"YOUR SERVICE IS 6 TIMES QUICKER THAN ANYTHING ELSE I KNOW"

(David Reeder, Ilford)

Thanks for all your letters, from over 40 countries. We'll continue to try to **SEND OUT YOUR PROGRAMS ON THE DAY WE GET YOUR ORDER**. And we'll send you - **FREE** - our latest catalogue of Spectrum best. We're the only company to play every single game, choose the best, leave out the rest - and then quote all the reviews, too! **ALL GAMES WORK WITH KEYBOARD CONTROL AND JOYSTIX AS SHOWN**. UK prices include VAT: export prices are the same. (This 15% surcharge helps us to get foreign orders to you very fast indeed.) Call 01-789 8546, any time, to order by Access or Visa card from any country where your own laws allow this. The **CURRAH SPEECH SYNTHESIZER** is very popular. If you **don't** buy one, the 'Currah compatible' games work perfectly well. If you do own Currah Speech, it brings the games to life in the most amazing way!

ALL PROGRAMS REQUIRE 48K

SPECIAL OPERATIONS "Has class and makes good use of graphics" (CompChoice). "Requires imagination and careful planning to play well" (S.User). This graphics adventure/war game has 7 play levels: 18 commands. Select your Special Operations team, choose your mission, set your own time limit. Split screen text graphics. The most involving game yet from Lothlorien. NO STIX. (Lothlorien) £5.95

WAR OF THE WORLDS "STUNNING GRAPHICS, which are identical to the pictures supplied with the LP" (GamesComp). Animated musical-graphical adventure. Find 6 locations, each on the right day, to rescue Carrie and save the world. Great (Jeff Wayne) music: huge scrolling graphics as you try to avoid the Martian Fighting Machines, each with its own personality. STIX: Protek/AGF/Cursor. **CURRAH SPEECH OK (CRL)** £7.95

COMPLETE MACHINE CODE "The Complete Machine Code Tutor" loads over 100K of data in 4 parts from two cassettes. This step-by-step guide with 33 lessons and exercises should convert a BASIC programmer into a writer of complex machine-code programs for the Spectrum. All exercises on-screen: user-friendly assembler helps you spot errors and correct them. Covers all machine-code instructions the 280 processor can handle. 24-page manual. By MALCOM EVANS of 'Trashman' fame! NO STIX. (New Generation) £14.95

WHITE LIGHTNING "White Lightning is the best package I have used on the Spectrum. Its features and flexibility are second to none and have to be seen to be believed" (PCN). The first true sprite manipulation language brings any arcade game within your power to write! NO KNOWLEDGE OF MACHINE CODE NECESSARY to use this Forth-based program with nearly 300 commands. Up to 255 sprites, with your own dimensions. A separate 20K SPRITE DESIGNER is included, with 167 pre-defined characters. Telephone help line from the makers, too! This must be the best key yet to creating and selling your own programs. 130 page manual. 2 cassettes. (Oasis) £14.95

WORSE THINGS "One of the most original games of '84.... incredibly addictive, playable game" (Crash). 'WORSE THINGS HAPPEN AT SEA' as you try to take your cargo ship from port to port before it sinks. Full-screen animated graphics as you search the ship for leaks. On later journeys, watch out as the ship wanders off course, too or the engine overheats! Great tunes, too. STIX: Cursor/Interface2. (Silversoft) £5.95

SABRE WULF "State-of-the-art Spectrum software ... the graphics are superb" (Crash). "Possibly even Ultimate's most impressive game" (PopCompWkly). Beautiful, really wonderful jungle maze for you to explore. Avoid the charging rhinos, slippery snakes, warthogs, bears and all the other animated animals. Search for the four pieces of the Sabre Wulf mask - then see what happens. It will take you a very long time. STIX: Kempston/Cursor/Interface2. (Ultimate) £9.95

TORNADO LOW LEVEL Not a flight simulation - it's easier to operate and more exciting, too! Fly your swing-wing supersonic tornado (you can watch from above). Fly low to wipe out enemy targets; land; refuel; take-off. The 3D landscape you fly over is the best we've seen - and your radar actually shows a map, not just blobs! All the thrills of real flying. STIX: Interface2. (Vortex) £5.95

LORDS OF MIDNIGHT "THE GRAPHICS ARE SUPERB.... it's obviously going to be an outstanding success" (PopCompWkly). Most elaborate adventure yet as you explore the land of Midnight. You see it only through the eyes of the characters you control. You will see only what they see from where they stand - 32,000 different views. Choice of two adventures. The whole family can play by controlling one character each. 32-page illustrated manual. PRIZE, too! STIX: None. (Beyond) £9.95

PAINTBOX "I've never had so much fun with a utility program" (ZXComp). "A powerful graphics aid. It's possible for even a beginner to draw reasonable pictures" (S.User). "If you've been looking for a Spectrum graphics aid this seems like one of the best" (PopCompWkly). "One of the most outstanding programs I've seen this year" (YrSpec). If you want to draw, you need PAINTBOX. STIX: Kempston/any cursor. (Print&Plotter) £7.70

JACK & THE BEANSTALK The animated graphics get better and better! As Jack, you must search the castle, without waking the giant. Watch out for the creatures and mind where you step. BUT - can you even climb the beanstalk first, without being eaten by the bugs! Very talkative, beautifully-drawn game. STIX: Kempston/Any cursor. **CURRAH SPEECH OK. (Thor)** £5.95

CURRAH SPEECH Makes your Spectrum talk. Use it with talking games, and/or teach your Spectrum to say any word or sentence you like - in English. Free demo cassette and talking adventure. If you wish to use a joystick as well as Currah Speech, you will also need the **CURRAH SLOT** expandable motherboard. This lets you plug any two things into your Spectrum with/without Interface 1. **CURRAH SPEECH £29.95. CURRAH SLOT £14.95.**

CONTENTS

Welcome 8

Ray (the editor) lead a school party to a residential course — and lived to tell the tale! Also, readers' letters and (oops!) corrections.

News 13

Find out what's going on in the micro world. Hardware, software, and books.

On Line 20

The editor recently discovered Prestel. Was he impressed? You bet he was impressed! Read his report — page 20.

The Sky at Night .. 24

An astronomical program at a down-to-earth price.

ASP FIGHTS SOFTWARE PIRACY

Much has been said and written in condemnation of software piracy but few have taken a positive stand against it. ASP is among those few that have taken action to help curb the grave problem of home copying of commercial software.

ASP has already taken steps to eliminate advertisements in our magazines which relate to tape duplication for piracy purposes. While it is appreciated that individuals may take 'back-up' copies of their own programs, it should be noted that it is *ILLEGAL* to copy commercially available software for other than personal use.

Software piracy is costing the software industry huge sums of money which is detrimental to the future development of the industry. It is in everybody's interests to dramatically reduce the level of software piracy primarily because firms need funds raised from software sales to plough back into research and development of new products. This means that the standard of software products can only improve.

ASP hopes our action will help combat this serious problem in order to maintain and improve the high standards of the UK software industry. We are asking you to do the same by refraining from duplicating or copying commercially available software for anything other than personal use.

Spectrum Lessons 28

Mike Edmunds reviews some Spectrum programs with an *edukashunal slant*.

The Golden Chalice — Part II 32

The second and final part of Alan Davis' massive adventure.

Slogo 40

David Nowotnik concludes his series on Do-It-Yourself Spectrum LOGO.

Light Screen Designer 43

Toni Baker puts the Designer to work.

Block Delete 47

Remove those chunks of unwanted code from your program with this essential utility.

Here Be Dragons .. 49

Two pages of excellent advice to help you construct an adventure.

Moving graphics on the QL 52

Tim Hartnell shows us how to implement moving graphics on the QL.

Pot Shot 56

Enjoy shooting all-year-round without muddying your Boots or dislocating your shoulder with this 'sure-fire' Spectrum game.

League Table 60

We're about a month into the football season, so if you need to keep a record of the football league, or any other league for that matter, this program is for you!

Astro Zone 64

Who needs a space-shuttle when you've got ZX Computing? This program and a ZX81 could put you in orbit for next to nothing!

Interfacits 68

Our team of reviewers have been looking at Spectrum joystick interfaces for the last two months. Look what they found...

Car Costs 73

Is your car driving you around the Mercedes-Benz? This little program could tell you what's wrong.

Portability II 74

M P Moore of Petron Electronics has designed a parallel input/output board for use with last issue's Portability interface, and suggests some modifications to the PCB.

Patience III 79

Colin Gooch shows us another variation (*where does he get them from?* — Ed) on a popular card game.

Designs for Living 83

Colin Christmas looks deeper into the creative possibilities of the Spectrum.

COMPUTING

ZX Computing is published bi-monthly on the fourth Friday of the month. Distributed by: Argus Press Sales & Distribution Ltd, 12-18 Paul Street, London EC2A 4JS. 01-247 8233. Printed in the UK by: Garnett Print, Rotherham and London.

The contents of this publication including all articles, designs, plans, drawings and programs and all copyright and other intellectual property rights therein belong to Argus Specialist Publications Ltd. All rights conferred by the Law of Copyright and other intellectual property rights and by virtue of international copyright conventions are specifically reserved to Argus Specialist Publications Ltd. Competition 86

Win yourself a robot. Ten Prism Movits to give away in our super 'what's that?' competition.

Met Plot 89

No. Not a program to help undermine the London police force, but a very interesting program to plot the weather conditions prevailing around the English coastline. We called it Met. Plot because the editor couldn't spell *meteorological*.

The ZX81 Soft Selection 97

Nick Pearce reviews the latest commercial releases for the ZX81, which in spite of everything continues to be very popular!

List Option 99

Give yourself some choice when listing your programs.

Compac 100

Colin Hogg and J Dave Rogers have not only produced an excellent maze game for us, but they have gone out of their way to describe exactly how such games tick.

Log Hop 107

This game should go down with a splash! Leap from log-to-log to cross the stream. But what's that on the opposite bank?

Minstrel 111

The old addage 'Spectrum should be seen and not heard' is about to become redundant. Turn your Spectrum into a musical composer but BEEP prepared for some startling results!

Across the Pond . 115

This issue, we start a regular US column with our newly-appointed American correspondent, Mark Fendrick. Mark discusses the Sinclair scene on both sides of the Atlantic but, specially for our US readers, with the emphasis firmly upon the Timex-Sinclair strain of micros.

Readers' Reviews 117

Three pages of what YOU think of today's software.

The '80 in '84 121

How does the ZX80 continue to survive without the support of the major software houses? Mike Hyams, our regular ZX80 contributor, explains what, and how well, the ZX80 is doing in 1984.

Club Corner 124

Are you looking for like-minded people in your area? Our club page could provide the information you need.

Bookshelf 125

Update your reading list — or otherwise — by following Patrick Cain's Bookshelf.

Keyboard Masks . 128

We reveal the secrets behind the production of professional-quality keyboard masks for the Spectrum.

The 1K Corral . . . 129

...or 'how to get blood out of a stone'. A selection of the nicest, smallest, programs for the 1k ZX81.

Quicksoft 132

Clive Smith reviews a selected bundle of software for ZX machines.

Win A Dream Holiday . . 133

Identify 12 photographs and you could win a £2500 to be spent on the holiday of a lifetime.

Debugger 134

Is debugging still a nightmare? Consult our regular aid-page and discover the tried and trusted methods.

Mindplay 135

Greg Turnbull tries his hand at some more games of strategy.

Please note that Sinclair, ZX, ZX80, ZX81, ZX Spectrum, ZX Microdrive, ZX Interface, ZX Net, Microdrive, Microdrive Cartridge, ZX Printer, and ZX Power Supply are all registered trademarks of Sinclair Research Ltd.

Subscription rates: UK £12.70 including postage. Airmail and other rates upon application to ZX Computing, Subscriptions, Infonet Ltd, Times House, 179 The Marlowes, Hemel Hempstead, Herts HP1 1BB (Tel: 0442 48432)

ZX Computing is constantly on the look-out for well-written articles and programs. If you think that your efforts meet our standards, please feel free to submit your work to us for consideration for publication.

All submitted material should be typed if possible; handwritten work will be considered, but please use your neatest handwriting. Any programs submitted should be listed, a cassette of your program alone will not be considered. All programs must come complete with a full explanation of the operation and, where relevant, the structure; Spectrum programs should be accompanied with a cassette of the program as well as the listing.

All submissions will be acknowledged and the copyright in such works which will pass to Argus Specialist Publications Ltd will be paid for at competitive rates. All work for consideration should be sent to the Editor at our Golden Square address.

ZX SPECTRUM COMPUTING

Britain's Best Magazine For The Sinclair User

Over 130 pages of information and programs for the ZX Spectrum, ZX81 and ZX80

Cube game to send you round the twist?

Machine code graphics to get you animated!

Get to grips with graphics

Turn on and tune up with our guitar tutor

£1.95

ZX COMPUTING OCTOBER/NOVEMBER 1984

A NEW, IMPROVED ZX81 KEYBOARD AT THE SAME OLD PRICE. £9.95.

There's only one thing wrong with the ZX81. Its keyboard.

Or rather its lack of one.

Since it's flat your fingers don't feel as if there's any response to the pressure put on the keys.

ZX81 KEYS

FILESIXTY KEYS

In other words, you're not quite sure which keys you've pressed until the screen actually tells you.

Our new, improved push button keyboard changes all that.

It matches the ZX81 perfectly. And the keys give a real calculator-type feel.

To set it up all you have to do is peel off the adhesive backing and stick it on top of the ZX81 touchpad.

Because no tampering or soldering is involved the guarantee is not affected. And it will last for up to 3½ million operations.

Filesixty Ltd., 25 Chippenham Mews, London W9 2AN, England. Tel: 01-289 3059. Telex: 268 048 EXTLDN G 4087.

But our keyboard doesn't just come loaded with features. With it comes a separate overlay and a set of coloured stick-on labels to make game playing easier.

It's yours for the original price of £9.95.

Whichever way you look at it, we think you'll agree that it's a keyboard that's quite outstanding.

Orders to Filesixty Ltd., FREEPOST, London W9 2BR.
Cheques/PO made payable to Filesixty Ltd.
Please send me _____ (qty.) Keyboards at £9.95 each
(including VAT and P&P).

Isn't it amazing how computing seems to take over your whole life!

I decided to go to the local to get away from computing for a while, if I wasn't working on my machine then one or other of the family usually was (including the cat who claims new peripheral cartons for his own). I needed a break.

On entering the "Merry Micro" I noticed a new device in the corner, a video juke box. Fascinating. Also expensive and chip controlled, much discussion ending back on micros. Try again.

A quick play on the fruit machine accompanied by the sound of zips and zaps from the latest arcade wonder sitting in the other corner. More chip control, more money, more talk, back to subject of micros.

Reset.

Join a group of friends from the local school, they are discussing control devices, word pros and educational software. Leave group. Move to join a bunch of local sportspeople, it's been a long time since I talked about football, cricket, horse-racing and other non computer related activities.

It took less than a micro-second before the conversation got round to horse and football forecasting programs and computer cricket simulations.

Give up, go for a long walk, go home. Its hard to believe that

only 10% of the population are computer orientated, everywhere you look the subject is raised. Perhaps the space invaders were harmless, its the micro that seems to have taken over. Don't get me wrong, I still love the whole subject, but you can get too much of a good thing sometimes.

Back to school

Recently I was privileged to attend a teachers' course in Exeter which had been organised by the Council for Educational Technology, the Microelectronics Education Programme and Avon Special Education Microelectronics Resource Centre. Both the organisers and the members of the course were convinced of the value of using computers to assist with teaching. Each of us worked from 9.00am to 9.00pm attending demonstrations and lectures and then continued far into the early hours trying out what had been learnt.

The outstanding feature of the course was the system that had been devised to allow teachers to communicate their needs to programmers, a system of 'specifying' their requirements.

I am a product of the home computer boom and have no formal training at all. My particular likes happen to be machine efficient programs — much along

the lines of the techniques used in the 1K Corral — and every time I saw or heard of "Structured" programming I tended to run a mile. However, trapped in the course, I had to follow this very subject. BUT now that I've experienced it first hand, seen how tremendously versatile it is and how easy it makes actual programming, I must admit to being completely impressed! Don't worry, I am not going to fill *ZX Computing* with educational programs or insist that all submissions are structured, but I do recommend that you take a look at this method, either by reading a book or preferably by attending a course of some kind (night school?), and decide for yourself.

Finally, I wish to thank all participants for the very friendly and warm atmosphere they generated.

Our education system is in good hands.

Contributions

We are always on the lookout for good programs and articles for future issues of *ZX Computing*, and where better to look than to our own readers. If, when reading through the magazine you think you can write programs as well, or better than, our present contributors, then let's hear from you.

All contributions are, of course, paid for at very competitive rates. So if you've got your eye on a new ZX add-on or you'd just like to supplement your pocket money, get writing! It is vital, though, that all the programs you send us are totally original, and not 'borrowed' or 'adapted' from other magazines or books. (When Tim Hartnell was sitting in the Editor's chair, he even received 'original' contributions he himself had written for his own books!)

Any kind of program (business, domestic, educational, or just fun) will be welcomed which use ZX BASIC in clever and efficient ways, or those which employ certain routines which can be re-used on other programs.

Program listings are vital, along with a clear explanation of how the program is constructed, what it does and what the user can expect to see once the program is RUN (a screen

dump is particularly valuable in this respect). When submitting Spectrum programs, it is very important to remember to enclose a cassette of the program as well as the listing, as this will allow us to check the program before publication.

Fulfilling obligations

Dear *ZX Computing*,

It is with interest that I read a number of letters complaining about mistakes in listings published in *ZX Computing*. It is very gratifying to see that you intend to do your best to rectify this situation by using a different printer to LLIST. Of course, you will get complaints that the graphics in the listings are confusing as they appear as letters but by including a key at the start of the program showing the way that graphics will appear, I would have thought that this would have satisfied even the most particular of your readers. Having said this, and acknowledging that the Sinclair print outs are not that good, one is curious to know how, if *ZX Computing* get tapes and listings of programs, programs are still published which fail to run correctly. Whilst it's a real test of one's skill to locate and cure 'bugs' in a program which one has laboriously keyed in, it's pretty annoying to find out that whole lines have been left out. Surely someone tries these listings to make sure they work before they are published? Your readers should be able to key in the programs you publish, and, providing they haven't made any errors, run your programs successfully. That is a reasonable expectation.

There are a number of publications which seem to ignore that they have legal obligation to fulfil. I know that mistakes happen, and I note that you are pretty good at *ZX Computing* about publishing error corrections as are a number of other magazines. There are a number of paperbacks on the market that do not. The publishers of these books should be a little more careful. The odd addage "caveat emptor" doesn't really hold much water in these days of Trades Description.

The question "What use is the IN function on the Issue III Spectrum?" needs answering by you and Sinclair. Nuclear Attack (Dec/Jan 84) Issue, is a typical example of how the IN command is now useless. On issue III machines the sights froze, missiles auto-fire, missile explosions didn't disappear, bomber planes refused to fly across the screen. I tried the 191 substitution, as suggested only marginal improvement. I then read Dilwyn Jones' fine book "Delving Deeper into Your ZX Spectrum". I adapted a program from that book, somewhat laboriously perhaps, but with interesting results. The program scans the 8 sections of the Spectrum Keyboard and counts the number of times 191 is found at the I/O ports associated with these sections. The scans are carried out periodically, and after 100 scans, summarizes the results of 100 scans for each section. Stupid program you might think... without pressing keys, no change should be observed. Not so... print outs from this program showed that when the Spectrum heated up to normal operation temperatures, readouts based on 191 and 255 were observed, the incidence of erroneous readings being as great as 70-80% for some keyboard sections. When cold, the keyboard gave 191 readings consistently. It would seem that the ULA is unstable in its effects. I wonder if Sinclair found this out after issuing the new model and have tried ever since to recover their position. In my eyes they have lost a certain credibility over this. I also believe that they may have tried to divert public attention from something which is their responsibility and which definitely has affected operation of the Spectrum. The IN function in its original form provided an elegant solution to cursor control and provided a fine enabling

mechanism. If the results of the program which I have sent you are correct, then it clearly confirms that the IN function is useless, certainly on my Spectrum and others which I have been able to test that were Issue III.

It would be interesting for your readers to discover if their Spectrums also exhibit this problem. It will also provide a good method of demonstrating whether or not they have an Issue III.

The Spectrum is an excellent little machine for the money, — unbeatable value. A lot of people have bought them. They deserve to know about how alterations are going to affect their machine's operation as soon as possible after that alteration has been made. Sinclair have been consistently evasive about this if the reports one reads are anything to go by. It would seem that Sinclair have had to be *cajoled* into revealing what they have to date only by persistent enquiries by the public and the user magazines (well some of them). By their own admission it is SEVERAL months since the ULA was changed. Still Sinclair have not really given the public a clear statement of how the ULA affects the operation of the Spectrum, and, more important, if there is a way to deal with the problem. IN is there for a reason... if it's no use then that is not what buyers of the Spectrum could reasonably expect from the handbook that Sinclair issue with their machines.

Best regards,
Dane Lavery

PS. For those of us who missed certain issues of your magazine, why don't you publish the program errors which you have become aware of in a summary form for the last 6 issues updating by one month for every new issue. It wouldn't take up

```
IN 65278=191
IN 65022=191
IN 64510=191

Keyboard familiarity

Dear *ZX Computing*,
The biggest problem for many young children when first attempting to write or enter listings is lack of knowledge of the position of characters on the keyboard. To assist in "learning by play" I wrote the simple drawing shown below.

```

10 LET L=0
20 LET C=0
30 INPUT A$
40 LET L=L+( 21)* (IN-
KEYS="6") -
(L 0)* (INKEYS="7")
50 LET C=C+(C 31)* (IN-
KEYS="8") -
(C 0)* (INKEYS="5")
60 IF INKEY$="9" THEN
PRINT " * "
70 IF INKEY$="0" THEN
GOTO 30
80 GOTO 40

```

On RUNNING the program stops first at line 30. At this point any key(s) may be pressed. The character(s) will then be used for drawing using normal cursor (5689) control (who needs LOGO?!). Pressing key 9 will

cause the present position to flash and pressing key 0 will return control to line 30 to enable the plotting character to be changed. Simple, but good fun, and it enables the beginner to cover the display in any of the characters.

Across the pond

Dear *ZX Computing*,
First, let me say that since finding my first copy of *ZX Computing* on the bookshelf of one of our booksellers here in the 'colonies', I have become an avid reader. I used to read the U.S. publications SYNC and SQ Quarterly, but both have gone by the wayside what with TIMEX ISinclair getting out of the marketing of the Sinclair line over here. So now it's back to the 'mother country' to keep life in the old ZX. Is there any way to go about obtaining back issues of *ZX Computing*? I would like to obtain Numbers 1 through 9 of volume 1 to complete my set.

I have had my 16K ZX81 w/Suntronics keyboard and Sanyo tape recorder in almost constant operation since 1981, and have only experienced an occasional RAMPACK 'crash' when my wrapping tape anti-wobble loses its stickum. The ZX plays games, handles the family budget and financial ac-

counts, and even occasionally runs communications system simulations when the big main-frame at work can't get to it.

Second, and my main reason for writing, I just got around to LOADING "MATHS MAZE" by Nick Broom (*ZX Computing* Dec/Jan 84), and ran into a couple of bugs. The first bug was a 5/3050 halt (Display full — Enter CONT to proceed). I solved that one with:

```
3045 CLS
```

The second bug was a 3000 to 3060 loop caused by not negotiating the maze while going around after the math signs. I decided the GOSUB 3000 wasn't bad, just the looping, so I modified the program as follows:

