two colours!
- They walk, run, climb and fly.
- Build houses, churches etc. in a flash - & erase them.
- Up to 15 mins. per 'film', or more if you're a good director.
- Make characters 'speak' using annotations as in strips.
- Full computer-prompting to save you making errors.
- Instant playback, editing and deleting as you go along!
- Most commands are a single key-stroke, without 'enter'.
- Compose your own tunes using the special three-octave chromatic music composer, which allows you to listen, correct and edit at each note... if you need to!
- Store up to nine 99-note tunes to 'call-up' at any time in a story... computer gives each a number in memory.
- Change tunes at any time, even whilst making a 'film'.
- You can even **add perspective** to buildings, roads etc.
- **No special skills or computer knowledge needed... Just imagination!**

IMPORTANT: FOR 48K SPECTRUM ONLY

**HEARING IS BELIEVING**  
**Tele Sound**  
**SPECTRUM BEEP BOOSTER**

TELESOUND is ready built and tested so that you can get the full sound of your Spectrum through any unmodified television set, black and white or colour. The unit is easy to fit in minutes without any previous experience as full fitting instructions are provided.

TELESOUND has been designed using the very latest ultra miniature components so it's size is an incredible 2 x 1.3 x 1cm. and fits neatly inside the Spectrum. Three easy push-on connections are made to the Spectrum. The connections are clearly shown in a diagram that comes with full fitting instructions.

**TELESOUND FEATURES**

- SOUND AND VISION TOGETHER FOR ADDED REALISM.
- BEEP VOLUME CONTROLLABLE FROM A WHISPER TO A ROAR.
- KEYBOARD CLICK CLEARLY HEARD TO ASSIST PROGRAM ENTRY.
- PROGRAMS CAN BE HEARD WHEN BEING LOADED • NO SOLDERING OR CASE CUTTING REQUIRED.
- ADDITIONAL AMPLIFIER NOT NECESSARY • SEPARATE POWER SUPPLY NOT REQUIRED.
- USES NO MEMORY SO WORKS WITH ALL PROGRAMS • COMPATIBLE WITH ALL OTHER ADD-ONS INCLUDING MICRODRIVE

TELESOUND comes complete with easy to follow fitting instructions and costs £9.95 inclusive of post, packing etc. Please state your computer when ordering.

# news

## In . . . . . Brief

● Timedata Ltd of 16 Hemmells, High Road, Laindon, Basildon, Essex SS15 6ED have produced two programs, both of which are utilities. TT-S consists of five programs in one packet to provide a versatile toolkit and costs £7.95. HI-T is a set of routines for formatting the screen. Up to 32 lines of 64 characters can be displayed, and input positioning to any part of the screen, window definition, pixel printing and definable comma spacing for flexible tabulation are its functions. A useful program which costs £5.95.

● Bel Tech have produced a series of programs for the serious user; Bel Base, a comprehensive Data Base program, BelGraph, a versatile graph plotting program, Bel Chem 1 & 2, an 'O' level revision program and Bel Gen, for keeping Genealogical records (if you happen to be tracing your family tree!) More details (including the price) can be obtained from Bel Tech Ltd at Stanmore Industrial Estate, Bridgnorth, Shropshire WV15 5HP.

● Fowler Software has marketed two tapes for graphics programming; Graphics Subroutine and Draw 15. Draw 15 seems to be for static art and the other is for animation. They also sell Giant's Dinner, a neat multi-choice childrens' program which ably demonstrates the capabilities of the other two programs. Fowler Software can be contacted at Hendon Mill, Nelson, Lancashire BB9 8AD.

● Procom Software's Dynamic Graphics, a two cassette package, is also aimed at the screen artist. I had a quick look at this one and it appears to be a very powerful tool; 27 functions for character designing and animation by using Sprites (fast machine code automatic moving objects) and 50+ for creating Hi Res screen drawings.

The manual was complex and needs careful reading, but the whole unit is designed as a professional programmers aid and as any good craftsman will tell you it takes time to learn how to use the tools of the trade.

● This editions most unusual program has got to be 40 Sermon Outlines for Busy Preachers from Melvyn Hamilton at 4 Southlands Avenue, Louth, Lincs. LN11 8EW for a mere £5.00. No it's not a joke (I promise) but all the computer fanatic priests who spend their time programming instead of organising their sermons will really find this one useful. The gospel according to St Sinclair?

● Widge Software of 48 Durham Road, East Finchley, London N2 9DT have produced an interesting tape containing two programs. Humpty Dumpty Mystery is on side one and consists of two games of differing difficulty levels and Who Killed Cock Robin is on the reverse side. (I'm sure I've heard those names somewhere before!) The program requires you to deduce the culprit in both cases by a combination of sensible questions and intelligent guesses and is a great program to encourage logical thinking. The age range is for those just starting to read up to ten and the price is £6.00.

● The Eastmead Medical Series bows in with The Complete Guide to Medicine, First Aid and How Long Have You Got. The first two cost £6.90 and the last, a real party killer, is £3.45. Both are available from Eastmead House, Lyon Way, Camberley, Surrey GU16 5EZ.

● Orwin Software, well known for their excellent ZX81 collections, venture into the Spectrum market with Education Compendium, a set of games and programs with an educational bias. An interesting series of Logo tortoise routines are on side two. The package cost £6.00 from 26 Brownlow Road, London NW10 9QU.

## Automata UK OK?

The cult of Pimanism is growing rapidly, a subversive organisation guaranteed to strike terror into the hearts of the strongest microprocessor chip. We wait with baited breath for the next onslaught.

Meanwhile, since our last issue, three forays into the realms of arcade games have escaped from their offices. Pi Eyed is a sort of farcical frogger plus. The old Piman is under your control and has to drink as much as he can. As in real life, the more he drinks the more awkward his movements become. Interesting.

Olympimania could have been great with the sporting interest at the moment, five events are billed but four of these turn out to be the same

game with different obstacles. Once again you control the Piman. Personally, I found it too fast at the start to let me get into the game easily and thereafter boring. Still, one man's meat. . .

Pi Balled is Automata's version of Q Bert and this time you control a character called Bert (surprise, surprise) who has to visit every square on the pyramid of Pi to change them to his colour while the Piman and associates hinder you. A simple but annoyingly addictive game, for me this is definitely the best of the batch.

All are for the 48K Spectrum and cost £6 each from Automata UK Ltd, 27 Highland Road, Portsmouth, Hants. PO4 9DA.

## It's magic

What have Paul Daniels and Silversoft Ltd in common? The answer lies in Silversofts Linkword language courses. Long, long ago when I was involved in the entertainment industry, I was introduced to a 'Memory Man' routine.

This routine was performed by the MM being blindfolded and members of the audience shouting out words which were written on a board under numbers 1 to 20 (or 40 if you were really good). Once the twenty or forty words were written, members of the audience called out the numbers and the MM instantly told them the word written under it. The secret was in the preparation, the MM had to spend ages memorising object for each of the numbers: for instance, 15 could be related to a rabbit. When the word for each number was called out the MM had to make a quick link between the

object related to the number and the word. For example, if the word for number 15 was HAT, the MM would be associating 15 with rabbit and so create a mental image of a rabbit wearing a hat! This link of a silly mental image works. This is where Paul Daniels comes in, he used the same routine on one of his recent shows.

This is the basis of these Linkword language courses in French, Spanish, German and Italian. OK so it doesn't teach the pronunciation or grammatical peculiarities of the language, but it will give you an easy and enjoyable way of learning a basic set of keywords which will enable you to communicate after a fashion on your holiday this year.

The courses consist of audio and computer cassette and instruction booklet and cost £12.95. Does it work? Ask Paul Daniels.

• Hickstead/Mathstead, Jungle Adventure and Diamond Quest are the titles of three Games for Girls, from CCS. They seem to me to have a distinct lack of respect for the female intelligence level. It's a good intention, but I'm doubtful of the method used.

Five other programs have also been released, all of which continue in CCS' business and strategy vein. CCS have been specialising in this type of game since the early days of the ZX81. The titles are War 70, Pacific War, Manage, Oligopoly and Stockmarket. All programs cost £6.00 with the exception of Diamond Quest which is a pound cheaper. CCS can be contacted at 14 Langton Way, Blackheath, London SE3 7TL.

• Grand old masters of the market, Artic, have released Monkey Bizness, another Kong game and Bear Bovver, a walls and ladders style game.

Both are up to their usual high standard with good graphics but Bear Bovver is my favourite with superb animation. For the 48K machine they are priced at £5.95 and £6.95 respectively.

• Kosmos Software of 1 Pilgrim Close, Dunstable, Bedfordshire LU5 6LX have given their French Mistress some company with the release of two new language cassettes, the German Master and The Spanish Tutor. There are two programs in each set and each program costs £9.95.

• Kuma Computers Ltd are selling Zen, not the philosophy but an established Editor/Assembler which has been around for the big machines for about seven years. It looks a very versatile program for £12.50. Another interesting program from them is Logo. If you can't wait for David Nowotnik's other articles or want a machine code version to really explore this language then this could be the one for you! It costs £9.95.

Finally, a game by the intriguing name of Vegetable Crash which is apparently selling well in Japan. It sounds like a down to earth Galaxians, but I can't comment as they have not seen fit to send a review copy yet. At £6.95, they are available from 12 Horseshoe Park, Pangbourne, RG8 7JW.

## Hurg to a classic adventure

Melbourne House have ventured from old to new with two recent releases.

Classic Adventure is the micro version of the original 1970s Fortran game and, as a text only standard format adventure game, is a departure from their advanced style graphics/text multi-instruction game The Hobbit!

Even more of a departure and a tremendous advance in games programming is HURG, or High-level, User-friendly, Real-time, Games-designer. (No wonder they shortened it to HURG!)

I must admit to being impressed, and with the volume of software that I check each week that takes some doing! This is a very powerful program and yet everything can be controlled by a joystick. To achieve this versatility, extensive use of menu-driven routines is employed. You move through a set of procedures from which you may diverge to access any feature

you wish to use in your game. Animation can be achieved easily and to a very high standard, and with options to detect collisions and special events this is very flexible.

Demonstration programs to show 'Zap, Chase and Jump' style games are also given on the tape and if you can produce a good game why not enter the £3000 competition for the best game designed using this system, the closing date has been extended to June 30th so you've still got time to write a masterpiece!

If you have great ideas for games but are limited by a lack of programming skill, this could be the answer. However, it won't do all the work for you and, like any tool, you will have to learn to use it but Melbourne House have made learning as easy as possible.

HURG will set you back £14.95 and Classic Adventure a mere £6.95

## Support for the 81

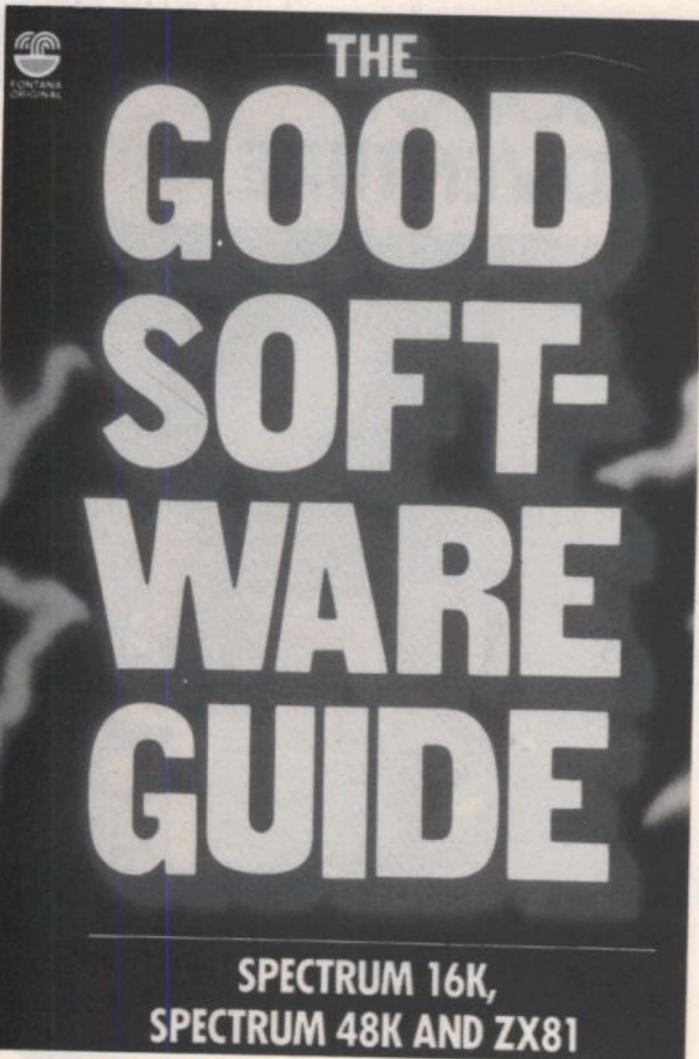

A big welcome to Softchoice Ltd of 52 Platts Lane, London NW3 7NT from myself and probably many ZX81 users. Softchoice is a subsidiary of International Publishing & Software Inc, a large organisation who have been producing software for quite a while in Canada. I am informed that response to the adverts placed so far has been very good indeed so the '81 still lives! Before you all write in confirming this, regular readers will know that I am a supporter of the old ZX81 and need no encouragement to continue to back it.

The range of programs is wide and comprehensive, Signals & Code and Tiny Logo are two general interest programs and three games are offered, Mr. Munchee, Speed Snake and Wrath of Kong.

These are clearly based on arcade games and I'm sure you need no further explanation. Fastload is a utility to enable you to save and load programs up to six times faster than normal and Fastword is a word processing package would you believe!

Finally, Diet is a domestic program to help you watch your eating habits. The Spectrum, however, is not entirely ignored and a version of Diet is available plus two educational games specifically for the 16/48K Spectrum, Take Away Zoo and Adding Machine, aimed at the 5-9 age range. Signals & Code, Mr. Munchee and Speed Snake cost £4.95 each, Tiny Logo, Wrath of Kong and Diet are £5.95 and Fastload and Fastword are priced at £7.50. All the Spectrum programs are £6.95 each.

# Book of reviews

Alongside the boom in micro-computers, the software on sale has naturally proliferated. It is impossible for us to keep up with the amount released each issue, although we do try. Software checklists, although useful, do tend to be merely lists. Helpful though is our sister magazine, *Software Today*, dedicated entirely to reviews of software for all types of domestic micro.

Along these lines is the *Good Software Guide* from Fontana Paperbacks which is described as a "source of reliable expert, comprehensive and critical information". The intention is to include only the best of the available software, I would be interested to know what criteria they use when deciding on the 'best'. Nevertheless, over 300 programs are covered, divided

into nine groups: adventure, arcade, collections, educational, novel, practical, strategy, traditional and utility and forty reviewers of a wide range of age and ability were used in the production of the book.

Fontana plan to make this an annual publication and there will be three editions, the first of which is devoted to the Sinclair machines — ZX81, 16 and 48K Spectrum. A good idea when the results of a recent survey indicates that Sinclair has 55% of the home market.

The 290 pages in the review issue still seemed too few compared to the amount on the market but for any keen games player, future historian or just for general interest it is well worth considering at £3.95 in the shops.

## In . . . . . Brief

- Pixel Pads could be very useful to Spectrum programmers who like to present their work with carefully drawn screens. Pixel Pads are large sheets of gridded paper in the Spectrum's screen format.

Each pad contains 50 sheets on each of which is a large pixel grid, several 8 × 8 UDG grids and a summary of related information such as INK and PAPER colour numbers. They may be obtained from Peter Bamford & Co at 10 Barley Mow Passage, Chiswick, London W4 4PH for £4.95 per pad.

- If you are near Battersea Park on the 14th or 15th of July, why not look in to the What Micro? Dr Barnardos Show. As well as Micros there will be other events and various surprise celebrities from the world of entertainment. This could be one way of combining a family day out and your hobby!

- Scott Adams is to adventure what Tim Hartnell is to Microbooks. We look forward to receiving the first in a new range of programs for review from the British branch of his company, Adventure International.

Marvel comic characters will be involved in what is described as graphic adventure games, the first of which is the Incredible Hulk. A comic will accompany the tape and at a certain point you take over . . .

All we need now is for Walt Disney to get in on the act.

## A mixed bag

CDS Micro Systems have recently released a selection of programs covering a wide range of topics. In the games field there is *Winged Warlord*, a jousting game, *Magic Meanies*, a chase game and *Timebomb*. All are 16/48K games and *Timebomb* has the added benefit of being compatible with the Currah Microspeech unit if you have it.

*Spectrum Safari* is for 48K machines only and is described as an adventure-style game. This looks suspiciously like the game of the same name

marketed by A J Rushton last year, not that it's anything to object to, I liked that game. It's a collection of mini games tied together with the theme of escaping from an island.

And finally, for those going abroad this year there is *French is Fun* and *German is Fun*, both of which are designed for students or for brushing up on a language before venturing abroad. A light touch is used with pictures and words. I can't give a personal comment as CDS so far have not seen fit to supply us with review samples.

In . . . . . Brief

• Euroelectronics, of 26 Clarence Square, Cheltenham, Glos. GL50 2JP, as well as producing the excellent ZX Lprint III detailed in my project, can supply software to print screen dumps in four colours on either the MCP40 or Tandy CGP printers.

It is called COPY 4, and a BASIC version is also supplied which can be adapted for use with earlier Lprint versions or other makes of interface.

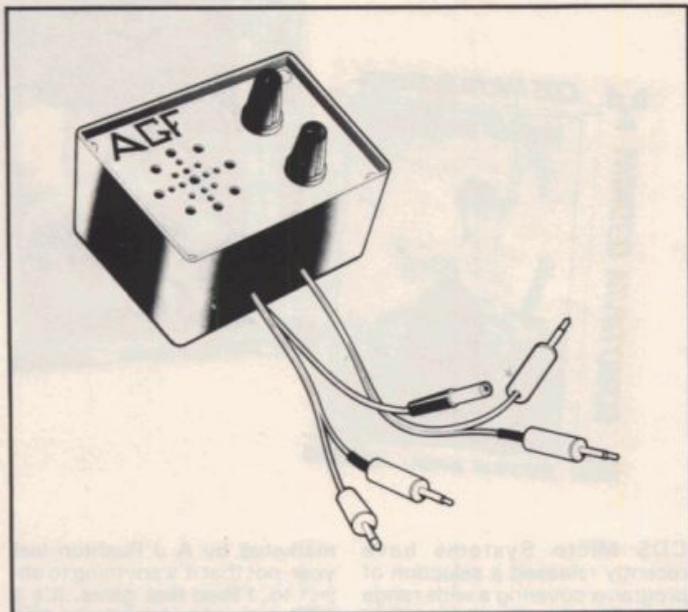

Priced at £5.50 it provides an economic way of getting colour into your print.