```
3046 IF PEEK — 1490
THEN GOTO 2000
```

```

Graphics
2000 REM * * * LEFT
THE TRAIL * * *
2010 PRINT "YOU LEFT
THE TRAIL. YOU
HAVE" " BEEN
PENALIZED ONE
POINT."
2020 LET
SCORE=SCORE-1
2030 FOR X=1 TO 10
2040 NEXT X
2050 GOSUB 6800
2060 GOSUB 1000
2070 RETURN

```

Now it runs like a champ, and forces one to be a little more careful in the maze if one wants higher scores.

I am now awaiting delivery of a TIMEX Sinclair 2068 computer (the U.S. Spectrum), a TIMEX 2040 printer (the U.S. ZX printer) and a TIMEX 2020 recorder, which I ordered from TIMEX when they announced their closeout sale. I have introduced two of my co-workers to your magazine (they both have 2068s) and one has been LOADING 'DEPTH CHARGE' from the Feb/Mar 84 issue (no indication as to problems or bugs as yet).

Thanks for a great magazine. Keep on sending it 'across the pond'!
Sincerely yours
Bob Leuyck
USA

A little SAGA

Dear Sir,
As a possible candidate for a Royal Yachting Association Certificate I was very interested in the navigational programme by Mr. Eric Hutchinson listed in the Apr/May edition of *ZX Com-*

puting. However, I have a problem!! I own a 16K ZX81 and have fed the program into it four times (20 hours' work!!) and I am unable to Run the program. All I get on the screen is an inverted L between " " 's. I am a recent newcomer to computing and perhaps I am making an error. However, where an O is used I am inserting 0 at lines 101,104,155,195,210,693,694,767,920,925,935,1009,1019.

I assumed that the program would have to be RUN before any entries are made into it as with other similar programmes. Any advice will be much appreciated.

Yours truly,
A. Russell Hey

This letter was followed by....

Dear Sir,
With reference to my letter dated 11th April regarding my difficulty in loading the navigational programme by Mr. Eric Hutchinson in the current edition of *ZX Computing*.

I have been successful with this problem by 'loading' the printed programme from a tape into the ZX81 and there by getting the 00 on the screen. Instead of pressing 'Run' and 'Newline' which resulted in failure) I pressed GOTO 4015 and then 'Newline' and the instructions were displayed on the screen. This must show you that I am a newcomer to computing but thought it may help any other newcomers, should there be any nowadays!!

Yours truly,
A. Russell Hey

Taken to task

And now for a big 'un

Dear *ZX Computing*,
I was very disappointed in the example program taken from Mclean and Gordon's book of Spectrum programs ("Taken to Book" April/May). Apart from the high quality of the listing print, (my compliments to the editor!), the diary program is riddled with errors and inefficiencies. Although a full review of the book was made by Patrick Cain, I would like to comment on this particular program by posing the following questions:

1. Why is the 'Diary' displayed at the beginning for 2 seconds, and then wiped from the screen before the information is given? Could it not be displayed at the top of the screen with the information below it? I think the author of this program must be a CLS fanatic!

2. IF option 4 is entered (line 130) by mistake, the screen is cleared, "Wrong response Press any key" is displayed, and you are very lucky if you see it! This is because — guess what? — the screen is immediately cleared and the program halts. Do you think:

PAUSE 0 : CLS: GO TO 110

or something similar is missing from line 140?

3. After reviewing or writing a page, the program returns to the place from whence it came and stops. Why? If it returned to the original menu of choices, more than one page could be reviewed or written. In this case, there would be the small problem when writing another page using a non-initialised array, d\$. This will not all be overwritten if any test lines are short. So line 200 could be a subroutine for filling the array with spaces before jumping back to line 110.

4. Why should anyone want to run the program to choose option 3 and stop? Amending it not to stop after the completion of each process gives the selection of this option more meaning.

5. Why, after the selection of option 1, does the program clear a screen which is already blank? Sorry — my mistake — it doesn't since the subroutine starts at line 430. This leads me to ask.....

6. What is line 420 doing there?

7. Is PRINT d\$ invalid? (line 490?) The only way I can display the array d\$, which is 2-dimensional, is by using d\$(n) and separating it for values of n from 1 to 21.

8. Why, after clearing the screen (line 150) and testing the options, is it necessary for option 2 to pause again and clear the screen-again? It seems to me that line 220 is unnecessary since the program pauses at line 230 to await the date.

9. What will happen if a date is longer than 10 characters when entered (eg. 17 September 1984)? I'm sure we know — an error when saving. The array will still exist when the program has stopped, but how many other users will know what was wrong, and how to save it correctly? This circumstance should have been allowed for, by way of a warning at INPUT time, perhaps, together with a test to ensure that the date is not too long.

10. Is line 140 (yet another CLS) necessary, since the screen is still clear and the input line has disappeared?

11. When the diary page is typed in, there is not a neat

routine for entering each line, allowing for the ENTER key (code 13), after the key pressed to start the process has been checked for it's release. The facility for deleting a character is also provided (code 12), but that character is not deleted from the array, only overwritten when another one is typed in that position. Even the screen deletion does not work when it needs to be made on the previous line, so is this program really a simple word processor? Deletions on previous lines can be made to work if both i and j are altered and tested for less than 1.

12. Why on earth has the screen not been cleared when the tape recorder has been set-up correctly, so that the saving and verification messages do not appear in with the diary page?

13. Is mention made in the book's accompanying explanation of what to do if there is a verification error? All that is needed is for the user to SAVE and VERIFY again. But the naive user will try and RUN the program again, no doubt, and will then have to re-type the whole page.

14. Does this program have any of the basic requirements needed in a wordprocessor? In the editor's own words, "A wordprocessor.....displays text on the screen. This can then be altered, modified, adjusted, corrected, added to, or removed." The only facility which this program can perform correctly is backspacing on the screen, clearing each character as it does so. However, the next text must then be typed over the cleared screen positions to alter the text in the array, and then this procedure only works on one line of text. Not really a wordprocessor, I think.

15. My overall impression is that this program was written very quickly and not very well tested. Is this the standard of programming which home computers users must expect? This sort of inefficiency is giving programming a bad name, and is occurring all too frequently, not only in books, but in purchased software too!

16. What can you do if a program like this, from a book or magazine, does not function as it should? Try contacting me (a professional programmer) at BUGBEAR, my microcomputer advice service — all micros considered, no problem too small. Ring Kenilworth (0926) 55376 after 4pm weekdays for an initial chat.

Yours faithfully,
Frances Daniel.

Corrections for August / September

The August/September issue of *ZX Computing* contained two fairly minor faults. Some may say that they were very serious! But it's all relative y'know. Anyway, the first fault was with the program 'Day of the Week' from 1K Corral. The accompanying text to this program referred to a 'figure 2.' This figure was, as readers have pointed out, omitted. To recap., readers were invited to type in the variables shown in the elusive figure. So, to put the record straight, figure 2 is displayed in all its glory, somewhere about this page.

The second problem occurred with part 2 of David Nowotnik's 'Slogo' series. If you cast

your mind back, the article contained several examples of Slogo in use. Now, whereas in the text David refers to 'square brackets', the illustration showed common-or-garden *curved* brackets. This was not David's fault, but came about through mis-interpretation by our typesetters. However, to put the record straight again, every reference to a bracket in LOGO should be to square brackets and not curved brackets. To avoid further confusion, we emphasise that square brackets **must** be used in LOGO programs, but not necessarily in the BASIC program used to implement LOGO on your Spectrum. Is that clear? No? If it isn't clear, refer to this issue's instalment of Slogo which shows the correct brackets used in the correct context. Phew!

Long sort

Dear *ZX Computing*,
I bought my first computer, a 48K Spectrum in April, mainly for storing data connected with my (other) hobby. I was therefore very pleased to find Nigel Salt's program 'DATAFILE' in Apr/May *ZX Computing*.

Having gained some knowledge of the keyboard, I eagerly typed in the program, followed by the first part of my data store (600 records, each of 15 characters over two fields). I then came to sort the file. HORROR! It took over 2 hours! Long than it took to type in the file in the first place.

Can anyone help? Can you publish a revised sub-routine, possibly in something I'm told is called 'machine code', which a novice like me can substitute for the SORT routine in Nigel Salt's otherwise excellent program.

Yours hopefully,
N.A. Shackelford

Can anyone offer any help?

Notting Dale Hi-Res

Dear *ZX Computing*,
Since May of this year I have been in proud possession of a Notting Dale Technology G007 Hi-Res pack for the ZX81 (16K). I have written a Duckshoot program for the pack using some of Tim Hartnell's graphics from your June/July 1983 issue. I would like to submit it to you for publication in case there are any other G007 owners out there in Microland.

If you could publish this letter with my address then any G007 users might like to get in touch with me for a postal interchange of ideas, techniques, programs etc.

Yours faithfully
J D Almond
12 Wear Drive,
Springfield,
Chelmsford,
ESSEX CM1 5PT.

Sorry, but we cannot use the program. However we published your name and address as requested.

news

Anyone for tennis?

I'm sure we are all pleased to see Psion's new Spectrum program Match Point released on the Sinclair label. Hands up all those who were beginning to feel abandoned in favour of the QL?

I once owned and enjoyed a similar game on the Atari VCS game centre, but this version is far more sophisticated.

As in any computerised version of a real activity, be it physical or mechanical, it is un-

fair to compare it to the "real thing" however I would venture to say that Psion have got as close as is possible. By making the position of the player determine the type of shot played, a fair amount of subtlety and control has been achieved using only five keys or a joystick.

At £7.95 Psion have once again proved that it's worth waiting for their products.

Sinclair Research continues to expand

The ZX Spectrum continues to be the most popular home micro in Britain, according to market research organisation Audits of Great Britain. A recent A.G.B. survey shows that Sinclair Research continue to lead the

field, with Commodore and Acorn in second and third places respectively.

Sensibly, Sinclair are not resting on their laurels but are spreading their wings in many directions. Sinclair Research has

created a separate European marketing unit and, by the time this has gone to press, should have offices in Paris and Frankfurt, which will be responsible for a major sales drive. An estimated half a million European sales are expected this year, and this should double in 1985 when full scale production of the QL gets underway.

Sinclair have recognised the need for programs which are written in the native language of the country and they believe this to be crucial for their continuing success. This should please our European readers, as we've had several very professional-looking submissions from them.

Presently, exports to the continent are critically low. When I visited some European

cities a short while ago the lack of both computer hardware and software was striking, when compared to the proliferation to be seen in our stores.

At home...

Meanwhile, another distributor joins the existing team which includes Prism and Websters. London based distribution firm Lightning have a non-exclusive agreement to handle UK wholesale distribution of Sinclair Research's own brand software.

Lightning currently supplies independent computer dealers, book shops, and record, video, radio and electrical outlets, offering a 24 hour delivery service.

Events

I'm pleased to say that some organisers of computer events are now giving us enough notice to enable us to pass the information on to you.

MYCOMP — 1st Nov. onwards Fulcrum Centre, Slough

This new show has been specifically designed to attract all those who want to buy a computer but are unsure of which one suits their needs.

Over 10,000 prospective home, business and educational users are expected to attend and lectures and discussions will be held daily and a special "hands on experience" area is to be set up.

PRESTATYN HIGH SCHOOL 2nd COMPUTER FAIR Sat. 29 Sept. Prestatyn 10.00am - 5.00pm

Local shops, suppliers and clubs will be along with samples and demonstrations, and local technology based industries, the armed Forces, IT and MEP will be there.

HOTECH - 3/4 Oct. Royal Garden Hotel, London

Exhibition and conference devoted to computers in the hotel industry.

PERSONAL COMPUTER WORLD SHOW 19/24 Sept. Olympia 2, London.

Wednesday 19th is Tradesmen and Press day, the show is open to the general public from the 20th.

One of the giants of the computer shows, last year over 46,000 people attended and this forced the venue to be relocated to this site.

Video and chips

A new six part series starts on ITV on Thurs. 9th Aug. Made by HTV the series has a wide ranging set of topics and is aimed at youngsters of 8+.

Director Alex Kirby intends to be "a fast moving, up to the minute show with the accent on fun".

In Brief

● Martech seem to be calling themselves Software Communications Ltd. these days and have produced "The Odyssey of Hope" for the 48K Spectrum. This is an adventure game featuring what they claim are instant hi-res graphics at each location.

Jump Challenge should also be around now, and this is described as a highly realistic game where you jump your motor-cycle over obstacles. None other than Eddie Kidd himself will be helping to promote this game.

● Griffin Software have four recent additions to their educational programs of the 48K Spectrum, all are for maths.

Mental Arithmetic for age 8+, Fundamental Algebra 10 to 15, The Theorem of Pythagoras 10 to 14 and Introduction to Trigonometry 12 to 16.

● Cheetahsoft, whose first two programs seem to be selling well, have signed an exclusive deal with Imagic of the USA to market their range of Spectrum software in the UK. The first two titles are Moon Sweeper and Dragon Fire and cost £7.95 each.

● Football Manager from Addictive games have been improved by the addition of some hi-res graphics. The company tell me that sales of this granddaddy of games are still as high as they deserve to be.

Versions are available for the ZX81 (no graphics), BBC and the 48K Spectrum at £5.95, £7.95 and £6.95 respectively.

● Mastertronic, the company who proved that selling games for £1.99 was not only viable but profitable, have formed a joint company with Galactic Software to secure their supply and to expand beyond games.

We look forward with interest to the next batch of programs.

● One of the most valuable prizes yet to be offered for the solution of a computer game (or puzzle as Haresoft insist it is called) is the famous Kit Williams' Masquerade Jewelled Hare. Players (Puzzlers?) will have to solve the clues in two programs, Hareraiser-Prelude and Hareraiser-Final, in order to win the hare, or cash prize of £30,000. Each game costs £8.95.

Haresoft is at PO Box 265, London NW1 7JD.

Finally at the time of going to press, "River Rescue" — one of their previous releases — makes its debut on the new label. This was reviewed by Clive Smith in the APR/MAY issue and his final

words were "definitely worth a trip to your local stockist to get yourself a copy"

All the Creative Sparks programs sell for £6.95

CCS strategy

Cases Computer Simulations have been producing strategy and simulation games since the early days of the ZX81. Three programs have been added to their range recently, two of which are part of a new series of "pocket money" games.

"United" is the latest in their full price range and is similar to Football Manager, an addictive game which has been on the market for some time from — would you believe it — Addictive Games. However, CCS say that the problems are quite different.

I have tried both games and I can see there are differences. However, with my lack of knowledge of the subtleties of football and the management thereof, they didn't seem to be too diverse. The aim of the player is to take his team from the fourth to the first division and eventually the league championship. As manager, the player of United picks his team, trains them, buys and sells players, and scouts to find out the tactics of the opposition teams.

There is a graphical representation of the match, but this is disappointing. The pitch is displayed with circles and lines representing the position and path of the ball — not very inspiring.

The main strategy of the game seems sound and this part of the program can give pleasure for many an absorbing hour.

United costs £5.95.

A welcome development is the "Charlie Charlie Sugar" range of games. CCS are constantly trying to develop new ideas and though some, like their "Games for Girls" series, may not get critical acclaim, at least they're trying.

The first two, at £2.99 each, are "Whodunnit" and "Dix Mille". Whodunnit is an investigative game for up to four players which changes each time it is played. The object is to solve the brutal murder of Professor Carpenter. There are six suspects and from the facts given, and the answers to the question you ask, you try to deduce the culprit, weapons used, and the two valuable missing objects.

Similar to, but more complex than, a well known board game, Dix Mille kept my daughter occupied for hours. Dix Mille is a traditional French dice game similar to pike dice except that the scoring and combinations differ. Up to six people can play, with the option of the computer as one of the players. Scores are displayed and the game ends when all players have had the same number of turns and one or more has scored 10,000 points.

DIX MILLE

WHODUNNIT?

Spectrum 48K UNITED

A bright spark

Thorn EMI has decided on their marketing strategy and created a series of programs for the VIC20, Commodore 64, Atari and Spectrum computers under the label "Creative Sparks". This has taken the publishing of computer software away from their video section and made it a part of their European publishing operation. The first two programs to make their debut under this label for the Spectrum were "Tower of Evil" and "Orc Attack", both for the 48K machine.

The graphics for both games are of a high quality and, although rather simple in plot, are decidedly addictive to play. Orc Attack has you defending your castle against increasingly numerous supernatural beings. This is done by throwing rocks at them until they reach the top and then hacking away at their heads with a sword. Should you

survive long enough then a cauldron of oil comes to the boil and you can pour that on them and watch them all being destroyed by the flames. This then causes another more difficult wave of beings to attack.

Tower of Evil has you moving around rooms in the tower trying to find the key, treasure and goblet before moving onto the next level. There are over forty rooms to visit and fire its between each room. I'm afraid I couldn't get past the first fire pit! A challenging game.

Following these they released "Money Manager", a home budgeting program. It allows you to keep a record of all your income and expenditure and to help you plan your finances. There are seven different methods for cash analysis and interest calculation, but no matter which one I used I still ended up in the red.

PSst!

Coventry company PSS are very busy lately. Apart from having their premises broken into, they took part in Radio 4's business competition to attempt to win the Enterprise Award. They were one of twelve finalists competing for the first prize of £10,000.

Sport also comes in for support from them in the form of sponsorship to Kevin Bowes, a 23 year old Coventry motor cyclist. He has done well recently and has qualified for the

Marlboro Clubman's Championship at Silverstone on the 23/24 September. Finally, the classic ZX81 favourite, The Gauntlet, has been repackaged and reissued. The news is that high street store Menzies reports an excellent response.

The Gauntlet costs £4.95 for the 16K ZX81.

The latest Spectrum game from PSS is Les Flics and is based on a little pink cartoon character and a policeman made famous by the late Peter Sellers. This is another good attempt at an arcade adventure game with a nice sense of humour.

Now showing at your local software centre for £6.95.

Argus Press Software Expands

APS seemed quite surprised at the success of their "Fall of Rome" strategy game and a fair bit of credit goes to Peter Holme, APS' marketing manager.

At the Earls Court Computer fair he arranged for a squad of live Roman soldiers to add to the chaos. In fact old met new when a wandering Robot decided to join in, all that was lacking was a visit from Dr. Who.

APS, appreciating the demand, have released three further strategy games.

INVASION is a simulation wargame where you have to exercise skill and judgement as

In Brief

• Voyager Software is a company which is new to me, and their first offering is Crazy Cranes for any Spectrum. The object is to unload ships as they pass by the pier. The problem? they don't stop and someone is shooting missiles at you!

Voyager is at Unit 31, Wirrel Business Centre, Gorsey Lane, Dock Rd., Birkenhead, Merseyside.

• Terminal Software have their first arcade 48K Spectrum on the market, called Carpet Capers and priced at £5.95. They describe it as being a tactical fun-action game about deranged carpet fitters and say that it has nine screens of machine code action. Sounds interesting.

• CRL have their long awaited and well publicised 48K Spectrum program "The War of the Worlds" on the market for £7.95. If you get stuck in this game then refer to the LP of the same name. I wonder if the game will promote the LP or vice versa!

• Some really top quality games have been produced since the last issue, one of which is "Worse Things Happen at Sea" — one of the most original games I've seen for a while! You become the captain of a very leaky cargo ship and you really have to work to succeed!

• Artic Computing Ltd. pledge to bring out at least one new game per fortnight until Christmas. Some of their recent releases in this batch are Mr. Wong's Loopy Laundry, a platform and ladders type game, Death Chess 5000, which will either play a normal game of chess or a hybrid chess/arcade game, and, my favourite, World Cup, a 3D perspective animated 1-9 player arcade type football game. Great.

All these programs cost £6.95.

• Brainbox Software, 20 Orange St. London WC2H 7ED have a brain twister of a program called Enigma on sale for £5.95. Its a real mind bender, the idea is to discover the rules — even the promise of five bottles of champagne failed to provided the stimulus for yours truly to succeed.

• Virgin continue to improve their output of 48K Spectrum games. Space Command is a 'shoot-em-up' game which provides plenty of action for space freaks.

The price is £5.95 from most stores.

• Great to see software from a new source. Ventamatic are sending their Spectrum range from Spain to the UK. The four games I have seen so far are Crazy Climber — a version of the arcade game where you climb up a building; The Builder — a simple but fun building block game; Martian Tunnels — a maze chase game, and Wreckage — a space zap game. The graphics are excellent and on the one I've seen, Crazy Climber — they really are going to make an impression on the market here. I only hope they get insert cards printed in English though, a lot of experimentation was needed before I could make any sense of the game!

• Computing is hell! Or at least playing Richard Shepherd's new game 'The Inferno' is. This is a devious graphic adventure based on Dante's concept of hell as depicted in his book of the same name. At £6.50 it could easily be another classic for the adventure fraternity. Me? I'm still trying to get somewhere with the Hobbit!!

• Pop Quiz is a very impressive program of the quiz type. Stuart Henry, the well known DJ is promoting it and for every copy sold a donation will be made to the Multiple Sclerosis Society Research Fund.

Buy this program, have fun and help others, at £5.75 it can't be bag.

• From the USA comes good news for ZX81 owners. XOR is for the 16K ZX81 and makes use of hi-res (similar to Spectrum) graphics. A straightforward space invaders type game, it is probably the ultimate version.

Sold by J. Till at 96 Charles St. Stratford, Ontario, Canada N5A 5X7 it is a little highly priced at £9.95. I'll get Nick to check it out for the next issue.

In Brief

● At last, the long awaited Scott Adams Spectrum Adventure, *The Hulk*, is with us. Nicely presented and from what I've managed to play, very devious. Adventure fans go get it.

● Melbourne House's *Mugsy* is worth a good look. Essentially a strategy/simulation game, the graphics put it into the realms of a classic. Lucky 48K Spectrum owners!

● Longman Software presented what they describe as "Revolutionary software" for O level and CSE revision.

Maths, Physics, Chemistry and Computer Studies are the first five titles and each are presented via a database plus interactive programs.

Priced at £7.95 each, if they send us some for review I'll get Mike Edmunds to report on them.

● Fantasy have pensioned off *Ziggy* for the time being, and have introduced *Beaky*, one of the Andromedian Armed Condors — the rare goggled variety.

Yours task is to hatch out as many *Beakys* as possible by fighting off the *Eggshatchers*. 12 screens are used in this fast arcade game — and it's not easy!

Look for it in your local software emporium. Priced at £6.50.

● A superb game from Micromega, *Full Throttle* does for computer motorcycle racing what *Chequered Flag* did for computer motor racing.

Many track options plus practice or race, excellent graphics and good, fast action. A must for all drive game fans.

● Widget have an excellent reputation for producing educational software, their two new programs are in the adventure game mould and are great for encouraging learning by experience.

Many people seem to think that education is about learning facts or practicing tables etc. In fact there is a great deal of learning done in an incidental way from programs such as these.

The two games on *Adventure Playground* are aimed at early readers up to 9 or 10 year olds and *Castle of Dreams* is designed for 11 to adults.

Not to be dismissed lightly and worth every penny of the selling price of £7.95.

● *Star Trader* is another excellent program combining the strategy of trading games with arcade elements. One of the most successful in a long line of attempts at this blend.

Available from local stores or from Bug Byte it cost £6.95.

● Compusound presents *Block Buster* (not to be confused with *Blockbuster* from *Clever Cloggs*, they're totally different). This is based on the TV series of the same name and is a challenging quiz game.

An extra set of questions is provided and further sets are planned.

● Software Farm had a resounding and well deserved success with *Forty Niner*, a hi-res ZX81 game. They have now produced the follow up, also in hi-res (Spectrum graphics without any add ons!!), called *Rocketman*. At £5.95 it is probably a must for the ZX81 owner, I'll get Nick to give his considered opinion in the next issue.

Software Farm is at 155 Whiteladies Rd., Clifton, Bristol, BS8 2RG.

● *Microsphere* now has *Omnicalc 2* available. This is a much extended version of the widely acclaimed original, and possessors of the first version may upgrade by returning their original and paying only £8.00. The full price is £14.95 and this is probably one of the best spreadsheet programs available for the 48K Spectrum.

Microsphere Computer Services Ltd. 72 Rosebery Rd., London N10 2LA.

● *Vortex Software* has produced a superb flight game called *TLL*. The name is not very eye-catching and stands for *Tornado Low Level*. The graphics are superb and you really must get a look at it at your local store.

you move, supply and build up your limited defences of the Western Alliance, just prior to an invasion by the Red's tank armies.

BISMARCK is for all would be sailors to try their hand at intercepting and destroying the *Bismark*. It's not easy!

PLANETFALL is my favourite, I was involved in attempting to get this program (22K original) into a 16K ZX81 from the listing published in *Computing Today* when I look over *ZX Computing*. That project had to be shelved as a consequence, but I did get an insight into the very complex logic behind it. Probably one of the most complex trading games I have seen, this program, set in the space age, will keep you occupied for hours.

All three programs are available at £6.99.

Also part of APS is the family firm *Clever Cloggs*. Their range of educational software is gaining in stature and receiving more positive reviews all the time.

Our reviewers are not part of

the APS/ASP organisation and no pressure is put on them to go easy on the companies' products. A reflection of their value is that *Star Trucker* and *Blockbuster* (beware of confusion with another program *Block Buster*) were in the *Non Arcade* top 10 chart recently.

There are now eight games in the *Clever Cloggs* series; *Party Time* and *Shipshades* for age 3+; *Jungle Jumble* and *Sam Safty* for age 5+; *Whizz Quiz*, *Blockbuster* and *Music* for age 7+ and *Star Trucker* for age 9+.

Most of these have a series of questions as part of the program and when these become too familiar then they can be changed. A welcome addition to the range is a series of supplementary question tapes featuring *Science*, *The Arts* and *General Knowledge* questions which can easily replace those built into the program. Also, a *Clever Cloggs* club is run for fans of these games.

These programs cost £7.95 each.

Beginners' BASIC

Books on programming tend to be either very intellectual and hard to read or presented in a "computing by numbers for idiots and two year olds" format.

The majority of people probably fall into a middle of these two extremes and there is very little to appeal to them.

Clive Prigmore has written *Beginners' BASIC* to fill this gap. He is the Principle of Orpington College of Further Education and was previously teaching as the head of Computing. His skill and experience shows in this book.

Clive's previous book was written for the NEC (National Extension College) and the BBC to accompany *The Computer Programme* and indeed "30 Hour BASIC" has become the standard text for many educational establishments. Using the comments and feedback from 30 hour BASIC, Clive has refined his ideas and *Beginners' BASIC* is the result. It is published in the same type of binder but is approximately twice the size.

Although this book is written in 'multi-micro' style with the usual lack of specific routines, I would wholeheartedly recommend this to the average beginner because of the style and expertise. Anyway it is better to get to grips with the essentials rather than bogged down in details — I remember when I first

used a BBC I spent three weeks just playing with the sound and envelope commands.

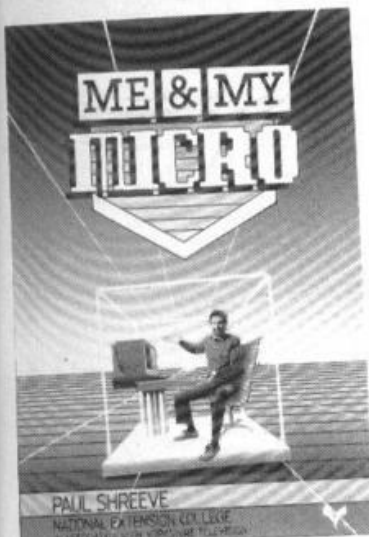

The book introduces principles and techniques of programming by means of worked examples and exercises (answer are given!), and later examples show how the problems of designing programs can be tackled. The advantage of "Structured" programming is discussed but is not over stressed.

The book attempts to show how programming can be an enjoyable, experimental, activity. The reader is encouraged to write his/her own programs rather than buy pre-recorded ones, to find out about the language and become self-sufficient in BASIC.

By the end of the book the beginner should have developed sound programming skills, should possess a repertoire of useful programs and will be given firm indications of how to continue to develop an interest in programming.

The price is £9.95.

NEC + YTV = "Me & My Micro"

Written by Paul Shreeve, the aim of the book is to show you how to write and develop properly structured and efficient, games programs. The professionals believe that you should never program to be machine efficient where this conflicts with structured programming, and yet this is often the only way to achieve satisfactory results when programming arcade games. However, it is to Paul's credit that he has chosen programs which do not require this compromise to be made and so achieves his aim. He uses games to demonstrate the use of loops, printing, movement, string handling and keyboard control.

The book can be used in conjunction with the Yorkshire TV series of the same name or used on its own. With the number of books on the market covering programming from virtually all angles, it really boils down to looking at what is available and finding one which suits your reading preferences. I suggest it may be worth your while having a look at this one.

Am I getting senile or do I remember being told repeatedly that the correct grammar was "My micro & I". Are standards slipping or am I being fussy?

Anyway, this book from the National Extension College is £2.95 for 115 pages. The text is packed in and the programs are written in both Spectrum and BBC/Electron Basic.

In Brief

● Bernard Babani who market a variety of small, value for money books have added two more to their range, both by R.A. Penfold. "A Practical Introduction to Microprocessors" is intended for those who have some knowledge of general electronics but little or no understanding of microprocessors.

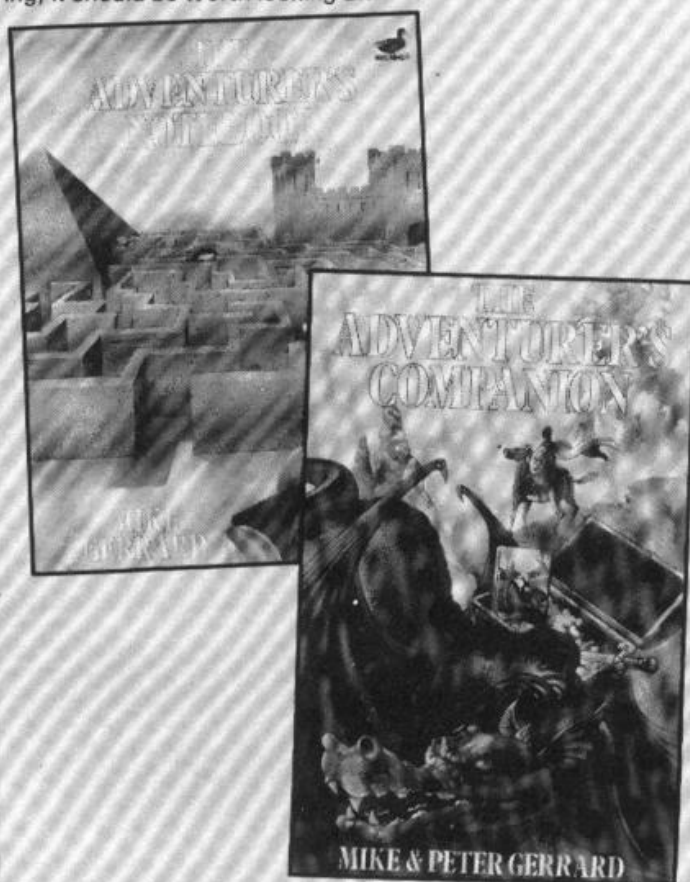

The book operates by constructing a simple circuit which the reader builds and experiments with. the cost is £1.95.

"Micro Interfacing Circuits — Bk 1" is for the amateur electronics enthusiast to build and use control devices for use with a micro.