• An interface which is not only fully programmable but also includes a sound amplifier has been marketed by Rainbow electronics of Glebe House, Southleigh, Witney, Oxon OX8 6XJ. The cost is £24.00 plus £1 per p&p. We will tell you more in a future issue.

• The Ram Tubo is a combination interface which provides a joystick port and a ROM cartridge software port. The specifications look good, although it does not appear to be programmable and the provision of a through port to allow for other peripherals to be added on afterwards is a useful facility.

The cost if £22.95 plus £1.00 p&p from RAM Electronics (Fleet) Ltd., 106 Fleet Road, Fleet, Hampshire.

# Save! Save! Save!

AGF have reduced the price of their joystick interfaces to £26.95 for the programmable and £13.95 for module II (plus of course the obligatory £1.00 p&p). Both of these have undergone slight modification to allow the Quickshot II rapid "auto fire" feature to be implemented.

A nifty new item also marketed by AGF is Ampli-sound, a lead switching and

amplifier unit. This cuts out the changing of leads when loading and saving. A volume control is included on the amp, much to the relief of many parents! The volume control also contains an on/off switch which operates the computer, this is very useful indeed. The price was not finalised at the time of going to press, but should be around £24.95 + £1.00 etc.

# Adventurous reading

THE COMPUTER & VIDEO GAMES

## BOOK OF ADVENTURE

by KEITH CAMPBELL

With listings for:  
SPECTRUM, COMMODORE 64  
and BBC

Foreword by Scott Adams

Melbourne House, famous for The Hobbit, have recently published. The Computer and Video Games Book of Adventure by Keith Campbell, resident expert from the magazine of the same name.

In this his first book, Keith introduces adventure games, gives advice on how to solve and write them and explains their history. The listings in the book are suitable for Spectrum, BBC and Commodore 64 machines and teaches simple programming techniques to

control movement, objects, space and time and interpret inputs. The book includes a full listing for a complete adventure in all three formats plus an introduction from Scott Adams, generally regarded as the father of adventures on the Micro.

Most of the programming tips appear to be expanded versions of his earlier C&VG columns but are still valid and nigh on essential for the serious adventure programmer. Available from most bookshops at £5.95.

# Dib dib?

One company that treats the Sinclair computers with some respect is Microvitec who have produced two colour monitors for use with the Spectrum and the new QL.

The Spectrum compatible monitor is claimed to be the only Low Complexity Colour Display

equipped to handle Spectrum outputs. Code numbered the CUB 1431/MZ, it is set in a metal cabinet with a die cast frame surround finished in matt black or beige. Should you decide to upgrade to the QL or another computer with a RGB/TTL colour output then

**In . . . . . Brief**

- The Arcade professional joystick, a big and sturdy unit, seems to have had a successful initial run. So much so in fact that Emax Computing have not only reduced the price to £28.95 but are giving a full refund to those who purchased it at the original price.  
Just send your sale invoice to Emax Computing, Pinfold Lane Industrial Estate, Bridlington, N Humberside. I wish other companies would adopt this refund idea. . .
- A floppy disc system for the Spectrum is available from Technology Research Ltd of 356 Westmount Road, London SE9 1NW. The FDC-1 MK2 is the interface and will support two 40, 80 track, single or double side drives. The cost is £85.00 exc. VAT, + £1.00 for p&p. To compliment this they will provide you with a 40 track single side drive with PSU for £185.00 exc. VAT + £5.00 p&p.
- For the ZX81, Sircal Instruments (UK) Ltd of 11 Southfields Court, Sutton Common Road, Sutton, Surrey SM1 3HJ provide a low cost EPROM Programmer. Send an sae to the above address for more details if you are interested in this unit which works with Intel 2716, 2732 or similar EPROMs.

there is a socket on board to accept output in this form. The CUB 1431/MZ has a 14in screen and costs £225 (plus VAT and p&p).

Specifically for the QL (and other Hires 80 colour machines) is their latest colour monitor, the CUB 1451/MQ3. This features a high contrast, self-converging

PIL tube (no, I don't know what it means, but it sounds good!) with a resolution of 653 x 585 addressable pixels.

Both units are supplied with a dedicated cable and the controls are sited at the rear of the cabinet. The CUB 1451/MQ3 will cost you a mere £299 (plus VAT and p&p).

# ZX Microdrives on the shelf!

By now, the well sought after ZX Microdrives should be available in your local Smiths, Boots, Menzies or other major retail outlets which has got to be good news for Spectrum owners!

The Microdrive stores a minimum of 85K bytes' information on magnetic cartridge but average access time to information is a mere 3.5 seconds as opposed to a frustrating 3.5 minute wait. It is controlled by the ZX Interface 1 which can support up to eight microdrives, giving a total of 680 bytes capacity. As the Interface 1 also incorporates an RS232 interface, your Spectrum can be linked to other computers and peripherals and a local area network facility which will link upto 64 Spectrums.

Both the ZX Microdrive and the ZX Interface 1 are priced at £49.95 each and cartridges are available separately at £4.95.

In ..... Brief

● BASIC and FORTRAN in Parallel, written by S J Wainwright & A Grant is published by Bernard Babani and is another of their small but good value books.

The introduction claims that it could be used to learn FORTRAN or BASIC, or both languages at the same time! I had enough difficulty learning BASIC on its own. At £1.95 it looks a useful book which includes a 16K FORTRAN interpreter in BASIC.

● Tim Hartnell is probably one of the most prolific of the microcomputer authors and has recently released his latest offering via Interface Publications. Non-machine-specific, it is intended to take you through programming your computer step by step. The Easy Way to Program Your New Computer costs £3.95 for 208 pages including programs to try.

● Spectrum Graphics and Sound by Steve Money, published by Granada at £6.95 deals in depth with these Specific areas of the machine. Or rather, in depth with nine chapters on graphics and briefly with one chapter on sounds. Looks worth a glance if you are interested in this application.

● Also from Granada is Exploring FORTH by Owen Bishop. Even though the book is non-machine-specific, a great deal of examples and information has been packed in and the author has taken pains to ensure that most of them will work with whichever FORTH system you have. £6.95 from bookshops.

● Another language book from Granada is Introducing Logo by Boris Allen priced at £5.95. This book seems to deal specifically with using the language, the philosophy and Turtle graphics. LOGO is arousing a good deal of interest at the moment and this might be a timely release.

● For the younger would-be programmer, Steve Betts has written Spectrum Magic. Published by W. Foulsham & Co Ltd at £4.95, it is written in simple style it will be useful for those who really feel they want a 'Computing by Numbers' course.

The trouble is that the vocabulary needed is necessarily greater than the age range it is aimed at. If you can read and understand words such as Variables, Randomize, Fractional then what's the point in using topics like Dolls and Toys? Nevertheless, a colourful, concise introduction.

# Give 'em some stick!

Kempston, probably as near to an industry standard as is likely in the field of joysticks/interfaces, have produced two new models of joystick. Modestly called the PRO 1000 and PRO 3000, the old but evergreen model being given pride of place as the PRO 5000, these will no doubt receive much interest from gamers everywhere.

The PRO 1000 has eight way leaf switches, a five foot cable so you won't have to sit right on top of your television, and a bar instead of a button which allows for left or right hand play — a good idea. This

idea is used again on the PRO 3000, in fact the bases are identical but this one features an 'ergonomically designed' grip handle (honest, their wording-not mine) with both a top and front fire button so you can use either thumb or trigger finger to fire. Kempston are giving you no excuse for missing that vital universe-saving shot!

Priced at a reasonable £10.99 for the PRO 1000, £12.75 for the PRO 3000 and, of course, £13.80 for the old faithful PRO 5000, these should be available from your local zap shop.

# Sinclair snooker

**Everything goes to pot in this program from Tim Blewitt in the West Midlands.**

Sinclair Snooker is a textual simulation in which the computer makes the decisions on the outcome of each turn. Just in case there are any readers who have never played the game or watched it on television here are the rules:

Each player must take turns to try and pot a red ball and, if successful, then pot a coloured ball (except red!). The balls are worth the following points:

RED	1
YELLOW	2
GREEN	3
BROWN	4
BLUE	5
PINK	6
BLACK	7

If you make a foul shot — miss or hit the wrong colour ball — then you lose a minimum of

four points. A snooker is when the next player cannot get a clear shot at the correct colour ball and you can attempt a snooker yourself at any time.

### On the ball

When all 15 balls have been potted, the computer will give you instructions on how to pot the remaining colours in their correct order. You will be given the angle between the white, the colour and the pocket, and you must input the speed (or strength) of the shot — this may include decimals.

The success of this shot is determined by the computer by matching your input with two numbers. If it is between these numbers — known only to the computer — then you succeed. The higher the angle, the harder it is to pot due to the

numbers being closer together — a small random factor has been introduced here to add to the difficulty. This routine can be modified by looking at the variables T and X.

There are three skill levels and this affects your opponent's chances of potting a colour after potting a red. The ratios of success to level is as follows:

Level 1	1 in 3
Level 2	2 in 3
Level 3	always

### Variables

Here follows a key to the variables used in Sinclair Snooker.

- P Player's score.
- C Computer's score.
- B Current break (player or ZX).
- R Number of reds left.
- SK Skill level.
- V Difficulty level for potting colours.
- M Decides which colour the computer pots.
- K Success of snooker attempt.
- G Decides angle for shot at colour.
- E Player's speed (strength) of shot.
- T/X Upper and lower limits for speed input.
- N Value of colour.
- FL How many points awarded for a foul shot.
- TB Decides who wins the tie break.

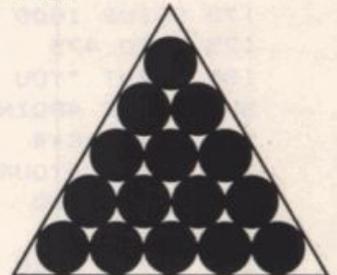

Other variables are used for loops etc.

### Structure

Here follows a brief description of the program:

- 0-269 Player attempting a red ball.
- 273-474 Player attempting a coloured ball.
- 475-600 Player attempting a red ball.
- 1000-1185 ZX attempting a red ball.
- 1190-1300 ZX attempting a coloured ball.
- 1500-1570 Player's snooker attempt.
- 2000-2342 Player's attempt at final colours.
- 2343-2420 Winner routine.
- 2500-2620 ZX's attempt at final colours.
- 3000-3030 Print out scores.
- 3500-3630 ZX attempting a coloured ball.
- 4000-4140 Player's snooker attempt at final colours.
- 4500-4540 Instructions for potting final colours.
- 4700-4760 Tie break winner.
- 5000-5100 Title.

Your chances of potting a colour are determined by the value of the ball, it will always be easier to pot yellow than black, but of course this means fewer points. If the game ends in a draw then a tie break is called and the odds are set at evens.

REF. CC100  
£79.95

REF. DLC200  
£185.00

REF. BHU300  
£46.95

REF. BHU400  
£39.99

**Ref. CC.100** — Especially designed for your home computer system whilst also giving plenty of storage space for software, magazines or perhaps a video recorder. Keeps your equipment **dust free**.

**Standard Features!**

1. Smooth sliding shelf locks in position just when you require it — and neatly glides away after use.
2. The computer shelf has been designed to allow adequate 'Knee room' for you to sit comfortably, and will avoid 'programmers back-ache'.
3. Adequate room to position tape recorder, printer, disc-drives, etc. alongside computer for ease of use.
4. All cables neatly and safely out of sight, while allowing all units to be permanently connected if desired.
5. Lots of storage space for cassettes, cartridges, books, listing paper, joysticks, etc.
6. With shelves and doors closed, instantly becomes an elegant piece of furniture.
7. The lower shelf suitable for your video recorder or storage of software, etc.
8. Smart Teak effect finish.
9. Supplied as a flat-pack. Very simple to assemble, using just a screwdriver. Full instructions supplied.
10. Measurements: Height 32½ in., Width 36 ins., Depth 16¼ ins.

PRICE only £79.95 incl. VAT.

**Ref. DLC.200** — This cabinet has the same basic features as model CC.100 but comes in a real wood veneer finish. Built in traditional English style to a very high standard of workmanship this cabinet will grace any home. Available in teak, oak, mahogany or walnut with brass fittings.

PRICE £185 incl. VAT — fully assembled.

**Ref. BHU 300** — A basic home computer housing unit in a teak effect finish. Storage shelf for magazines etc. Supplied as a flat-pack, very simple to assemble. Full instructions supplied. Measurements — 32" wide x 31" high x 18" depth plus VDU bridging unit 21" x 6" x 12" (available as a separate unit). See **Ref. BU.500** below.

PRICE only £46.95 incl. VAT

**Ref. BHU 400** — Similar to BHU 300 but without the storage shelf. Measurements — 32" wide x 27" high x 18" depth plus VDU bridging unit 21" x 6" x 12"

PRICE only £39.99 incl. VAT.

**Ref. BU.500** — Bridging Unit only — Price £12.50 incl. VAT

**TERMS OF OFFER:**— UK Mainland Customers only. Please allow 28 days for receipt. Cash with order or charge to one of the credit card accounts specified. Money back if not satisfied provided goods are returned undamaged at the customers expense to Marcol Cabinets, Southampton within 72 hours of taking delivery.

# The ZX81 soft selection

Nick Pearce gives us his critical views on some of the latest ZX81 software.

## Bubble Bugs and Bank Robber — Romik Software

I thoroughly enjoyed Bubble Bugs. It is, I suppose, an invaders-type game. Your base ship is at the bottom left hand corner of the screen (where it remains during the game) and is under attack from the bubble bugs. You race backwards and forwards along the bottom of the screen firing missiles and "popping" the bubbles. The bubble bugs drop bombs which can damage both your craft and your base ship. Your ship can tolerate a certain amount of damage but eventually is destroyed whereupon the game ends.

Not only do bubble bugs bomb you but when hit, they shatter and the debris can also inflict damage. When your craft is hit, a rescue vehicle is automatically sent out from the base ship to carry out repairs. You consume a unit of fuel each time you fire a missile and as you can only carry ten units, you have to return to the base ship regularly to replenish stocks. Alternatively, the rescue craft will come to your aid should you run out completely.

You can select an attack speed from 1 (easy) to 10 (impossible) the screen display is good and the action is smooth and responsive. Quite an impressive game.

In some respects Bank Robber is similar. You rush along the bottom of the screen taking money from the bank on the left and depositing it in your house on the right. As usual, life just isn't that easy. You operate in a street constantly bombarded by meteorites which you must avoid, and occasionally bricks and pills drop from the sky. If you catch a brick, a protective building will be rebuilt and a pill gives you another 'life'.

The protective buildings

resemble the shields in an invaders type game. It is worth trying to keep them built (the meteorites quickly destroy them) in order to facilitate your dashes between the bank and your house. Unfortunately, you can only enter your house or the bank when the doors are open: they occasionally close during the game.

There are twenty levels of play and the density of the meteorites is selectable from 1 to 3. Another good quality action game from Romik Software.

Both Bank Robber and Bubble Bugs are 16K games. They include on screen instructions

and each has a "freeze frame" whereby if the action all gets too much you can freeze everything while composing yourself.

## Asteroids! — Mikro-Gen

This is a fast moving arcade-type action game. The screen displays large variously shaped asteroids moving through space and endangering your ship. By rotating your ship and moving forwards, you try to avoid them, or shoot them with your lasers. When hit, an asteroid breaks into several smaller ones. There

are also UFOs and space mines to contend with.

You have three lives per game. Game speed is selectable in ten steps from slow to impossibly fast. Your score and the highest score recorded, are displayed at the end of each game.

ZX Asteroids is good fun to play although the graphics are not particularly subtle. The action is generally good and the game is responsive at high speed. Control of your space craft takes a while to master, it keeps moving forwards indefinitely once the thrust key is pressed and the only way to stop is to rotate through 180 and thrust forward again.

Not possessing a joystick, I had to use the ZX81 keyboard although a joystick option is included. It is a 16K game and is recorded both sides of the cassette.

## Forty-niner and Asteroids — Software Farm

If you are still prevaricating over whether to purchase the ZX Spectrum, maybe you should forget it and get Forty-niner instead. Forty-niner is an excellent game. It requires a little practice to master, but persevere, it's worth it. No sound or colour but the high resolution screen display gives another dimension to the trusty ZX81.

The 1949 Great American Gold Rush has just started and you are out there with the best of them excavating for the precious metal. Somewhat unusual hazards (for a gold digger anyway) are present to hinder you. Giant rats search through your excavations after you and there are snakes which when released, head straight for the surface and destroy everything in their path. There is also a gremlin to contend with and you have to deposit ex-

cavated soil on the surface to delay it capturing you.

The aim of the game is to collect all the nuggets of gold. When you have accomplished this awesome task, you pass on to a more difficult stage with more rats but less snakes to destroy them.

An interesting feature of Forty-niner is the facility for the player to select his own control keys. A hi-score chart is kept by the computer and displayed at the end of each game and there are five levels of play. The hi-res display is excellent, those rats really do look like rats. A great game.

The Software Farm game of Asteroids is similar to the Mikro-Gen version reviewed above. It has three levels of play, and you have three lives per game. It requires a 16K RAM pack and the graphics are in "normal" ZX81 resolution. There is an option for up to four players to hold a contest, each player's highest score being separately recorded and identified in a score table.

I thought the action rather jerky, even at the hardest level but the game works well and is good fun nonetheless. More expensive than Mikro-Gen's game but with the additional facility to keep score during a contest.

## Gamestage 1 — Fawkes Computing

There are four good quality games on this cassette; Dodge-it and Trojan Dragon on the A side and Death Trap and Tablets of Hippocrates on the reverse.

Dodge-it is a variation of the hungry blob-type game. Your character moves anticlockwise following lanes around the screen. Your only control is to change lanes when you reach gaps by the use of the cursor keys. True to tradition you consume dots and leave crumbs. The second time you travel the same lane you eat crumbs and leave dots and so on. There is also a strawberry which, if eaten, gives you extra points and, of course, the inevitable monster which travels clockwise around the lanes and must be avoided.

This is an unusual but effective game in which your character is always on the move. You cannot reverse direction to escape the monster — once you are in the same lane that's it. Good fun to play but frustratingly difficult to judge

which lane to cross to at the next gap. Dodge-it has four speed levels from learner to expert and a high score feature.

In Trojan Dragon the programmer has taken some liberties with popular legend to produce an interesting game.

The problem is that you have to guard your castle at two positions simultaneously. You control the drawbridge but must only allow "goodies" across and the swordsmen on the battlements must only kill "baddies". The difficulty is in recognising goodies and baddies as they approach these positions so that appropriate action can be taken.

An interesting idea is in the way the game is made more difficult for the experienced player; at the harder levels of play the goodies and baddies are represented by characters which more closely resemble each other. There is also a choice of speed but the speed increases automatically as the game progresses and action can become frenetic.

A very good game which gets exciting as the goodies and baddies approach in ever increasing numbers.

Death Trap, on the reverse side of the cassette is a game in

which you move your character around the screen in an attempt to avoid being boxed in by the computer. A rather pedestrian game which nevertheless works well.

Dodge-it, Trojan Dragon and Death Trap are all 100% machine code games. The final game on the cassette, Tablets of Hippocrates, is a BASIC program and is a role playing adventure with some 30 locations set in an enchanted forest. Your object is to get the two valuable Tablets hidden deep within the forest. Hazards abound and the forest contains such horrors as a tunnel of death, chamber of echoes and devils rock.

An imaginative game, not unduly difficult and a good introduction to adventuring for the beginner.

Further details on any of the reviews above can be obtained from the following addresses:

Romik Software, 272 Argyll Avenue, Slough, Berks.  
Mikro-Gen, 24 Agar Crescent, Bracknell, Berks.  
Software Farm, Craig Farm, Botany Bay, Tintern, Gwent.  
Fawkes Computing, 41 Wolfridge Ride, Alveston, Bristol

"Run more than ten tasks on a ZX81-FORTH ROM?"

Sure! More than 10 tasks simultaneously and, in some cases, up to 300 times faster! That's what replacing the basic ROM with the new FORTH does for the ZX81 — and more!

The brains behind the breakthrough belong to David Husband, and he's building Skywave Software on the strength of it. Already orders are flooding in and it's easy to see why.

The ZX81-FORTH ROM gives you a totally new system. In addition to multi-tasking and split screen window capability, you can also edit a program while three or four others are executing, schedule tasks to run from 50 times a second to once a year, and with a further modification switch between FORTH and BASIC whenever you like.

The ZX81-FORTH ROM gives you a normal keyboard with a 64 character buffer and repeat, it supports the 16k, 32k, 64k RAM packs, it is fig-FORTH compatible and it supports the ZX printer.

The price, too, is almost unbelievable. As a "fit it yourself Eprom", complete with manual, it's just £25 + VAT. Add £2 p&p UK (£5 Europe, £10 outside Europe) and send your order to the address below.

# Spectrum ESP

**There have been many unusual applications of the Spectrum but this one from D Barraclough has to be the strangest yet . . .**

Everyone has heard of ESP (extra sensory perception) but did you know that scientists investigating the phenomena have categorised it into the following groups:

- 1 Remote viewing
- 2 Seeing into the future
- 3 Telepathy (mind reading)
- 4 Telekinesis (moving objects by thought)

This program is concerned with the last group. Some individuals claim that they can move objects by mental energy alone, and while there has been no conclusive proof documented and published, it is interesting to realise that scientists do not scoff at the idea.

There is a rumour that Atari are being sponsored to develop video games and programs that are thought controlled, the idea being that this will develop a human's mental power — aching brains instead of aching fingers. *ZX Computing* always likes to be among the leaders in any new field and so we present, courtesy of Mr Barraclough, a program to expand the already

awesome mental power of our readers.

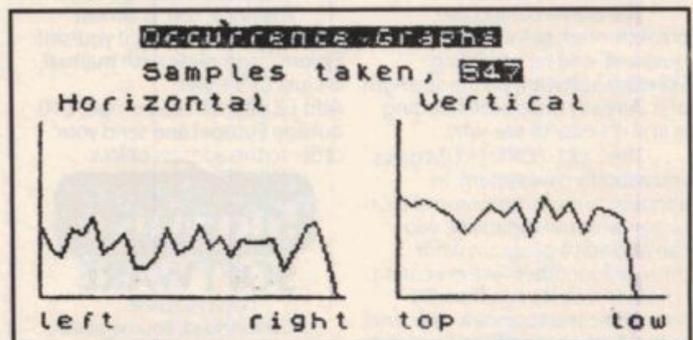

ESP is a simple program to help you develop any sixth sense which you may possess — it won't give you any if you don't already possess any. In this field you either got it or you aint! The idea is to attempt to keep the moving character in the centre of the screen by your willpower alone. After you have made a lengthy effort — two hours is recommended — pressing any key will produce a graph of the occurrences of a central position. This should be repeated daily for best results. The graph shows the number of times the character has appeared at a particular horizontal and vertical position: any tendency for the character to centralise will be displayed.

The inspiration for the program apparently came from the *Horizons* television programme of September 26th 1983 but Mr Barraclough admits that he has not been successful to date. We would be very interested to hear from any reader who gets a favourable result, but no fakers please.

# Cool and calculating

While most of us hotly deny that personal computers are only glorified calculators, B McIntosh of Glasgow proves that that is one of their most useful functions.

This program, for the 16 or 48K Spectrum, is different to other calculator programs in that the functions are displayed as you type them in.

## Arithmetic

Enter numbers by pressing the keys as seen. Enter arithmetic functions by pressing the keys on the keyboard where they are printed. For example:

ADD 12 + 5  
PRESS 1,2,K,5,ENT  
DISPLAY =17

SUB -13 - 7  
PRESS J,1,2,J,7,ENT  
DISPLAY = -20

MULT 4 \* 32  
PRESS 4,B,3,2,ENT  
DISPLAY =128

DIV 18 ÷ 6  
PRESS 1,8,V,6,ENT  
DISPLAY =3

## Roots and percent

The square root function is obtained by typing the first letter; ie (R)oot followed by a number. This function can be used on its own or in calculations involving other numbers. For example:

FIND ROOT 2 by typing R,2,ENT  
or ROOT 2/2 by typing R,2,V,2,ENT

The percentage function must always have two numbers, one to carry out the function and the multiplier for the percentage. This can also be used on its own or in calculations. For example:

FIND 5% of 17 by typing 1,7,B,5,P,ENT

## Memory

The calculator is equipped with eight memories. To store a number there must be an "=" in front of it and then you type "F" to get you into the special function mode followed by "M" for memory and then the number of the memory that you wish to be used. This number can then be used as an operand; ie you can type F,M,1,K,5. This displays M1 + 5. Press enter to find the answer. Memories can also be used with each other; ie M1 x M2 etc.

The contents of any memory can be displayed in two ways. Firstly, when the display is showing "0" then by typing as "=10" or such like. Secondly, at any time you can type F,D,M,1. This will display the

contents of memory 1 at the top of the display without interfering with any calculations which might be in progress.

The contents of all memories can be reset to zero by typing F,X and following the prompt. If you change your mind, then any other key will abort the memory clear.

## Number conversions

This program will also do conversions from HEX to DEC and vice versa. HEX letters are obtained by typing "F" and the number under which they

10-40	Sets up variables and flags and puts the computer into CAPS mode.
50-96	Sets up graphics and POKEs the USR routine for the letters into the memory. Screen colour etc.
98	Draws the calculator
100-200	More variables
210-490	Handle the input of data (main loop).
500-560	Special instructions for any key pressed which is not a number.
600-850	Calculates the answer and running totals.
1000-1020	Converts from decimal to hex.
1100-1140	Displays contents of memory.
1200-1300	Converts from hex to decimal.
1400-1420	Input from keyboard.
1500-1520	Main loop for special functions.
6000-6050	Handles memory functions. Decides whether to update memory or include it in calculations.
6100-6140	Resets all memories to zero.
6200-6250	Converts to and displays large characters.
9000-9060	Saves program.
9900	

appear. For example:

Find the HEX for 255  
Press 2,5,5,H  
The display then shows FF

Find the DEC for 1AB  
Press 1,F,1,F,2,D  
The display then shows 427

The only function left is the C/E which, by typing "C", will erase the last thing that you entered.

## Program breakdown

Here follows a brief description of the program functions:

# 1K disassembler

Disassemble your ZX81 ROM in just 1K — sounds impossible? Well, have a go with this program written for us by HM Tucker of Luton.

This program is designed to decode any area of ROM or RAM into instructions comprising op-code and data if any, and to print them out with their addresses, one to a line, until the screen is full (approximately one second in Fast mode) and groups all Z80 instructions.

It fits easily into an unexpanded ZX81, and will also run in Slow mode, which is essential if you wish to change the program to scroll so that you may sit back and watch the entire ROM unfold before you (about six instructions per second in Slow mode).

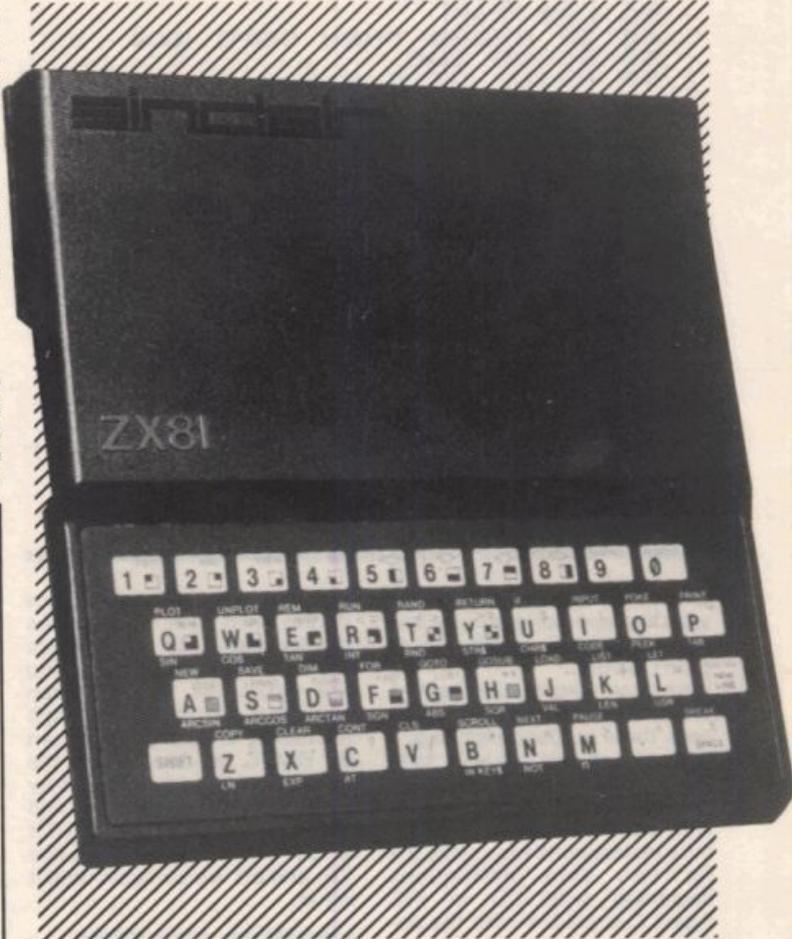

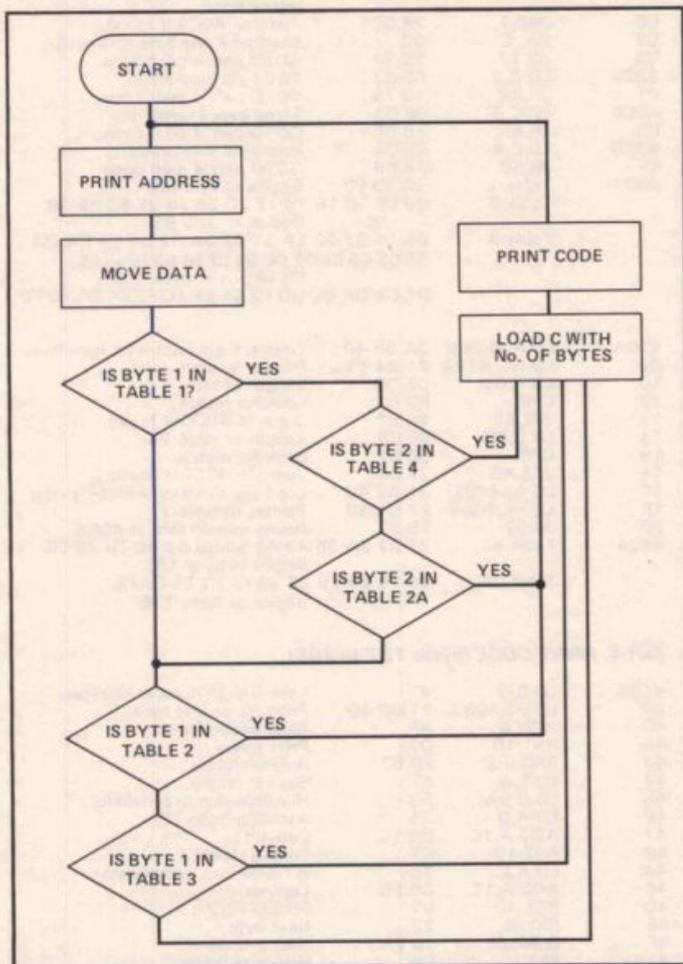

It accepts up to four digits of Hex address, but if decimal

addressing is preferred, simply change lines 10 and 20 and omit lines 30 to 60. Options are available for copying to printer, continuing disassembly or of selecting new start address.

Apart from being very interesting to write and to run, it will allow you to find the misprints in some published versions of what is in the ROM.

## How it does it

The BASIC program asks for the start address in Hex; this is converted to decimal by lines 30 to 60 and POKEd into spare locations in the system

variables area by lines 70 and 80.

The machine code now takes over and *Part 1* prints out the address as four digit Hex. The program doesn't seem to have achieved much so far does it? But these few bytes can be tucked away above RAMtop or in the printer buffer as a handy decimal to hex converter.

*Part 2* moves four bytes of data from the start address to the four reserved bytes at the start of the REM ready for *Part 3* to look at, and for *Part 4* to print as necessary.

*Part 3* is the longest and most complicated of the whole program and comprises all the

decision blocks in the flow chart, and all the tables. Briefly, it searches the tables guided by a pointer in HL and a length in BC, looking for a match for a particular byte of the op-code. The accumulator is loaded with the first byte and table 1 is searched; if a match is not found in table 1 all we can be sure of, is that we do not have a four byte instruction, but more about this later.

Tables two and three are then searched for two and three byte instructions respectively; any code escaping these searches must of necessity be a one byte instruction. All these instructions have one byte op-codes

# ZX81 PROGRAM

## LOADER

ENTER NEW CODE FOR CHANGES

USE "Q" TO QUIT

USE NEULINE TO ACCEPT CODE

```

1 REM .....
.....
.....
.....
.....
10 LET A=16513
20 LET B=A/A
30 LET T=B
40 IF B=209 THEN GOTO 240
50 GOSUB 200
60 PRINT AT 5,0;B;" IS ";H$;"?";
70 INPUT H$
80 IF H$="" THEN GOSUB 200
90 IF H$="Q" THEN STOP
100 IF LEN H$ < 2 THEN GOTO 70
110 LET D=CODE H$*16+CODE H$(2)
-476
120 IF D>255 THEN GOTO 70
130 POKE A+B,D
140 LET T=T+D
150 PRINT TAB (10);H$
160 SCROLL
170 LET B=B+1
180 GOTO 40
200 LET D=PEEK (A+B)
210 LET I=INT (D/16)
220 LET H$=CHR$ (I+28)+CHR$ (D-
I*16+28)
230 RETURN
240 PRINT "CHECKSUM = ";T
    
```

and in all cases C is loaded with the appropriate value and control passed to Part 4 to print code.

If a match was found in table 1 we may have an instruction two, three or four bytes long, it depends on the value in byte two, so the accumulator is loaded with the second byte and table 4 searches for four byte instructions then table 2A for two byte instructions beginning with DD or FD. Again C is loaded with the appropriate value and control passed to Part 4 to print code.

I told you it was complicated didn't I? Don't worry though, the worst is yet to come. We are now left with 50 two byte instructions which began with ED, and 48 three byte instructions which began with DD or FD. Nobody wants 98 bytes of tables, so the accumulator is re-loaded with the first byte and the main program rejoined at table 2 where the 50 two bytes are picked out by ED. And so to table 3 where the 48 three bytes are picked out by DD and FD. Again C is loaded and control passed to Part 4.

Part 4 prints out the appropriate number of bytes and is virtually the same as Part 1,

but this time prints a space before each byte to make the display easier to read. Since we don't care about corrupting the data, this time we can leave out the rotate left digit necessary in Part 1. On return to BASIC at line 100, the decimal address is updated by the number of bytes used and the screen examined to see if it is full. If not then back to line 70, and off we go again until it is full.

## Loading the REM

This is without doubt the worst part of all, but the following hints may help. Use Fast mode to load the REM with 208 characters, eg a sequence of nine full stops and a zero repeated makes counting quite easy, but as a check when you have finished, a direct command of PRINT PEEK 16511 should give a value of 210.