Address decoding, analogue/digital converters and parallel/serial interfacing are all dealt with. The price is £2.25.

● Kingfisher Books have published "A Beginner's guide to the ZX Spectrum", written by R. & D. Graves, a father and son team, and priced at £2.50.

Described as a clear, well structured, straightforward guide based on overcoming problems experienced by them when learning, it should be worth looking at.

● Duckworth are publishing two books of interest to Adventure game fanatics, "The Adventurer's Companion" by M. & P. Gerrard is a complete guide to playing four of the most popular adventures: The Hobbit, Colossal Cave, Adventureland and Pirate Adventure.

"The Adventurer's Notebook" is a must for all adventurers. The main part is a series of ready made maps with space for nouns, verbs, locations etc.

A chapter for beginners is included as well as a hints and tips section, and a list of recommended adventures is included. Both books sell at £3.95.

● Linda Hurley has added "Spectrum programming for young programmers" to her previous title "ZX81/TS1000 programming etc."

Both published by McGraw-Hill they are worth looking at if you prefer your information presented in a step by step and very simple way.

In Brief

● Robot control is interesting more and more people, especially those in the field of education. The main problem is the cost, but this too is coming down gradually.

Powertran Cybernetics, Andover, Hants. produce four different fully programmable robots, the simplest is Henbot II, a turtle type robot at £95.00, and the most expensive is Genesis P102 a complex robot arm at £1476.00.

● Kelwood Computer Cases, Downs Row, Moorgate, Rotherham S60 2HD have come up with an interesting idea, why replace the whole of the Spectrum's case when all that is really needed is that the keys themselves are replaced?

K-Board simply replaces the keys and switches with a complete top of their own, not just the rubber keys like some units. This means that only the height of the actual keyboard is altered and so all add ons, interfaces etc. are not affected. This is certainly an alternative worth considering and as Kelwood can often be seen at Microfairs etc. I'll let you know as soon as I can get a good look at one.

K-Board costs £28.50.

● Challenge Research, 218 High St., Potters Bar, Herts. EN6 5BJ have a cassette recorder specifically for the Spectrum. At £65.95 it seems expensive, but it connects via the user port and it is claimed that all software, including commercial, loads four times as fast and with increased reliability.

One has been despatched for review and I'll give more details as soon as I can.

Four from Dk'tronics

Dk'tronics has always been a company which, as far as I know (I add that because as soon as I say something with confidence someone always write in to tell me of their horrendous experiences to the contrary), has always produced good, reliable wares.

Four units have been produced recently by them and all look quite interesting. Unfortunately although they sent a couple of items to us the GPO managed to mislay them, therefore I won't be able to give a "hands on" report as I like to do but will simply reiterate the information supplied by them.

The keyboard

The first item is a Microdrive

compatible keyboard. Now I have used one of theirs for the last year and I have been very pleased with it. There were a few minor problems of which I know two have been corrected.

The lack of a proper space bar has been remedied and the delete and decimal point keys are provided in single keypress form. A good idea as I'm always entering data as 1 m2 etc.

The keyboard can be used with the Spectrum alone or with interface I attached and the Microdrive leads are fitted to a 16 way cable on the left of the case.

The numeric keypad which was a feature of the earlier model is retained and Dk'tronics tell me that the old problem of

the key legends which were printed on stick on labels and which soon rubbed off has been eliminated by having the print on the underside of the label! — simple when you think of it!

Until I see a production model I can't say if they've done anything about the back of the case which sloped awkwardly on the old model, hopefully they harkened to the criticism and modified this design fault.

Regardless it looks to be a very good buy at £45.00, the same price as their old model, and I may invest some of my ill-gotten gains on one myself.

The joystick interface

Into the crowded world of joystick interfaces is their offering. This is fully programmable and they claim it will work with any software from any supplier.

This seems to be achieved by mimicing the keyboard and it does not disable the keys while in use. This is important as many programs need more than five keys to play them.

Often I have commented on the lack of planning when add on producers make their units dead ended — ie. you can't add anything onto the back of it — this one is supplied with a full through port so printer, speech

interfaces etc. can be used with it.

The price is also very competitive £22.95.

The Beep Amp

A new interface boost the aptly named beep so much that a volume control was deemed necessary, a boon to many parents no doubt.

This is supplied with separate 4" speaker in a "pod" type box and 1m of cable.

The cost of this is £14.95.

The 3 channel sound synthesizer

This incorporates the Beep Amp but adds the capabilities of the usual AY-3-8912 sound chip. I have used this chip in other units and it is capable of fantastic things.

However the end results depend on the programmer's skill or the software provided and as yet I have no information as to what, if any, support Dk'tronics will be providing in the way of programs.

The same speaker in it's pod as for the beep amp is supplied with this unit.

If sound and/or music is an interest of yours then this is a unit worth looking at.

It will cost you £29.95.

Super champ joystick

Dean Electronics Ltd. who import and market the impressive Alphacom 32 printer have entered the crowded joystick field.

Again this is an American import which they tell me has been the top selling joystick in the USA for the last two years due to several features not usually found on the majority of

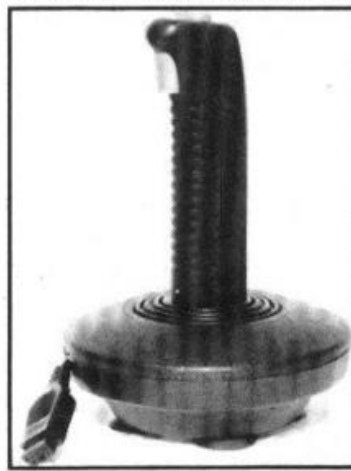

joysticks. Instead of having a trail of cable lurking around your computer, the Super Champ's ten feet of cable can be retracted into the base of the joystick when not being used.

The handle is said to be specially contoured to provide maximum comfort for both left and right handed players.

A feature which Dean Electronics describe as a 360 degree swivel base with suction cups for single handed control is mentioned, I'm sure this probably does something useful but I can't clarify as we have not yet received one for review.

Finally it is claimed to be robustly built to withstand the severest of "physical abuse" — that's one test I'd enjoy putting it to when those aliens beat me yet again!

Available at £12.95 from most high street stores or from Dean Electronics Ltd. Glendale Pk, Fernbank Rd, Ascot, Berks. (plus of course £1.00 p&p).

WIN **£25,000** AND SAVE THE WORLD

Eureka!

**250 K OF PURE MYSTERY
BY IAN LIVINGSTONE**

- 5 complete Adventures, each with its own Arcade, in one multi-load mega-program: "Eureka!" is the ultimate computer Epic.
- Epic in scale: "Eureka!" spans five eras of history! You battle against the dinosaurs, outwit Nero and his gladiators, join the Knights of the Round Table, escape from Colditz, and finally into 1984 defeat the evil master of the Caribbean who is holding the world to ransom.
- Epic in sheer size — there's more than 250K for you to get yourself killed in.

5 PROGRAMS IN ONE

- All 5 Adventures are linked — but you can choose to play them separately. And they all have REAL TIME built in. So if you don't think fast, you wind up as a pterodactyl's lunch, die of over-exertion in a Roman orgy, or just lose your mind...
- "Eureka!" is not just an Epic — not just an Adventure. At the start of each historical era, you face an Arcade Action test, to decide your strength level for the Adventure to come.
- The better your score, the stronger and faster you'll be.
- And it'll keep you on your toes, with constantly-changing, static and moving graphics. Brilliant music and sound effects add to the excitement.
- As part of the "Eureka!" pack, you receive a full-colour illustrated booklet, containing cryptic riddles and mysterious illustrations. Using booklet and screen together, you steadily unravel the clues and build up a secret phone number piece by piece.
- If you're first to ring it, you save the world and collect the \$25,000!
- Quite a package! And to give everyone a fair chance, "Eureka!" will be released simultaneously worldwide on October 31st, 1984. No packs will be available until that date. All orders received by mail or phone by 26th OCTOBER will be despatched by post on the 31st right across the world. So order now, and be one of the first off the mark.

THEN THE RACE IS ON!!!

**DEvised BY
IAN LIVINGSTONE**

The storylines for "Eureka!" are by Ian Livingstone, whose "Fighting Fantasy" books have sold over 2,000,000 copies. He's dreamed up some rather nasty tricks and twists for you in this Epic, because he has also devised the cryptic clues and conundrums in the booklet that goes with the program. He's the one who knows the answers.

"Eureka!" was programmed by Andromeda teams led by Hungarians Donát Kiss and András Császár. It took the equivalent of 5 YEARS to create, and the skills of 4 graphic artists, 2 musicians and a professor of logic too. We told them to stretch the hardware's capabilities, and make sure you were kept awake for hours!! They've done it...

£7 BONUS

When you order "EUREKA!" before 26 OCTOBER 1984, you receive an additional bonus: £7 voucher off the price of the **TROJAN LIGHT PEN** from PSL MARKETING. Normal price is £17.75. You buy it for just £10.75.

Spectrum 48K or
Commodore 64
(TurboLoad)

Full-colour booklet,
packed with cryptic
clues to help you
unravel the mystery —
and win the £25,000
reward

Music and

The race for the \$25,000 starts on 31 Oct 1984 and closes on 31 Dec 1985.

This is an account of how I became one of Prestel's customers, and a description of what the computer information service offers from the point of an interested incompetent.

I have always been fascinated by the more practical aspects of computing, you only have to remember my previous project on using a Spectrum for word processing to realise that, and the thought of being able to access the information on British Telecom's computer intrigued me.

Early in June 1 contacted Micronet 800, a computer specialist user group who provide an information service on the Prestel Database, and applied for registration with them.

Prestel is very similar to Ceefax and Teletext, services offered by the TV companies, in display and basic functions but with two very important differences.

The first is that you can communicate with Prestel by sending messages, replies to questions and quizzes and also download information and programs into your computer or to a printer for a permanent copy.

The second is that you have to pay for it! However at off peak times, after 6.00pm weekdays or 12.00 Saturday or all day Sunday the use of the computer is free, but you still have to pay the standard phone charges either at local or national rates depending on which computer you contact.

In order to use the Prestel computer you must be a member of one of its user groups, once you become a member then you have access to all the other information in the database except for some pages which another user group has set up and may want to keep private.

Having phoned Micronet, (01-278 3143), a few days later a letter and an application form arrived. I dutifully completed said form and returned it to them the same day. I was starting to become quite excited about it.

The equipment

Before I continue the saga any further it is worth mentioning the various boxes which will allow you to connect your computer to BT's lines. Note that any equipment attached to the phone needs to be approved by BT, so look for their approval sticker before purchasing anything.

A specialist system of a keyboard/keypad and a connec-

On Line

Ray Elder describes his close encounter with British Telecom

tion device can be acquired, but for one purpose I'll take a brief look at the modems available to link up the Sinclair computers, both Spectrum and ZX81.

By the way, the modem is a MODulator/DEModulator and is the device which connects the computer to the phone lines and by which the signals to and from the computer are matched to the signal that is sent over the phone lines.

This use of a universal standard means that you can communicate with someone who is using a completely different micro and not only another Sinclair user.

There are two methods of making the connection, probably the cheapest is by an acoustic coupler. This is a rubber device into which you insert the telephone handset and all

installed. If you have the old type of connection then BT will have to change it, this may cost £25.00, but many "special" offers are around and Micronet were (and may still be) providing this free when I joined.

Meanwhile...

A week after I posted my application a large envelope bounced off the doormat and was quickly sat on by the cat. After removing the moggie I tore it open (the envelope, not the cat) and found a nicely produced folder of information, a Prestel contributors directory, a welcome letter and an advertising brochure from a well known credit card organisation.

The people who provide and maintain the pages are known as Information Providers or IP's

— yet another bit of jargon to remember.

The letter proclaimed "WELCOME TO MICRONET 800! YOU ARE NOW ONLINE TO ONE OF THE WORLD'S LARGEST DATABASES." Except I wasn't.

My phone had one of the older type of connectors and I couldn't link up to the phone lines until a BT chappie changed it. I also had another problem. My phone was situated in the small entrance hall at the front of the house, my computer was set up at the back.

There was no room to put the machine with the phone and I wasn't practical to have a 20ft lead running through the centre of the living room, not with a cat that attacks anything, a child who eats anything and other members of the family including myself, who'll trip over anything.

So the phone would have to be moved. No great problem as the line arrived at the back of the house anyway, all they'd need to do was drop it down, bring it in the window and add the new connector.

The other reason that I wasn't online was that all users have their own customer identity and password to prevent someone else from using the service at your expense, this would be forwarded in a separate envelope later.

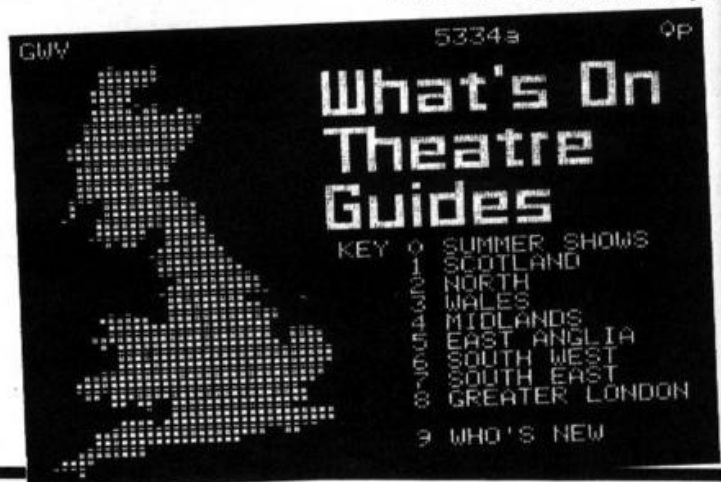

With all this justified security I was expecting Securicor and full escort to arrive and not just

signals are sent audibly. The computer is then loaded up with accompanying software and the connection is made as normal.

The disadvantage with this system is that in a noisy environment extraneous noise may cause the link to fail. An advantage is that if you own a portable computer then information can be sent from a call box anywhere in the world and collected later on your home (or office) based machine.

The other method is by using a direct connection via the detachable telephone socket that is fitted to the latest phones

the plain brown envelope that eventually was sat on by the cat.

Excitement becoming more intense.

The Spectrum box

The unit which I am using is the Prism VTX5000, this is a direct connection device which fits under the Spectrum and is the same length but slightly deeper so that a bit will either stick out in front or at the back. It is compact and has an ON light, a LINE light connected to a toggle switch and a 3 way slide switch marked M/NET, Tx and Rx on the front.

A lead comes from the back of the unit and is plugged into the phone socket, the telephone lead is then plugged into the socket provided at the back of the modem.

A connector ribbon is supplied which has three sockets, one for the back of the unit, one to fit the Spectrum's port and one which provides an extension for the printer etc. This lead was rather short and I would have liked it to have been longer to allow for non standard set ups.

I do not have a Microdrive as yet, but I can foresee difficulties in using both together, some unsatisfactory lashing together of leads and the devices would have to be undertaken. I have my Spectrum housed in a DK'Tronics keyboard and there was no chance of the modem fitting beneath it!

I solved the problem by putting the modem on top of the keyboard and plugging one socket into a Currah micro slot adapter. The unit hangs over the back and I support it with wooden block legs, this is only satisfactory because the whole lot is permanently housed in a cabinet and the back is not seen.

The manual is a work of art, only a genius could make something so simple so confusing!

Actually each section of the manual is written in a very clear step by step manner, its just that the sections were put together in a confusing way. The main sections dealing with operating the modem are in two chapters, "The main features" and "User instructions in more detail".

Being a 'do it by numbers' type idiot, I found myself trying to operate the system from the first section which does not contain an adequate explanation. It would have been better if all the details of "How to log on" for instance, were not split into the two sections.

On Wednesday the BT engineer called, I was out, my wife explained what was required, move phone from front to back of house.

"Ummm. Very sorry, that's an 'outside' engineers job. Can't do it, I'll talk to the boss" and away he went. The next week two of them turned up and spent a day drinking tea and climbing ladders. Eventually the phone was repositioned, a very neat job, they even fitted two sockets and also managed to sell us a new phone!

Cost £18.00 (the reason I'm quoting prices is so the Taxman will make an allowance)

Fine — except that the phone now permanently picks up radio 4 and this does not seem to be appreciated by Prestel. Excitement reached fever pitch.

ZX81 box

I'm afraid that I haven't been able to test out the ZX81 adaptor as either my letter to them has been lost in the post, or the unit has been delayed on its trip to us. I will quote from the information I have.

The unit fits between the ZX81 and the RAM pack and other peripherals such as the printer, and it can be used in conjunction with both acoustic and directly connected modems. With both ZX81 and Spectrum units the screen is changed into a 40 character per line format and the double height and graphic modes are also used.

The ZX81 loses the colour, flash and more sophisticated screen controls but the Spectrum unit copes admirably.

I have been told that the ZX81 screen does not completely fit onto the TV and that a sideways scroll is provided to allow you to read all the text.

Considering the problems it sounds like an ingenious device!

The last roundup

Finally all was ready, connected and powered up. Here we go! As soon as the Spectrum was switched on the Micronet 800 logo appeared, on pressing a key a menu of seven options was presented, the last being to go to BASIC.

I am using the ZX Lprint III Centronics interface to drive a Shinwa printer, this has to be initialised before use so I pressed seven. The machine then reset, ie cleared out all programs and gave the usual Sinclair copywrite notice.

I initialised the interface and then stopped. There was no way of getting back to the Modem program bar turning off and on the power to the machine, and this would mean the interface would need to be reinitialised!

After many attempts I discovered that by getting into LOAD or SAVE mode from the modem and pressing BREAK, I could initialise the interface and get back to the modem. Fortunately they had allowed for load/save problems and also you may need to get back after downloading software.

Right, option 0, enter my identity, phone number given. When carrier tone (a high pitched whistle) is heard switch on modem, replace phone.

I did. It worked!

After entering my personal password I was greeted by name and allowed free access to the whole lot, and what a lot there is. I haven't counted but there are hundreds, probably thousands of different companies providing information. I was able to demonstrate its use to four people, none of them interested in computers, by finding a subject they were interested in, wines, photography, camping and money.

I was able to save screens on

tape or printer for a permanent copy, download software, some free — perhaps not professional quality, but what can you expect — and some charged for.

I can order goods through this system by quoting my credit card number (now I understand why American Express sent their brochure) or reply to questionnaires.

I can send and receive messages to other users on the Micronet mailbox, and by joining Directel, another user group, I can use their mailbox facilities.

I also found a "personal" section somewhere in the system which was very amusing, a set of messages to and from users almost like an electronic version of CB.

It would take months to just look at all the info. held in the system, but I'm convinced there must be something for everybody and personally I find it the most exciting development that I've encountered.

A word of warning, it is easy to become so engrossed in the system that you lose track of time, remember that all the time you are on line you are being charged for your call at the appropriate rate!

So far I must have spent enough time logged on to keep Buzby in birdseed for a year or two!

I adorn this article with some samples of the Prestel IP pages, and if any readers are using Micronet already or link up in the future, then I can be contacted through Mailbox and my number is 919993265, whether I will be able to manage to find the time to reply to everyone who writes will depend on how many people make contact. As usual I'll do my best.

The Sky at Night

J D Nicholson presents a program based on the sky at night in Lincoln.

A neat little program to help you identify some of the constellations, the program will display each of the star patterns in turn asking you each time if you wish to try the test.

If you enter "Y" or "YES" you will be passed on to the test routine, otherwise the program continues to display the next pattern. Once all the sets have been shown, the user is encouraged to try the test.

You must be extremely careful with the strings in the lines from 500 onwards, as a mistake will cause a universal disaster!

I suggest that you check each pattern with the screen dump and make corrections as you go.

The last time I saw stars was when I'd refreshed myself overmuch at the Plough and Harrow . . .

'Calling all whizz kids – my CLEVER CLOGS games are the ultimate challenge!'

These exciting games of skill and chance are the combined work of real life 'Clever Clogs' and their teachers to give you whizz kids the ultimate challenge in computer games that really make learning fun.

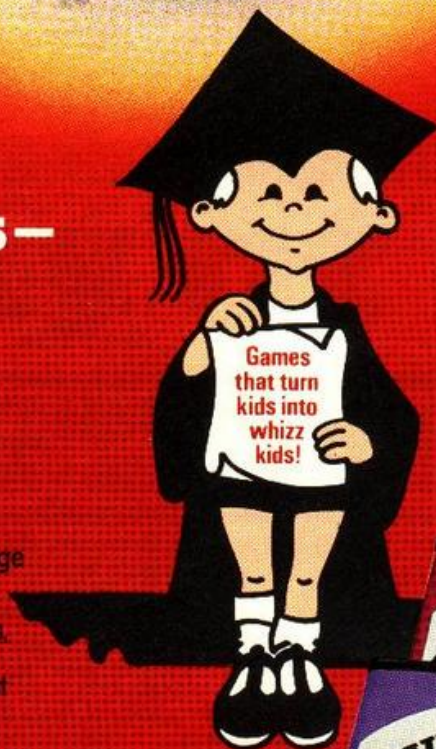

Exciting graphics, a wide choice of 'difficulty' levels, plus supplementary knowledge packs for several games in the range make Clever Clogs Britain's best buy in early learning software.

Starting with 'Party Time' for Age 3+, the Clever Clogs range brings a new approach to learning for whizz kids of all ages. And if you join the Clever Clogs Club you'll automatically be eligible for many money-saving special offers.

Selected titles available at W H Smith, Menzies and other leading retailers.

CLEVER CLOGS early learning games

Supplementary Knowledge Pack SCIENCE
Challenge your whizz kids with 600 science facts.

Supplementary Knowledge Pack THE ARTS
600 first steps in Poetry, Painting, Music and English Literature.

STAR TRUCKS
for age 8+
Hyperspace holds for whizzkids who answer right.

PARTY TIME
for age 3+
8 different games of increased difficulty teaching letters and numbers the fun way.

JUNGLE JUMBLE
for age 5+
You've never seen this one – a laugh out with 3 different games increased difficulty.

WHIZZ QUIZ
for age 7+
A real challenge to whizzkids with increased difficulty option.

BLOCKBUSTER
for age 7+
The puzzle with a million billion variations. Can you whizz kid find the answer?

SHIPS SHAPES
for age 3+
See and understand SHA with 5 great games.

MUSIC
for age 7+
A suite of musical games to encourage budding Beethovens.

SAM SAFETY
for age 5+
Teach adventurous Sam road sense and guide him safely home.

Spectrum £7.95, BBC and Commodore 64 £6.95
Supplementary Knowledge Packs £5.95.

THE AGE OF THE R.A.T

CONVENTIONAL JOYSTICKS ARE DEAD!

The Cheetah Remote Action Transmitter is the most sophisticated computer controller available.

It has these features:

- Infra Red transmission – so there are no leads trailing across the living room. Just sit back in your chair up to 30 feet from your machine.
- Touch control – no moving parts, extremely fast, long life.
- No extra software required.
- Can be used with all Cheetah RAT/Kempston compatible software.
- Fits comfortably in your hand for long play periods.
- Comes complete with receiver/interface unit which simply plugs into the rear of your Spectrum.
- Compatible with all Sinclair/Cheetah peripherals via the rear edge connector.

Simply incredible at £29.95 including VAT and p & p.

Dealer enquiries welcome. Export orders at no extra cost.

Send cheque/p.o now to:

Cheetah Marketing Ltd. (Dept. ZX), 24 Ray Street, London EC1R 3DJ. phone 01-833 4909

Cheetah products are also available from branches of

John Menzies  **WHSMITH**  **Rumbelows**
and all good computer shops.

£9.95 each
Arrow, 17-21
Conway Street,
London W1P 6JD.**

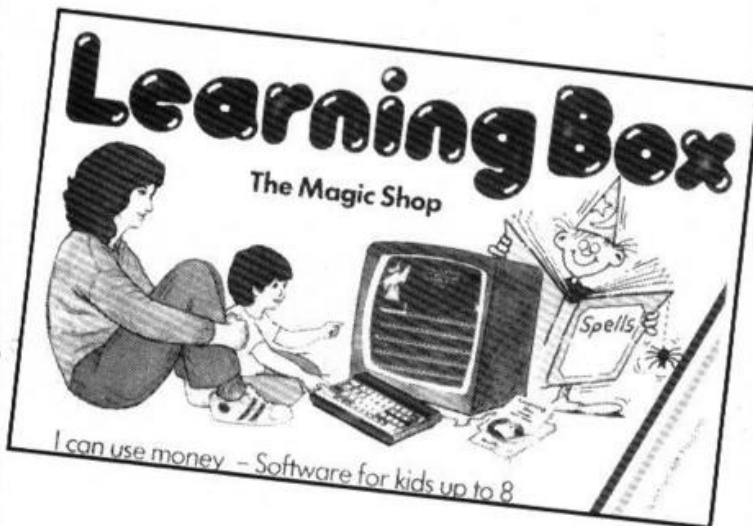

When home micros first began to appear, one of their major selling points was the fact that children would be able to continue their education at home. In reality, this claim proved less than accurate, not because of hardware limitations but because the software available did little at the time to inspire prospective buyers. Happily however, this situation has changed and although a lot of mediocre material still manages to get published, a few names

are earning a reputation for quality educational software. One such is Fiveways Software whose latest offering for the home/educational market is 'The Learning Box' series published by Arrow.

The series consists of eight titles, each based upon a familiar story or nursery rhyme. They are designed to help children develop and extend upon basic reading and number skills. Four of the titles: 'Five Little Ducks', 'Nine currant Buns', 'Goldilocks' and 'Red Riding Hood' are for children up to six years of age. The remaining titles, 'The Enormous Turnip', 'Hansel and Gretel', 'Mr. Mac's Day' and 'The Magic Shop' are for children up to the age of eight.

Each program costs £9.95 and, for the price you get a durable video-style cassette box which contains a storybook, parents guide, keyboard overlay and a tape which has the story on one side (narrated by Toni Arthur) and the program itself. The main emphasis throughout the series is one of structured progression and the activities are intended to be worked through over a length of time rather than as a one-off, repeatable activity.

Each program offers a wide

range of options, with anything from four to seventeen activities. These are intended to be used initially with the parent sitting alongside the child, but are structured so that even the youngest child should, quite rapidly, be able to work unaided. This aspect is reinforced by use of the double-sided overlays, which divide the keyboard into coloured sections, thus avoiding the need for the young learner having to search for specific keys.

Quality

An indication of the quality of the programs is seen as soon as the colourful loading page appears — bright, appealing graphics indicate the fun to come! Upon loading, a large-print 'menu-style' option sheet details the range of activities available — Fiveways have designed their own character set and the alphanumeric characters are large, colourful and nicely formed. This attention to detail is common to all the programs and the standard of graphics, colour and sound throughout is excellent!

For the youngest children the first title is 'Five Little Ducks' which is divided into two sec-

tions; Early Numbers and Counting, with five activities in each. Early Numbers deals with grouping, colour matching and one-to-one correspondence. Counting makes use of the little ducks in the title to demonstrate sequences and numbers up to five. Errors are treated with doleful 'quacks' and the child must try that part of the activity again. Variations on this theme should lead gradually to the child's recognition and understanding of numbers up to five.

'Nine Currant Buns' is subtitled 'I can do sums' and it provides seventeen activities to demonstrate the stages of addition and subtraction as well as simple sums. A novel feature, which typifies the 'fun to do' approach, is provided by animated '+' and '-' signs. This, combined with many varied objects, such as friendly currant buns or flapping seals, provides an amusing yet effective way of reinforcing the basic concepts involved.

'Red Riding Hood' (I can read words) uses tried and tested educational techniques such as matching pictures, matching letters, word snap and picture snap as an introduction to the recognition of letters and words,

thereby providing a sound basis for reading skills. Characters and events from the stories of both Red Riding Hood and Goldilocks are used in an entertaining way and the child can choose to work alone, play against a friend, or play against the computer. The speed of the program in self-adjusting to cater for the differing abilities of the users. This program is full of little surprises and a child cannot fail to be motivated by the sight of Little Red Riding Hood stamping her feet in anger at a wrong answer — to the obvious delight of the hungry looking wolf beside her!

Along similar lines is 'Goldilocks' (I can read sentences) which also has two sets of vocabulary and introduces groups of words and simple sentences.

For the older child is 'The Enormous Turnip', which introduces 'word making' using a cheeky little mouse to help the old man pull up his turnip. Exercises cover initial sounds, sound blends and simple spelling, all of which are designed to encourage the child's word building skills.

'The Magic Shop' is intended to assist in the understanding of money and its use. This is perhaps the weakest of the programs in that the progression of activities is not very clearly defined and initially a lot more parental guidance is required. The 'number line' used is also rather confusing and not as clearly defined as it might be. However, having said that, the program is nevertheless a useful aid for a child to reinforce the idea of buying articles and receive-

ing change. It is up to date, including the 20p and £1 coins, but perhaps does not fully achieve its aim even though the idea of buying and concocting magic potions is undeniably self-motivating!

'Mr. Mac's Day' helps the child to tell the time. This is done by, amongst other things, help-

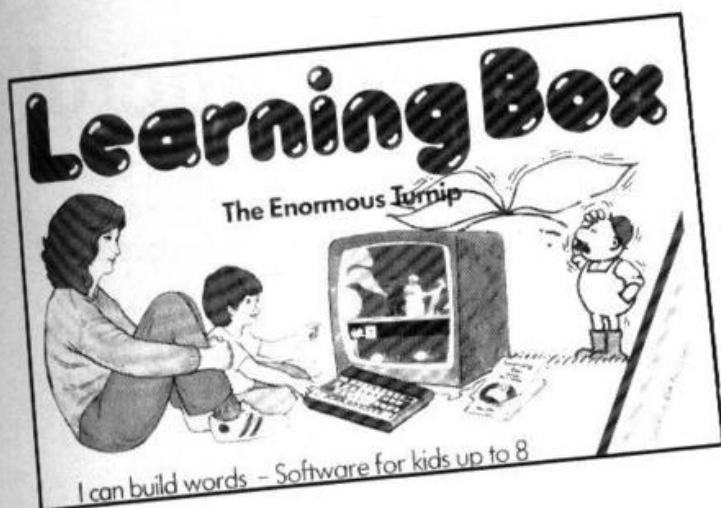

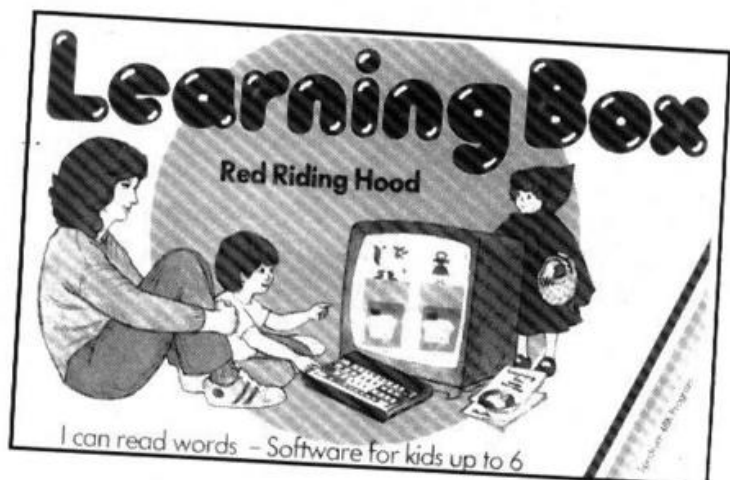

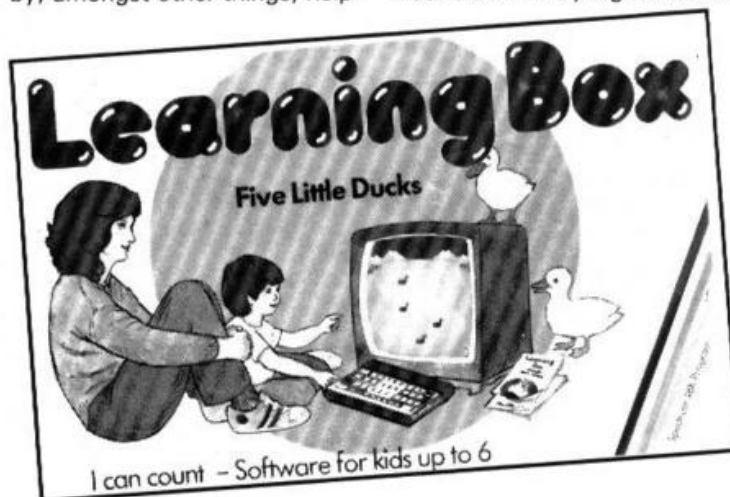

ing forgetful Mr. Mac to do the right things at the right time....woe betide you if you make him arrive for work in his best kilt! Further activities include 'Driving the engine' (and reaching the destination on time) as well as exercises on Digital Clocks and the 12 and 24 hour clock. This program causes

my own (very minor) criticism... there is no provision for adjusting the time backwards in the event of overshooting the time you actually want. (Mind you — I always seem to have the same trouble with my digital watch!) The graphics in this program however more than make up for the minor quibble...they are first rate! — even to the extent of Mr. Mac doing a Highland Fling to the skirl of the bagpipes!

Finally to my favourite of the bunch — 'Hansel and Gretel'. This is a series of graded activities to encourage word building and spelling using techniques such as 'Make a word' or 'Mend a word.' Again the exercises progress gradually and use a wide range of vocabulary from the story to develop word building skills. The final activity is a novel version of 'hangman' which is harder than it looks. However, I must admit that this program is my favourite for the simple reason that it contains some of the most imaginative graphics that I have ever seen in an educational program. (Wait till you see the way that the wicked witch gets stuffed into her own oven!)

Overall these are value-for-money packages with a wealth of activities that will help the learner develop and improve upon basic skills. The Parents Guide also gives plenty of suggestions as to how to help the child and extend upon the subjects covered. This is one of the best sets of educational software I have yet seen for the Spectrum.

Full marks Fiveways and Arrow for some excellent work — to the top of the class!

Choosing a printer is a lot easier than choosing a computer.

THERE are dozens of quality printers from which to choose. With quality price tags of around £250.

The Brother M-1009, however, breaks all the rules.

Stays defiantly below the £200 barrier.

Though it has far more than its fair share of features, it maintains the extraordinarily low price of £199.95.

Travels at a steady fifty.

In the speed stakes, the M-1009 is certainly no slouch, being fully capable of up to 50 characters per second.

Providing bi-directional and logic seeking printing for normal characters and uni-directional printing for super and sub script and graphics.

Prints on any paper.

Being an impact printer, the M-1009 will print on virtually any paper, including letter headings, invoices and standard office stationery.

It will even print two copies together with your original.

A superb character recommendation.

In its price range, the M-1009 has a great deal more character than many printers.

96 no less, plus international type and graphic characters.

Reliability comes as standard.

Built to the same exacting standards as Brother's elite office

printers, the Brother M-1009 already has faultless credentials for reliability.

Its 9 x 9 dot matrix head, for example, has an astonishing 20 million character service life.

One printer that doesn't block out the light.

Many home computers tend to be a little on the large side.

In contrast, the compact M-1009, at only 7 cm high, keeps a discreet profile.

Well designed, reliable – and conscientious.

The Brother M-1009.

The future at your fingertips.