Use any loader program you may have that loads Hex or use the following which although rather long and with limited protection on the input, is easy to use. When RUN, it will display the current contents of the first byte of the REM as '1 is 1B?' and wait for

## 1. Print address (bytes one to 29).

ADDRESS	MNEMONIC	CODE	REMARKS
4082	4xNOP	00 00 00 00	Watch this space.
86	LD B,2	06 02	Counter for two byte address.
88	XOR A	AF	Clear accumulator.
89	LD HL,407C	21 7C 40	Address of hi byte of start.
8C	RRD (HL)	ED 67	Move nibbles.
8E	LD E,A	5F	Save lo nibble.
8F	LD D,(HL)	56	Hi nibble into accumulator avoiding code 7E.
90	LD A,D	7A	
91	ADD A,1C	C6 1C	Convert.
93	RST 10	D7	Print hi nibble.
94	LD A,E	7B	Lo nibble into accumulator.
95	ADD A,1C	C6 1C	Convert.
97	RST 10	D7	Print lo nibble.
98	SUB A,1C	D6 1C	Restore the byte in (HL).
9A	RLD (HL)	ED 6F	
9C	DEC HL	2B	Address of lo byte of start.
9D	DJNZ,ED	10 ED	Jump to 408C.

## Part 2. MOVE DATA (bytes 30 to 40)

ADDRESS	MNEMONIC	CODE	REMARKS
9F	LD BC,4	01 04 00	Byte counter.
A2	LD DE,4082	11 82 40	Destination, is the reserved space.
A5	LD HL,(407B)	2A 7B 40	Source, is start, or updated address.
A8	LDIR	ED 80	Move it.

## Part 3. SEARCH (bytes 41 to 186)

40AA	LD A,(4082)	3A 82 40	Load accumulator with byte one.
AD	LD HL,40D1	21 D1 40	Pointer to table 1.
B0	LD C,3	0E 03	Length of table 1.
B2	CPIR	ED B1	Look for match.
B4	JRZ,54	28 54	Jump to 410A if found, to look at byte two.
40B6	LD C,1A	0E 1A	Length of table 2.
B8	CPIR	ED B1	Look for match (two byte instruction).
BA	JRZ,9	28 09	Jump to 40C5 if found.
BC	LD C,1C	0E 1C	Length of table 3.
BE	CPIR	ED B1	Look for match (three byte instruction).
C0	JRZ,7	28 07	Jump to 40C9 if found.
C2	INC C	0C	Must be a one byte instruction.
C3	JR,77	18 77	GOTO part 4 print code.
40C5	LD C,2	0E 02	Two byte instruction.
C7	JR,73	18 73	GOTO part 4 print code.
40C9	LD C,3	0E 03	Three byte instruction.
CB	JR,6F	18 6F	GOTO part 4 print code.
40CD	LD C,4	0E 04	Four byte instruction.
CF	JR,6B	18 6B	GOTO part 4 print code.
40D1	Table 1	DD ED FD	Begins at byte 80.
	Table 2	06 0E 10 16	18 1E 20 26 28 2E 30 36 38
			Begins at byte 83.
	Table 3	01 11 21 22	2A 31 32 3A C2 C3 C4 CA CC
			3E C6 CB CE D3 D6 DB DE E6 EE F6 FE
			CD Begins at byte 109.
			D2 D4 DA DC DD E2 E4 EA EC F2 F4 FA FC FD

410A	LD A,(4083)	3A 83 40	Load accumulator with byte two.
0D	LD HL, 4124	21 24 41	Pointer to table 4.
10	LD C,0D	0E 0D	Length of table 4.
12	CPIR	ED B1	Look for match.
14	JRZ,B7	28 B7	Jump to 40CD if found.
16	LD C,0B	0E 0B	Length of table 2A.
18	CPIR	ED B1	Look for match.
1A	JRZ,A9	28 A9	Jump to 40C5 if found.
1C	LD A,(4082)	3A 82 40	Load accumulator with byte one.
1F	LD HL,40D4	21 D4 40	Pointer to table 2.
22	JR,92	18 92	Rejoin mainstream at 40B6.
4124	Table 4	21 22 2A 36	43 4B 53 5B 63 6B 73 7B CB
			Begins at byte 163.
	Table 2A	09 19 23 29	2B 39 E1 E3 E5 E9 F9
			Begins at byte 176.

## Part 4. PRINT CODE (bytes 187 to 208)

413C	LD B,C	41	Load B with number of bytes.
3D	LD HL,4082	21 82 40	Point HL at first byte.
40	XOR A	AF	Clear accumulator.
41	RST 10	D7	Print space.
42	RRD,(HL)	ED 67	Rotate nibbles.
44	LD E,A	5F	Save lo nibble.
45	LD D,(HL)	56	Hi nibble into accumulator.
46	LD A,D	7A	Avoiding code 7E.
47	ADD A,1C	C6 1C	Convert.
49	RST 10	D7	Print hi nibble.
4A	LD A,E	7B	lo nibble into accumulator.
4B	ADD A,1C	C6 1C	Convert.
4D	RST 10	D7	Print lo nibble.
4E	INC HL	23	Next byte.
4F	DJNZ,EF	10 EF	Until B is zero.
4151	RET	C9	Return to BASIC.

BASIC PROGRAM

```

10 PRINT "START IN HEX."
20 INPUT H$
30 LET S=0
40 FOR N=1 TO LEN H$
50 LET S=S*16+CODE H$(N)-28
60 NEXT N
70 POKE 16508,INT (S/256)
80 POKE 16507,S-PEEK 16508*256
90 LET N=USR 16518
100 LET S=S+N
110 PRINT
120 IF PEEK 16442=2 THEN STOP
130 GOTO 70
    
```

you to either accept it by pressing Newline, or to change it by entering the desired code followed by Newline.

In either case the code will be POKEd in and displayed to the right of the old code. The next byte is then displayed below the first, so carry on and enter all 208 bytes, and good luck, remember to start with four 'no ops'.

If you make an error leave it for corrections later, the byte numbers will help you keep in step with the program which will stop after 208 bytes and display a simple checksum

which should be 22880; if it isn't you have made an error. Run the loader again and step through till you find it. Note that a simple checksum is not an absolute guarantee of accuracy but you may proceed with fair hope of success. Save it onto tape just in case. Delete all the loader except the REM in line 1 starting with the last line and working back to line 10.

**Basically . . .**

Enter the BASIC program, select Fast mode, enter RUN

Newline and you should see: 'START? IN HEX'.

Type in a start address, say 0, and with your fingers crossed press Newline; all being well you should have no more than one second of suspense followed by a display of Hex addresses and groups of code, which are the first 22 instructions in ROM. The program will stop with error code 9/120.

You may now COPY to printer if required, continue disassembly by CONT Newline or use RUN Newline to select a new start address.

Assuming all has gone according to plan, it is now play time; why not look at our own program using 4086, then use 4082 and note that even though not starting at the beginning of an instruction, that the program is self-aligning. Instead of the boring old THEN STOP in line 120, try THEN CLS or THEN SCROLL but do select Slow mode before running these last two.

**Notes**

There are seven possible routes through the flow chart

corresponding to the following table:

number of bytes		
opcode	data	instruction
1	0	1
1	1	2
1	2	3
2	0	2
2	1	3
2	2	4
3	1	4

For our purpose it has been sufficient to look no further than the second byte of the opcode, since all 62 three byte op-codes form four byte instructions which are detected by their second byte.

In the interests of easy programming and description, no great attempt has been made to save memory, since even at the most crowded part of the ROM around 0650 there is plenty of room on the screen for all the code.

My thanks to Dr Ian Logan's book 'Understanding your ZX81 ROM' for the inspiration to write this program. Should you require more information on the techniques used in my program, I suggest you look no further than this excellent book.

# It's easy to complain about advertisements.

Every week, millions of advertisements appear in the press, on posters or in the cinema.

Most of them comply with the rules contained in the British Code of Advertising Practice and are legal, decent, honest and truthful.

But if you find one that, in your opinion, is wrong in some way, please write to us at the address below.

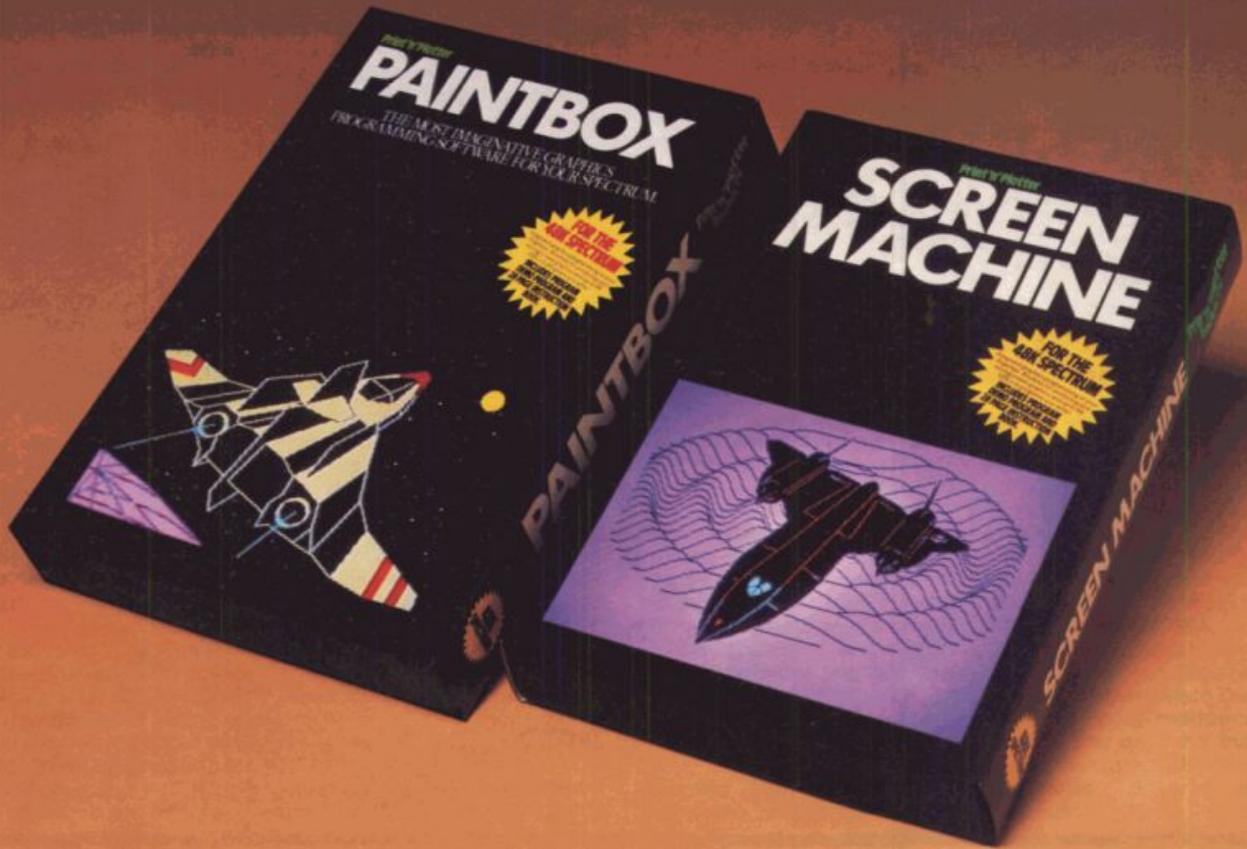

We'd like you to help us keep advertising up to standard.

**The Advertising Standards Authority.**  
**If an advertisement is wrong, we're here to put it right.**

A.S.A. Ltd., Brook House, Torrington Place, London WC1E 7HN.

## PRINT 'N' PLOTTER

### PAINTBOX

Superb Graphics  
— without expensive hardware!

PAINTBOX gives the 48K Spectrum owner every facility to produce excellent graphics — easily, quickly and professionally.

There's no need for expensive hardware. PAINTBOX is flexible, precise and incredibly simple to use!

Just take a look at some of the facilities available:

#### UDG EDITOR

The facility to define up to 84 graphics characters which can be stored in your BASIC programs for instant recall from its own built-in machine code!

#### UDG DRAWING BOARD

UDG planner for the 4 banks of characters. Facilities include: MIRROR IMAGE, ROTATE, INVERSE, FILE.

#### SKETCHPAD

Experimentation 'window' that allows you to try-out your UDG ideas under development.

#### PRECISION PLOTTER

Amazing versatile high-resolution drawing board which includes PAPER choice, PLOT, DRAW, DRAW RADIALLY, CIRCLE, ARC, OVER, FILL, instant change of INK and BRIGHT, multi-function ERASE and STORE.

Cursor is controlled by keyboard or Joystick with FAST, SLOW, and Cursor size choice!

#### SCREEN PLANNER

For the best of both worlds! PRECISION PLOTTER and UDG CHARACTERS! For complete screen planning of graphics. A multi-purpose facility to enable you to produce superb screen graphics!

All results can be sent to a printer, saved as SCREEN\$ or SAVED as CODE with its built-in machine code routine for instant recall from BASIC.

The program is complete with a cassette demo and a 28 page booklet describing in easy-to-understand language how to use it, plus many tips for storing and using your graphics in programs.

## PRINT 'N' PLOTTER

### SCREEN MACHINE

Instant machine code  
for graphics and text.

SCREEN MACHINE is an invaluable graphics utility to use with PAINTBOX or any other graphics hardware or software!

It gives a wide range of facilities to enable you to manipulate graphics and text, saving time, memory and giving truly professional results.

For instance: SCREEN MACHINE COMPRESSES Screen Files to cram even

more into the memory!

It **COMPILES** text, graphics characters or UDG's instantly into machine code giving fast smooth access to the screen!

It **CREATES** re-callable Multiple Screen Files automatically with its own built-in machine code!

It **ENLARGES** screen sections in 2X steps!

It **REDUCES** the whole screen in 2X steps!

It **RECOLOURS** your screen graphics either globally or selectively!

It **MIRRORS** the screen left to right making flip-action animation easy!

It **RELOCATES** your screen graphics to any other part of the screen with block or high-resolution scrolls!

It **SUPERIMPOSES** screen graphics giving incredible 'mixing' results!

It **SAVES** everything to tape or Microdrive for use within your BASIC programs!

There's no doubt that SCREEN MACHINE is a major graphics toolkit for the 48K Spectrum. It is completely menu-driven and comes complete with demo program and fully-documented instruction booklet.

Another first from Print 'n' Plotter!

## PRINT 'N' PLOTTER

### ZX SPECTRUM JOTTER

Pre-planning your screen  
made easy . . . and precise!

Print 'n' Plotter JOTTERS have become a household word for the Sinclair enthusiast.

Despite various imitations our original ZX SPECTRUM JOTTER is still the one people prefer!

Of course it could be because it is professionally produced . . . the quality is superb.

And the fact that it is BIG SIZE A3 (16½" x 11¾") is a distinct advantage when working in high-resolution.

It's also 100 pages thick. 50 pages of PLOT grids showing each numbered pixel co-ordinate and 50 pages of PRINT grids showing every character and graphic character position and INPUT lines.

Each page also contains 24 UDG planning grids (2400 per pad).

Consider also the fact that it is printed on Artist's Detail paper . . . thick enough to take any writing, drawing or colouring, yet thin enough to overlay onto a drawing and trace-off.

For pre-planning graphics, text, tabulation or anything to produce 'on screen' a Print 'n' Plotter JOTTER won't be beaten.

The complete package comes with a set of coloured pens, a Pixel ruler and a handy corrugated storage tray.

If you use PAINTBOX, SCREEN MACHINE or any other graphics utility . . . you'll do things better with the ORIGINAL Print 'n' Plotter JOTTER!

## PRINT 'N' PLOTTER

### KEYBOARD OVERLAYS

The simple answer to  
"Which key?"

Print 'n' Plotter KEYBOARD OVERLAYS for the standard ZX Spectrum keyboard are the economic answer to "Which key does what?"

If you program, or buy commercially-produced software, sooner or later you'll be faced with a mind-boggling mass of keys that perform different functions.

This can be as simple as the "FIRE" button in a game or as precise as the "analysis" button in a scientific program.

Let's face it, the Spectrum keyboard is complicated enough so why not take the easy way to remember . . .

. . . lay over the keyboard a Print 'n' Plotter OVERLAY and write the function underneath . . . it's child's play!

Then keep the OVERLAY for the next time you use the program.

Print 'n' Plotter KEYBOARD OVERLAYS come in packs of ten.

Punched to fit your Spectrum. Priced to suit your pocket!

## PRINT 'N' PLOTTER

### ZX PRINTER PAPER

Print 'n' Plotter Products also market ZX PRINTER PAPER that gives good, clear print, eminent feeding qualities — probably the best you'll find in the U.K.

**FAST DELIVERY and economically priced . . .** you won't find better!

# Data handling

## Keith Williams of Newport Pagnell gives us some 'pointers' on this oft needed subject.

In my job as a teacher I have, often, to handle large quantities of data which needs to be sorted in a number of different ways. This is the sort of task for which a computer is ideally suited, but how do you write the program to perform these tasks?

Let us take an example. The example that I shall use is one from teaching but one could very easily think of equivalent examples in business, or sports or anywhere else that some form of data base is used.

In this example I will consider a year group of 120 pupils in four classes. They are studying six subjects (Maths, English, Computer Studies, History, Geography and Science). These are referred to by their initial letters. The information I need to store (and sort) is:

Name, Class, Age (dob), Results in M,E,C,H,G,S

So far, this is easy. I can set up a character array A\$(120,50) and put in the information for each child. As parents rarely consider how many letters there are in the name that they give to their child, the amount of string space taken up by the name will vary. Still, this is easily overcome by taking a maximum name length of, say, 30 characters and using Sinclair's "Procrustean" slicing-off of feet or padding with spaces to fit the name into spaces 1 to 30. The rest of the data can be put

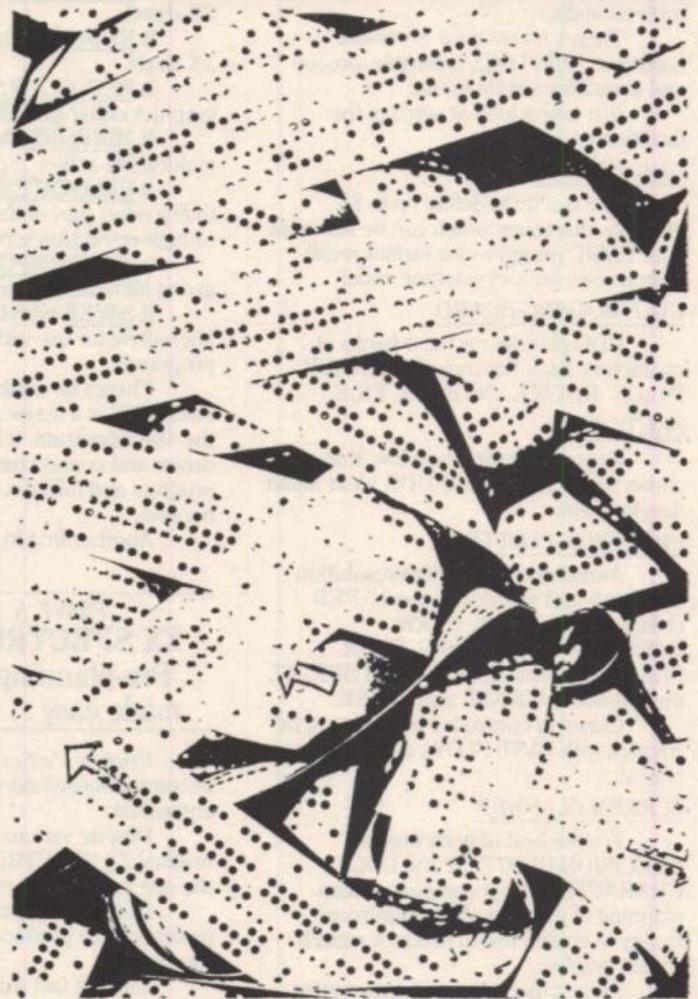

into other specific areas of the string, eg class will be held in A\$(x, 31 to 33).

This is still very simple. But the whole aim of the exercise is not just to hold the data but to be able to use it. I need to be able to sort the list in alphabetical order throughout the year and within each class, in exam result order for each subject and for the total mark overall both within each class and across the whole year. Why is this so difficult? Fig 1 can be used to illustrate this.

If they are sorted in alphabetical order then A\$(1) refers to Fred, A\$(2) to John and A\$(3) to Harold. If I then want to sort according to Maths marks, then A\$(2) has to become A\$(1), A\$(3) becomes A\$(2) and so on. If I now want to sort according to English or History or anything else, then the strings have to play musical chairs. Large amounts of data have to be moved about every-time sorting, resorting and sorting again. Moving large amounts of data is slow and inefficient. Therefore, it is bad programming practice. What is needed is a more efficient way of linking and handling the data.

### Data stacks

This is where planned data structures come in. If we call all the data relating to one child a record, then this is divided into a number of fields as shown in Fig 2.

As you can see, each field is represented by a different array. The common index  $i$  links them all. So, for  $i=1$  then  $N$(i)$  is Fred Bloggs,  $M(i)$  is his maths mark and so on. The importance of the pointer array will become apparent soon. The value of  $i$  will vary from 1 to the total number of students. This can be input

when the program is first run. This number held as a variable, say total, can be used to DIM the arrays. If the initial DIM statements are of the form DIM  $N$(total+5,30)$  then we can hold 30 character long names for each pupil and allow for five new pupils to join the school during the year.

The pointer is used to give the index of the next record in the list. Two other variables are needed, toplist and topempty. When the program is first run the data stack will look like Fig 3a. Topempty tells me the index of the first empty record,  $P(i)$  tells me the index of the next empty record and so on through the chain. When I input data for my first record this will go into the one indicated by  $i=1$ . Toplist will now hold 1,  $P(i)$  will become 0 and topempty will become 2. After 3 record entries my data stack will now look like Fig 3b.

NAME	MATHS MARK	ENGLISH MARK	HISTORY MARK
A\$(1) BLOGGS FRED	30	80	56
A\$(2) COLLINS JOHN	60	27	30
A\$(3) SMITH HAROLD	45	42	70

Fig 1

INDEX	NAME	CLASS	d.o.b.	MATHS	ENGLISH	C.S.	HIST	GEOG.	SCI.	POINTER
$i$	$N$(i)$	$C$(i)$	$D$(i)$	$M(i)$	$E(i)$	$C(i)$	$H(i)$	$G(i)$	$S(i)$	$P(i)$

Fig 2

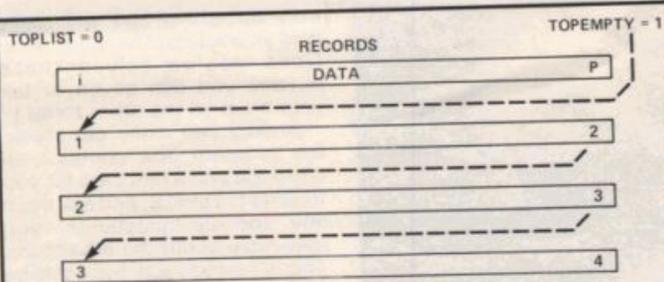

Fig 3a

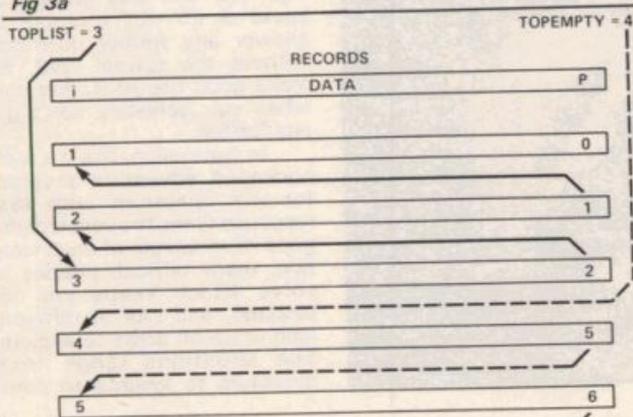

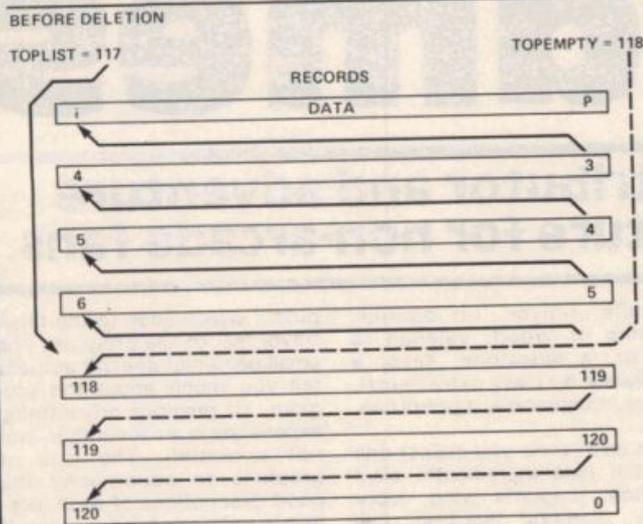

Fig 3b

AFTER DELETION

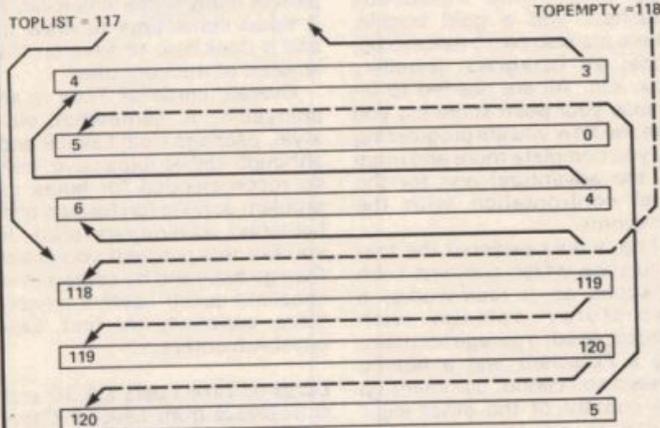

Fig 3c Removing a record from the list

## Adding and removing records

If a child leaves then I don't even have to delete his record. I just add it to the empty list (on the end) and adjust the relevant pointers. Fig 3c shows what happens to the data stack when the student whose record is held in 5 leaves the school. Note that no data has been moved, just three point values changed. Similarly if a new pupil arrives, he is assigned the data lock pointed to by the variable `topempty` and then this block is tied on to the full chain in the relevant position. Again three pointer values altered and no data moved.

## Sorting

What about sorting? My original problem was how to sort the data in  $n$  different ways efficiently and without moving masses of it around. Well, this is where my rather complex method of storing data comes in to its own. Let us take the simplest case of only sorting by one criterion, eg alphabetical order.

Using the original model we would compare two strings. If one was 'greater' than the other then they would swap places using some such lines of BASIC as:

```
1000 IF A$(i) > A$(j) THEN LET
B$ = A$(j); LET A$(j) = A$(i);
LET A$(i) = B$
1010 NEXT j: NEXT i
```

On our model we would move just two numbers not massive data blocks:

```
1000 IF A$(i) > A$(j) THEN LET
temp = P(j); LET P(j) = P(i); LET
P(i) = temp
1010 NEXT j: NEXT i
```

But this is not the end of the story. If  $P(i)$  is the pointer in sorting by alphabetical order, we can use other pointers to sort by all other criteria. For example,  $r(i)$  could be the pointer for sorting by Maths mark,  $q(i)$  for sorting by English mark and so on. We would need new variables to act as pointer to the top of each list, eg `topmaths`, `tophist` etc.

The sort routines can be as above so that if  $m(i) > m(j)$  then  $r(i)$  and  $r(j)$  would swap values.

To print names in order of maths mark we would use a routine such as:

```
5000 POKE 23658,8
5010 INPUT " Hard copy or
to screen (H/S)"; LINE
B$
```

```
5020 IF B$(1) = "H"
THEN OPEN #2,"p"
5030 LET i = topmaths
5040 IF i = 0 THEN RETURN
5050 PRINT N$(i)
5060 LET i = r(i)
5070 GOTO 5040
```

Line 5000 locks on CAPSHIFT (see ZX COMPUTING Vol 1 No 8 p 126) Lines 5010 and 5020 direct output to printer or screen. 5030 print the names held in the `topmaths-r(i)` pointer chain in the sorted order.

## Final tidying up

All that really remains now is to tidy up the many arrays and then sit down to coding.

The neatest way to hold all the pointers and numerical data is in one three-dimensional array. If we do this in the array `a()` then it would be DIMmed `a(m,2,i)`.

The first dimension -  $m$  - represents the number of fields which will be stored or sorted (don't forget to allow for the string arrays). The second dimension - 2 - represents pointer or data. The numerical data held in 1 and the pointers held in 2. Finally, the third dimension -  $i$  - holds the actual data and pointers ( $i$  here is the index that we have used throughout).

If maths, for example, were held as field no 3, then the maths sorting routine described above would be written comparing `a(3,1,i)` with `a(3,1,j)`, if it is larger then we would swap pointers `a(3,2,i)` and `a(3,2,j)`

Only two routines are needed to sort the data - a string sort routine and a numerical sort. First a string array is set up to hold the names of the fields - say `S$` - so that `S$(2)` holds ENGLISH, `S$(3)` holds MATHS and so on. Remember to hold these as capitals and to convert all input into capitals. Then a simple FOR - NEXT loop will find the correct field:

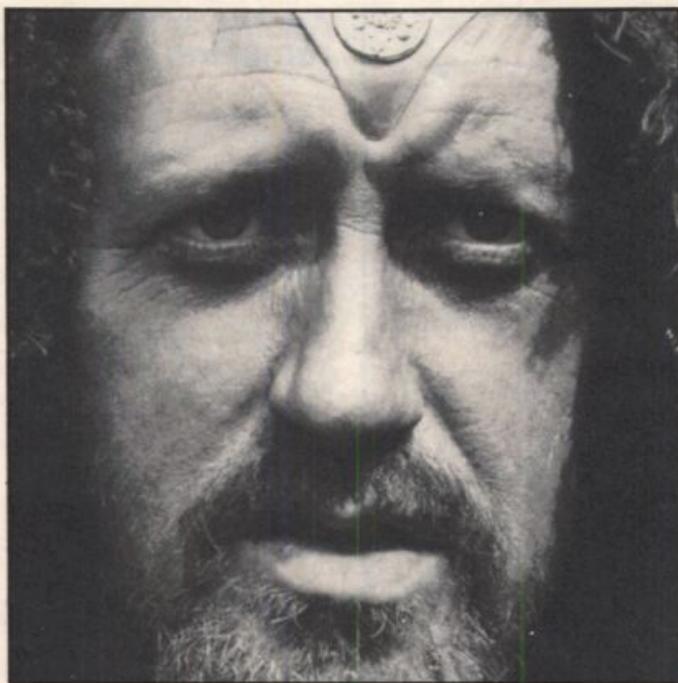

```
8050 INPUT "Which field do
you want to sort?"; LINE B$
8060 FOR n=1 TO Number of
fields
8070 IF S$(n,1 TO 3) = B$(1
TO 3) THEN GOTO number sort
8200 REM number sort
8205 IF a(n,1,i) > a(n,1,j)
..... and so on as before
```

The routine above can also be used to automatically direct operation to the string sort routine. Similarly, the print subroutine can use `Ss`.

A data saving and loading facility needs to be written to make the data base program complete: now all that is left is the coding!

Level 9 are well known for their adventure programs. Their latest offering, *Lords of Time*, follows hot on the heels of the Middle Earth trilogy (*Colossal Adventure*, *Adventure Quest* and *Dungeon Adventure*) and the Silicon Dream trilogy (*Snowball*, *Return to Eden* and *The Worm in Paradise*). *Lords of Time* is written in what is called "a super-compact adventure language; a-code". This gives fast response times with long text messages but doesn't occupy much memory.

The tape comes in an attractive (if superfluous) large package and has a brief ten-page pamphlet (like *Dark Crystal*) which contains highly cryptic clues in the form of an introduction and a poem. The tape appears to be well duplicated and loads first time. Although it only occupies 32K of memory, the program is very wide in scope, having some 300 locations, 750 messages, and about 80 objects. The objective is to

very absorbing and will easily hold your interest for some time. Once you've solved these puzzles you can go on to tax your brain on the other zones.

Should you really get stuck, the program box contains an envelope and a hint card for you to send to Level 9, and ask them any specific question(s) you may have about the adventure. This is a nice touch, but could be your one and only chance as Level 9 do not promise to answer any further questions without the special card. So make good use of it, and only when you definitely can't get any further.

In conclusion, this is a well-packaged adventure program for the Spectrum with fast response times to avoid tedium, good descriptions of each location, many difficult puzzles to solve which keeps you interested, and lots of different (and unusual) areas to explore. The situations range from dinosaurs to knights to com-

# Mindgames

**Greg Turnbull, regular contributor and adventure fanatic, begins a regular feature for non-arcade fans.**

score points by collecting each of 9 ingredients and 18 treasures.

Bonus points are awarded for certain actions and for completing the game; points are lost if you get killed! The central location point is the clock from which nine time-zones can be reached. These must be completed in numerical order, as objects from previous zones are required to solve problems in subsequent ones. The ultimate aim of the adventure is to defeat the evil *Timelords*.

The program recognizes most of the usual adventure words such as: examine inv(ventory), score (out of 1,000), drop, look, give, take, N, S, SE, NW, U, D, forward, backward, enter, get eve(rything), search, open, wear, it, etc. AGAIN repeats the last command but there is no HELP routine. The vocabulary understands some 200 words and will accept short sentences, eg search the bedroom, examine the clock, etc. However, you may need to rephrase some requests that it doesn't understand.

The usual quit/save game features are available — the word RESTORE will load a previously saved situation. This feature is always welcome if you get stuck and want to go away and think about a problem over a cup of tea. The speed of reply is excellent and the scenes described are very detailed. However, no graphics are available as this is an old-style adventure without character interaction and not in 'real-time'. Hence it suffers badly in comparison to the likes of *The Hobbit* and *Valhalla* — perhaps the closest equivalent would be Artic's series of text-only adventures.

Some of the problems are very perplexing; one of the earliest being how to get to each of the time-zones, and later how to get the maddeningly-elusive keys under the door of the garden shed! Each of the time-zones contains various locations and problems for you to solve. Numerous objects are provided to help you in these tasks, eg a rope, spear, tin of catfood, metronome, a pick, matchbox,

candle, mirror, tin opener, planks of wood, valerian (a plant), a lodestone, keys, a rucksack (to carry extra items), coins, mushrooms, a petrol can, etc.

In each zone you collect one of the nine ingredients: olive branch, dragon's wing, ivory tusk, diamond teardrop, evil eye, dinosaur's egg, jester's cap, silicon chip (the program has some nice humorous touches) and a gold buckle. There are also two treasures per zone, an hourglass, jewellery box, etc. All are needed to increase your point score (so you can see how you are progressing as you complete more and more of the adventure) and for the final confrontation with the *Timelords*.

I have only explored the first time-zone which contains such locations as a road-works, a two-storey cottage with garden, shed, a garage (containing a Porschel) and a nearby stream so I cannot comment on the content of the other eight sections of the program. However, this early section is

puters which adds to the time-travel feel of the program. The small pamphlet doesn't actually tell you much about the program, so previous adventuring experience is an advantage (but not essential). The lack of graphics to accompany the good descriptions of each location is a shame, but I suppose it could be said that you can get bored with looking at the same picture many times (especially if it takes some time to draw it) and it does help to save on the amount of memory used.

Overall, *Lords of Time* is an enjoyable, if somewhat old-style, package from Level 9 and although rather expensive, can be recommended for hours of problem-solving fun for new and hardened adventurers alike. If you like this program you could then go back and try some of the excellent earlier Level 9 adventures, especially the first, *Colossal Adventure*.

*Lords of Time* costs £9.90 and is available from Level 9 Computing at 229 Hughendon Road, High Wycombe, Bucks.

# De-bugger

Getting a program typed in is often only the start of your problems. Ed to the rescue.

Typing in a program is a useful exercise. Apart from the patience required, techniques learned and the end program to be used, probably the most educational part of it is tracking down the bugs introduced by yourself or occasionally by our publication system.