```

As promised, we bring you the second and final part of our king-size Spectrum adventure.

To recap on the notation for the Golden Chalice program, as published with part 1 in the August/September issue of ZX Computing, here is a brief description of the program.

The main routine (lines 200-350) checks the input first for movement (single letter ?) then for the few verbs that single word entry is allowed and

finally for the standard two word (Verb-Noun) entry.

If movement is required then subroutine 600 checks that it is valid. Subroutine 750 prints the permitted movements from the new location and any visible objects. 6000-7100 are the location subroutine lines.

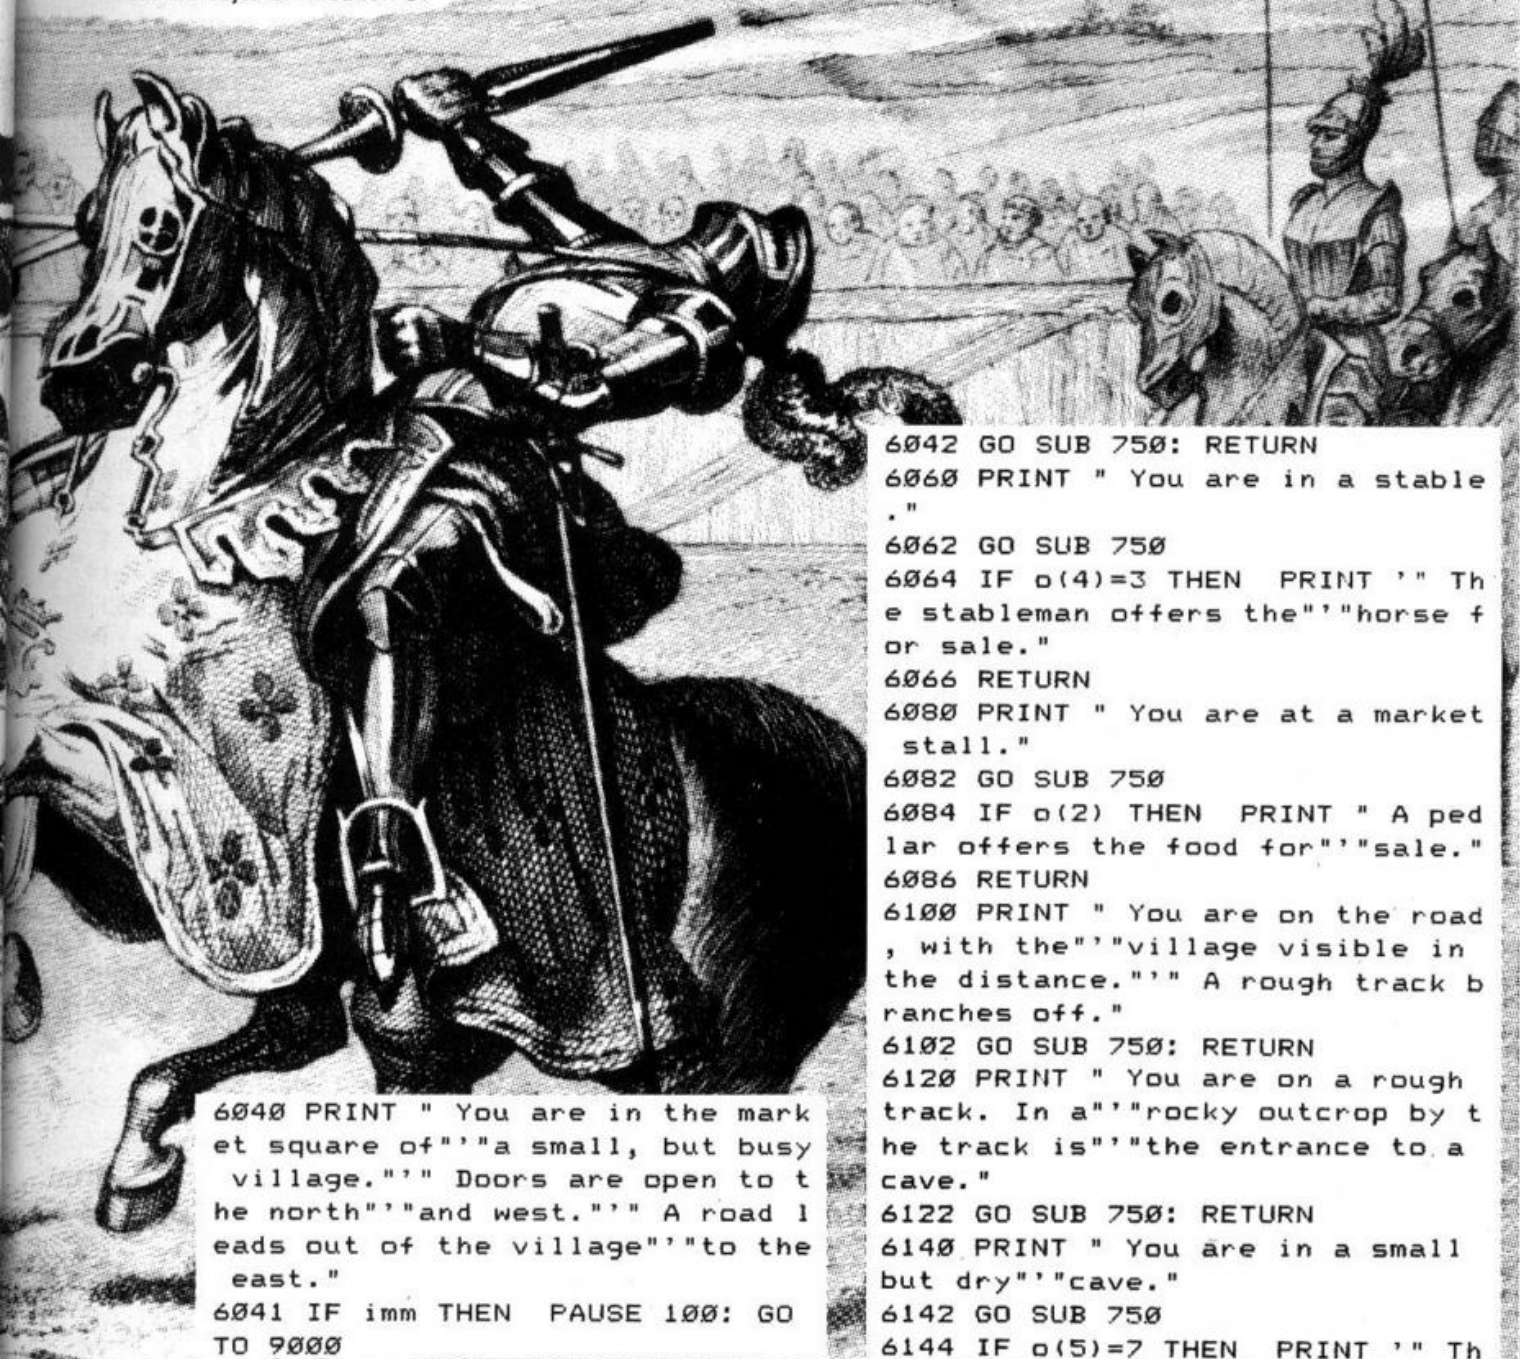

When an action is required then each verb is allocated it's

own subroutine which checks all the conditions necessary for that action to take place — pro-

vided that both verb and noun have been recognised by the input routine!

Main Variables

- R — Current location number.
- R(i,j) — Permitted movements, modified as game proceeds.
- O\$ — Object names.
- O(i) — Object locations, hidden objects = location 90.
carried objects = location 0.

Tel: (0376) 22425

In this, the final part of the series, I'll be providing you with the last part of my LOGO program for 48K Spectrums, and showing you structured programming with LOGO.

To incorporate the program in this issue with the version you completed last time, first enter the listing in fig. 1. into your computer, then store it on tape. Then, load into your Spectrum the program completed last time (from parts 1 and 2), then MERGE this issue's program into it. Finally, save a copy of the completed program, then you're ready to RUN.

New Commands

There are two additional commands created by the extra routines in this issue. The first is BACKGROUND (BG), which allows you to define the paper colour in specified areas of the screen. Five numbers are required after BACKGROUND to complete the command. Here is an example which you can try:

```
BACKGROUND 0 0 31 6 5
```

The first four numbers define the area, a rectangle, to be "painted", and the last number is the colour (0 to 7, as shown on the Spectrum keyboard). The first two numbers are the x and y co-ordinates of the top left point of the area to be coloured. In the example, 0 0 refers to the top left of the screen, unlike the co-ordinates for SET which start at the bottom of the screen. In fact the first two BACKGROUND co-ordinates are the same as the BASIC PRINT AT. The third and fourth numbers of the BACKGROUND command are width and height of the square to be coloured. In the example the number 31 is the full screen width, and the number 6 means six character squares down. The number 5 is the colour cyan, and so, the example given will "paint" a cyan block at the top of the screen. In an example later on, the same command will create the sky in a scene which will be created with LOGO commands.

The other new command in this issue is LIST. It will list to screen or printer a LOGO program. But, as I haven't yet explained how to create a LOGO program, you won't yet have anything to list!

Defining Logo Commands

LOGO programs are made by creating new commands from

Slogo

Part 3

David Nowotnik concludes his fascinating series on this adaptation of LOGO.

the commands that LOGO already understands. You can create a new command using DEFINE (DF). Most versions of LOGO use TO instead of DEFINE, but I've used the latter as it is more explanatory. You complete the DEFINE command with the new command name, which must be different from all the commands currently available to LOGO. As an example, let's tell the computer how to draw a box; we'll define a command called BOX. First enter the command:

```
DEFINE BOX (or DF BOX)
```

The screen will clear after the computer has checked that the command BOX doesn't already exist. You'll get the message 'DEFINE BOX' at the top of the screen, and the usual 'W:' at the base of the screen.

There is no standard way of defining new commands in LOGO; there are probably as many different ways as there are versions of LOGO. So the instructions that follow just happen to be the way I have decided to allow the definition of new commands.

To define our box, enter the command:

```
RP 4 [FD 40 RT 90]
```

and press ENTER.

That line will appear at the top of the screen with a line number of zero. The line number is not used by LOGO; I've just added it to identify lines in case we want to make any changes. In any one definition, you can enter up to 10 lines, but no line can be longer than 28 characters. For our BOX definition, all we need is the one line already entered, so we tell the computer we've

Fig. 1. The program listing

1-8*lk
6600 POKE at,ll+8*a
6605 NEXT j: NEXT i
6710 RETURN

```

finished by entering END. You'll get a message to tell you that the new command BOX has been stored, then you're back to a clean sheet of paper, and the 'W:' symbol. The LOGO program will now accept BOX as a command; try it!

You can include in your definitions already defined commands. As an example, define another command PATTERN, as follows:

```

DEFINE PATTERN
RP 8[BOX RT 45]
END

```

When complete, enter PATTERN as a direct command; you'll get a pattern based on the BOX routine you defined. Fig. 2. contains another command called MOVE which also uses BOX. Define the command as before, then enter MOVE as a direct command. This definition uses several commands which were described in parts 1 and 2.

Editing commands

The pattern created PATTERN wasn't particularly exciting; we could change PATTERN to improve it. To do this we use the command EDIT. The syntax is EDIT PATTERN. Once you have entered this command, the computer will spend a few moments

searching for PATTERN, then reformatting, ready for changes to be made. The definition will reappear on the screen as you entered it (apart from END). At the bottom of the screen is a menu of editing options.

- Option 1 is EDIT. It will allow you to change a line. Enter the line number of the line you wish to change, and re-enter the line as you want it.

- Option 2, INSERT allows you to insert another line between two lines of the screen. Remember, you cannot exceed a total of ten lines, so you can insert a line if you have 9 lines or less in your definition. If you opt to insert a line, say number two, then the previous line two becomes number 3, 3 becomes 4, and so on.

- DELETE (option 3) allows you to delete a line.

- REMOVE (option 4) will remove the whole definition. Pressing 5 will return you to normal command ('W:').

```

DEFINE MOVE
PU XY 50 PD BOX
PU SX 120 PD BOX
PU SX 190 PD BOX
END

```

Fig. 2. Definition of the command MOVE

So, to EDIT the command PATTERN, you will want to change line zero. Press 1 to get the EDIT option, and press 0 to indicate that it is line 0 which you want to replace. Then enter:

RP 12 [BOX RT 30]

Press 5 to exit the edit routine, enter the direct command DRAW to clear the screen and reset the turtle, then try PATTERN again.

LOGO Structures

By now you should already have an idea of how programs are built up in LOGO. Each definition should be quite independent; you should check it out before moving on to the next definition. This is structured programming. It has the advantage of being easier to follow what is happening (than, for example, 'unstructured' BASIC), so it should be easier to correct any mistakes. Programs written in this way are

also much easier for others to understand. The BBC machine's PROCEDURE and the QL's DEF PRO also allow programs to be structured in a similar way.

To start you off in LOGO programming, fig. 3. contains a listing, obtained by the LIST command. When entering a LOGO program, remember to enter one definition at a time (end each with END, which is not shown in the listing), then test it and edit as necessary before moving onto the next. In the example program, notice that the command SCENE is the command which uses all the other commands in its definition. It is the command which is central to the operation of the program; you operate the whole program (when it's all in the computer) by entering the direct command SCENE. In this way LOGO differs from BASIC. Its programs will not start with a single RUN command; they start with a defined command which is the 'core' of the program.

There is more to LOGO than the aspects I have covered in this series. LOGO also uses variables; it allows decision making with IF... THEN... ELSE structures; and it permits text handling. If you want to know more about LOGO there are several good books available (for example LOGO Programming by Peter Ross). Despite the limitations of my program, I hope you have gained an insight into the

fascinating possibilities that LOGO is able to offer as an introduction to programming to young and old, or simply, as an easy to use graphics creation package.

Robotics!

The 'FORTH' dimension for the Spectrum.

Now your 16k and 48k Spectrum get 12k of fig-FORTH from a new cartridge that's perfect for robotics.

This piece of genius is the creation of David Husband and it's the only ROM cartridge of its kind available.

It has RS232 and Parallel ports that not only facilitate remote control but are usable from FORTH or BASIC with the parallel also allowing a Centronics printer to be driven.

Due to an Interrupt driven 'Break' key the

machine cannot be 'hung-up' and a number of routines and FORTH words are Vectored allowing reconfiguration.

Later in the year a software upgrade will be available which will permit multi-tasking.

Order the Spectrum FORTH I/O Cartridge £59+VAT using the coupon adding £5.75 p&p & insurance (£10 for Europe, £15 outside) or if you want more detailed information, tick that box instead. SUBJECT TO AVAILABILITY

Light Screen Designer

Part 3

Toni Baker completes the structure of our Spectrum graphics package, and describes the cursors generated by the program.

In this part of the series we tie up all the loose ends (and leave a few more in the process). Once you have part three, the program will be unified and even partially usable — no longer a fragmented assortment of meaningless subroutines. The building blocks we constructed in the first two parts will be drawn together, (to become a foundation in whose structures should be evident) the organisation of the, as yet, unfinished whole. We start off part three with two rather weird subroutines, but we quickly progress to the initialisation and main loop of the program.

Cursor positions

As we explained earlier, cursor positions are held in four registers: B and C, which store the row and column numbers respectively and register pair

HL, which stores the address of the byte within the display file which contains the given pixel. These four bytes may be stored in memory in the order LHCB, so bytes one and two between them contain an address, byte three contains the column number, and byte four contains the row number. We also have the additional convention that byte four may contain the value FF — this is just a signal meaning "this cursor is not in use"; The following subroutine is used to give initial values to some of the cursors. It performs the following task: *if* the cursor is not in use, *then* reset the cursor to co-ordinates 0,0. It assumes that HL is already pointing to byte four.

Origin, marker and cursor

I'd like to introduce you to three

cursors now. They are called ORIGIN, MARKER and CURSOR. The second one — MARKER — is not always used, but ORIGIN and CURSOR always are. Basically, ORIGIN marks the start of the line, and CURSOR marks the end. Each of these cursors is stored amongst the program variables between DB00 and DB41. Each occupies four bytes — ORIGIN from

34	RES_CURSOR	ORG DDA3	Is byte four FF?
200E		INC (HL)	Jump if not, restoring value of byte.
2B		JR NZ,RC_EXIT	
2B		DEC HL	
2B		DEC HL	Point to byte one.
3600		DEC HL	
23		LD (HL),00	Specify cursor address 4000h (top left hand corner of screen).
3640		INC HL	Specify column number zero.
		LD (HL),40	Specify row number zero (because of next instruction).
23		INC HL	
3600		LD (HL),00	
23		INC HL

C: = column number of cursor position. B: = row number of cursor position. Point HL to next variable. A: = row number, or FF if cursor not in use.
E1 C1 10E9 D1 C9	DCS_CONT	POP HL POP BC DJNZ DSC_LOOP POP DE	Jump if cursor not in use. HL: = address of cursor. Draw specified cursor. HL: points to next variable. B: = loop count.
	RET		Leave original DE unaltered.

Routine to draw each of the three cursors, ORIGIN, MARKER and CURSOR.

DBOC to DBOF, MARKER from DB10 to DB13, and CURSOR from DB14 to DB17. This next subroutine draws each of the three cursors onto the screen (if they are in use). It relies upon the subroutine DR_CURSOR which was listed in part two.

Calling the program

Now we come to the START of the program. The whole pro-

gram may be run simply by calling the machine code from the START address. In hex, this address is DDD5, but by an absolutely astounding coincidence (what?) the START address in decimal is the highly memorable 56789. The BASIC instruction RANDOMIZEUSR 56789 will call upon "Light Screen Designer" to do its work. To use this program you have nothing to remember except 56789. Got it?

In fact, USR 56789 can be

used for two entirely different reasons — to begin a picture, or to CONTINUE with a picture, since with this program you are free to hop back and forth between BASIC and machine code as much as you wish. Note that a BASIC CLS instruction is needed before a new picture is started.

The program distinguishes between the two different forms of start by quite an ingenious method. To BEGIN with, none of the cursors will be

self-consistent (that is — if HLX says one thing, BC will say another). Whereas, if a drawing is being continued then each cursor will be consistent.

The program uses a total of sixteen different cursors. Each of them occupies four bytes, and each of them lives between DBOO and DB3F. Watch how the initialisation sequence works. You may find it helpful to look at the top part of Figure One in order to follow the program through.

Complete program initialisation subroutine.

CDCCDC 01 DD2140DB CDB016 2100DB 0610 C5 5E 23 56 23 4E 23 46 78 FEBO 300A E5 CD41DD	START	ORG DDD5 CALL DCCC,MESSAGE DEFB 01 LD IX,DB40 CALL 16B0,SET_MIN LD HL,ORIGIN2 LD B,10 PUSH BC LSD_LOOP INC HL LD D,(HL) INC HL LD C,(HL) INC HL LD B,(HL) LD A,B CP B0 JR NC,LSD_RESET PUSH HL CALL DD41,PIX_ADDR	(decimal 56789) Print message "Light Screen Designer". Main loop program

Now we come to the main loop program. If you take a look at Figure 1 you'll see I've drawn a flow diagram to show how it works. I don't often do flow diagrams but this was one of

those rare exceptions where I did. If you follow the workings of the flow diagram you'll see that the cursors are only on the screen whilst waiting for a key to be pressed. Once a key is detected the cursors are erased

before any further action is taken. One thing to watch out for though, is the fact that the keys do not repeat automatically. However, the "shift" key activates a repeat facility for the cursor keys only. Can you see

how this is achieved?

"Shift" with any other key will result in the possibility of returning to BASIC. Incidentally, don't worry about the copying the screen part — all will be revealed later on.

1883		JR MAIN_LOOP_2	DE: = keyboard scan.
			Loop back.

Main prog

Main program loop.

Returning to BASIC

And now for the final piece of code for this issue... This is the RETURN TO BASIC part. It will ask you whether or not you wish to return to BASIC and will do so only if you reply "Y". (You

may alternatively reply "N" or "escape"). Incidentally the RETURN TO BASIC option should in fact be available directly (without shift), just by pressing the "escape" button. To set

this up, you should POKE address DB82 with A4, and address DB83 with DE. This effectively stores the address of an appropriate RETURN TO BASIC subroutine amongst the COM-

MAND ADDRESS table which runs between DB42 and DB8F. The skeleton of the program is now complete. In the next part I shall start filling in some of the functions available.

```
CDA4DE
C31BDE
CDCDCD
12
FE59
C0
F1
C9
```

```
RET_BASIC
ESCAPE
```

```
ORG DE9E
CALL DEA4,ESCAPE
JP DE1B,MAIN_LOOP
CALL MESSAGE
DEFB 12
CP "Y"
RET NZ
POP AF
RET
```

Ask whether BASIC wanted.
Jump back to main loop if not.

Print message and await reply.

Return unless reply was "Y".
Empty the stack.
Return to BASIC.

Subroutine to detect and comply with a RETURN TO BASIC request.

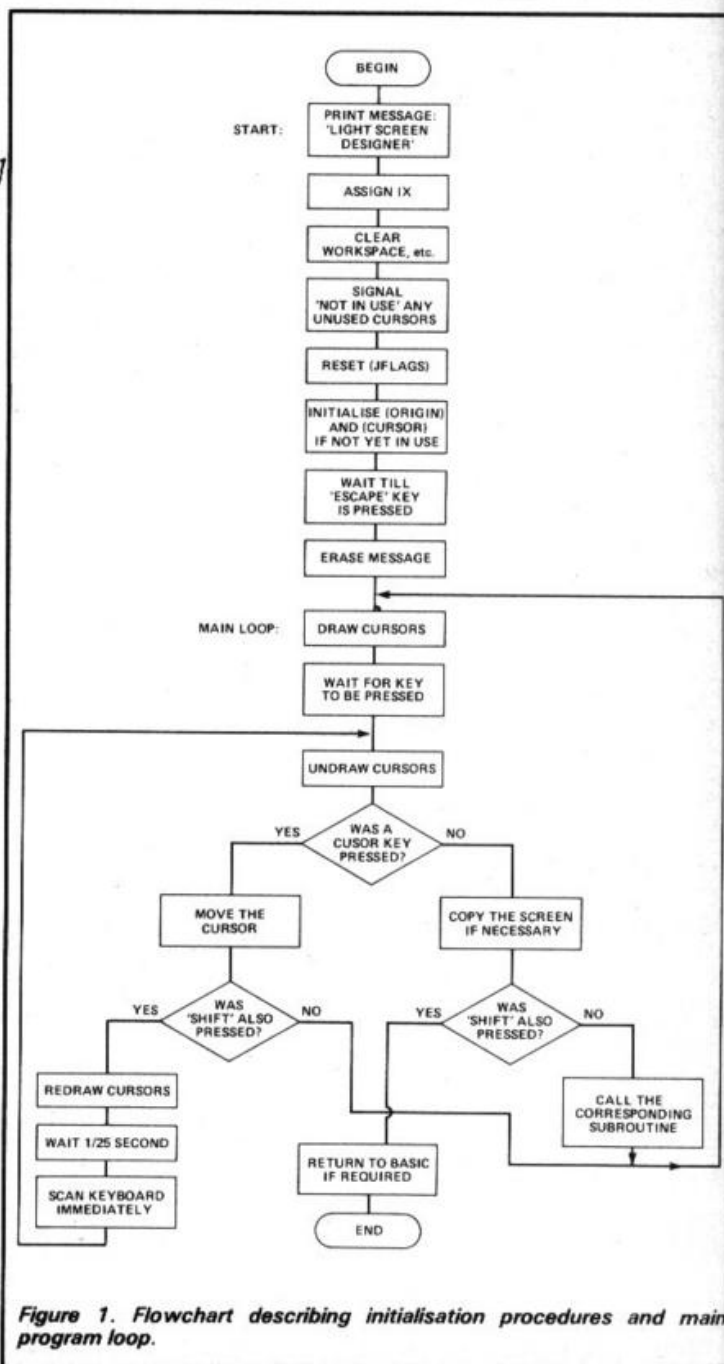

Figure 1. Flowchart describing initialisation procedures and main program loop.

Block Delete

Stan Rodgers sent this routine all the way from Switzerland, and it's worth Yodelling about!

I was going to put this in the "letters" section but then decided that although it's short it is a real masterpiece and deserves to be shown in all its glory.

Stan was already working on this when we published Rodney Francis' version in the DEC/JAN issue, and he says that he thought that the version only did half the job, since the user still had to delete one line by hand. This routine deletes the block automatically and is shorter to boot!

A short machine code routine is set up in the printer buffer and this makes it suitable for both 16 and 48K machines, it functions as Stan explains:

"It calls the monitor routine at 6510h to get the address of the first line to be deleted and then again to get the address of the line following the last line to be deleted. These addresses are then passed to the monitor routine at 6629h which performs the necessary deletion"

Simple eh? especially if you're a genius. I have tried this and it is incredible, it is much, much faster than several block deletes used in some professional Toolkit programs I've tried!

Stan also has a few words to say on the IN function which has been causing mayhem. As you may know on using this the value of BIT 7 is 1, except on issue 3 Spectrums when it is usually (but not always) 0. This means the value returned as natural varies between 255 and 191. Stan says "Strictly speaking only the 5 least significant bits are relevant when testing for a key in, so:

```
LET X=IN 65022: LET
X=X-32 *INT (X/32)
```

and test for lower values which will be the same regardless of whichever machine is being used:

```
IF x=23 THEN...
```

He asks why we didn't think of it, all I can say is "Of course, it's obvious really, I thought everyone would have realised excuse, waffle, blush....

Anyway, over to Stan who will explain how to operate his Block Delete.

Stan Say's...

The routine shown in fig. 1 provides a simple, compact, easy to use way of deleting blocks of source lines from a BASIC program. To use it, key in the program and SAVE it. Lines 4 to 6 comprise the loader and data necessary to create the machine code. Key in 'GOTO 4 ENTER' and the machine code is POKed into memory locations 23300 onwards (this is in the PRINTER buffer). If the flashing message 'Checksum error' is displayed, you have probably made a mistake in the DATA statement at line 6. Check it carefully, correct the error and key in 'GOTO 4 ENTER' again. When correct, the message "DELETE loaded" comes.

Now you can test the routine. Key in 'GOTO 1 ENTER' and the routine requests the line number at which you want to start deleting. Key in '4 ENTER' and the routine will ask for the line number up to which you want to delete. Key in '6 ENTER' and the routine will delete lines 4 to 6.

You can now save the BASIC and m-c with the commands

```
SAVE "delete"
```

and

```
SAVE "deletecode" CODE
mem,20
```

Now you have a routine

which occupies only lines 1 to 3 of a BASIC program. To use it, make sure there are no lines 1, 2 or 3 in the program you want to edit. Key in

```
MERGE "delete"
```

and the three lines of the BASIC routine are merged with your program. Now key in 'GOTO 3 ENTER' to load the machine code. The routine will ask you which lines are to be deleted as already described.

There is no restriction on the line numbers which you enter, except that they must satisfy the tests in line 1. If you give a non-existent line as the start line, deleting will commence with the next valid line. If the last line number you give does not exist, deletion will include the last line before this number. This is the most compact way of using the routine. However, if you don't mind using more than three lines, you can do the following. Delete line 3. Change line 5 to 'GOTO 1'. Now the routine will initialise itself when you MERGE it and key in 'GO TO 4 ENTER'.

Fig. 1 BASIC Block Delete routine and loader

```
1 INPUT "Delete from line ";f
;" to line ";t: IF f<3 OR t>9999
OR f>t THEN GO TO 1

NOW READ THIS!

It's your chance to become a programmer for a friendly, dynamic new company!

We are currently looking for additional programmers (and games) to add to our team.

The benefits include, the chance to work on a wide range of projects, the chance to pass opinions and present suggestions on other ideas within the company, financial help with equipment, and, of course, an excellent royalty rate.

(Your chances will be improved if you can send us examples of any of your programming. If sending us games please give a brief description of the object of the game, time taken to program and any other information you may feel to be relevant. As well as a cassette, of course.)

Please apply in writing only to:
LISA VALLMER

THE PROGRAM BUREAU

Chesham House, 136 Regent Street, London W.1.

It's easy
 to complain about
 an advertisement.
 Once you know how.

One of the ways we keep a check on the advertising that appears in the press, on posters and in the cinema is by responding to consumers' complaints.

Any complaint sent to us is considered carefully and, if there's a case to answer, a full investigation is made.

If you think you've got good reason to complain about an advertisement, send off for a copy of our free leaflet.

It will tell you all you need to know to help us process your complaint as quickly as possible.

The Advertising Standards Authority. 
 If an advertisement is wrong, we're here to put it right.

ASA Ltd, Dept 1 Brook House,
 Torrington Place, London WC1E 7HN

This space is donated in the interests of high standards of advertising.

Here be dragons

Adventure games are often most difficult to write. It is relatively easy to write a simple arcade type game: here you are only concerned with trying to get your 'space invader' to do what you want it to do. With an adventure program you are dealing with people. Your program must appear intelligent and be 'user friendly'. It has to be able to cope with all sorts of input from a frustrated adventurer.

There are several ways of writing an adventure program but they all begin the same. The programmer must have a good idea for an adventure and a plan. This is often the most difficult part of the whole process. The best place to get ideas is from a video range of source material. This mainly consists of Science Fiction and Fantasy books. The most widely used are those by Tolkien, but there is a wide range of books which can offer ideas.

There are other authors which are rarely touched such as Isaac Asimov, H.P. Lovecraft and Tanith Lee. Many of the books from these and other authors can provide brilliant ideas for adventure scenarios.

Be seeing you...

Another, more widely used source, are television programmes and films. T.V. programmes such as The Prisoner and Doctor Who are good starting points to collect ideas. Many films, both in the cinema and on Video release, are good sources of inspiration. Films such as Krull, Dark Crystal and Science Fiction epics such as Return of the Jedi provide ideas for events and locations within your own adventures.

Magazine advertisements also provide ideas. The graphics displayed in an advert can spark off ideas for locations and characters within an adventure. The 'blurb' itself describing adventure games can provide ideas. If a game is for a computer other than your own, then based on descriptions in adverts and reviews in computer magazines, you can create a scenario for your own version of the game.

The majority of ideas come, not from only one source, but a mixture of all those mentioned.

Some pointers on how to produce that adventurous masterpiece from Glaswegian demon-destroyer, Brian J. Robb.

If you note down ideas for a while one day you may find you have several which fit together well to create an adventure scenario.

Mapping your Scenario

Once you have your scenario worked out then it's time to draw a map. Maps are an important part of adventure game writing because they provide an idea of where each location is, not just an abstract thought but

a solid visual representation of your fantasy land.

When the map is finished you must 'stock' it with items, monsters and characters. On your map list the items to be found there and any monsters which may be lurking in the shadows. You should also list any special conditions to be met before a monster can be killed or and item collected. All this is shown in figure 1.

Only when all this has been done should the computer keyboard be approached. It is very tempting to begin program-

ming as soon as you have an idea, without any planning, but all this will result in is a bug filled shambles of a program.

An adventure program can be put together as a series of interlocking 'modules' making it easier to trace bugs. A list of variables to be used throughout the program should be made and the variables should be initiated at the very beginning of the program. This makes up one module. The second module should contain the instructions for the game. The variables are shown in figure 2.