In debugging you gain a much deeper insight and understanding on how the program actually works than by merely typing it in, but tracking down these errors is an art in itself and needs some skill. So here are some tips to help you in your efforts when faced with that cryptic error report!

## 1 NEXT without FOR

Look back through the program, either the loop has not been set up — no related FOR 'letter' = No1 TO No2 line, or the letter has been re-used as an ordinary variable within the loop with a LET 'letter' = No.

## 2 Variable not found

This is one of the most common errors. Again, the problem may not lie in the line where the error was detected and reported. If there is only one variable, which may be one or more letters or a string (\$) variable, then that is the problem. There may be more than one variable in the line section reported and you will have to identify the offending one. In a line PRINT AT Y,X;A\$ the culprit could be Y or X or A\$. To find out which of them is causing the problem (it may be more than one) type in turn as a direct command:

```
PRINT Y Enter/Newline
PRINT X Enter/Newline
PRINT A$ Enter/Newline
```

Note which produces the error report. Now look back through the program printout for the line which sets it up — usually a LET or FOR command. Did you leave it out? Does the program get there or has a GOTO/GOSUB been wrongly addressed?

## 3 Subscript wrong

Connected with DIM A(No) or DIM A\$(No). If the number in the brackets on the line where the error is reported is greater than the one in the original DIM statement, is not an integer or is less than 1, then this report is generated. If the subscript — number in brackets — is a number then check and change, however, if it is a variable then follow the procedure for tracing variables. It has probably exceeded the limits, look for lines with the variable being altered with + - \* / : if necessary add limiting code. For example:

```
IF X >10 THEN LET X = 10
```

## 4 Out of memory

As well as for programs which are too big, it may happen if the previous program set RAMtop. Before despairing, enter CLEAR USR "a" -1 on the Spectrum: on the ZX81 SAVE the program, turn the machine off and on, then reload the program.

## 7 RETURN without GOSUB

Somehow the computer has reached a RETURN command other than via a GOSUB instruction. Check a GOTO hasn't been entered in place of a GOSUB. Check for a missing GOSUB.

## B Integer out of range

An integer (whole number) either as a number of variable is too big or small and you are attempting to do something like PRINT AT 0,33 — not allowed! Check any variables involved as per report 2 and trace it back through the program looking for adjustments to it by + - \* / : Add limiting code if needed — see report 3

## E Out of DATA

A Spectrum problem. Check the number of DATA items match the number of READs; usually one (or more) has been missed out. Attempting to reread a DATA list without first using a RESTORE command will cause

this and it can happen on an auto start program (saved with a LINE number). Good programming usually RESTOREs to the correct line number before using READ.

## I FOR without NEXT

See report 1 but this time the NEXT is missing!

Note that the letters I have used for examples could be ANY letters not just A\$,X,Y etc and depend on the particular choice of the programmer.

This is by no means a comprehensive list but I have tried to cover many of the most common error reports. Personally, I get almost as much satisfaction from debugging as I do from programming I do assure you, however, that there is absolutely no truth in the rumour that we deliberately inject bugs into our listings in order to introduce you to the dubious delights of debugging!

# Conversion tips

## A guide to ZX81 / Spectrum program conversions from David Nowotnik.

The versions of BASIC offered by the two ZX computers are so similar that many programs for one can be used by the other. The ZX81 has only two commands which are not present on the Spectrum, SCROLL and UNPLOT, and these should cause you few problems when converting ZX81 programs to the Spec-

trum (see Table 1).

There are quite a lot of commands and functions on the Spectrum which are not available on the ZX81. A list of these appears in Table 4. The stars indicate those commands and functions for which there is no simple translation to ZX81 BASIC. Those for colour and sound can be omitted;

but you will have to find some alternative for the high resolution and file I/O commands.

The command PLOT appears on both computers, but the effect is quite different, so beware! Another tip: PEEK and POKE should be used with caution. In conversion, addresses will almost certainly have to be changed. Some of those

changes appear in the tables. A command such as POKE USR "a" . . . on the Spectrum indicates User Defined Graphics; ZX81 users don't have this facility, so you'll have to omit this and use a standard character instead.

ZX81	Spectrum	Comments
SCROLL	RANDOMISE USR 3582 or LET t=USR 3582	If the program uses random numbers, they could become rather predictable with the first option. If so, use the second, using a variable (in this case t) which is otherwise not used.
PLOT Y,X	PRINT AT 21 - Y/2,X/2;	Print the appropriate quarter square graphics character.
UNPLOT Y,X	PRINT AT 21 - Y/2,X/2;	Print a space, or the appropriate quarter square graphics character.

Table 1 ZX81 to Spectrum conversions.

Spectrum	ZX81	Comments
BIN eg LET y = BIN 10010101	LET y = (decimal no.) Conversion to decimal: 10010101 = 149  128 64 32 16 8 4 2 1 Add these numbers together when a 1 appears at the appropriate position in binary.	BIN allows the representation of a number in binary. On the ZX81 use the decimal equivalent, but beware; BIN is often used with User Defined Graphics, which are not available on the ZX81.
READ/DATA eg READ x,y DATA 50,60	LET LET X = 50 LET Y = 60	READ and DATA are used to store a lot of information in a program. Use LET instead.
DEF FN and FN eg DEF a(x) = SQR x LET t = FN a(i)	LET X\$ = "SQR X" LET X = 1 LET T = VAL X\$	The defined function can appear in a string. Use the keyword for built-in functions (eg SQR). The equivalent of FN may need 2 lines, as shown.
PLOT	no equivalent	
SCREEN\$ eg LET a = SCREEN\$ x,y	LET A = PEEK(PEEK 16396 + 256 * PEEK 16397 + 1 + Y + 33 * X)	Used in interactive games to detect characters in the display file. Note — this formula only works when a RAM pack is fitted.

Table 2 Spectrum to ZX81 conversions.

## PROGRAMMING TIPS

### ZX81

1 FRAMES  
POKE 16436,255  
POKE 16437,255

LET T = (65535 - PEEK  
16436 - 256 \* PEEK 16437)  
/50

2 Line number zero

POKE 16510,0

3 RAMTOP

POKE 16388,X - 256 \* INT CLEAR x  
(X/256)

POKE 16389, INT (X/256)

*Table 3 General interconversion hints.*

### Spectrum

POKE 23672,0:POKE 23673,0

LET t = (PEEK 23672 + 256 \*  
PEEK 23673)/50

For times greater than 10  
minutes, you can use byte  
23674 as well.

POKE 23756,0

(As the start of BASIC can  
move, eg with microdrives)  
use with caution.

CLEAR x

### Comments

Both computers have a counter  
which accurately varies by 50  
every second. In the example,  
use the first line to start the  
'clock'. The variable T will  
have the time in seconds after  
the start. The counter can  
only be used for 10 minutes.

Converts the first line of a  
program to line number zero,  
which cannot be edited, and  
so is protected.

Creates a safe area at the  
top of RAM starting at address  
x, for storing data, machine  
code etc.

BEEP	*	FORMAT	*	ATTR	*

## CERAN SOFTWARE

**Professional Software for the  
ZX MACHINE CODE Programmer**

### "CODESCAN" MACHINE CODE MONITOR

- Memory and contents display. Single step and rapid scroll up/down facility.
- Address-change facility for rapid access to any part of memory.
- Edit with automatic scroll feature.
- Run and post-run register display.
- Resides above RAMTOP leaving memory free for normal BASIC use.
- On-screen instructions and all functions shown on a single display.
- Supplied with user guide incorporating test schedule.
- Available for ZX81 16K and SPECTRUM 16/48K.
- Price £5.25 including VAT and P&P. Despatched within 7 days of order.

Please include your name and address.

*Cheques/PO's payable to:*

**CERAN SOFTWARE**  
9 Parliament Road, Thame, Oxon OX9 3TE

### MAIL ORDER PROTECTION SCHEME

If you order goods from Mail Order Advertisers in this magazine and pay by post in advance of delivery, this publication will consider you for compensation if the advertiser should become insolvent or bankrupt, provided:

1. You have not received the goods or had your money returned; and
2. You write to the publisher of this publication explaining the position not earlier than 28 days from the day you sent your order and not later than 2 months from that day.

Please do not wait until the last moment to inform us. When you write, we will tell you how to make your claim and what evidence of payment is required.

We guarantee to meet claims from readers made in accordance with the above procedure as soon as possible after the advertiser has been declared bankrupt or insolvent to a limit of £1,800 per annum for any one advertiser, so affected, and up to £5,400 p.a. in respect of all insolvent advertisers. Claims may be paid for higher amounts, or when the above procedures have not been complied with, at the discretion of this publication, but we do not guarantee to do so in view of the need to set some limit to this commitment and to learn quickly of reader's difficulties.

This guarantee covers only advance payment sent in direct response to an advertisement in this magazine (not, for example, payments made in response to catalogues, etc. received as a result of answering such advertisements):

**CLASSIFIED ADVERTISEMENTS ARE EXCLUDED.**

# Currency conversion

If you're going abroad this summer, this program from K J Rider in Kingston is a must!

Currency Conversion will store and retrieve the rates of exchange between sterling and any other currency of a wide range of countries.

Keith has used some neat programming techniques to fit it into 16K, one of which is holding the rates of exchange in a REM statement and using the PEEK/POKE functions to store and retrieve it. The program even allows for lucky microdrive users by using the system

variables to get the 1 REM address.

When first run you will have to use the option to set up each of the exchange rates (these can be found at any bank) and the program will crash if they are not entered before attempting to convert currencies. Countries other than those supplied in the listing may be changed or added to and the following notes will help you to make any adjustments.

## Program details

1	REM statement used to store the currency conversion rates
20-30	Strings containing various instructions and information
35	Sets CAPS SHIFT on the Spectrum
40-45	Prints titles
50	String with countries and currencies, modify for other places but watch spacing and positioning.
60-69	Prints Menu
70-80	SAVE or get rate of exchange
90-650	Display routines
1000-15	POKE new rates to place in REM
1500/05	SAVE routines
5000/50	Get new rates routines
6000	DATA of B\$ offsets for each country used in printing the correct country and currency in line 90

Bon voyage!

```

# Kelwood ZX-tras

## BACKPACKS

Six versions of this indispensable unit complete your computer. All have SAVE/LOAD and ON/OFF switching and a housing for the transformer. Compatible with interface one. Ideal for use with cased keyboards

Ref BP1 - Fully variable sound amp - 3 x 13 amp sockets, switch and neon indicator - cable and plug ..... £27.50

Ref. BP2 - as BP1 but no sockets, cable and plugs. Has room to fit your own 'Duraplug' sockets ..... £19.50

Ref. BP3 - as BP1 but no sound ..... £21.50

Ref. BP4 - as BP1 but no sound or sockets ..... £13.05

Ref. BP5 - ZX81 version inc. sockets, mains switch neon, cable and plug ..... £20.85

Ref. BP6 as BP5 but no cable or sockets ..... £12.85

## MICROSTATION

17 square tray for above plus computer and tape  
Ref. MS £7.50

## WOBBLE STOPPER

**STOPS ZX81 RAM-PACK WOBBLE**  
Flat: Ref SW £5.25. Tilted: Ref STW £6.25  
Extra long for printer - Flat: Ref LW £5.75. Tilted: Ref LTW £6.75

## Complete your computer

With the **KELWOOD SOUND POWER BASE** has all the 'basic bits' that Sinclair left off.

- Fully adjustable sound amplification
- LOAD/SAVE switch
- Angled stand
- ON-OFF re-set switch

Does not take up any extra space • All wires included • Saves wear and tear on connections • Gives out distinct click with each key depression • Amplifies all sound on program and on cassette • Does not need batteries • Does not interfere with inside of Spectrum or any other add-ons • No soldering required, simply plugs in REF SPBI £19.90  
Standard Power Base without sound SPECTRUM REF PBSI £13.50 ZX81 REF PBZXI £13

## COOL-IT UNIT

Takes the heat out of your computer. Lets your Spectrum or ZX81 run much cooler.

Separate Cool-it Unit  
ZX81 Ref ZXC £11.65 Spectrum Ref SC £11.85

Cool-it units built into other Kelwood add-its  
Power Base (Spectrum) Ref PBSIC £18.55 • Power Base (ZX81) Ref PBZXC £19.35 • Sound Power Base (Spectrum only) Ref SPBIC £25.00 • Back Pack 1 Ref BP1C £32.55 • Back Pack 2 Ref BP2C £24.55 • Back Pack 3 Ref BP3C £26.55 • Back Pack 4 Ref BP4C £18.60 • Back Pack 5 Ref BP5C £26.90 • Back Pack 6 Ref BP6C £18.90 • Wearsaver (Spectrum) Ref WSSC £16.00 • Wearsaver (ZX81) Ref WSZXC £15.80

## WEAR SAVERS

Cuts out wear and tear on plugs and sockets • Switching for SAVE/LOAD and 9 volts ON/OFF • Simply plugs in  
Spectrum Ref WSS £9.95  
ZX81 Ref WSZX £9.75

# The ZX81 goes Forth

Peter Shaw tries an unusual variation on an old favourite.

When the Ed told me about a ZX81 with a Forth ROM the same thoughts flashed across my mind as when I heard someone had linked the '81 to a 800K disc drive and an Epson printer: for what possible reason would they go to the trouble? Well, although I have the same feelings about the drive and printer, Forth on the '81 is a slightly better idea.

The EPROM is either sold as a single complete unit, ie a ZX81 with a Forth EPROM fitted, or as a 'diy' conversion kit, so that you can take your existing ZX81 and exchange the BASIC ROM for Forth.

Fitting the chip is quite simple, if your BASIC ROM is in a holder. All you have to do is whip one out with a screwdriver, and drop in the new one. If your BASIC ROM is soldered in then you'll probably be better off just buying the complete Forth package. David Husband, the producer of ZX81-Forth, calmly tells you

to de-solder the basic ROM in one line of the manual. Taking one of those ROMs out is not very easy for one thing, and even if you do manage to get it out, you'll probably never be able to use it again and you might have damaged some of the other chips on the PCB while using the soldering iron.

Once you've managed to get your EPROM in and working, what have you got? Well, it's not the Fig-Forth that I know and love, but what it loses on the swings, it gains on the roundabouts. ZX81-Forth is fast. I mean FAST, even compared to other versions of Forth it is pretty nippy. In AUTO (FAST mode), the Forth version of a FOR-NEXT from 1 to 30000 takes less than 1 second. One major feature of Forth is that it is 'Multi-tasking' this means ZX81 Forth was probably developed with real-time controlling in mind. There are no graphics, as such, so the games players

amongst you will be disappointed if you think this will provide a simple way of writing games without resorting to machine code.

I couldn't find any bugs in the system while I was playing with the machine, this seems too good to be true!

## Conclusions

As ZX81-Forth is based on TREE-FORTH and not the popular Fig Forth, I am not as thrilled with ZX81-Forth as I could have been. There must be a very limited market for ZX81 owners who want to run their hot-water boiler with a Forth program written on their small Sinclair. Apart from that, ZX81-Forth is a well written ROM.

*Addendum: Since Peter wrote this review I have had many conversations with suppliers*

*of control units who all said that the ZX81 has taken on a new lease of life with Forth as a control unit — one telling me of a University which has installed several to monitor experiments.*

*Although, as Peter says, perhaps the home user may have a limited, specialised use for it, I find it interesting to know of the applications for which the humble home computer is being used. If you know of any special ways in which these machines are being used, why not write in and let me know.*

*Spectrum owners are not forgotten as David Husband also supplies a FORTH ROM unit for this computer. RE*

ZX81 Forth costs £25 plus £2 p&p. (VAT is not included.) It is available as an EPROM, or complete ZX81 with EPROM fitted from: David Husband, 2 Gorleston Road, Branksome, Poole, Dorset BH12 1NW.

# Snake Trap

**Don't get hissterical over this chase game from Pete Cooke in Leicester!**

In this program, your snake (the grey squares) has to try and trap the computer's snake (inverse 'c's). You can move using the arrowed keys 5 to 8.

The squares occupied by the snakes are contained in two 1 dimensional arrays, A(50) and B(10). For the player's snake, two pointers, AA and AB, move by POKing in the new head at A(AA) and wiping out the tail at A(AB). Changing (AA-AB) lengthens or shortens the snake.

As the computer's snake is always ten squares long, it only needs one pointer, BB moving through the array. The old value of B(BB) is overwritten and the new value replaces it.

## Line by line

Here follows a breakdown of the program which should help you understand the listing a little better:

90-660

Forms the game loop. The player's move is input and the computer line 150 checks that it is to an empty square. Line 130 allows for the player's snake finding food. Lines 300-550 check for the computer's snake. If the next square is a wall then it is either right or left at random.

1000-2050

Shows who has won the game and reruns the program for another game.

5000-6990

Sets up the variables and gives instructions.

7000-7200

Sets up the board.

## Variables

A(50)

Positions of player's snake.

B(10)

Positions of computer's snake.

AA,AB,BB

Pointers in the arrays.

P(4)

Codes for the four directions N, S, E and W.

# ZX designer

Make the most of your Spectrum's designing facilities courtesy of Chris Timson of East London.

This program allows you to create designs on your Spectrum using the PLOT, DRAW, and OVER commands.

After specifying the BORDER, PAPER and INK colours, you are invited, through user friendly instructions, to either plot a point, draw a line, or plot and draw over a line (in order to remove any mistakes). It is worth noting that DRAW always draws from the last point plotted, so that if you want a line separate from the last point drawn you must plot a point first.

On this last point, one of the major drawbacks (pun intended) of the DRAW command is that the co-ordinates of the end of the line are offsets of the last point plotted. However, it is quite easy to programme around this by using the two system variable, bytes 23677 (which holds the x co-ordinate of the last point plotted) and 23678 (which holds the y co-ordinate of the last point plotted).

The functions defined in lines 10 and 20 subtract those held in these bytes from the absolute screen co-ordinates you wish to draw to and gives the offset values required by the DRAW command. This method has ramifications for graphics work far beyond the scope of this relatively simple, if enjoyable, program and you should be able to make very good use of it in other graphics applications.

```

# AGF Joystick Interface II for Spectrum or ZX81

**9.95**

Now the AGF Interface II is even better value. Since we pioneered the cursor-key interface in October 1982 there are now over 100 games or utility programs with either the AGF option or cursor key controlled - that makes it unbeatable at this new low price.

Still incorporating the all important rear expansion connector which means other peripherals can be connected at the same time i.e. Ram Packs, Printers, Speech Units etc, and of course the key replication principle used guarantees this will never conflict electrically with any other add-ons.

When you feel like upgrading to a more flexible joystick system you can claim 12.5% off the purchase price of our Programmable Interface.

All AGF Joystick interfaces will work with any industry standard joysticks using 9-pin 'D' plugs - including QuickShot II and the new Trackball controllers.

Don't settle for less ..... choose AGF.

## Joysticks

The choice is yours. The standard QuickShot is excellent value incorporating suction cups for sure-footed precision and a comfortably contoured handle with a convenient top firing button, plus conventional button in the base.

Four feet of cord terminates in the industry standard 9-pin 'D' plug for compatibility with our interfaces or direct connection to a selection of home micros.

The new QuickShot II has improved styling with a trigger type firing control as well as the top firing action and a broader base for greater suction stability. The rapid fire switch, which allows a continuous stream of shots where normally a button press is required for each one, is located in the base for easy access in use.

Cord length and termination is as the standard QuickShot controller.

**8.95**

The ALPHACOM 32 high-speed, thermal printer is compact, lightweight and quiet in operation. No maintenance is required for the life of the machine (i.e. no ribbons to change). Fully interfaced to the SPECTRUM and ZX81, this printer operates at 2 lines per second, with full 256 x n dot graphic capability, 32 column line width. It uses the standard Sinclair print commands (COPY, LLIST, LPRINT). Paper rolls only £1.00 per roll – 25 metres long.

## Alphacom 32

This thermal printer, now available in the UK, is the standard printer which has sold in tens of thousands for use with the American version of the ZX81.

Special Function Keys

### WOKING COMPUTER CENTRE

32 Chertsey Road, Woking, Surrey.  
Telephone Woking (048 62) 23845.  
Trade enquiries welcome

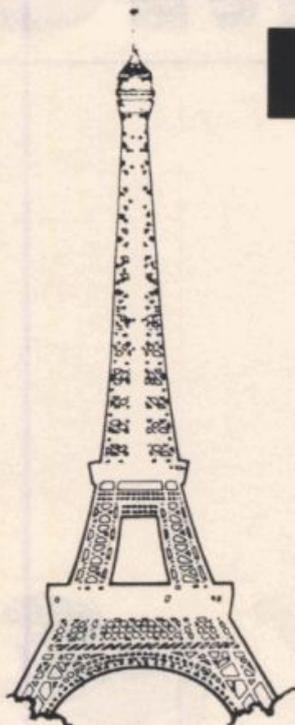

Many customers have fallen for the classical good looks of the Emperor, its slim appearance, clean lines, the perfect typing height and the professional feel of the full travel keys. Now we have added the CRUSADER to the range, identical in appearance but purpose built for the serious programmer, typist or business user. It is the same size, 14.5"x7.3"x2" fitted, in Ivory, but has a triple matrix featuring 22 AUTOSHIFTED function keys: all the microdrive command/maths keys ÷ × = - + # are together in the top right hand corner, main punctuation , . ; : " where typists expect them, autoshifted cursors, Caps lock, \$, Graphics, < >, Edit and DELETE. We have retained the convenience keys, ◁(7), ▷(6), fire (0), double caps shift & symbol shift for easy access to the extended modes, and the full sized space bar.

We have also maintained: the easy fitting, you need 1 screw driver – and 5 minutes AND, for a quality keyboard, incredible low cost of £59.95.

Please send me Emperor/Crusader keyboard(s), £49.95/£59.95+£1.50 P&P  
I enclose cheque/PO /Access/Visa No.

# Parlez-vous Micro-PROLOG?

Although I enjoy learning and exploring new computer languages, when I saw the Sinclair Micro-PROLOG package I was a little worried to say the least at the size of the manual and its complexity.

Still thinking that I had let myself in for a pretty stiff little number, I dived into the introductory manual which is much thinner and aimed toward your average Specy user. After three pages of how to switch your computer on and how to load a program, I finally found out about the SIMPLE language. SIMPLE is a program which changes the way you use Micro-PROLOG so that it is not too confusing at first. I was quite impressed, I managed to follow what the manual was telling me without becoming hopelessly lost.

PROLOG itself is a logically-structured language; that is, it is no where near as messy as BASIC, but then it is not as easy to grasp as BASIC. Consider the Micro-PROLOG line:

which (x : x larger London)

Taking this line step by step, first we have the command 'which'. This is asking Micro-PROLOG a question. The question is contained within the brackets and is in the form 'out-

**Our reviewer has taken a look at an up and coming language from Sinclair.**

put format:argument'. In the example above I am dealing with cities and am looking for all the cities 'larger' than London. The word 'larger' in itself doesn't mean anything to Micro-PROLOG, what it is doing is just looking through its database and finding any places where a city has been specified as larger than London.

The large green manual which accompanied the cassette was far beyond me. I found I could use the program quite well enough just by following the small booklet.

The main use of Micro-PROLOG is obviously 'do-it-yourself' database. Tailoring the filing system to your own requirements is very simple. Once you have a knowledge of Micro-PROLOG, you can create a database far better than any commercially available — because you know exactly what you want from the system. Table 1 shows the commands available and their syntax.

The loading and saving operations are similar to that of the BBC in that they load in blocks and it is very slow. It is quite reliable though, and the programs you write are not likely to be too large anyway.

Micro-PROLOG was written by Logic Programming Associates Ltd, and is available from most high street stores under the Sinclair label priced at £24.95.

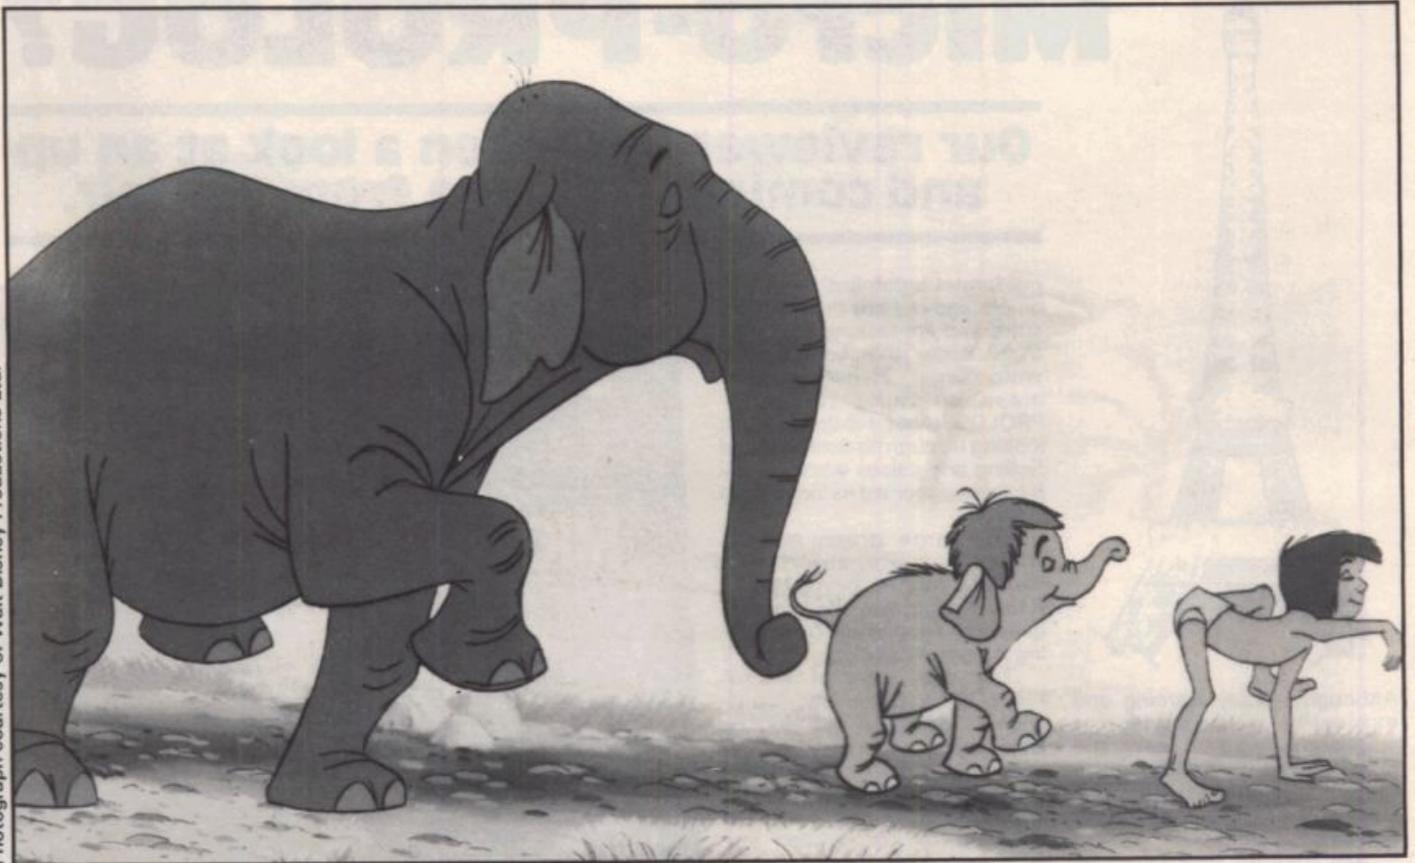

Table 1. Commands and Syntax

add (argument)  
list description  
is (argument)  
which (output format: argument)

delete description  
kill description  
save program name  
load program name

This will produce a YES or NO response  
This will produce all objects, etc, which fit the argument.  
This takes out single arguments  
This takes out whole blocks

## A game calculated to give you brain strain from Stephen Proctor in Avon.

This is an unusual version of the old electronic game in that PLOT and DRAW are used to create a very large solid circle. A loop is set up for the X co-ordinate then a line is drawn using two numbers stored as DATA.

These numbers are the Y co-ordinate for the start of the line and the length of the line.

Another unusual feature is that up to eight players can play! Each player has a score which is equal to the number of colours in

his sequence, provided that he gets it right of course. The game is simple but addictive; all you have to do is watch the sequence of colours presented by the computer and then repeat them in the same order.

Full instructions are included in the program and when prompted with "Up to" at the start of each game enter the score which one of the players must reach before the game ends.

## Quality programs from HARTLAND SOFTWARE

### Hartland Software's Famous FOOTBALL POOLS PROGRAM

This program has proved exceptionally popular so far, winning several dividends! The program lists out, in order of preference, the sixteen most likely score draws; also the sixteen most likely home wins, draws (including 0-0) and away wins. The program will be initialised to the English and Scottish league tables, but you can use it on the Australian pools just as easily, by altering the built-in team names and saving them on another cassette. At time of press, this is the ONLY pools forecasting system that uses purely statistical methods!  
FOR ZX81 (16K) or ZX SPECTRUM (48K) ..... **£6.95**

### MISTERMIND

Hartland Software's version of the popular board game, commonly known as "Bulls and Cows". Not only can you play the game with this program, but you can take the computer on. You will find it very hard to beat!  
FOR ZX SPECTRUM (48K) ..... **£6.95**

### TOP DOG (formerly marketed by BOSOFIT)

A game simulating the world of dog showing and breeding. You start with £500 to buy your first pair; the object of the game is to win the Cruft's Supreme Champion prize without going bankrupt!  
FOR ZX SPECTRUM (48K) ..... **£5.95**

### TRAVELLING SALESMAN PROBLEM

Not a game, but a fascinating insight into the world of network theory. The travelling salesman problem is an old one. You have a number of towns (with their grid references); the object is to find the shortest route so that the salesman visits each town once, then returns to his original starting place. This program uses the 2-optimal method to tackle the problem.  
FOR ZX SPECTRUM (48K) ..... **£8.95**

HARTLAND SOFTWARE, (DEPT Z), 32 IVOR PLACE,  
LONDON NW1 6DA

## AUF WIEDERSEHEN *Chérie* SUPER GERMAN VOCABULARY TEST & SUPER FRENCH VOCABULARY TEST

Tutorial Software have greatly improved their successful German & French language tutors.

These Programs provide an extensive basic vocabulary. By using the 'Add New Words' facility the range of vocabulary that can be learned becomes limitless.

If you are studying for G.C.E. 'O' level or just interested in languages let these programs take the pain out of learning.

Programs £6.95 each and are only available for the 48K Spectrum.

### Features:-

- \* 550 Foreign Words.
- \* Nouns, Verbs, Adjectives & Adverbs.
- \* Gender & Accents.
- \* Learn Mode & Test Mode.
- \* Add New Words Facility.
- \* Score Record And Average Score.
- \* Words Checked By Language Teachers.

### Cheques or P.O.'s to:-

Tutorial Software  
P.O. Box 43,  
Enquiry Office  
22 - 29 Mill Street,

## LIBRARY OF ADVANCED MATH/STAT/ECON FOR SINCLAIR ZX81 AND SPECTRUM

**TAPE 1: MATRIX OPERATIONS (\*), (+) £9.95**  
SIDE A: Inversion, multiplication, addition, subtraction, scalar multiplication and determinants of matrices and vectors within one single program. Any output can in turn be used as the input of the next operation without re-typing. Capacities: 16K ZX81: 25x25, 16K Spectrum: 15x15, 48K Spectrum: 48x48.  
SIDE B: Determinants of square matrices.

**TAPE 2: POLYNOMIALS (+) £6.95**  
SIDE A: Includes quadratic equations (as degree 2 polynomials) and Newton-Raphson and half-interval search methods for higher degree polynomials. Computes the real roots with 8 digits of precision. SIDE B: Plot of polynomials in any interval, values of real roots, extremum points.

**TAPE 3: INTEGRATION (+) £6.95**  
SIDE A: Simultaneous integration of two functions by Simpson's and trapezoidal rules. Also computes the area enclosed between the two functions. SIDE B: Plot of two functions in any interval. Integrated area shaded.

**TAPE 4: SUPER-REGRESSION (\*) £14.95**  
SIDE A: A highly developed multivariate regression program with log/ln option on each variable, allowing for exponential and geometric regressions. Displays estimated coefficients, standard errors, t-statistics,  $R^2$ , corrected  $R^2$ , F-statistic, degrees of freedom, Durbin-Watson statistic, variance-covariance matrix, matrix of correlation coefficients, INTERPOLATION and PLOT of residuals. Capacity examples (var.xobs.): 16K ZX81: 2x400, 5x200, 10x100, 16K Spectrum: 2x75, 5x30, 48K Spectrum: 2x1650, 5x900, 10x500. SIDE B: Plot of bivariate regressions, slope, intercept,  $R^2$ , standard deviation.

**TAPE 5: PROFESSIONAL LINEAR PROGRAMMING (\*) £14.95**  
SIDE A: A user friendly optimisation program capable of handling all sorts of linear programming problems (any combination of  $\leq$ ,  $\geq$  constraints and  $X_i > 0$ ,  $X_i < 0$ ,  $-\infty < X_i < \infty$  sign constraints). Displays the canonical equivalent of the primal, values of slack variables, dual problem and its solution. Capacity examples (var.xcons.): 16K ZX81: 10x21, 15x18, 20x13, 16K Spectrum: 8x8, 48K Spectrum: 10x45, 25x35, 50x25. SIDE B: Solutions of simultaneous equations.

**TAPE 6: STATISTICS (\*), (+) £14.95**  
SIDE A: STATISTICAL TESTS AND DISTRIBUTIONS. Chi-square, Students t-, F-, Mann-Whitney U, Wilcoxon's Signed Rank tests and Chi-square, Students t-, F-, Binomial, Poisson and Normal distributions. Data on many samples can be entered at once, sorted and basic statistics displayed. Capacity examples (samp.xobs.): 16K ZX81: 1x230, 2x110, 5x45, 16K Spectrum: not available, 48K Spectrum: 2x1300, 10x250, 20x125.  
SIDE B: DESCRIPTIVE STATISTICS. Analysis of ungrouped or grouped data. Ungrouped data sorted and grouped. Output includes mean, mean deviation, standard error, skewness, kurtosis, moments, Pearson's coefficient, etc. A comprehensive histogram with up to 30 class intervals, class frequencies, midpoint values. Capacities: ZX81: 450, 16K Spectrum: 200, 48K Spectrum: 2000.

**TAPE 7: BIBLIOFILE £9.95**  
An academic indexing program to keep record of books and articles. Loading and saving of files, printing and listing of up to 150 records in a file, searching for an entry and sorting records into alphabetical order. It is possible to modify, delete and add a record.

### EDUCATIONAL SERIES

INTRODUCTION TO ECONOMICS SET (48K Spectrum only): Basic concepts are introduced by extensive use of graphics, examples and exercises.

**MICROECONOMICS I (+) £9.95**  
SIDE A: Demand and supply analysis, demand theory, cost-benefit analysis. SIDE B: Budget line analysis, indifference curves, decision making in a market economy.

**MICROECONOMICS II (+) £9.95**  
SIDE A: Cobb-Douglas production function, linear programming and exercises on linear programming. SIDE B: Theory of the firm, elasticity of demand, CES production function.

**MACROECONOMICS (+) £9.95**  
IS/LM curves, national income determination, aggregate demand and supply analysis, multipliers.

**ECONOMIC GEOGRAPHY (+) £9.95**  
SIDE A: Von Thunen's model of agricultural land use. Locational rent and principle of diminishing returns. SIDE B: Models of agricultural and urban land use.

(\*) Programs with INPUT, CHANGE, LPRINT and SAVE-DATA facilities. Spectrum versions of tapes 4 and 6 also embody MERGE/READ DATA facilities. A common data file can be used with these programs.

(+) Recommended for "A" Level, first year university and poly students.