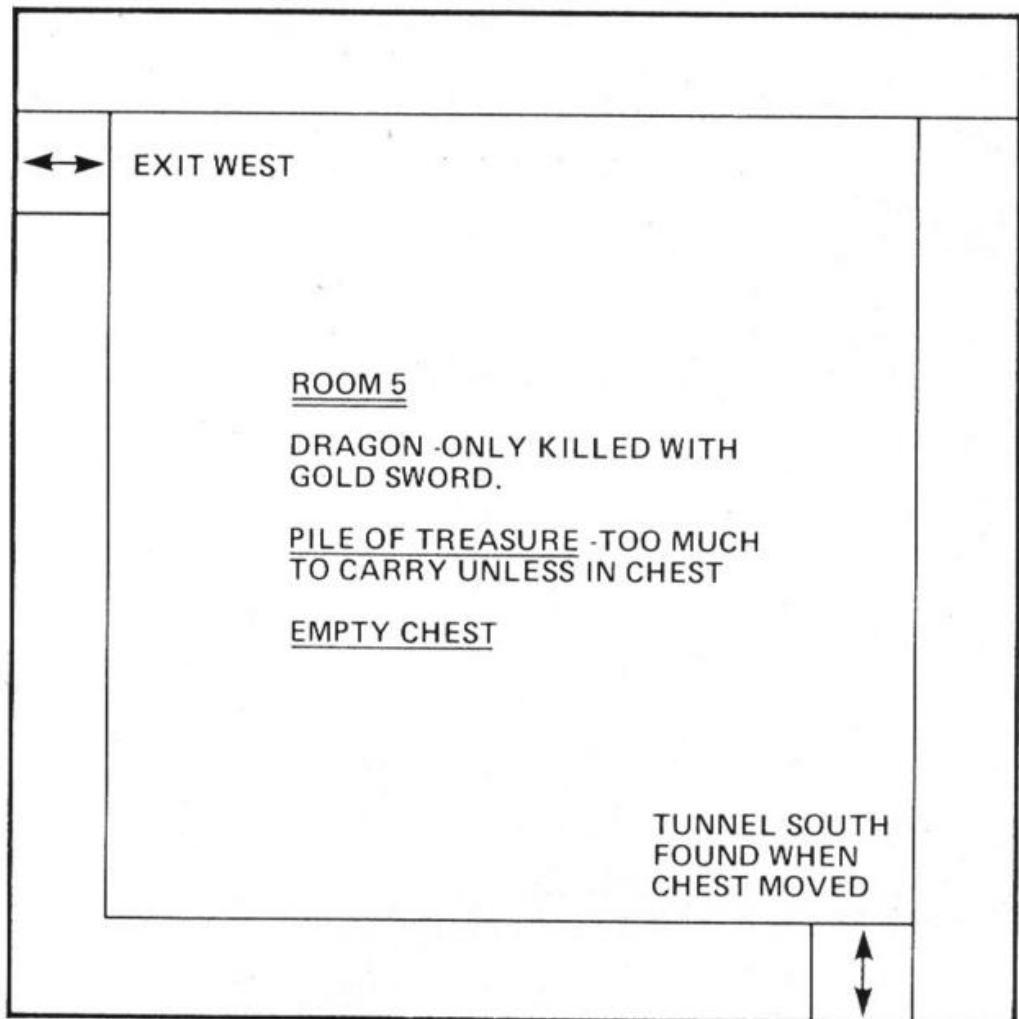

Figure 1. Mapping your adventure.

```
10 LET S=0 This is the characters strength
20 LET IQ=100 This is his wisdom/intelligence
30 LET M=0 This is his magic ability
40 LET TR=0 The value of treasure carried
50 LET A$="What Now?" A typical response
60 LET L=0 The location number
70 LET N=0 The number of items carried.
```

Figure 2. Setting up the variables.

```
300 REM MONTERS
310 IF M=1 THEN GOSUB 6000
315 IF M=2 THEN GOSUB 6010
Etc.,
6000 PRINT "YOU SEE A DRAGON"
6006 RETURN
6010 PRINT "YOU SEE A ZOMBIE"
6015 RETURN
Etc.,
```

Figure 3. Monster descriptions without READ and 'DATA'.

```
600 REM TAKING
610 PRINT "WHAT DO YOU WISH TO TAKE?"
620 LET N=N+1
630 INPUT LS(N)
640 IF N=5 THEN PRINT "YOU ARE CARRYING TOO MUCH.DROP AN ITEM."
650 PRINT "YOU MAY CONTINUE"
660 GOTO 1000
```

Figure 4. A 'brain' routine to TAKE.

line 1000 is the location of the general input routine. This module is for the ZX-81 but is easily converted to other micros.

```
200 REM LOCATIONS
210 IF L=1 THEN GOSUB 5000 (Where L is the location Number.)
220 IF L=2 THEN GOSUB 5010
230 IF L=3 ETC.
5000 PRINT "YOU ARE IN A DEEP PIT, FILLED WITH SNAKES".
5005 RETURN
5010 PRINT "YOU ARE IN A FOREST WITH EXOTIC BIRDS".
5015 RETURN ETC.
```

Figure 5. Location descriptions without READ and DATA.

Main Module

Then follows the main module a control program or 'brain'. This module has to collect the location descriptions from the main body of the program. A large number of computers do this using READ, DATA loops, but the ZX-81, does not have this feature. Figure 3 shows a way to get round this problem.

The brain module contains all the routines likely to be used many times during a game. This would include routines such as GET;TAKE;DROP;FIGHT;RUN;REST;HELP;and USE. As your adventure grows so too can the program's vocabulary and 'brain'.

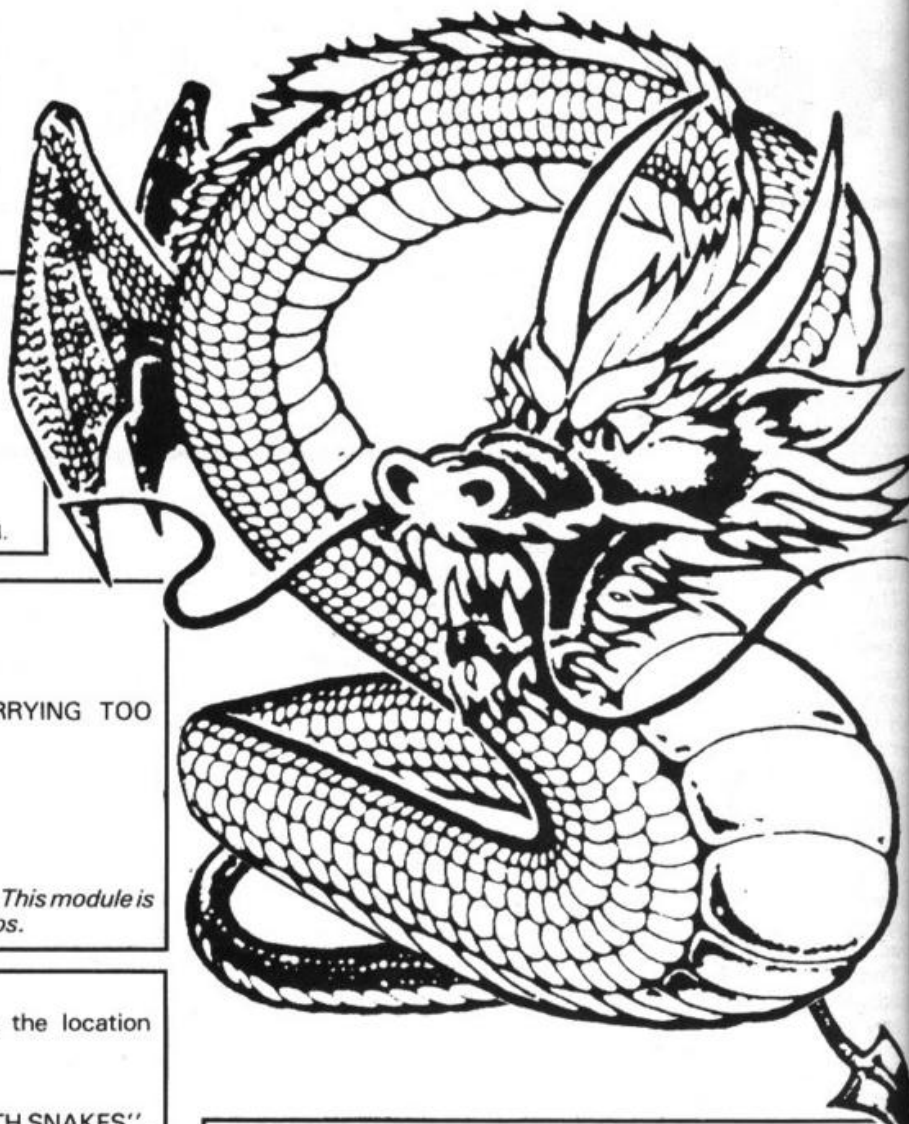

Once you have your variables set up, the many brain routines, and the location descriptions laid down you have to make your player-character mortal. A variable will have been set up to contain your characters strength or life points. During

the program this should be decreasing until it reaches zero when the player-character is dead. The players strength or life points can be increased by eating food along the way or by using potions and magic.

Example Routine

Figure 4 shows a 'brain' routine for use with the ZX-81, but this is easily converted to other micros. Figure 5 shows a routine for finding locations without the need for READ and DATA statements. Figure 6 is a table showing the structure of the completed adventure.

When you have finished programming you should have an adequate adventure to baffle your friends for a while. If the task set or aim to be achieved is difficult enough your players should be occupied for quite a while. That is a sure sign that your program has succeeded.

Moving Graphics On The QL

Drive a racing car around the screen in this fast-moving game from Tim Hartnell, which demonstrates how effectively SuperBASIC can be used for moving graphics.

Drive a racing car around the screen in this fast-moving game from Tim Hartnell, which demonstrates how effectively SuperBASIC can be used for moving graphics.

Although the speed of the QL has been criticised, it is still possible to produce highly satisfactory moving graphics programs as you'll see when you run this program.

In QL RACER you drive a little

racing car (which looks remarkably like an arrow) around a race track. You'll discover that the game, although it starts off running fairly slowly, is almost impossible to play. If you manage to get around the track once without crashing, it will speed up, and will continue to increase its speed for twenty games.

The program, which comes from my book *Tim Hartnell's QL*

Games Compendium (Interface Publications, £5.95), makes the most of a number of features which are unique to the QL, such as the real-time clock.

You travel from the top left hand corner round the course clockwise, then up the left hand edge to your starting position, where you'll be given a new car. You must avoid all the edges to stay in the race. Your score is related to how long you manage

to keep the car in action, and also to the 'difficulty level' which is set at the start of a game.

As I pointed out, the real-time clock is used in this program. The QL's internal clock is used to give a readout which shows how long you have survived. The clock, and the score, is updated using the procedure defined in lines 470 to 560.

Tower of Hanoi

Kenneth Baker of Southampton has written the ultimate version of this game in machine code for the 16K ZX81.

Invented about 100 years ago by the French mathematician Edouard Lucas, The Tower of Hanoi is perhaps the most fascinating and enduring of all puzzles. The object is to transfer the six parts of the Tower from position 'A' to position 'C' in the least possible moves, and without ever placing a larger block upon a smaller one. Position 'B' is used throughout as a temporary store.

To transfer a block from 'A' to 'B', simply input AB. If the move is valid the transfer will be made, and the score incremented by 1. The program is designed to reject any illegal moves.

In this six-tier version of the puzzle, the least possible moves is 63, and the maximum allowed is 99 — when the computer will decide that the player is doing so badly that it will automatically call a restart to the program. Restart can be called at any time by pressing 'R', and the only other active key, apart from the transfer keys ABC, is 'F', which will clear the program from memory.

To put the player on the right track, the first few moves are AB AC BC... but to say more might be to deprive the player of hours of hair-tearing frustration.

At the end of each game a caption containing a suitable comment as to the status of the final score will appear on the screen. Please remember that the least possible moves is 63.

The program is written entirely in Machine Code, which must be entered most carefully. The code is arranged in 139 lines of 11 HEX pairs: the first nine pairs representing the actual code, whilst the last two contain a checksum which is an addition of the code values in the line plus the line number. In this way, if any line should contain

an error, or even if the wrong line is entered by mistake, it will be rejected with a request for the line to be re-entered.

Each line of 11 pairs should be entered together as a string, with one space between each pair. It should be noted, particularly if any other method of input is used, that the last two pairs are NOT instructions.

Making Space

The biggest problem with entering large Machine Code routines into the ZX81 is being able to create large enough REM statements in order to store them. The method chosen here is to form a REM statement of 120 characters in Line 4, and duplicating it 9 times in Lines 5-13 by the following method:

```
4 REM xxxxxx(120
characters) xxxxxx
EDIT
Change the Line No. to 5
Press N/L
EDIT
Change the Line No. to 6,
and so on, until Line 13 is
reached.
```

The size of Line 4 is then adjusted to encompass the 9 ensuing lines, which will result in a REM statement with the required number of 1254 bytes. When a REM statement is created in this way, it is most important to stabilize it with the addition of at least one line afterwards — hence the apparently redundant REM in Line 14 of the program, which must be left intact when the HEX LOADER is deleted.

Purely by the way, should you wish to use this technique in your own programs, the number of bytes per number of lines can be found by using the formula: $((C+6)/L)-6$ where C = the total characters required, and

```
1 REM
2 SLOW
3 RAND USR 16731
4 REM THIS LINE CONTAINS THE
MACHINE CODE READ TEXT
BEFORE ENTERING THE
PROGRAM
```

```
14 REM
15 POKE 16541,232
16 POKE 16542,4
17 LET Z=16544
18 LET V=28
19 FOR N=1 TO 139
20 LET T=N
21 LET C=1
22 DIM A$(33)
23 DIM A(9)
24 PRINT AT 18,0;"INPUT LINE N
O. ";N
25 INPUT A$
26 FOR M=1 TO 25 STEP 3
27 GOSUB 50
28 LET A(C)=P
29 LET T=T+P
30 LET C=C+1
31 NEXT M
32 GOSUB 50
33 LET Q=P
34 LET M=M+3
35 GOSUB 50
36 LET P=256*Q+P
37 IF NOT P=T THEN GOTO 39
38 GOTO 43
39 PRINT AT 18,0;"ERROR IN LIN
E ";N;AT 19,0;"PLEASE RE-ENTER"
40 PAUSE 100
41 CLS
42 GOTO 20
43 FOR M=1 TO 9
44 POKE Z,A(M)
45 LET Z=Z+1
46 NEXT M
47 NEXT N
48 PRINT AT 18,0;"ALL CORRECT"
49 GOTO 54
50 LET I=CODE A$(M)-V
51 LET F=CODE A$(M+1)-V
52 LET P=16*I+F
53 RETURN
54 PAUSE 100
55 CLEAR
```

L = the number of lines. To avoid fractional answers, the odd byte or two can be added to the total characters. The best way to determine the number of lines is to factorize $(C+6)$, again adding the odd byte until a convenient balance is reached. The length of the first line is then poked with $(C+2)$.

When the code has been successfully entered, lines 15 to 55 can be removed, and the final instruction, before saving and running the program, is to POKE 16543,127: this will make the REM statement invisible, but can be omitted if my flair for cosmetic surgery is not to your taste.

ZX-81 OWNERS

**AT LAST
THE PROGRAM YOU'VE
BEEN WAITING FOR!**

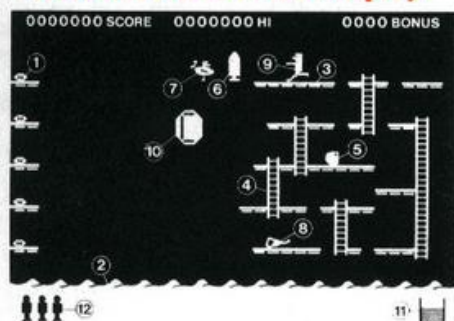

Rocket Man

**Coming
Soon!
SPECTRUM
VERSION**

**with
Hi-Res Graphics
on standard ZX-81 16K**

Actual ZX-81 Screen Display!

- | | | |
|--------------|----------------|-------------------|
| 1. Diamonds | 5. Fuel Cans | 9. Player |
| 2. Sea | 6. Rocket | 10. Bubloid |
| 3. Platforms | 7. Vulture | 11. Fuel Gauge |
| 4. Ladders | 8. Leg of Lamb | 12. Men Remaining |

Get rich quick by collecting Diamonds that are simply lying there waiting for you!

Oh... I forgot to mention that there are one or two problems! There is an expanse of Shark infested water between you and the Diamonds and a strange breed of Bubble that seems hell bent on getting you in it! Somehow you must cross it...

You have a Rocket Pac to help you (a Vulture on higher levels) but you must rush around the platforms and ladders collecting cans of fuel (legs of lamb with the Vulture) and cursing that weird Bubble. Once you have enough fuel then it's Chocks Away!

Oh... but don't run out of fuel on the way - otherwise it's SPLASH!

The aim is to collect all the diamonds from the far left hand side of the screen, whilst avoiding the rampant Bubloid. These emerge from the sea and are hell-bent on returning to their watery habitat with you in tow. Sooner or later you are going to end up in the drink - The idea is to make it later!

By belting round the system of platforms and ladders, cleverly avoiding the Bubloid, you collect the fuel cans which appear in random positions, until you consider that your fuel gauge indicates sufficient in the tank. Now you can go and collect your rocket. With the rocket-pack strapped to your back you can fly across the expanse of sea to collect the diamonds... but don't run out of fuel or your rocket-pack will simply disappear and you will wind up in the drink!

There are six stages with six different platform layouts. On stages 1-3 the Bubloid, which floats in front of the platforms with uncanny ease, gets an ever increasing ability to home in on your position, making the task of staying alive more demanding with each stage. On stages 4-6 you once again start with the easiest Bubloid (which is a blessed relief!) but the fuel cans are replaced by legs of lamb which you must collect to feed your vulture, and once it has enough energy (or you think it has!) you must flap across the water on its back to collect the diamonds.

Extra men are awarded for every 10,000 points - but ONLY once you have collected all the diamonds and so completed each particular stage.

GOOD LUCK!

Pot Shot

Indulge in a little 'fowl-play' and avoid the gamekeeper with F A Slade's Pot Shot.

A simple but nonetheless entertaining game presented in two forms. Firstly a BASIC listing which plays perfectly adequately and then for comparative purposes try the Machine code version. The Basic program is entered as read.

To enter the machine code program enter listing 1, not forgetting the 356 dots in 1 REM, and RUN it.

Input each of the numbers in each line one at a time, the sixth number is a check and any errors will be trapped and you will be asked to re-enter an incorrect line.

Once all the numbers have been entered you may delete all the lines except 1 REM or leave them, the choice is yours. Enter

the Machine code driver lines then SAVE your program. Although the code is checked on entry there is still a slight chance of error.

For further details I hand you over to Mr Slade:-

This game was originally written in machine-code for the younger members of the family. However, I have endeavoured to produce a reasonably accurate representation in BASIC. Any key may be pressed to fire the bullets.

The object is simply to score as many points with your limited ammunition, as possible. Set two or more six year-olds off on a competition and they will play for ages!

Program Description

Lines
20-80
90-110

Set up the array A\$ for the ducks.
The variables
A for the control of the bullet position loop.
B for the number of bullets fired.
C for the score.
D for the moving of the ducks.
E for the position of the base.
POKEs the base into position. (Using D/FILE)
Prints the ducks each loop.
Adds 1 to D to move the ducks.
Checks D for restarting print position.
checks if bullet fired or key pressed.
Checks no bullets to end game. (May be changed).
Prints score and asks if another game required.
Start of bullet fired/print loop.
Adds bullets fired if loop just started.
Clears old bullet prints new bullet.
If bullet is not near ducks, jumps past hit routine.
Checks if hit head or body or nothing.
Increments bullet position or resets to 0
Hit duck... clears A\$ of duck
(340-360)prints splat (362-368), increases score (370)
Resets A for hit (head or body)
Delay loop
Clears bullet
for hit body.

Listing 1. Machine code loader

Machine Code

The machine code is held from 16514 to 16869 and requires a REM to hold the instructions. These numbers are POKed into their correct addresses. The speed of the game is controlled by a delay loop from 16795 to 16807. 16797 and 16799 may be POKed with different values to change the speed of

the game. 16818 contains the number of bullets that can be fired and again this may be changed up to a maximum of 255.

It's easy to complain about advertisements. But which ones?

Every week millions of advertisements appear in print, on posters or in the cinema.

Most of them comply with the rules contained in the British Code of Advertising Practice.

But some of them break the rules and warrant your complaints.

If you're not sure about which ones they are, however, drop us a line and we'll send you an abridged copy of the Advertising Code.

Then, if an advertisement bothers you, you'll be justified in bothering us.

The Advertising Standards Authority. 
If an advertisement is wrong, we're here to put it right.

ASA Ltd, Dept 2 Brook House, Torrington Place, London WC1E 7HN

This space is donated in the interests of high standards of advertising.

ALL-IN-ONE

Spectrum Interface

Drive Unit 1

Drive Unit 2

RS232 Interface

Centronics Interface

Spectrum owners! Imagine what great use you could make of all these components. Rotronics have integrated them all into one attractively styled, compact unit. All the power and convenience of floppy disk can now be yours, but at a fraction of the cost.

A complete package

Wafadrive is extremely versatile. Five major components are housed within this one unit—the micro interface, two 128K drives, RS232 serial and Centronics parallel ports. Also included in the package are a blank wafer and Spectral Writer—a superb word processor program. The micro interface forms the nerve centre of Wafadrive, controlling all its major functions. The dual drive configuration and the ability to connect standard peripherals directly provides professional system flexibility. All this without a mass of separate components and vulnerable cables. Wafadrive transforms your Spectrum into a very powerful system.

Speed, reliability and capacity

The wafers contain an endless loop of specially developed magnetic tape driven at high speed past a read/write head. The result is fast access without data loss.

Three sizes of wafer are available with minimum formatted capacities of 16K, 64K and 128K. The 128K wafer costs £3.95.

Data transfer rate is approximately 2K per second. Access time is proportional to capacity. 16K wafers are ideal for program development, with the larger capacity wafers being more suitable for general use and archiving of completed programs and data. Mechanical longevity is assured by the use of high grade materials throughout and full interchangeability between machines is guaranteed.

Extensive software applications

Wafadrive provides intelligent file handling and rapid access to data. Program development and other applications can be performed with ease. Start word processing immediately with the specially developed software package included with Wafadrive. Or battle with a spectacular interactive games program. Whatever your mood, you'll find the sophisticated Wafadrive software challenging and rewarding. Future versions of Wafadrive will be available for most popular home micros, so software back-up will be comprehensive.

For further information contact us now for our full colour brochure.

League Tables

Keep track of who's where with Gordon Jones who, just for the record, hails from Middlesex.

This is a versatile program for keeping track of teams in a league, it could be football, darts or drinking, in fact any activity which involves team positions.

The maximum number of teams as the program stands is twenty. This is all the ZX81 can display at once, but with a little programming effort and by viewing the league in sections this could be expanded.

The program is menu driven and prompts are provided at each stage, the program has provision for:

- Setting up a league table
- Entering results and calculating positions
- Displaying the processed table
- Viewing any teams previous result
- Copying either the table or list of results
- Saving the table and results on tape

This versatile program, a boon to any club secretaries, will run as it stands on a Spectrum.

For the adventurous programmer it could be used as a basis for a simulation game. We already have several football progs, so what about a pool league simulation game?

THE KEY TO PROFESSIONAL GAMES DESIGN ON THE SPECTRUM 48K

THE GAMES LANGUAGE OF THE 80'S!

Now, without any knowledge of machine code, you can write fast, smooth, professional, totally original games and market them **without paying royalties**. Even if you have already mastered machine code, we believe that the time and problems saved by writing in **White Lightning's** FORTH-based high level language could revolutionise commercial games writing for years to come.

IDEAL IDEAL is an Interrupt Driven Extensible Animation sub-Language. Once you have mastered IDEAL's easy to learn set of over 80 commands and just a little FORTH, you will be ready to produce arcade-quality games even if you don't know machine code. Up to 255 Sprites, each with its own user-defined dimensions can be moved around the screen (or memory), scrolled, spun, reflected enlarged or inverted with amazing speed and smoothness. Operations are possible between screen windows, Sprites and Sprite windows. Sprites can even stretch across several screens, so those difficult scrolling landscapes that form the basis of so many games are easy to achieve. Sinclair's own sound and graphics commands such as CIRCLE, DRAW and BEEP are fully supported, and there are some unique collision detection facilities.

MULTI-TASKING Because **White Lightning** uses interrupts, you can effectively run two programs at once. This means of course, that games like Space Invaders and Defender can be written without complex timing calculations. So while one

program smoothly scrolls the landscape, the second animates the other characters. This is undoubtedly one of **White Lightning's** most powerful features.

MARKETING AND PORTABILITY Although **White Lightning** uses an integer FORTH as its host language, programs can be written in a combination of BASIC, FORTH, IDEAL and machine language. What is more, programs written in FORTH/IDEAL will be highly portable between the Spectrum and implementations under development for other popular micros. When it comes to marketing your completed games, there's no problem either. In fact Oasis themselves will offer to market outstanding software.

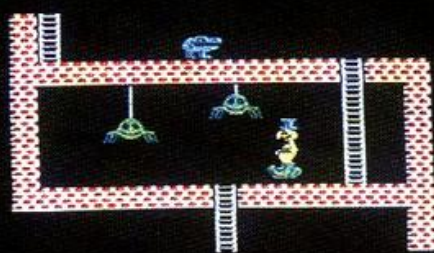

SPRITE DESIGN **White Lightning**, comes complete with a separate 20K program for developing the Sprites used in the main system. Not only can you use this to design your own Sprites from scratch, it also comes complete with 168 pre defined characters covering games like Asteroids, Pac-Man, Assault Course, Defender, Space Invaders, City Bomber, Lunar Lander, Frogger, Centipede, Donkey Kong and many, many, more. These characters are ready to use or can be enhanced. And Sprites can be saved to tape between editing sessions before being finally loaded into the main program.

The High Level
Graphics Development
System for the
SPECTRUM 48K.....

**OASIS
SOFTWARE**

AND COMING SOON!
the power of **White
Lightning** on the
COMMODORE 64!

● Produces real machine code programs which run independently of **White Lightning**.

● A multi-tasking animation language AND a Sprite Development program together in one system-pack.

WHITE LIGHTNING

● Supplied with a FREE 16-minute demo, and a 130-page, easy-to-follow manual.

If your local dealer doesn't stock **White Lightning**, just send off this coupon for our rapid-despatch service.

Please send me _____ **White Lightning System Packs** at £14.95 each. I enclose my cheque/P.O. for £_____

Astro Zone

Where would we be without our usual foray into space? Craig Sanders of Stockport provides the transport

Don't they ever learn? Despite the incredible losses due to Earth's accurate and deadly fire from an army of computer trained marksmen, those suicidal Aliens continue to attempt to invade us.

But this time... who knows? Maybe we are getting over confident, trigger fingers wearing a bit thin, stricken by conscience?

I liked this one because of the attention to detail, stars etc. and

the fact that you have the extra advantage of five energy shields.

Craig has taken care to produce a game which is graphically effective with good use of sound and provides a challenge. I won't tell you my final rating, but there used to be an old cinema newsreel with a similar name.

All instructions and details of the control keys are included in the program.

THE MOST IMAGINATIVE GRAPHICS PROGRAMMING SOFTWARE FOR YOUR SPECTRUM

GRAPHICS PROGRAMMING MADE EASY— THE PRINT 'N' PLOTTER WAY!

PRINT 'N' PLOTTER PAINTBOX

Superb Graphics
— without expensive hardware!

PAINTBOX gives the 48K Spectrum owner *every* facility to produce excellent graphics — easily, quickly and professionally.

There's no need for expensive hardware. PAINTBOX is flexible, precise and incredibly simple to use!

Just take a look at some of the facilities available:

UDG EDITOR

The facility to define up to 84 graphics characters which can be stored in your BASIC programs for instant recall from its own built-in machine code!

UDG DRAWING BOARD

UDG planner for the 4 banks of characters. Facilities include: MIRROR IMAGE, ROTATE, INVERSE, FILE.

SKETCHPAD

Experimentation 'window' that allows you to try-out your UDG ideas under development.

PRECISION PLOTTER

Amazing versatile high-resolution drawing board which includes PAPER choice, PLOT, DRAW, DRAW RADIALLY, CIRCLE, ARC, OVER, FILL, instant change of INK and BRIGHT, multi-function ERASE and STORE.

Cursor is controlled by keyboard or Joystick with FAST, SLOW, and Cursor size choice!

SCREEN PLANNER

For the best of both worlds! PRECISION PLOTTER and UDG CHARACTERS! For complete screen planning of graphics. A multi-purpose facility to enable you to produce superb screen graphics!

All results can be sent to a printer, saved as SCREEN\$ or SAVED as CODE with its built-in machine code routine for instant recall from BASIC.

The program is complete with a cassette demo and a 28 page booklet describing in easy-to-understand language how to use it, plus many tips for storing and using your graphics in programs.

PRINT 'N' PLOTTER SCREEN MACHINE

Instant machine code
for graphics and text.

SCREEN MACHINE is an invaluable graphics utility to use with PAINTBOX or any other graphics hardware or software!

It gives a wide range of facilities to enable you to manipulate graphics and text, saving time, memory and giving truly professional results.

For instance: SCREEN MACHINE COMPRESSES Screen Files to cram even

more into the memory!

It **COMPILES** text, graphics characters or UDG's instantly into machine code giving fast smooth access to the screen!

It **CREATES** re-callable Multiple Screen Files automatically with its own built-in machine code!

It **ENLARGES** screen sections in 2X steps!

It **REDUCES** the whole screen in 2X steps!

It **RECOLOURS** your screen graphics either globally or selectively!

It **MIRRORS** the screen left to right making flip-action animation easy!

It **RELOCATES** your screen graphics to any other part of the screen with block or high-resolution scrolls!

It **SUPERIMPOSES** screen graphics giving incredible 'mixing' results!

It **SAVES** everything to tape or Microdrive for use within your BASIC programs!

There's no doubt that SCREEN MACHINE is a major graphics toolkit for the 48K Spectrum. It is completely menu-driven and comes complete with demo program and fully-documented instruction booklet.

Another first from Print 'n' Plotter!

PRINT 'N' PLOTTER ZX SPECTRUM JOTTER

Pre-planning your screen
made easy . . . and precise!

Print 'n' Plotter JOTTERS have become a household word for the Sinclair enthusiast.

Despite various imitations our original ZX SPECTRUM JOTTER is still the one people prefer!

Of course it could be because it is professionally produced . . . the quality is superb.

And the fact that it is BIG SIZE A3 (16½" x 11¾") is a distinct advantage when working in high-resolution.

It's also 100 pages thick. 50 pages of PLOT grids showing each numbered pixel co-ordinate and 50 pages of PRINT grids showing every character and graphic character position and INPUT lines.

Each page also contains 24 UDG planning grids (2400 per pad).

Consider also the fact that it is printed on Artist's Detail paper . . . thick enough to take any writing, drawing or colouring, yet thin enough to overlay onto a drawing and trace-off.

For pre-planning graphics, text, tabulation or anything to produce 'on screen' a Print 'n' Plotter JOTTER won't be beaten.

The complete package comes with a set of coloured pens, a Pixel ruler and a handy corrugated storage tray.

If you use PAINTBOX, SCREEN MACHINE or any other graphics utility . . . you'll do things better with the ORIGINAL Print 'n' Plotter JOTTER!

PRINT 'N' PLOTTER KEYBOARD OVERLAYS

The simple answer to
"Which key?"