**PLEASE SEND A5 SIZE S.A.E. FOR INFORMATION ON MICRODRIVE-BASED PACKAGES.**

Tapes 1-6: £60. Introduction to economics set: £35.  
All inclusive prices for the U.K. For overseas orders add 50p per cassette. Dealers enquiries welcome.  
Cheques payable to: **UNIVERSITY SOFTWARE, 29 St. Peter's Street, London N1 8JP. Telephone: 01-359 0978**

# Youth club

Tired of fighting intergalactic troublemakers? Let Simon Springett put you in charge of the human type with this unusual simulation game.

fundraising and balancing the books. If you fail at any of these tasks you lose the game. Just to make it more difficult, troublemakers will turn up from time to time and attempt to destroy all your hard work by causing damage and deterring new members.

The program is designed to be user-friendly, requiring single key operation without the need to ENTER data.

Remember the Youth Club? You know, that place you used to go before you had a computer. Running one isn't as easy as you might think — you are responsible for recruitment, training,

## On the right lines

Here is a rundown of some of the more important lines in the program:

- 5 — Initial display and setting of variables to initial values.
- 500 — Information. Note the use of a FOR-NEXT loop with RESTORE and DATA to produce a neatly set out display without too many PRINT commands.
- 1000 — Displays current situation. With so many variables needing printing lots of PRINT commands is the easy option this time!
- 1500 — Runs the group for one month. Calculates new members, expenses etc.
- 2000 — Runs a fight. BEEP commands produce a siren effect and damages increase until B is pressed. The program then goes to 1500.
- 3000 — This section allows you to change the balance of the programme (ie the club programme!) to raise more funds, train new leaders etc.
- 4000 — Decides if there will be a fight this month. Fights occur at least one month in ten, more often if you have only just enough leaders.
- 5000 — Displays the fact that you've lost — ran out of money.
- 5500 — Displays the fact that you've lost — didn't get the required number of members (100) in the allowed time (30 months).
- 6000 — Displays the fact that you've won and offers a new game.
- 9000 — A subroutine that stops 'overrun' when a key is held down. It is used eg. to prevent you running two weeks when you meant to run only one. Release the key and press it again to run another week.

## YOUTH CLUB (Month 0)

I enclose a cheque/P.O for £  
LAZE BLAZE

# Put everything you need on the keyboard with a Custom Keypanel Kit.

Everything you need  
IS on the keyboard with  
CUSTOM KEYPANELS.

These precision die-cut plastic panels fit perfectly over your keyboard and provide an instant and individual reference to all of your software.

Each Kit comes in a clear plastic storage wallet and contains: 10 Matt-black Keypanels plus sheets containing over 140 self adhesive Command labels pre-printed with words, symbols and arrows, plus a sheet of blanks for your own designs.

SPECTRUM KEYPANELS are 96x224mm and the labels are printed in 'Spectrum' bright red. A MUST for flight-simulation and all multi-key games and applications.

The FIRST add-on for your Spectrum.

ORIC KEYPANELS are 105x275mm and the labels are 'ORIC' blue. Master those CTRL and ESC key combinations.

An INSTANT reference to all ORIC's keyboard functions.

NOW IN 'SUPER ME' PLASTIC!

Post today to **Softech Limited**, 25 College Road, Reading, Berkshire, RG6 1QE.

Please send me:

..... Spectrum Keypanel Kits at £3.95 + 35p p&p each (overseas should add 25% for additional surface mail)

..... ORIC Keypanel Kits at £4.95 + 35p p&p each (overseas should add 25% for additional surface mail)

I enclose a total remittance of £..... cheques/postal orders payable to **Softech Limited**.

ADDRESS .....

# Bar Charts Revisited

Don't just store that information inside your ZX81, display it with the aid of Norman Brooks in Kent.

When confronted with a mass of numeric data it is often easier to understand and analyse if it is drawn as a bar chart. This program enables you to chart up to twenty-four numeric quantities and can handle numbers in the range of 0 to 9999. You can manipulate the vertical scale at will to suit the commodity you are charting.

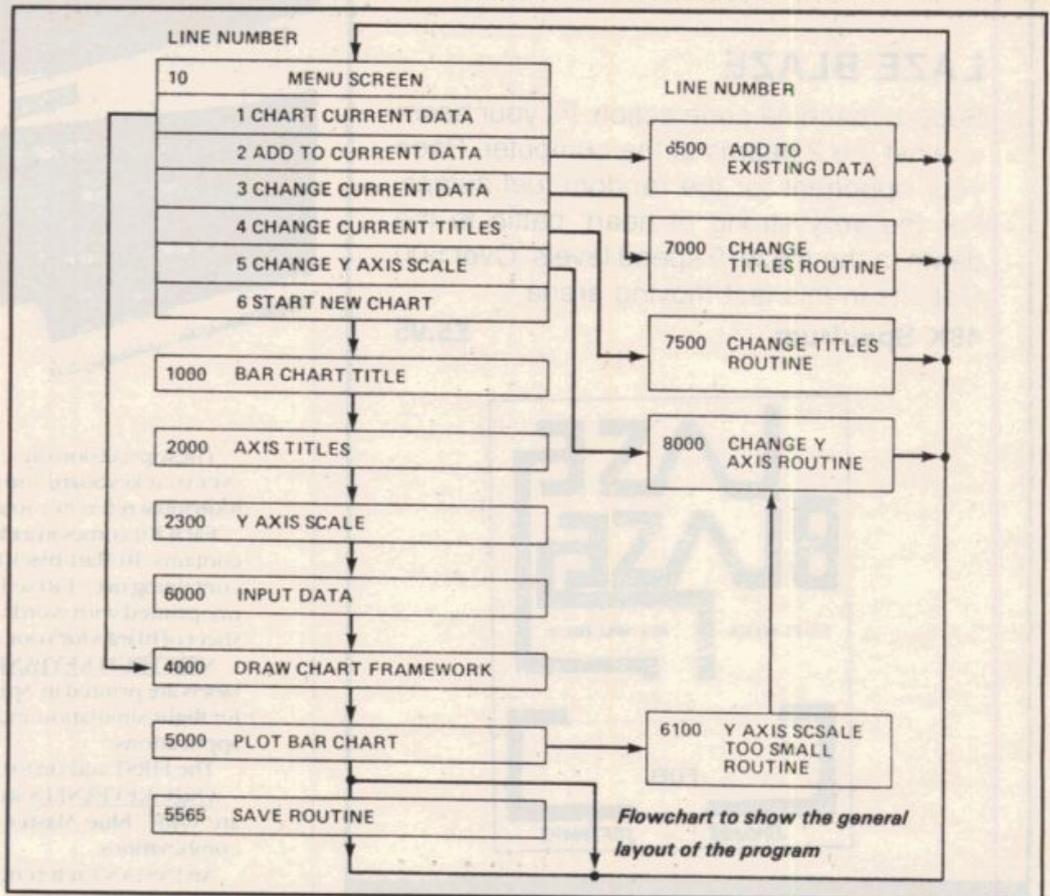

Menu driven, it enables you to set up a bar chart and, once created, add and change data quickly and easily. You might for example use it to:

- Chart annual income.
- Graph media statistics (eg Retail Price Index.)
- Compare electricity/gas usage quarter by quarter.
- Chart bills such as telephone, rates, groceries etc.
- Log petrol consumption, car mileage, service charges etc.
- Present experimental results for school projects.

The list is really endless and I'm sure you can think of many more applications which would benefit from this method of presentation.

## Variables

- V Number of menu option selected.
- T\$ Bar chart title.
- X\$ X axis title.
- W\$ Column label.
- Y\$ Y axis title.
- A Maximum Y value.
- B Minimum Y value.
- Z1 A-B modified to suit screen size.
- Z2
- P Power of 10 to which A-B has been modified.
- Z(10) String of scale numbers for printing on Y axis.
- D\$ to I\$ Graphic variables for drawing chart framework.
- C Number of columns required.
- D(C) String of inputted data.
- N(C) String of inputted data less minimum value of Y (ie B).
- C1 Number of extra columns required.
- C2 Number of column where data is to be changed.

## Loading instructions

Type in listing using line 10 REM "BAR CHART" to periodically SAVE as you go. Once this is completed, line 10 is redundant as the program offers an automatic SAVE option at line 5600. You might wish to change this to read 5600 SAVE T\$ so that you SAVE and LOAD to the specific name you give to your chart.

Start the program by typing RUN 1000. This will then take

you through every stage necessary to set up a new chart. (Alternatively type GOTO 10 which will start you at the menu screen and then choose option 6). From then on *never* RUN the program as this will destroy your variables. If for any reason you break out of the program then re-enter by typing GOTO 10.

You can always start a new chart on a different topic by LOADing an existing chart and selecting menu option 6.

**A few words**

1 INPUTted numeric data is rounded to the nearest pixel division on the Y axis scale.  
 2 By PLOTting the bars I amusing a grid of 20 rows by 24 columns.  
 3 The Y axis scale will never show a number greater than 100 but at the base of the scale you will see a scale factor eg X1, X10, X100 etc. Thus, a value of say 600 would show a bar to a

height of 60 with a scale factor of X10.  
 4 I indicated in the opening remarks that the maximum number the program can handle is 9999. The graph can be used to plot *any* positive number but as the data is PRINTed above the graph I am limited in space to 4 digits per number to prevent adjacent numbers merging. You can INPUT non whole numbers providing the maximum number of digits does not exceed 4.

ie Data less than 1 = numbers to 3 decimal places.  
 From 1 to 9.99 = numbers to 2 decimal places.  
 From 10 to 99.9 = numbers to 1 decimal places.  
 100 and above = whole numbers only.

I have found this adequate for most applications.  
 5 As all INPUTted information

is shown on the resultant bar chart (option 1 from menu) a hard copy of the graph is offered using the COPY feature at line 5730.  
 6 Using the "Electricity Consumption" shown in Fig 1 you will note that I have INPUTted data as zero in columns 5, 10, 15 and 20 to delineate one year from the next and have labelled these columns with a SPACE. I have found this a useful presentation technique.

## FOR SPECTRUM 48K:

### WANT TO MAKE A MILLION?

Then play **BOSSMAN:** the exciting life game — involving, amongst others, production, wages, unions and natural disasters — where you make all the decisions **£5.95**  
**PIT-STOP:** Become an expert racing driver picking up tools as you go but watch out for the oncoming computer cars — they're out to get you. **£4.95**  
**OMADAN ATTACK:** Save Planet Mardon. Shoot through force fields with your lasers and astro-cannon, but beware — the Omandans fight back. **£4.95**  
All games with Hi-Res colour graphics and full sound effects  
Cheques/POs to:  
**AVALON SOFTWARE LTD., 62 Albion Street, Mansfield, Notts NG19 7AU**

**SPECTRUM KOPYKAT**  
IMPROVED PERFORMANCE

Simply the best. Copying any program is now as easy as LOADING and SAVEing your own programs. Any ZX Spectrum program can be backed-up onto a fresh tape. Even programs that cannot be stopped can now be copied. 100 per cent machine code. Prints file names. Copies headerless files. SPECTRUM KOPYKAT uses no program area so full size programs over 41.7K (9K for 16K machines) can be copied

PLUS FREE Header Reader program Despatched by first class return of post. Send cheque/PO for £4.95 to:

MEDSOFT, 61 Ardeen Road, Doncaster, South Yorks DN2 5ER. IT CAN EVEN COPY ITSELF.

**TAPE COPIER 5**

Makes back-up copies of all Spectrum programs (incl headerless, m/c, unstoppable) that we are aware of with many unique features. Full money back guarantee if you are not satisfied.

★ Loads in all program parts continuously. Verifies. Abort. Program names. Header data.

★ Full instructions, very user friendly. M/Drive Genuinely copies onto microdrive - stops programs to help make them run.

Cost only £4.50 or £5.50 with M/Drive (Overseas: +£1 Europe, £2 others).

5 Stars from the HCW Review. With 3 out of 4 ratings of 100%! LERM, Dept ZX, 10 Grunswick, Gardens, Corby, Northants.

**KEEP THE BANK MANAGER AT BAY**  
WITH... HOMAC ZX Home Accounting System

- Database for up to 1,000 records Spectrum: 3,000 for book-keeping and financial forecasting.
- Fast data entry.
- Manages most accounts: bank credit card, cash, savings, standing orders, direct debits etc.
- Predicts credit card bills.
- Up to 94 account headings covering an eighteen month period (Spectrum: 30 months) with annual carry forward.
- Printed or displayed summaries and statements for any account or period.
- Spectrum version provides for up to twenty currencies or individuals; ZX81 for any single currency only.

HOMAC ..... £8.95

Please state if ZX81 (16K) or Spectrum (48K) version is required. Price includes cassettes and instructions. Post and packing £1.05.

DAVID MARTIN

Associates Ltd, 71A Princes Road, Richmond, Surrey TW10 6DQ

<b>MONEY</b>	Age 3-10	£6.50
Coin recognition, 4 easy levels teach money sums		
<b>TELLING THE TIME</b>	Age 3-10	£7.00
6 programs for learning in easy stages. 12, 24 hour, digital time, time in words, clocks to set.		
<b>LEARNING TO READ 1</b>	Age 2-6	£6.50
4 All graphics Pre-Reading games		
All cassettes include special keyboard overlays. P&P inc.		
Richmond House, Ingelton, via Carnforth, Lancs LA6 3AN		

### TINO COPY

#### For 48k or 16K Spectrum

Why be satisfied with just a tape copier?

Get our 3-in-1 utility featuring:-  
**COPY ANY CASSETTE PROGRAM PLUS**  
**DOUBLE SPEED LOAD/SAVE UTILITY PLUS**  
**CASSETTE 'HEALTH RATING' UTILITY**

Copier does it all — MULTIPLE sections, HEADER printing, MULTIPLE copies, Full SIZE programs. Double speed utility halves your load/saves time. 'Health Rating' program detects possible faults in your cassette recorder before they become serious. Also useful for finding defects in tape. Avoid wasted SAES & lots of frustration.

At £4.50 this must be the best value.  
**CAMEL MICROS, 33A Commercial Road, Weymouth, Dorset**

**BEGINNING PIANO**, or keen on text adventures? Send SAE to Fair Software, 30 Fair Lane, Robertsbridge, East Sussex.

### KILSOFT

48K SPECTRUM: Educational revision programs, GCE 'O'/CSE Biology, Physics, Chemistry, Maths etc. £4.95 each. For FULLEST details: **Kilsoft, 32 Briarlyn Avenue, Birchencliffe, Huddersfield. Tel: (0484) 31491**

## LIBRARIES

### SPECTRUM OWNERS

Why not use our software hire service. With an extensive range of games, educational programs, etc. Only 50p per tape plus P&P.

Send SAE for full details to:

**X.E. Lent Software, 8 Cheviots, Highfield, Hemel Hempstead HP25RD**

**OUR READERS NEED YOUR SERVICES RING 01-437 0699 X338**

## UTILITIES

### SUPERIOR TAPE COPIER

We are convinced that the new 007 SPY is the very best Spectrum tape copier available on cassette. **Find a better one offering better value for money, and TWICE your money will be refunded.**

- Can copy multipart programs in one go automatically.
- Can copy genuine 48K long programs.
- Genuinely the easiest copier to use.
- Has copied all the programs we know of.
- Microdrive compatible AND includes program to transfer tapes to the Microdrive AND they'll work.
- Post free even to Europe.

**007 SPY IS JUST £2.95**

**ZX GUARANTEED (Dept ZX), 29 Chadderton Drive, Unsworth, Bury, Lancs Tel: 061-766 5712**

### (S)TOP SECRET(S) for any Spectrum

Be in full control of programs on your computer. STOP and reveal the SECRETS of your favourite programs. A machine code UTILITY that STOPS, most Basic or Machine Code programs, protected or not, WITHOUT CRASHES.

Activate routine, press two keys and be in FULL CONTROL/LEARN/LIST/MODIFY etc., all the options are yours. The ideal MICRODRIVE companion.

If you're a basic beginner, a machine code master, a program writer or a games fanatic, this is the UTILITY that can open the door for YOU.

**PLUS:** pages of SECRET information about methods used by professionals to keep their secrets hidden.

48K SPECTRUM **£5.95**, including HEADER READER and Dec/Hex Hex/Dec converter.  
16K SPECTRUM **£4.95** (Relocatable under software control).  
Cheque/PO to:

**ASH BYPRODUCTS, Dept ZX, 183 Bristol Road, Edgbaston, Birmingham B5 7UB**

### G. A. BOBKER Does it again

(How long before the competitors catch-up with this super program)?

New TAPE 3 lets you STOP Headerless Files and unmergeable Basic programs so you can study them and/or put to Microdrive. Includes a pseudo disassembler which clearly gives all the relevant info in plain English.

**TAPE 3 £3.50** (£3 to club members)

**ZX GUARANTEED (Dept ZX) 29 Chadderton Drive, Unsworth, Bury, Lancs. Tel: 061-766 5712**

## COURSES

### NEW TO COMPUTING

We are here to help you gain skills in computing. Individual machines, qualified tuition, practical course. **Ring Computer Workshop on 01-318 5488. 4 Lee High Road, Lewisham, London SE13 5LQ**  
*Childrens' Holiday Courses also available.*

## SERVICES

### ATTENTION

all 16K Spectrum owners. Have your Spectrum internally expanded to 48K. Does not affect warranty. All work guaranteed for **£35** including VAT, fitting and return postage. 24 hour turnaround.

Send cheque/postal order and Spectrum alone (no wires power pack necessary) to:

**Barnsley Micro Computers, (Dept ZX), 196 Carlton Rd., Smithers, Barnsley, South Yorkshire or phone 0226 4637 for further details.**

## CLUBS & USER GROUPS

### MICRODRIVE USERS CLUB

Called **Microdrive Exchange** this newsletter club is designed to help by the exchange of info and ideas. Did you know you can pay up to £5.50 for a cassette to transfer tapes to microdrives, and then they don't run. Issue 1 will include how to avoid this plus transferring **Vu-File, ZZOOM**, etc. Membership is £5 per year. Europe £8 per year. Please make cheques payable to ZX Guaranteed **Microdrive Exchange** is run by C. A. Bobker.

**ZX GUARANTEED (Dept ZX) 29 Chadderton Drive, Unsworth, Bury, Lancs.**