Print 'n' Plotter KEYBOARD OVERLAYS for the standard ZX Spectrum keyboard are the economic answer to "Which key does what?"

If you program, or buy commercially-produced software, sooner or later you'll be faced with a mind-boggling mass of keys that perform different functions.

This can be as simple as the "FIRE" button in a game or as precise as the "analysis" button in a scientific program.

Let's face it, the Spectrum keyboard is complicated enough so why not take the easy way to remember . . .

. . . lay over the keyboard a Print 'n' Plotter OVERLAY and write the function underneath . . . it's child's play!

Then keep the OVERLAY for the next time you use the program.

Print 'n' Plotter KEYBOARD OVERLAYS come in packs of ten. Punched to fit your Spectrum. Priced to suit your pocket!

PRINT 'N' PLOTTER ZX PRINTER PAPER

Print 'n' Plotter Products also market ZX PRINTER PAPER that gives good, clear print, eminent feeding qualities — probably the best you'll find in the U.K.

FAST DELIVERY and economically priced . . . you won't find better!

**Print 'n' Plotter
Products**

One of the first add-ons that a computer owner may contemplate buying is a joystick of some kind. The increase in control that this provides is of obvious benefit to the dedicated games player. In addition it is becoming increasingly necessary for some of the complex graphics packages that are appearing for the Spectrum. However if you have not yet taken the plunge and are now contemplating the purchase of some form of controller you have a difficult choice ahead of you. In essence, most of the actual joysticks are very similar, and your eventual purchase will be based upon personal preferences for shape, size, ease of use etc., but the biggest decision to make will be that concerning the vital link between your joystick and the computer i.e. the INTERFACE.

Interfaces allow the use of joysticks with compatible software, and although there is a great variety of material available for use with all the more common interfaces no single one will give you control over every game, unless, of course you opt for a PROGRAMMABLE INTERFACE. These claim to give you joystick compatibility with ALL software.

Non programmable Kempston £11.95

Probably the nearest thing to a "standardised" interface. This unit has been around almost as long as the Spectrum itself and most games have a Kempston option.

The unit works by utilising the IN31 function and so the keyboard is not enabled. This also means that a program must cater specifically for it and some of the earlier games don't. To get over this Kempston market a set of tapes which will convert some of these to operate with their interface. Each of these will cost £4.95.

The box plugs into the port of the back of the Spectrum and the joystick plugs into a standard 9 pin socket at the front of the unit. This means that the joystick leads trail over the keyboard and if you have a full sized keyboard then this plus the fact that the box has a "lip" means that fitting it is a great problem.

Although it's starting to show its age there's still plenty of life in this well tried and loved device.

INTERFACITS — Joystick Interfacing Investigated!

A comprehensive round up of the units available — checked out by our team of reviewers

Interface II Sinclair Research £19.95

A multi purpose unit which includes two joystick sockets, a ROM cartridge socket and a limited through port.

Sir Clive in his wisdom, decided to use his own "standard" for operating his interface and this is not the same as Kempston. This means that many of the earlier games will not operate with it although most of the recent programs incorporate an interface II option. In fact many games have a larger choice of joystick options than gameplay options!

When provided, two joysticks can be used simultaneously and this is the greatest advantage of this unit. It has been on the market for quite a while now and the presumed flood of cartridge programs has not materialised. This is really the power of this unit and if they are not going to be produced then it has limited value as a joystick interface.

RAM Turbo Ram Electronics (Fleet) Ltd. £22.95

Similar to the Sinclair Interface

II, this unit has two joystick sockets and a cartridge slot. It also has a through port but in the Turbo it is a full one unlike the Interface II.

The Sinclair format is not used, but both Kempston (IN31) and Protek (cursor keys) systems are supported. I don't know if this means that only one joystick at a time can be used as we never received a review unit.

Games Ace Vox Box Datel Electronics £29.95

Although requested, neither of these units were sent for review, so I'll just give a mention of the information available.

Games Ace works on the Kempston function so it will be compatible with that option, it also has the bonus of including circuitry to output the sound to the TV where the volume can be controlled.

Vox Box is the same as the Games Ace but also includes speech synthesizer based on the allophone system. Sounds interesting.

Pro Joystick Interface Kempston Micro Electronics Ltd. £19.95

After a long run with their best selling interface Kempston have decided to introduce this model. Similar in many respects to the Sinclair Interface II it seems

much more versatile. As it's hot off the production line we haven't yet seen one. However, I'm told that it has three separate 9-pin plugs which cover Kempston's own system, Sinclair I/F II standard and the AGF/Protek cursor key format. There is also a ROM cartridge port. With Kempston's experience in the market it's got to be worth a look.

Solidisk Technology Ltd. £8.50

One of the cheapest interfaces on the market, this one operates on the Kempston standard and is claimed to be wobble free. Sold complete with a Quickshot-style joystick for £15.50.

Even more useful is that should you forget to change the switch or get the wrong option then you can safely change the option once the program has loaded and is actually running!

An interface which I would recommend to any dedicated games player who requires a simple, effective means of joystick control.

Protek also market a presentation pack of joystick, interface and their own flight simulation program for £24.95.

AGF Joystick Interface II £9.95

AGF have two joystick interfaces on the market at the moment — one programmable and

the other not. Interface II is the non-programmable one, but there are versions for both the ZX81 and the Spectrum.

The interface will accept a wide range of joysticks including Atari, Starfighter, Le Stick etc. and has facility for a second joystick to be used. There isn't much to it in the way of hardware, just a few plugs and sockets and six chips. I noticed they have rubbed off the numbers on the chips to deter people making their own, but at £9.95 it's not worth the bother.

The interface just clips on the back of your computer and has a rear extension for more add-ons. With a joystick plugged straight in it will mimic keys 5, 6, 7, 8 and

0 and the second port will give you T, Y, U, I and P.

To convert games that do not use these keys, you will have to purchase AGF's software and you have a choice of two cassettes. Tape one will convert Arcadia, Schizoids, Hungry Horace, Horace goes Skiing, Spectres, Penetrator and tape two converts Centipede, Planetoids, Jet Pac, PSSST, 3D Combat Zone and Invaders.

After you have loaded the cassette it will ask you which game you would like to play and after running the tape further it will automatically find the corresponding software to convert that game and tells you when to load your game.

On the inlay, it lists the games you can use the interface with. I would have thought it would have been better to list the key operations as well so that it would be easy to find what other games you could play with it.

You can buy the interface, software and joystick direct from AGF if you cannot find it at your local store. Cassettes are £4.95.

It is a slightly 'Heath Robinson' way of connecting a joystick but it is cheap.

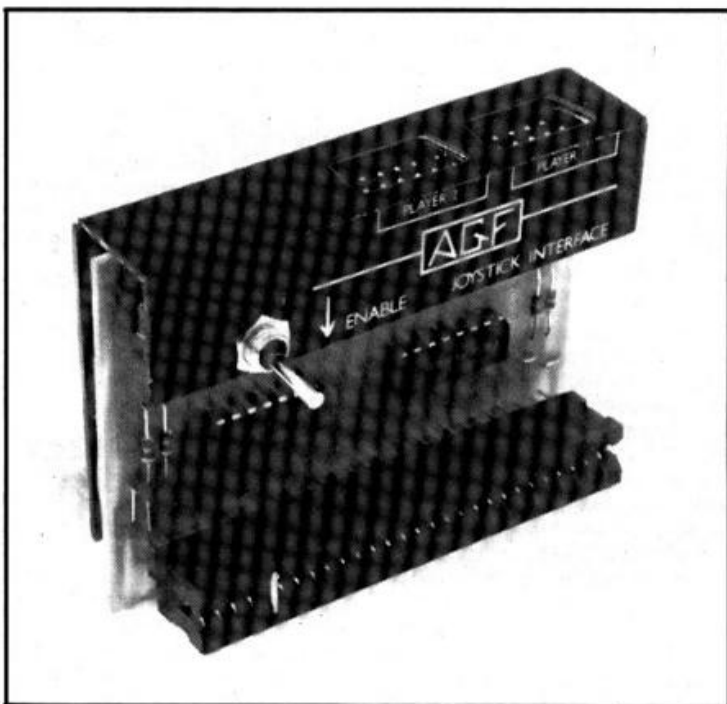

Clive Smith

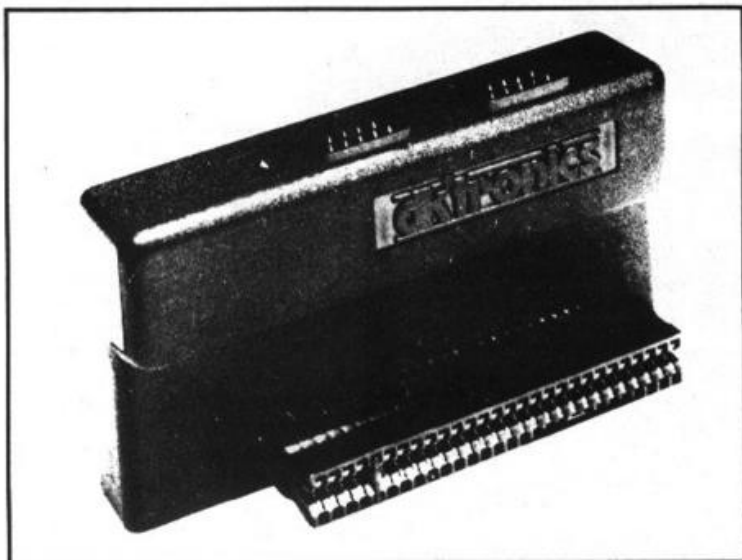

DK'Tronics Joystick Interface DK'Tronics Ltd. £13.00

Another little shiny black box (7 x 5 x 2.5cm.) to get quickly forgotten somewhere between joystick and computer is the **DK'Tronics Joystick Interface**.

It has a firm positive fit into the expansion port at the rear of the Spectrum, although because only 22 of the contacts on the edge connector are used, the actual fitting tends to require more care and caution than with other units. There are two nine pin, 'D' type ports at the top of the unit and both are clearly identifiable. The first is for use with software using a key change option or using 6, 7, 8, 9 or 0 keys. The second port uses the IN31 command is therefore for use (software compatible) with the Kempston type joystick.

The test routines and a few example programs (one using

machine code) are given in the accompanying instruction leaflet, for those people who want to stretch themselves beyond being mere players, who want to incorporate their joystick and interface into their own programs. And for those programmers who want to use two joysticks to control two separate objects at the same time on the screen, then both ports of this interface can be incorporated simultaneously into programs.

Just out of interest, I wonder how many micro-users actually do use their joysticks and interfaces for anything else besides playing commercially produced games?

Colin Christmas

Programmable Interfaces

Rainbow Electronics
£24.00 (+ £3.00 extra for a through-port)

Another interface which never made it to our office in time for this roundup.

The interface includes a built in amp and speaker, the joystick socket and the programming switch are positioned at the front (with all the associated problems).

CCI (Custom Cables International)
£15.00

This unit is programmed by means of software supplied on tape, and this means that you have to load in the program supplied before loading your game. This isn't a great problem as it is

a short program and setting up the keys is straightforward and only takes a few minutes. The unit we had didn't have any instructions. CCI promise that they are supplied with each purchase — we just had "a very early preview model". Nevertheless I found it simplicity itself to operate even without them — which can't be bad.

The only problem is that some games don't tell you which keys the program uses so you have to load them in first to find out! This is only a problem the first time round because, being sensible, you kept a record for the next time, didn't you?

The unit proved reliable and effective over a three week period of constant and frequent use and I see no reason why it shouldn't perform admirably for a long, long time.

At the price it is probably one of the cheapest of it's kind and worth considering if, as it is for me, money is a prime factor.

Jim Watson

Programmable Joystick Interface Stonechip Electronics £24.45

As with most similar interfaces this is simply a plug-in unit which requires no additional links such as flywires of extra tapes to load. The unit itself measures 90 x 75 x 35mm and is contoured to fit snugly to the rear of your Spectrum. It features a three-way switch at the front enabling the user to select any of the three modes; Program, Play or Normal operation (where control relies upon the keyboard alone).

The interface draws its power from the computer and a

small red L.E.D. indicates power on. A standard 9 pin Atari-style joystick socket allows the use of your favourite zap-em-stick!

It is at this stage that my first complaint appears. No doubt many satisfied users will disagree, but why, when an increasing number of games require the use of at least two extra hands, does the port have to be placed so that the joystick lead runs right across the keyboard?

Programming of the interface is fairly easy — set the selector to the Program position, press the appropriate direction key and move the joystick into the relevant (or not so relevant) position. The small, but adequate, instruction sheet advises that the most complex functions be dealt with first and this gives rise to the second little quibble.

As opposed to certain other interfaces available, the Stonechip requires the FIRE function to be input separately for each and every direction. This is sometimes not all that easy when you require one hand for the keyboard, one for the fire button and direction and one to stop the mobile joystick from sliding off the table!

Apart from that, the programming of this interface is a straightforward, it not lengthy, process. Programming complete, just move the selector to Play and away you go! One additional feature is the Normal position that allows the joystick to be removed without loss or corruption of the keys already programmed.

The unit was tested with a variety of joysticks and performed perfectly well with all of them. Included in the instructions is a sample program to enable practice — programming prior to testing on the real thing.

If a Programmable Interface is the sort that you require then this should be considered. It is slightly expensive in comparison to some of the updated and newer models now appearing, but nevertheless is a tried and tested product that has stood the test of time.

Mike Edmunds

The Cambridge Joystick Interface £34.95 (including joystick)

This interface has a through-port at the back which is very useful for using other units like speech or sound devices. The unit also has a lip on the front to help prevent "wobble" but if

you have a non-standard keyboard it gets in the way.

There is the usual nine pin plug on the left hand side for the joystick and the overall size is 11.5cm x 3.5cm x 7.5cm.

To use the interface you have to load a tape first which programs the interface to respond to the appropriate keys. If the game you're using fails to give this information on the instructions then you have to load the game first to find out! However, once you have programmed a set of key-sequences, they can be saved on tape (the reverse side of the tape has been left blank for this purpose and provision is also made for saving to microdrive) and many games can be saved at one time. You are able to check the joystick position at the end of the programming sequence.

This interface is sold complete with a joystick and tape, the joystick is available separately and is reviewed as such.

The interface is a bit fiddly to use but has proved compatible with all software tried, but where an option of joystick or keyboard is offered from within a program, you must use the keyboard one as the joystick option frequently does not work.

M J Maggs

Programmable Joystick Interface Downsway Electronics (UK) Ltd. £22.95

The Downsway Programmable Interface, which has been available for quite some time now, is at first sight rather a plain black unit which plugs directly into the Spectrum's real expansion port. It measures 65 x 95 x 25mm and has a dual-position switch on the rear and a standard 9-pin joystick socket on the right side of the unit. This is one of the advantages that this Interface has over some other units currently available, in that the keyboard is left uncluttered by control cables and therefore can be used in conjunction with the joystick. This gives the user a wide range of control options which can be a distinct benefit considering the handful of keys that some programs demand. A small instruction sheet provided with the Interface gives all the information that is needed to make your joystick compatible with any program.

Programming of the Interface can be achieved either prior to

loading a game or after the game has loaded. This facility takes care of all those programs that have no detailed instructions on the cassette inlay. To use this unit is simplicity itself — with the dual position switch in 'program' mode press the key for the specified command and move the joystick to the appropriate position. Release joystick and key then repeat for all other movements. In essence that's all there is to it!

After programming (a few minutes work) switch to the 'play' mode and away you go!

In operation the unit performed perfectly and on the odd occasion when a mistake was made it was a simple matter to re-program the offending key without the necessity of going through the entire procedure again.

The FIRE command is independent of direction command and this means that FIRE has only to be programmed once, as opposed to the multiple movement/fire operations needed with some interfaces.

The unit was tested with several joysticks ranging from the cheapest to one of the most expensive available and it performed equally well with all, the only noticeable difference being a somewhat coarser movement with one of the cheaper joysticks. Of the many programs used with this interface only two gave any problems — keys could be programmed but pressing the firebutton caused the game to restart. As it happens the particular games weren't intended for joystick use anyway!

In conclusion, if a joystick interface is high on your list of priorities then it may well be worth your while paying a bit more for the extra flexibility that this excellent little unit provides.
Mike Edmunds

Fox Programmable Interface **Fox Electronics Ltd.** **£34.95**

I have used this unit consistently over a four week period with a wide variety of games and I recommend it to anyone looking for such a unit.

It is a rather large unit and the long suffering DK'Tronics keyboard needed another bit removed before it would fit! The standard case presents no problems however.

The unit has a through port so you can use other interfaces behind it, the Currah micro

speech unit worked fine at the back, and the standard 9 pin joystick socket is near the bottom of the right hand side of the case. Just above the socket is a small, two-way (up/down) switch. On power up the switch should be in the down position — switching it up instantly presents on screen a menu of 16 possible combinations of responses and options to create or select a set or to exit.

The more knowledgeable among you will have worked-out that the unit must contain a programmable chip of some sort. The program and set of key combinations are kept permanently refreshed by a battery which is constantly recharged.

What happens if something goes wrong?

The interface is supplied with a back up tape and also your own sets of positions can be saved on tape and easily reloaded into memory if needed. A few times I had to perform this operation due to the awkward fit with the keyboard but it was no real problem.

Documentation is good, covering all the operational details and also how to use it as a pseudo ROM. All in all easy to use and one of the most impressive joystick interfaces I've used.

AGF Programmable Joystick Interface **£26.95**

AGF sell a version of this interface for both the Spectrum and the ZX81 and both cost £26.95.

The interface works by duplicating the keyboard layout with a grid of wires. The wires ending in crocodile clips can be attached to the various grid wires to route specific keys to the joystick. This means that all games can be controlled by joystick although you must use the keyboard option and not the joystick one when provided.

The joystick is connected by a standard 9 pin D socket so it is compatible with the majority of the sticks on the market, two sockets are provided for two sticks for two players to play alternatively. Both sockets operate on the same keys and both sockets and the keyboard are always operative. A possible cause for dispute when used by two players! A set of quick reference cards, a demo tape and a stick on chart completes the package.

The sight of uncased wires and chips may put off some users, but treated reasonably,

this is an almost foolproof method of providing joystick control to any game.

The unit has a through port and further peripherals can be added afterwards, I used a Centronics interface and a speech unit with it and had no problems.

Switchable Interface **Protek Computing Ltd.** **£19.95**

An interesting and unusual idea from Protek is to provide the ability to switch between the common interface options. The interface has a three way switch at the back marked, logically, 1, 2 and 3. Setting the switch will give you compatibility with Protek/AGF (cursor keys), Kempston and Sinclair Interface II formats respectively.

Between these three options I should think that around 90% of the software on the market can be used with this unit. The only programs which will cause problems are those where no joystick options are provided and keys other than the cursor keys are used, and there can't be many of those!

The case is quite small and neat with the usual 9-pin plug fitted in the right hand side of the unit. This is a handy position to allow the joystick lead to clear the keyboard.

The instruction leaflet is as I like them, written in a simple step by step manner with diagrams — if you get it wrong it certainly won't be Protek's fault.

My biggest criticism is the lack of a through-port, but with other devices available to compensate, it's not as drastic a problem as it used to be.

Using this is a delight, even though most programmables are quickly and easily programmed, sometimes it doesn't seem worth the bother. With this one, compatibility is usually available at the flick of a switch.

Firmware Programmer Interface **£29.00** **Software Programmer Interface** **£22.95** **Voltmace Ltd.**

Two other interfaces unseen by us. One is programmable by using a two-way switch and the other by using a program on

tape. The most interesting item that I've seen from this company must be their Delta 3 joystick, which has a rectangular base, three fire buttons (to allow for individual styles of holding the thing), and a fingertip type joystick at £10.00.

Pace Computing

This company advertises a programmable interface for £26.00 which they say does not disable the keyboard and can be reprogrammed during a game. No further information is available so far.

East London Robotics Ltd. **£15.00**

Designed to be sold with their Trick Stick (of which we're still waiting for a review sample), it appears to be similar to the AGF programmable interface, in that flyleads which are connected to pins to mimic the keyboard are used.

If bought with the Trick Stick, then it will only cost £10.00, which can't be bad!

Dk'Tronics Ltd. **£22.95**

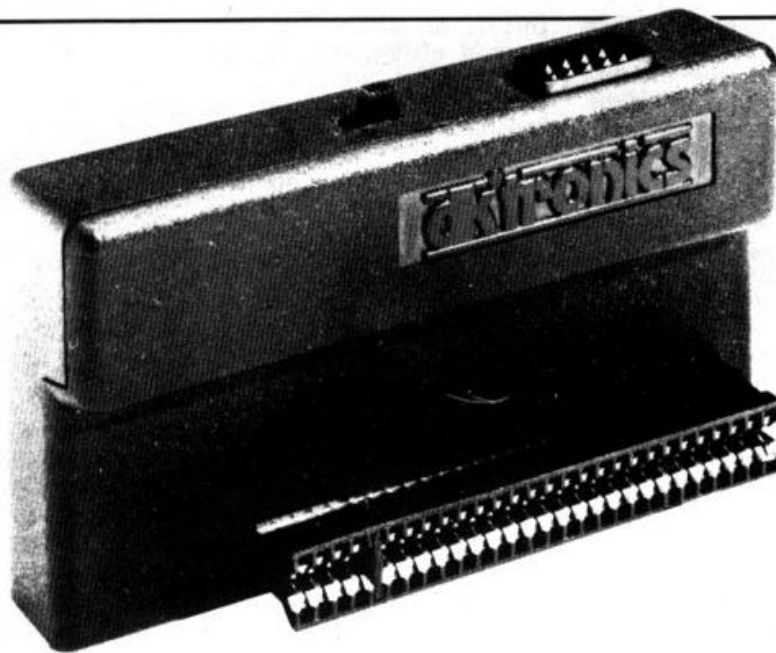

This is Dk'Tronics deluxe interface and is programmable from the keyboard by using the switch provided on the top of the unit, or via the program supplied on tape.

There is only one socket provided on this model, but as it is fully programmable there isn't any need for two separate sockets to cover the different methods of providing control. The socket is located on the top of the interface next to the switch.

During operation, the keyboard is still enabled so that complex games requiring more than five keys to be pressed can still be played.

At the time of going to press we haven't been able to obtain one because they're short of stocks, however Ms Green of the company assures me that by now their stockroom will be overflowing. The information given to me claims that movement in seventeen directions is possible, I will be most interested to put this through it's paces!

A full through port is included and it is claimed to be microdrive compatible, the usual lip at the top of the interface is there and I would also be interested in trying it for compatibility with one

of their superb looking keyboards.

Protocol 4 AGF Hardware £30.95

The very latest unit from AGF, this is an interesting looking interface. It lies flat and is programmed by a set of reprogram-

mable cards which are snapped into place on the interface.

The device is supplied with three pre-programmed cards to cover Kempston, Sinclair and Protek/AGF (cursor keys). An extra, blank card is supplied for your own use.

This is a great advance on their older interfaces in style and ease of use, however, ZX81 owners will be pleased to

know that AGF are to continue producing and selling their old units because, as Mr. Fosberry told me personally, the demand by ZX81 owners is as great as that from Spectrum owners.

The unit has a full through port and amazingly, up to five of these can be connected and programmed individually for multiple control! The latest Quickshot II joystick is supported and the

socket for the joystick is placed on the side of the unit.

Yet another small but useful extra is a reset button to allow you to turn the computer on and off without having to pull the plug each time with the eventual problems this causes.

Slightly expensive but for the dedicated games player probably well worth the money.

Endnotes

We covered as many interfaces as we would and I'd like to thank all the companies that sent us review units which allowed us to write a more comprehensive and detailed report.

I do realise that, as always, these are written by people who are giving their own opinions and you may or may not agree with them. Overall we have tried to give you an idea of what is available but really nothing substitutes for trying them for yourself at your nearest store.

There are probably a few companies that we've missed, if they would like to write and tell us, we'll include them in our future features.

Each review was written by the person named at the end, if no name appears then it was reviewed by myself — it's a hard life!

Car Costs

Is it time to retire the family Rolls? Peter Lawrence drives from Norwich with his program for the ZX81 or Spectrum.

This is a simple but accurate and useful program for all motorists (or sons and daughters of motorists) to check upon how much the gasoline guzzling beastie is actually costing you. Note that the # sign in the listing should be replaced by the pound sign. Happy motoring!

Portability 2

M P Moore of Petron Electronics describes the construction of a parallel I/O board for use with the Portability Interface

In this issue we show you how to build a parallel interface board to be used in conjunction with the interface published in the last issue. The Parallel In/Out Board has two 8 bit input and two 8 bit output ports. We also describe an LED board, which allows your computer to light LEDs (Light Emitting Diodes) from the output ports, and another board containing four relays which can be switched on and off by your computer.

Up to four of these parallel interface boards could be connected to the interface giving a total of 64 input and 64 output lines (eight, 8 bit input ports and eight, 8 bit output ports). The really dedicated enthusiast could use the interface to control 64 relays...

Important note

Since publication of the first part of this project, the design of the PCB has been changed slightly. Although the ICs on the main interface board still draw their 5 volt supply from the computer, this 5 volt line is no longer taken to the four I/O sockets; instead the 9 volt line is used, requiring each additional board to have its own 5 volt regulator. This is to reduce the load on the com-

puter's 5 volt regulator. In addition — as a safety precaution — the positions of PWR and GND have been swapped over. Table 1 gives the revised I/O socket connections. All PCBs supplied by Newtech contain the altered circuit.

The revised copper foil layout for the main interface PCB is shown in Fig. A.

Four circled areas indicate where changes have been made. The link next to SK4 is dispensed with and pin 14 of each extension socket is taken to +9V rather than +5V via a new track which runs down the right-hand side of the PCB. +5V now goes no further than the link above IC2. OV/GND is taken to pin 1 of each extension socket rather than pin 2 and pin

2 is connected to $\overline{\text{PWR}}$, the port write line.

For those who have already made their own PCB from the layout in the first part of this project, Fig. B shows the alterations that must be made.

There are three tracks (marked with an X) to be cut and three new links marked A, B and C to be fitted. Use insulated wire, especially for the 9V lead from the edge connector. The points where new links must be fitted are marked, A, B and C; connect them so that A joins to A, B joins to B and C joins to C. Note that one end of A connects to pin 2 of SK1; one end of B connects to pin 1 of SK4 and that C (the 9V lead) connects to SK4 pin 14 and the previously unused 9V pin of the edge connector.

Parallel board connections

Fig. 1 shows how the parallel In/Out board could be connected.

Output port A is shown connected to an LED board containing 8 LEDs. +5V (VCC) and OV (GND) are taken to the board along with the eight outputs.

0.1 inch PC plugs and sockets (supplied with the kit) are used to connect the parallel board to external circuits.

Each output is connected via a resistor to an LED; the LED can be connected so that the indicate either a 1 or a 0. If the were wired to indicate a 1 and the number 200 (for instance) were to be output to port A, the

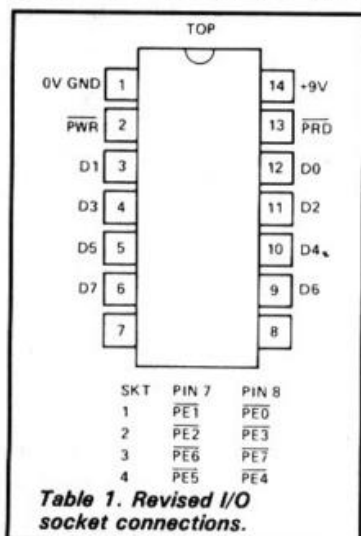

Table 1. Revised I/O socket connections.

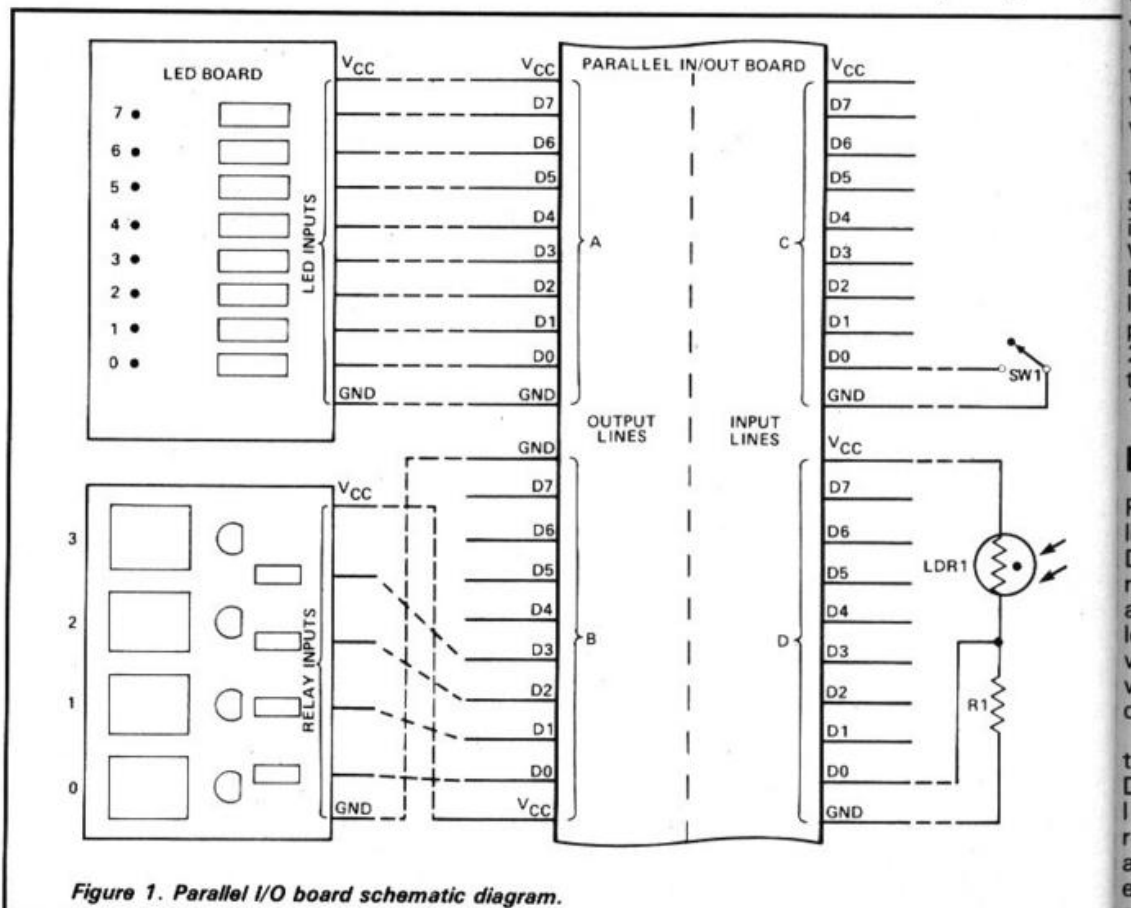

Figure 1. Parallel I/O board schematic diagram.

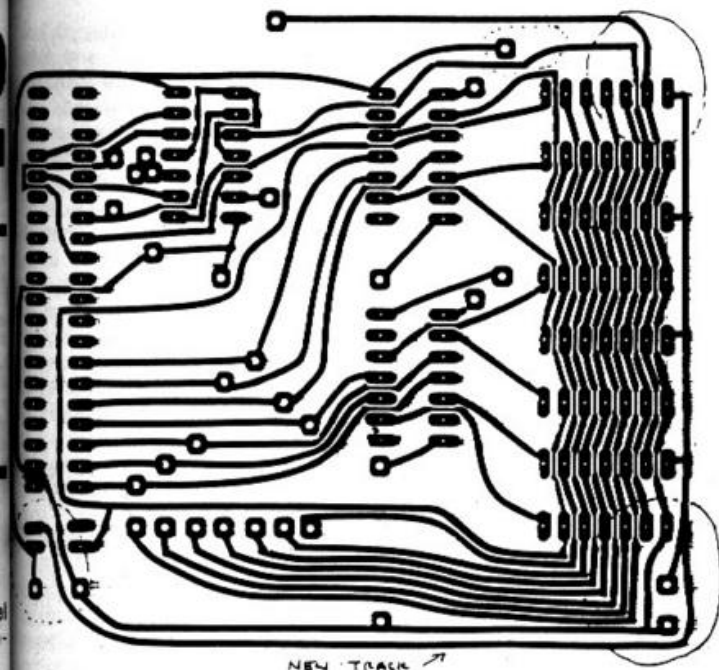

Figure A.

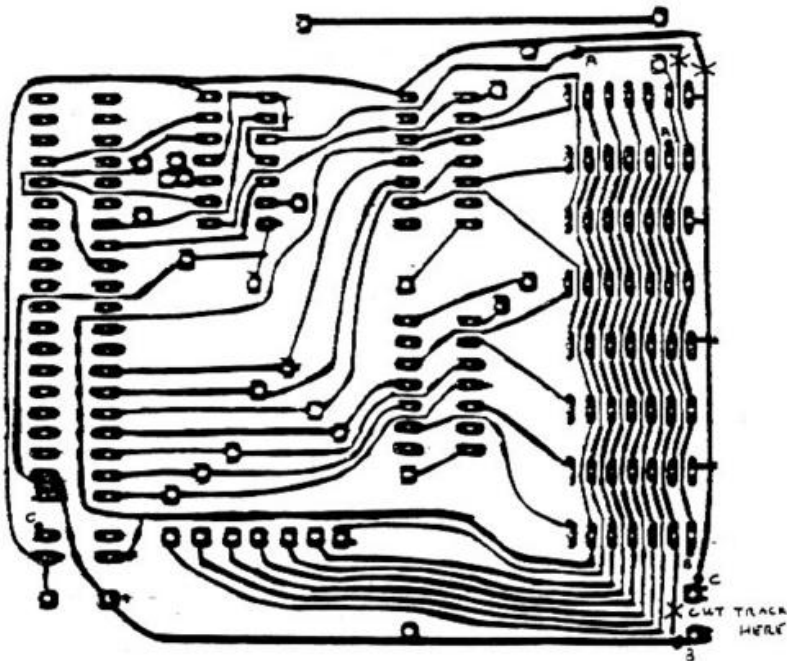

Figure B.

Revised PCB foil pattern.

LEDs 7, 6 and 3 would light since 200, in binary code is 1100 1000.

The LED board could be used to display numbers in the range 0 to 255 in binary code, output to port A (or B).

Output port B is connected in a similar way to a relay board containing four miniature relays — again, note the VCC and GND connections. Outputting a 1 to a relay will turn that relay on: if you wished to switch relay 2 on, you would output the number 4 which is 0000 0100 in binary; to switch on relays 1 and 2 you would output the number 6 which is 0000 0110.

A method of connecting external switches to the board is shown at port C. Unconnected inputs will always read as 1. When the switch is closed (on), D0 will be taken to GND which is logic 0 and the value read in from port C will be 1111 1110 or 254. With the switch open (off), the value returned would be 1111 1111 or 255.

Light detector

Port D is shown connected as a light detector. An LDR is a Light Dependent Resistor; the resistance of this component alters with the ambient light level. At low light levels the LDR will exhibit a high resistance which falls as the light increases.

LDR1 and R1 are wired so that when the light level is high D0 will be at logic 1 and as the light level falls and the resistance of the LDR rises above that of R1, D0 will be pulled to GND (logic 0). This circuit could be used as a daylight

detector which will return the value 255 in full daylight and 254 in darkness. Since daylight comes and goes gradually, there will be a certain point where LDR1 and R1 have about the same resistance and D0 will alternate between 0 and 1; software written for use with the circuit would have to take this into account.

Programming the parallel interface board

The parallel interface board connects to the main interface published in the last issue via a 14 way DIP jumper cable. Depending on which of the four DIP sockets on the main board is

used, each of the ports on the parallel board will have a number to identify it (See Fig. 2).

Each port is marked A, B, C or D. Table 2 gives the number of each port, A, B, C & D depending on the DIP socket used.

It is important to ensure that the DIP jumper plugs are the same way round on each board; the wire at the top end of the socket on the main interface board must be the wire at the top end of the socket on the parallel board. Since multicolour ribbon cable is used for the jumper cables, this is not difficult to check.

Let us suppose that the DIP jumper cable connects the parallel interface board to main interface socket 1:

For the SPECTRUM

To output data to the parallel output port marked 'A' (Fig. 2) and to input data from port 'D':

OUT 65407, 254 (selects ports A & D)

OUT 65471, x (outputs the contents of variable x to port A)
LET A = IN 65471 (reads the data on the input port D to variable A)

The following program will display a count from 0 to 255 in binary code on 8 LEDs connected to output port A.

```
10 OUT 65407, 254
20 FOR F=0 TO 255: OUT
   65471,F: PAUSE 20:
   NEXT F
```

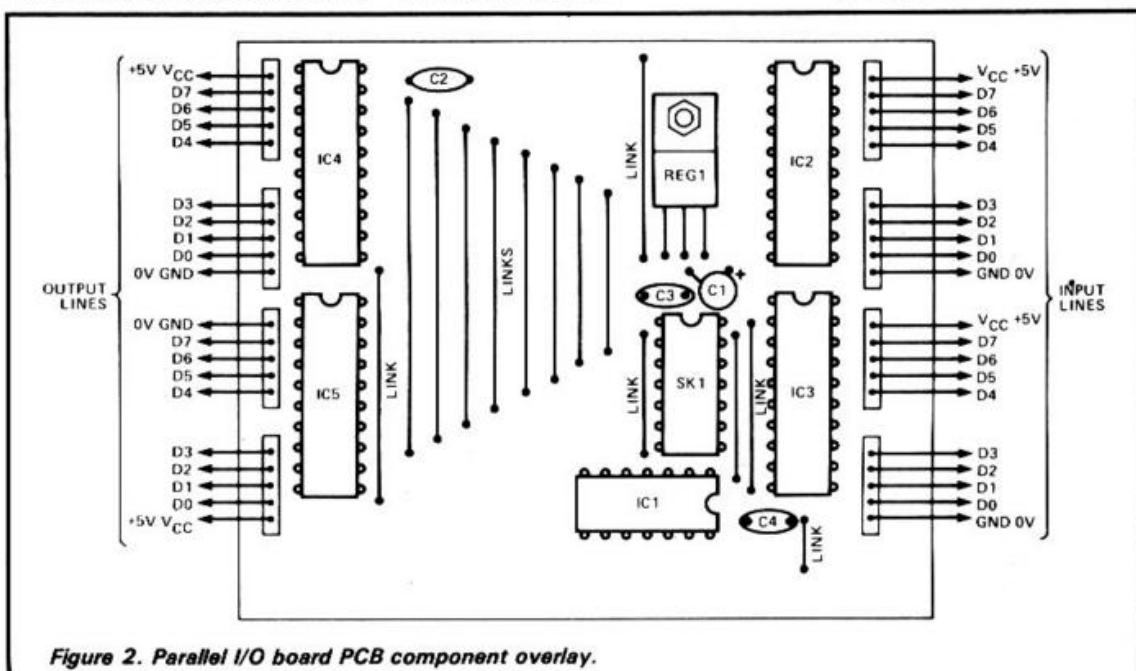

Figure 2. Parallel I/O board PCB component overlay.

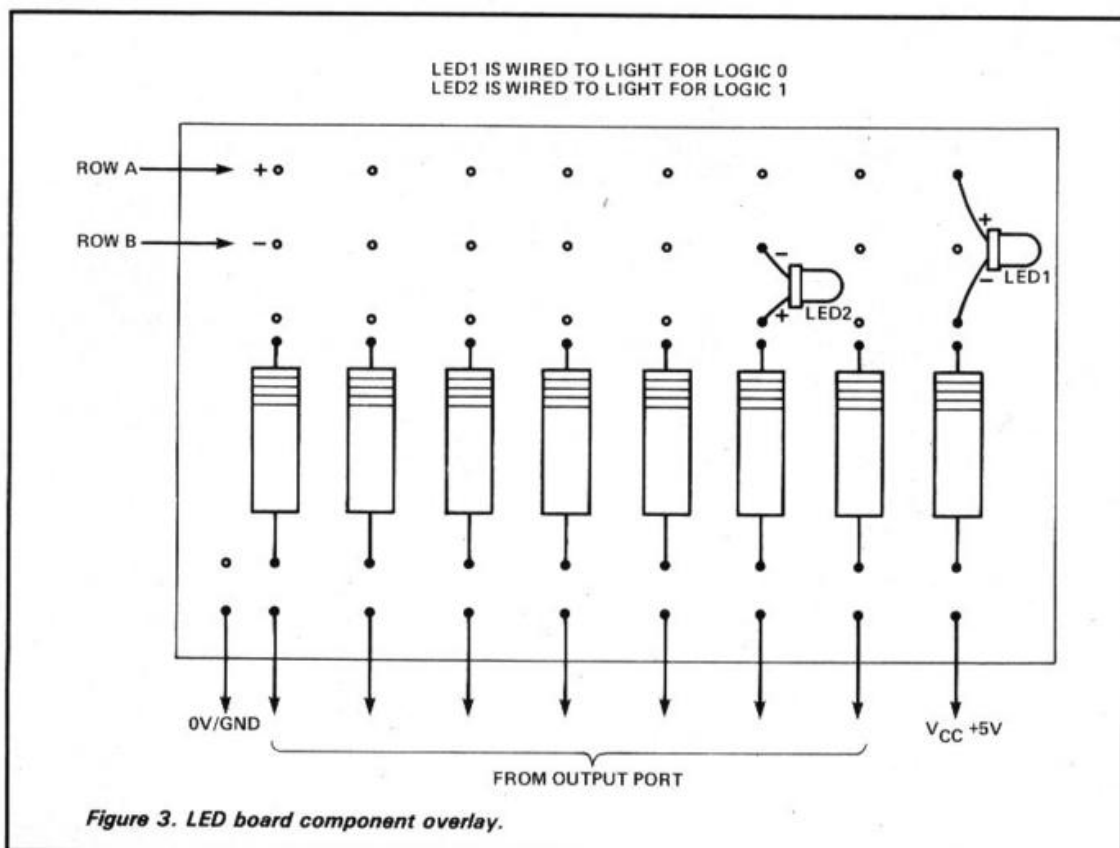

Figure 3. LED board component overlay.

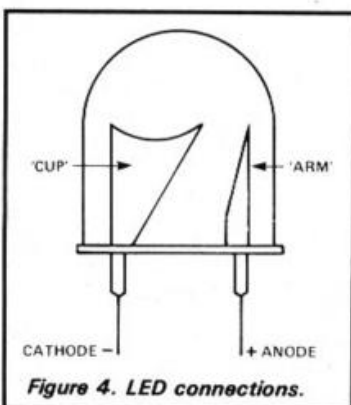

Figure 4. LED connections.

(The PAUSE command is simply to slow the count down so you can see it).

For the ZX81

Since the ZX81 has no IN or OUT commands, the short machine-code subroutines demonstrated in part 1 of this project must be used.

The following program will count from 0 to 255 and will display the count on 8 LEDs connect to output port A.

```

1 REM (machine code)
10 POKE 16515,254
20 RAND USR 16514 (to
  select device 254 i.e.
  ports A and D
30 FOR F = 0 TO 255
40 POKE 16520,F
50 RAND USR 16519 (to
  output the value of F,
  POKEd in line 40)
60 NEXT F
  
```

To input data use:

POKE 16515,n (where n is the device number)
LET A = USR 16524

The data on the inputs of the selected input port will be returned in A; if the number POKEd to 16515 were 253, then data would be input from port C (still assuming the parallel board is connected to SK1 on the main interface board).

Parallel input/output board construction

See Fig. 2 (PCB Overlay)

Using thin, single core insulated wire, solder wire links between the points marked, one at a time. There are fourteen links in all. Be very careful not to allow solder to bridge across any of the tracks which run close to to link pads.

IC sockets should be used for all five ICs plus one for the DIL plug from the main interface board. Solder these in one at a time, again watching out for solder bridges onto tracks which pass between IC pins.

The voltage regulator, Reg.1, should be soldered next. It is very important to mount this component the right way round (otherwise the board will not work). Insert is so that the flat, all-metal side faces ICI and SK1.

Next solder capacitor C1. This is a large tubular component, it must be mounted the right way round (see overlay). C1 will have one lead marked (either the negative lead (-) or the positive lead (+) so you can see which way round it should go. Don't push this component right into the board, rather leave it standing about 1/4" above the PCB surface. It is a good idea to put a small piece of insulating tape around C1's leads so that they will not short against each other or, against any other component.

Solder in the three 0.1uF capacitors, C2, C3 and C4. These components can be mounted either way round.

Finally, solder the right-angle PCB plugs (the shorter end goes through the PCB leaving the long ends pointing out to the sides of the board). There are eight of these plugs altogether, each plug consisting of five pins.

Before plugging in the ICs, check the board thoroughly to ensure that all connections have been soldered and that there are no bridges across any of the PCB tracks.

Now plug the ICs in, one at a time making sure you mount them the right way round. The top end of each IC is marked with a deep notch or circle cut into the plastic, these correspond with the 'top ends' marked on the PCB overlay. If a circle is cut into each end, and there is no notch, the deeper circle marks the top end.

Construction of the LED board

This board has been designed to allow LEDs to be mounted in such a way that they will either indicate a logic 1 state or a logic 0 state. See Fig. 3.

First of all, solder the eight resistors (330R). These are small tubular components with coloured bands (indicating their value). They can be mounted either way round.

LED1 is connected between the top row of holes (Row A) and its associated resistor and will light up when the output port line, connected to the other end of its resistor is at logic 0.

LED2 is connected between

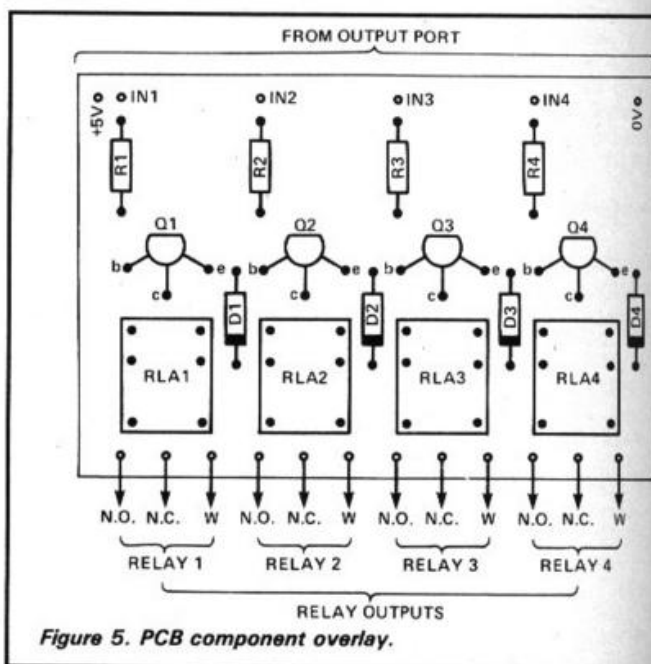

Figure 5. PCB component overlay.

the middle row of hole (Row B) and its resistor; it will light up when the logic level on the other end of its resistor is 1.

It is very important that LEDs be mounted the right way round. Look at Fig. 4.

If you hold an LED up to the light you will be able to see the ends of its leads inside the plastic case. One of these will resemble a 'cup' and the other will appear to be a smaller, shorter 'arm'. The 'cup' is always the Cathode or negative (-) terminal, while the 'arm' is the Anode or positive (+) terminal.

When you solder the LEDs in, you may choose any combination of logic level indication (ie. as in LED1 or LED2) though it is usually more useful to have all eight LEDs indicating the same logic level (1 or 0).

Remember that when an LED is connected between row A and its resistor the positive lead MUST go to row A; the negative lead to the resistor: When an LED is connected between row B and its resistor the negative lead MUST go to row B; the positive lead to the resistor.

Don't experiment by connecting an LED between row A and Row B — at best you will destroy the LED...

When you have decided how you wish to mount the LEDs, insert and solder them, one at a time.

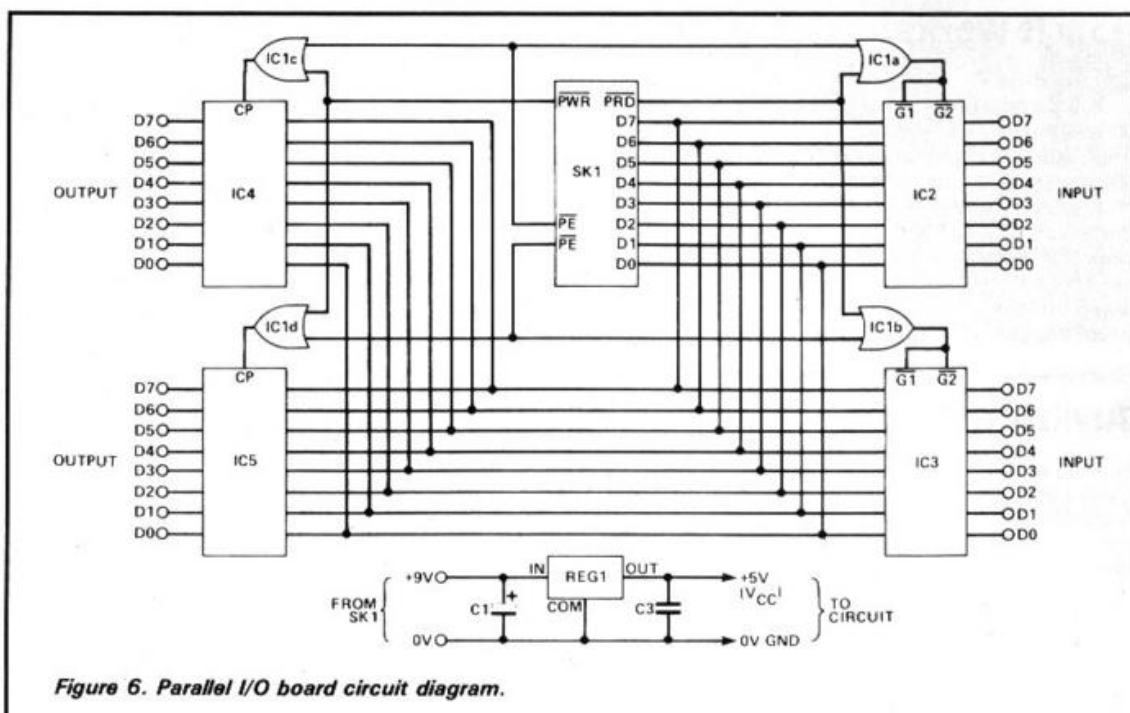

Figure 6. Parallel I/O board circuit diagram.

Using the relay board

Each relay has three contacts see Fig. 5 marked N.O. (Normally Off), N.C. (Normally Connected) and W (Wiper or common contact).

When a relay is de-energised (switched off) the wiper makes contact with the N.C. terminal. When energised, the wiper con-

nect to the N.O. terminal instead.

You can switch small DC motors, bulbs etc. on and off with these relays but they must NOT be used to switch the mains under any circumstances.

Relay board construction

See Fig. 5

First of all, insert and solder the four relays.

Each relay has a driver transistor (TR1 to TR4), these are small, black plastic encased components with three leads. They should be mounted so that the flat side of the transistor faces away from the relay, the three terminals being taken

through the three holes as shown. The middle transistor lead (C — the Collector) is slightly nearer the relay than the other two leads (B — Base and E — Emitter). Solder the transistors taking care to mount them the right way round.

Next, diodes D1 to D4 should be fitted. These are tiny glass-cased components with a black band near one lead which indicates the Cathode or negative lead. Be sure to mount these components the right way round. In each case, the Cathode is the lead nearest to the relay.

Finally, insert and solder resistors R1 to R4 (560R). These components are larger than the four diodes and have coloured bands which indicate their value.

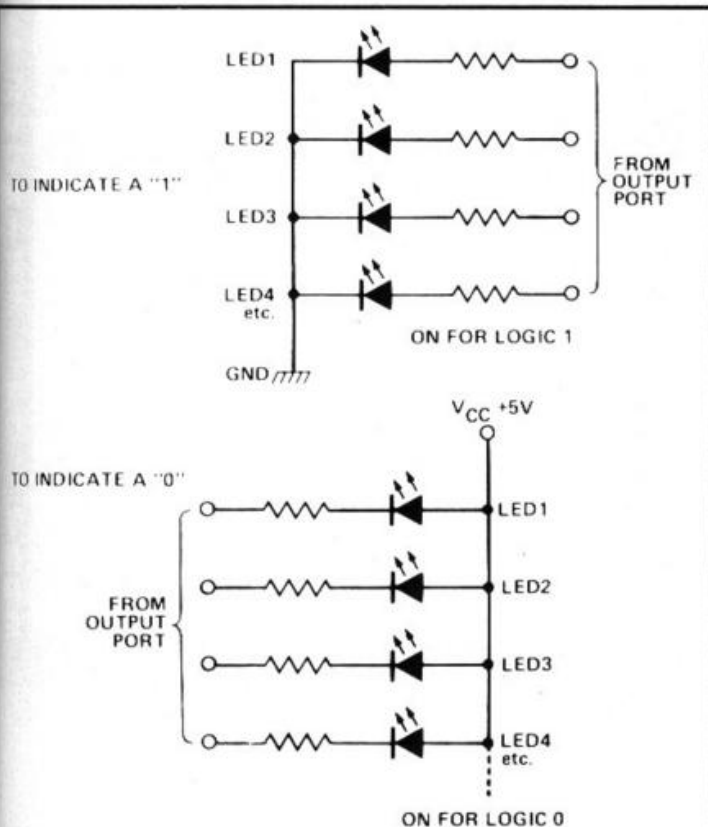

Figure 7. LED circuit diagram.

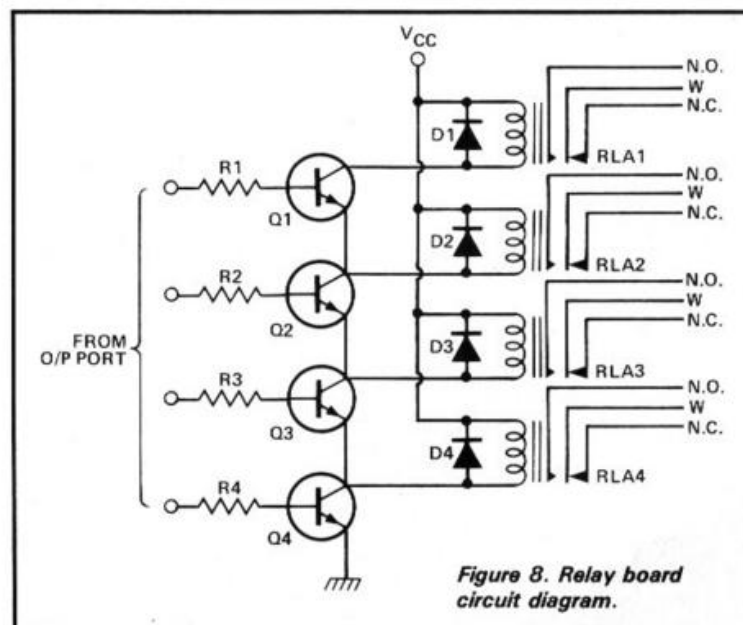

Figure 8. Relay board circuit diagram.

How it works

See Fig 6.

ICs 2 and 3 are 81LS97 octal tri-state buffers which have their outputs connected to the computer data bus. When PRD and (one) PE line go low, one of these buffers will be enabled, causing the data on its inputs to be placed on the data bus. Should both PE lines go low (as could happen), the result would

be indeterminate since this would give rise to data bus contention (Not very desirable).

ICs 4 and 5 are octal tri-state latches whose output enable lines are tied to GND. Data is latched into these 74LS374 chips on the low to high transition of CP, the clock input driven by a PE line and PWR.

The board's 5 volt line is derived from the computer 9V line by a 5 volt regulator. Since

this regulator will tend to run hot, especially if many relays are to be controlled by the computer, it is a good idea to fit a

small heatsink to it; in any case if very many relays are to be controlled, a larger external power supply would have to be used.

Parts list

Parallel In/Out Board

IC1	74LS32
IC2,3	81LS97

1 PCB	

Buylines

All the components used in this project with the exception of the PCBs are available through electronic component suppliers who advertise regularly in electronics magazines.

The PCBs are available from Newtech (Micro) Developments Ltd., 1, Courtlands Road, Newton Abbot, Devon. The

Parallel Board costs £4.50, the LED board 85p, and the Relay Board £1.05.

Newtech will also supply complete kits of parts for this project which include the PCB and all components. The Parallel Board costs £14.95, the LED board £2.50, and the Relay Board £11.95. Postage is extra at 30p per order.

Wizard Software

ZX SPECTRUM 48K

BUGS

£5.95

Superb use of colour and animated graphics make this multiple page machine code Arcade game a joy to play. In this slick and addictive game you have to manipulate BUGS, a software bug, whose task is to lay a track in order to mend faulty components on the printed circuit boards inside your computer. As well as mending these boards you will have to traverse the cables joining the boards. 3 varieties of demon hardware bugs, GLITCH, SPIKE and HOTSPOT, chase you around, beware if they catch you or you will be fried.

SPECTRUM CRICKET

£5.45

Play either test match or limited over cricket. Select your teams from the 6 available or choose your own players. Enjoy all the features of a real game of cricket including three types of bowler delivering a variety of balls, batsmen running between the wickets, umpires making appropriate signals and many more. 72 field positions available. Score board continually updated during game. Good moving graphics. At the end of a match you have the option of a hard copy of the score cards on your printer. Game save facility.

MR GULP — NEW RELEASE

£5.45

MR. GULP is a compulsive cookie eater with an insatiable appetite which is just as well, since he has twenty different rooms of cookies to get through. The peculiar world of MR. GULP is inhabited by all means of strange adversaries, amongst these are the whirling atoms, the alarm clocks, the robots and the war machines and... many others that you will have to discover for yourself. A melodic, colourful, original and exciting machine code arcade game.

Also available: Time Port 1 £6.95 Evictor £5.45 Fruitia £4.95

All prices inclusive, mail order, cheque or postal orders to:

Wizard Software, Dept ZX, PO Box 23, Dunfirmline, Fife.

Also available from software retailers world wide. Send large S.A.E. (7in x 5in) for full program catalogue. Royalties for machine code Spectrum software.

DO IT WITH TRANS-EXPRESS

TAPE TO MICRODRIVE

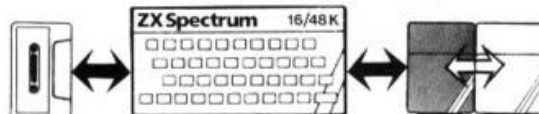

MICRODRIVE TO TAPE

Would you like to transfer your Spectrum programs from

- ① MICRODRIVE TO MICRODRIVE ③ TAPE TO TAPE
② TAPE TO MICRODRIVE ④ MICRODRIVE TO TAPE

Then do it with

TRANS-EXPRESS

TRANS-EXPRESS is the most comprehensive package of four m/c utilities for transferring Spectrum programs. They are user-friendly, simple to use, reliable & very efficient. They go much beyond where similar attempts failed, enabling you to transfer any kind of programs up to the full 48.0K length - provided you do not infringe copyright. **TRANS-EXPRESS** is an essential microdrive companion and an invaluable software back-up utility.

We are offering the entire package for **£9.95** or a combination of TAPE TO MICRODRIVE & MICRODRIVE TO MICRODRIVE for **£7.50**. You can also buy each of the four programs separately for **£5.50** only.

Card Corner Patience III

This issue, Colin Gooch presents us with his version of 'eleven-up' Patience.

Card games are often good starting points for micro simulations. In particular Patience games are good for they are already designed for one player. I find programming them a fascinating insight into the working of the brain. It is amazing how many factors we take into account when we so simply look at a card and decide that it will "go". The same decision may well take several subroutines each involving several variables and loops.

Criticism is sometimes levelled at such simulations that they are pointless because you can just as easily use a pack of cards. That may be true, but it has many parallels in other branches of life.... Why get out the vacuum cleaner when it might be just as quick to use a brush? Anyway a table to play on is not always available, and if you are ill in bed its much easier to balance a spectrum on your knee than a large tray.

One major decision to take is to decide just how much we allow the computer to do. It would be quite easy to write a program and simply watch the Spectrum play by itself. It's best I believe, to allow the player to do quite a lot, but to reject faulty inputs. With an actual pack of cards you can go back and correct your error if for instance you misread a heart for a diamond. You cannot do this without breaking into a program so it is best to avoid the problem. At the same time we need to allow unwise but not illegal moves.

I hope you enjoy the in-

tricacies of long strings of cards.....

Happy programming.

Ray Elder

11 Up Patience

This is one of the simplest of the great family of patience games,

of cards that can be shown in full to a maximum of two rows of four (or five if you omit gaps between). This game needs a display of nine cards and to allow for an attractive deal I have made a five by seven matrix the order of the day. This means that the pips on the cards are not in quite the traditional

places but I think they are still acceptable.

The cards are represented in memory by five characters and are held in a main string P\$ in which they are dealt and shuffled. Each card is made up of a first character giving its 'name', the next two its value, the next the suit and finally the colour.

```

```

and depends entirely on the run of the cards, but it can still be quite frustrating and will practice your powers of mental arithmetic!

Nine cards are dealt out and you must endeavour to get rid of the rest of your cards by covering either pairs of cards that total 11 or a run of J,Q,K. If you can't go you may deal one card on the centre. If you are still stuck then you must resign.

The first thing that we must do before programming a card game is to decide on the presentation of the cards. A nine by five block of print positions will allow for a very realistic layout but unfortunately restricts the number

Programme operation

When loaded the programme will auto run and set up the graphics using line 1760 onwards. The main programme will then 'RUN'.

The first operational line is 1020 which produces two defined functions to locate the printing of the cards to x and y coordinates. The main loop, which is quite long starts at 1040. It first of all gives you the choice of instructions held in lines 1600 onwards, then initialises some variables line

```

1710 and sets up and shuffles the pack in lines 1400 and 1490.

Line 1060 will print out a hand using the card printing subroutine at line 1250. You're then asked to input your move. The lines from here up to 1210 check that this is a valid combination. If all is well then your move is printed and we loop back to the beginning. If it is a faulty input you will be asked to enter again. If you have run out of cards or resigned you will be directed to the end game routine at line 1510.

The spectrum keeps track of what cards are dealt by using an array R\$. I have done this rather than using the SCREEN\$ function to read the value as '10' is a U.D.G. which this will not recognise.

The subroutine to print out the cards runs from line 1250. It breaks down the card into its various components (the string slicing ability is excellent for this purpose) and uses these to print the correct card, the place being given by the two defined functions. Picture cards are shown as letters.

Main variables

A	counts out cards in deal
CD	cards played
FA	temporary flag
N	for next loops
T	total value of cards to cover
x,y,z(x)	position on screen values derived from Z\$
A\$,B\$,D\$	setting up pack
C\$	card being printed
E,F\$	components of C\$
P\$	pack
R\$(x)	cards dealt
Z\$	your move
T\$	title
U\$	instructions

Memory

This program will easily fit into 16K.

All that remains now is to type it in. Debugging should not be difficult. If you get 'funny' cards then your error is almost certainly from line 1250 onwards. If it's rejecting a legitimate move then it's in the main loop..... have PATIENCE and it'll all be OK!

Keypanel Kits

for High Flyers...

Assemble a **Custom Keypanel** for each of your programs and you create an instant and individual reference to every one.

Look at these Features!!
Durable stay-flat **Plastic** not cardboard.

Matt-black panels look super on your **Spectrum**.
Pre-printed '**Spectrum Red**' labels for a professional finish.
Useful too with a joystick for all those other keys.

Each kit comes in a clear plastic storage wallet and contains:
10 Matt-black Keypanels, a sheet containing over 140 self-

adhesive labels pre-printed with words, symbols and arrows, plus a sheet of 140 blanks for your own design.

A **must** for **Fighter Pilot**, **Flight Simulation** and all multi-key games and Business applications.

The First add-on for your Spectrum.

Custom Keypanel Kits are £3.95 plus 35p p&p each.

From **W H SMITH** and good computer stores or by return of post from:

SOFTEACH LIMITED
25 College Road,
Reading,
Berkshire RG6 1QE.

Keypanel Kits

and Early Learners.

The **Spectrum** keyboard is quite a complicated sight for even adult eyes, but young children really do need something bolder to ensure they get the best from educational programs in particular.

These flexible printed overlays are mounted on individual locating frames and produce a clear and simple keyboard for young users.

The kit contains a complete range of panels, printed in a **large clear typeface**. (Lower case, upper case, upper and lower, blank key outlines and two blank panels for you to draw on.)

Your child will get more

from your **Spectrum** with the **Early Learners Keypanel Kit!**
From **SOFTEACH LIMITED**
25 College Road,
Reading, Berkshire RG6 1QE.

Please send me:

☐ **Custom Keypanel Kits**
@£3.95 plus 35p p&p each.

☐ **Early Learners Kits**
@£2.95 plus 35p p&p each
(Overseas please add 25%.)

I enclose a cheque/P.O.
payable to **SOFTEACH LIMITED**.

Designs For Living

Colin Christmas takes a further look at computer art.

Still hooked on Graphics? Well don't be afraid to admit it, some of us addicts are often mistaken for respectable members of society, and some of us are regular readers of *ZX Computing*. And while we're on the subject, it's worth a reminder to check back over the past three or four issues of the magazine to see just how much there is to be getting on with for the more enthusiastic programmer who really wants to come to grips with the theoretical and technical aspects of using the graphics and design potential of the micro.

I have great respect and ad-

miration for such enthusiasts. If I wore one, I'd raise my hat to them. I don't, so this vote of thanks will have to do. Other enthusiasts such as myself tend to start about half way through the process. In other words, when most of the hard work has been done and the programs and the hardware have been produced. Lazy? Incompetent? Possibly, but it takes all sorts.

In the last issue I looked at the growing potential of graphics pads generally and of the RD Digital Tracer and Dream Software's CAD package specifically with reference to graphics and design work. However two

other, more established "tools" for the graphics design specialist also merit serious consideration.

La plume de ma micro

Light pens for use by Micro users have been around for a long time now. Opinions as to their usefulness and value for money vary of course. Recently I've been using the LIGHT PEN produced by DK'TRONICS for the 16 and 48K Spectrum.

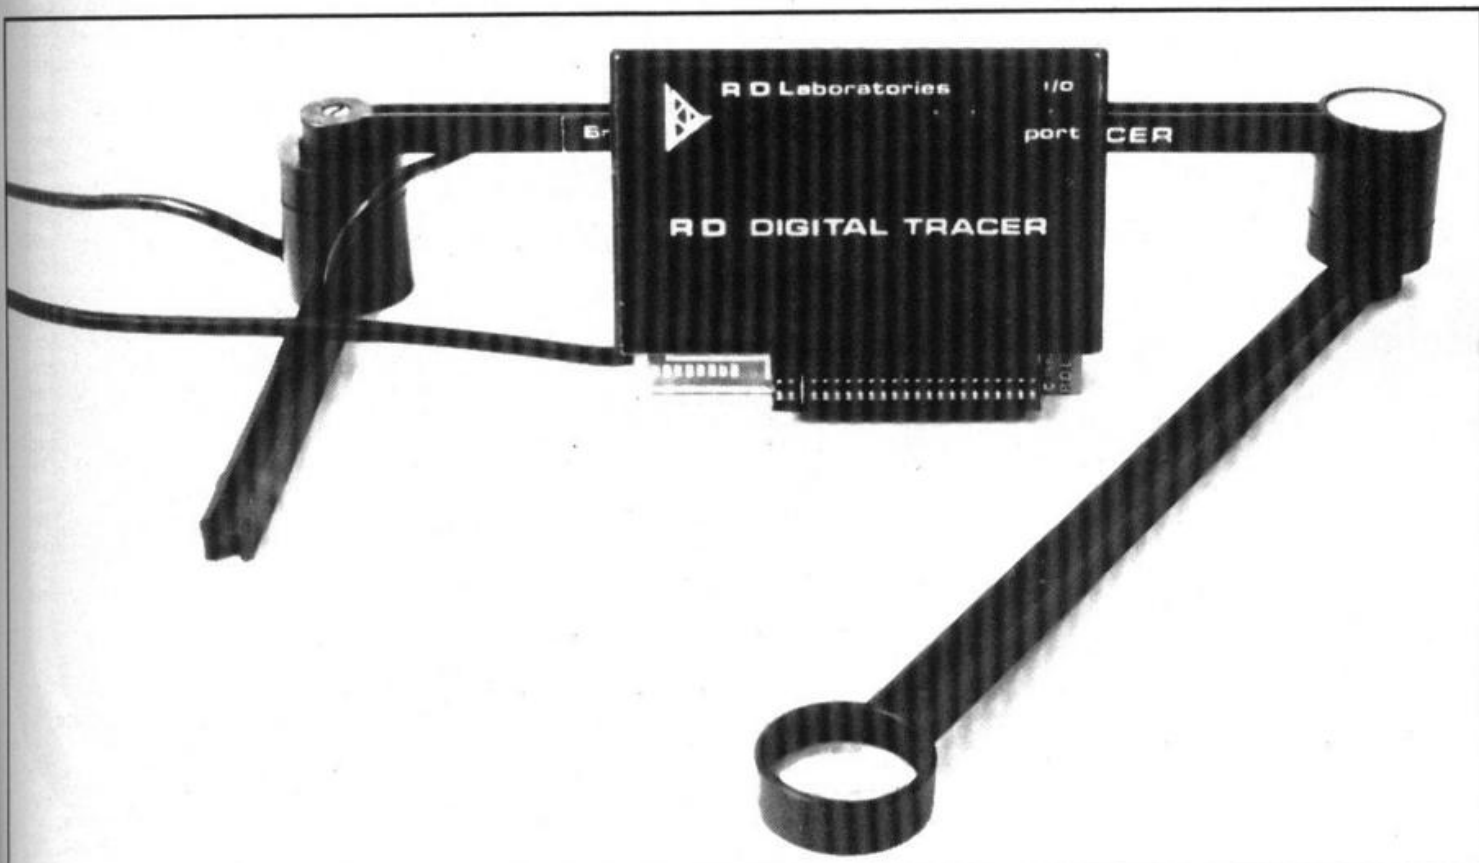

The package consists of a program on cassette, an instruction booklet, the pen itself and a

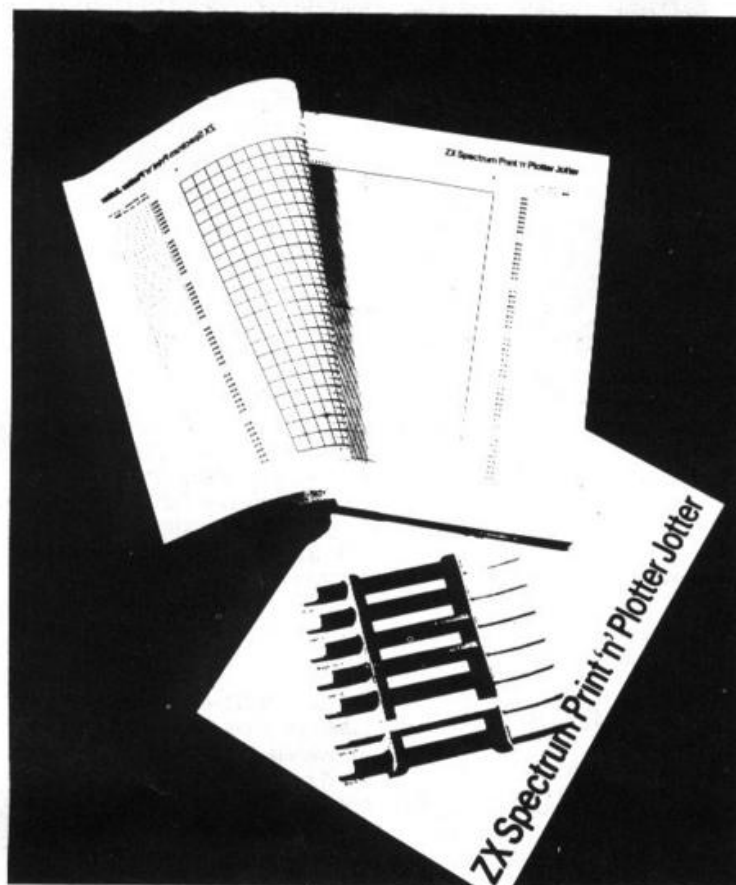

control Interface which is plugged into the back of the computer.

The Interface is compact and well designed and fits neatly and reassuringly into the port. The metre long lead from the pen is fitted with a jackplug which plugs firmly into a socket located on the top of the interface housing. The booklet in fact is one of the best I've seen. It is informative, brief, easy to follow and includes a section at the end on "error conditions" which might be encountered.

The program contains several routines which enable the user to select from sixteen functions. These are displayed as a menu on the bottom two lines of the screen. This means the drawing area is always clear. In order to select a function once the program has been loaded you simply point the pen at the letter or box displayed on the menu and press any key. This is made possible by a machine code routine, one of the several provided.

The program uses two variables called "origin" and "target" which need to be positioned on the screen in order to determine the co-ordinates required for drawing lines, corners of boxes, centres and circumferences of circles, define arcs and so on. The full menu also enables the user to erase the line, circle, box or whatever has just been drawn, to ink in

shapes, to set border, ink and paper colour, to draw freehand and to clear the screen. Screens can be SAVED or LOADED from tape or can be kept in memory for later recall.

Text can also be inserted into the display. Several of the functions require definite steps which must be followed before the command can be carried out. These are well laid out in the instruction manual. At first it seems as if these separate steps are going to prove tedious and cumbersome but it is surprising how quickly one becomes familiar with them.

Set up

Some people will also find the calibration routine at the beginning of the program annoying. The brightness, contrast and colour controls of the T.V. set they are using may have to be adjusted before the pen can be positioned accurately. I've tried the pen with a Black and White set and this only seems to treble the problems of calibration. I have to confess that I pronounced it's use with Black and White set more nuisance than it was worth.

One last piece of advice, when using a lightpen give some thought to where you position your micro in relation to your screen. Ideally it should go

underneath the screen or beside it, for most of us on the left. Remember that your main working area is the screen itself and you need to be able to work there freely and without developing arm strain.

High marks then for one of the most recent lightpens to come onto the market. Something I neglected to say is that it has so far proved to be very reliable. Not so I'm afraid with another lightpen I've been trying to use, the TROJAN.

I've read elsewhere that there were problems of compatibility with the early TROJAN Lightpens and the newer spectrums. I'm assured that I've got one of the new lightpens. Sorry, Trojan Products, but mine has been giving me grey hairs just where they are not welcome — in amongst the few I've already got. The most common problem being that the program seems to jump between commands or to stick in commands. At best erratic and unreliable, at worst, it seems to crash.

The software solution

A Utility which has also been with us for a while now but which is still capable of straining the imagination is PAINTBOX from PRINT 'N' PLOTTER PRODUCTS. Again, it's now only

one of the many Graphics packages available from the Spectrum but it's certainly worth serious consideration nevertheless.

It claims to be "ingenious", "unique", "the most imaginative." In the cold light of the monitor screen may I offer Impressive and Comprehensive as more critical alternatives?

This graphics programming tool-kit for the 48K Spectrum consists of a cassette containing two programs, one on each side. One to demonstrate some of the results which can be achieved. The other with the machine code program which enables you to do all the work. There is also a twenty eight page book to take you through this supermarket of graphics 'deals'. It contains a lot of detail and the print is small.

Working through it is not easy but it is written well and conveys real excitement and enthusiasm for the tasks involved. In the end it's a smooth ride and it gets easier to use.

The main menu, as you would expect, is displayed once the program is loaded. Before you move on you have a choice of cursor control, keyboard or Kempston Joystick, although other Joysticks may be used. If you then choose Menu 1 — most Games enthusiasts do, you can explore the UDG Editor.

Without affecting the normal character set you can program up to 84 user definable characters and locate this set into your own written programs. This is made possible by storing 4 Banks of characters in memory and recalling them at any time into the usual UDG area by a built in short machine code routine. There is of course a facility of both saving all four banks to tape and loading pre-recorded banks.

Sketch Pad, next off the main menu, puts on the screen a small 'try out' area for related characters before they are used in screen graphics or programs. The current UDG file appears at the top of the screen.

Food for thought

As you continue to work through the Menu like some gourmet in a great restaurant, you discover how to define any or all of the 84 characters available and put them in position, then put them into your own programs.

High resolution screen graphic work can be attempted using the Precision Plotter section of the program. The format will be familiar. Plot, draw, fill,

erase, circle, radials and arc, together with choice of ink, cursor and with some difficulty paper colour. The cursor moves smoothly and quite quickly as you work. However, sometimes it is useful to be able to move the cursor with great precision and accuracy. This also is possible by keeping the SHIFT key pressed during movement. I was very impressed with the action and ease with which one could work with this section.

Moving on quickly, the rest of the program offers a Screen Planner where your graphics produced using Precision Plotter can be combined with the UDG's you defined and stored in any or all of the four UDG Banks. Procedures are given for achieving Multiple Screen Files. A short machine code routine, used as a memory file, when called transfers data to the screen as a picture. This data call can be held permanently above RAM-TOP and called at any time.

Impressive and comprehensive, it is a fairly powerful Graphics aid, above all, it is fun to use and experiment with. The more you use it, the bolder and more adventurous you become.

State of the art

It is usual to talk of exploring the potential of our micros when discussing the hardware and software available for say Graphics and Design. It seems to me that together they offer a challenge to us, the users, to explore our own potential to make, create and design.

A challenge not our powers of logical thinking or convergent thinking, but to our powers of divergent thinking. As users it's up to us to take up the challenge. What can we achieve, making use of lightpens, tracers, graphics tool-kits and so on?

It's difficult trying to imagine a young Leonardo da Vinci sitting down with paper, canvas, pens, inks, brushes and paints, sucking his thumb and wondering, "Well what do they expect me to do with this lot?" There may not be many Leonardos amongst us, but the challenge remains, What CAN we do with this lot?

And I don't just mean Games.....

STATACOM

Statacom Distribution Ltd, sole UK Distributors of Datafax 3" Disk Drives, proudly announce the introduction of the New Datafax Spectrum Disk Interface.

The Interface connector fits neatly into the rear expansion slot on the Spectrum via a high quality, gold plated card edged connector, and still allows full usage of other peripherals (Printer, Joystick etc).

A system reset button is also included in the Interface connector. The disk operating system, designed for the Hitachi 3" disk drive uses only 8K of user memory and gives easy to learn commands to run the drive.

The Interface comes complete with Utility Disk and comprehensive Datafax Disk Interface Manual. Also suitable for 5¼" single sided drives.

Statacom Price £75 + VAT

As a special introductory package Statacom offer the Hitachi 3" Disk Drive Unit, complete with Power Supply Unit, Utility Disk, leads and cables plus the new Interface at only £245 + VAT (Normal R.P. £271 + VAT)

PRISM competition

**This is your chance to win
a super PRISM Movit!!**

Yes! This issue's competition gives you the opportunity to win one of the excellent robots from the PRISM Movit range! We have ten Movits to give away, and all you need to give yourself a sporting chance of winning is a keen eye!

Cast your gaze upon the curious-looking pictures numbered 1-5. Do they look familiar? Can you identify them? If you think you can, write down what each object is next to the corresponding number on the coupon supplied. To enter the competition, pop the coupon into an envelope, and send it to:

**PRISM Competition,
ZX Computing,
ASP Ltd,
1, Golden Square,
London W1R 3AB.**

Please ensure that the envelope is marked PRISM competition, else your entry may not be accepted! (shame!) Also, be sure to indicate on the coupon your order of preference, as we have two models of each Movit to give away.

Prism's Movits

Prism Microproducts Limited (to give their full name) who have generously donated this issue's prizes, are probably best known as distributors of the Spectrum. However, PRISM is also a robotics company, hence the Movits range. Prism production and developments manager, Stuart Barnard, outlined the history of the Movit in a recent interview. As he explained: "They (Movits) had been available in Japan for some years, which meant that we were looking at a product which has been completely test-marketed and proved before we had even started. When we first began to look at Movits, there were twenty-one products in the range. But, during the period in which we were formulating our marketing arrangements with the Japanese manufacturer, the Movit range had been

reduced to six which were suitable for the British market, and which gave a full selection of movements and sensory systems.

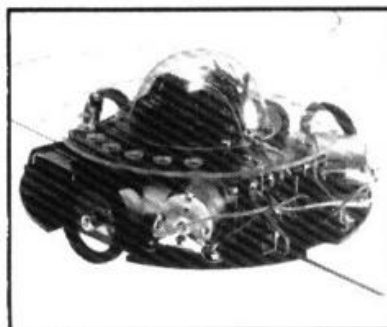

"With the remaining six Movits, we did extensive field trials and eventually decided that one of the six we originally chose could cause too many problems, as it has a very delicate leg-mechanism. This was quite sad because it (a Movit called the Avider) was potentially the biggest seller, but we decided to drop it from the range."

Once the decision had been made on which robots were to comprise the range, the next problem was finding the right market-place for them as Stuart explained. — "They're not really toy's although the toy market is very interested in them, and they are so different that they don't really fit into the computer market-place."

Despite such difficulties, Movits have been selling well. "When we first decided to test the market with a little advertising 'continued Stuart' we shipped two-hundred Movits from Japan which would cover the demand, or so we thought! However, from that first advertisement we had over six-hundred advance order's. That first two-hundred went within ten days!"

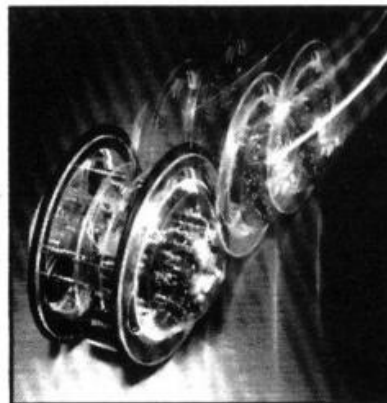

Did PRISM intend to expand the range to include some of the Movits which were not originally chosen for the British market? Mike Richardson, PRISM's PR executive had this to say — "Prism, at the moment, have only taken those five. But, if people go for them as we anticipate, there's obviously going to be a demand. Once someone's got five of them, or whatever, they're going to say 'Well, what else have they got?'. So obviously we would like to bring in more!"

Finally, I asked Mike about his own experiences with Movit's. Does he build the kits? — "Well, the thing is with Movits is that they are so addic-

Line Tracer II £17.99

The Line Tracer II has 3 wheels driven by 2 DC motors. Control is via an infra-red transmitter/receiver.

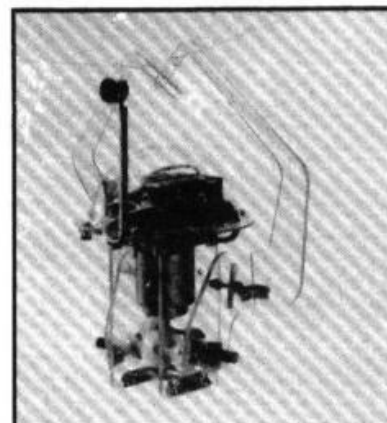

Piper Mouse £19.99

The Piper Mouse has 3 wheels driven by 2 DC motors, and is controlled via an ultrasonic transmitter/receiver.

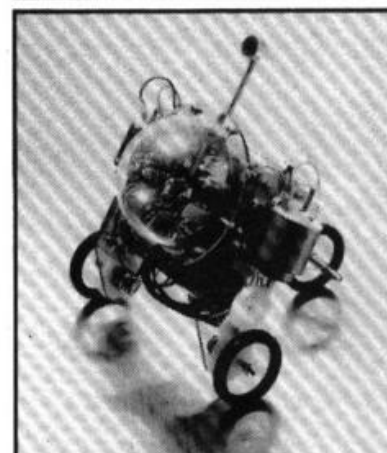

Memocon Crawler £34.99

The Memocon Crawler has 3 wheels driven by 2 DC motors. It's motion is under program control and is programmed via a detachable keyboard.

Monkey £9.99

The Monkey moves 'tightrope-fashion' along a guiding cord. Motion is via two, alternately-moving gripper arms driven by a crank, and is controlled by sounds falling within the audible range ie whistling, clapping etc.

Circular £29.99

The Circular has 2 wheels driven by 2 DC motors, and is controlled via a hand-held remote controller.

tive. I take them home and think 'Oh well, this won't take long', and you get the construction-plan — which is superb — but you find it's a little bit daunting to start with. But when you start to build the thing you get well and truly hooked. You find that instead of taking an hour, you spend four hours putting the thing together and it's like a really good book — you can't put the thing down and before you know it it's four o'clock in the morning and you've still got to get up for work!"

So, if you'd like a Movit, fill in the coupon and enter our competition — **NOW!**

The Rules

- The competition is open to all UK and Northern Ireland readers of *ZX Computing*, except employees of Argus Specialist Publications Ltd. Their printers and distributors, employees of Prism Microproducts Ltd, or anyone associated with the competition.
- As long as the correct coupon is used there is no limit to the number of entries from each individual.
- All entries must be postmarked before November 30th 1984. The prizes will be awarded to the first ten entries picked at random which bear the correct answers, the decision to be made by the Editor of *ZX Computing*. No correspondence will be entered into with regard to the results and it is a condition of entry that the Editor's decision is accepted as final.
- The winners will be notified by post and the results will be published in a future issue of *ZX Computing*.

'Jumbogram' Competition Results

There was a moderate response to the June/July 'Jumbogram' competition, which is not in the least bit suprising because it was very tough! However, the forty lucky winners were:

Adrian Everett of Plymouth.
David Clifford of Cheltenham.
Herwig Timm of West Germany.
Peter Glen from Ashby-de-la Zouch.
B J Kamphuis of The Netherlands.
Mr. K R Foot in Surrey.
Stuart Ferris of Kilmarnock.
Richard Oive in Exmouth.
Mr D Jones from Bekhill, East Sussex.
Paul Waugh in Coventry.

Mr J Moran from Carterton in Oxon.
Mr B E Thomas in Bromley, Kent.
Carol Powles of Merthyr Tydfil, Mid Glamorgan.
R A Mellor from Walsall, West Midlands.
James Phoenix of Middlesbrough.
P R Shears of Rolleston in Leicestershire.
J D Kidd of Clacton in Essex.
David Lawley of West Bromwich.
Mr N Symes of London.
Philip Andrews of London.
Mr A Landan of London.
Christopher Pearson of Carlisle in Cumbria.
Mick Wilford of Charing in Kent.
Robert Hugh Roger of Kilmarnock.
Jamie Seymour of Leeds.
Colin E Piggot of Leeds.
N F Owen of Missenden, Bucks.
Shai Kedem of Israel.
Keven Denness of Bideford in Devon.
K M Walsh of Alnwick in Northern Ireland.
Ben Jackson of St Leonards-on-Sea.
Ian Jay of Bristol.
Ian Hilton of Crawley, West Sussex.
Tony Buckley of County Durham.
K R Foot of Chessington in Surrey.
J K Marston of Wimborne in Dorset.
Andrew Thomas of Downend in Bristol.
R A Barnaby of Sale in Cheshire.
and Andrew Broome of Dollington in Cheshire.

Many thanks to all of you who entered the competition. It was a tough'en — nothing like this issue's PRISM comp., so be sure to enter!!

Write a Pun

The *ZX Computing* 'write a pun' competition prompted one extraordinary entry which, though I am ashamed to admit it, had me baffled. This being so, I invited reader's to enlighten me upon the meaning of the following pun, submitted by John Stuart:

GOSUB AND THEN ARRAY
STEP INK SCROLL OR dREM
CODE — DIM Pice & RAND
NEW LOAD RED OR.

Three people wrote in with the answer. One of the three was Jeremy Snelling from Thundersley in Essex. He wrote:

Dear *ZX Computing*,
I believe that I can INPUT a suggestion as to the translation of John Stuart's ENTER IN the 'write a pun' competition. I have SIN this usical beFOR. It is very entertaining and I was stuck to my seat IN the CIRCLE as soon as the curtains were DRAWn and would not (you missed one there, Jeremy — Ed.) LET myself leave until the INterval 'COS it was so SPECTrum AT ULAr. I can't wait to see it again the NEXT time. The name of the musical? 'Joseph And His Amazing Technicolour Dreamcoat' by Tim Rice and Andrew Lloyd Weber of course!

Thank your Jeremy. I knew it all along of course. Thank you also Mrs. J. M. Benson of Broughton-in-Furness in Cumbria (ah, Cumbria!) who also supplied the true meaning, as did Richard Danby from Quarn-don in Derby, who says "It wouldn't have been half as interesting if all he had come up with was CAT\$!" Laugh? I thought — well you know what I thought! Each of you should have received something nice by the time you read this.

To sign off for this issue, could I just suggest that you all enter our Prism competition. The Movits are excellent, so get out your specs, examine the pic's, and **WRITE!**
Jamie Clary.

SPECTRUM BUSINESS GRAPHICS AND OTHER SOFTWARE FROM McGRAW-HILL

PROJECTOR 1

Business Graphics, Forecasting, and Presentation System

Just enter your data then select the option you want for fast, professional, full-colour graphics. You can add headings, notes and captions, and store a fantastic 50 or more full-screen illustrations in memory!

Key points frames in a bold, modern typeface can be mixed in any order with graphics frames, for presentations which will run automatically or on your cue. And many other features. Data can be stored on cassette tapes or on microdrive.

£13.95 Incl. VAT

SPECTEXT

The Spectrum Word Processor

All the features of a professional word processor - INSERT, EDIT, MOVE, SEARCH AND REPLACE, SAVE and LOAD FILE, etc. with automatic print formatting to any line width, and printing on screen, ZX printer or full-size printer through a suitable interface.

The SPECTEXT suite includes SPECFILE, a filing system for addresses or other data, and SPECMERGE, to produce, for example, personalised mailings with a standard letter. Cassette software, microdrive compatible.

£13.95 Incl. VAT

PROFILE 2

Spreadsheet File Handling System

A filing system, with sophisticated processing facilities. Your screen is a moving window to a large spreadsheet on which your file is written.

Use the processing facilities for calculations and text changes in all or selected records. Sort into order, total numeric fields, and much more.

Save files on cassette tape or on microdrive.

£13.95 Incl. VAT

THE SPECTRUM GRAPHICS MACHINE

An Advanced Machine Code Tool Kit

The secrets of high-speed high-resolution graphics revealed, with a tool kit to allow rapid and easy manipulations.

The tape of ready-made routines for graphics handling provides fast, efficient and elegant programs. The 100 page book included gives detailed explanations, and complete assembled listing - invaluable techniques and routines for simulations, arcade games and educational programming.

£13.95 Incl. VAT

McGraw-Hill software available from selected branches and computer shops and bookshops everywhere.

More exciting games for your ZX

Athlete

So you didn't make the Olympics? Never mind. Here is a selection of track and field events where you can show the difference now you compare against some tough opposition. Sprinter (100m & 400m), Hammer Throw, Poles (150m & 400m).

Super Bridge

For engineers and experts alike. Designed to give average players a good run for their money and to give beginners an excellent introduction without the worry of an impatient partner.

Make Music

A music synthesiser program designed to compose 3 part harmonies when used with the Zax, Fuller and Tonesels and boxes or any other using the AT-3802 chip where the GUT command is known. Instant - ZX Computing.

Buffer Adventure

Featuring the real life characters who work at Buffer Micro. Have you solved the mysteries behind the shop? Are the people who serve you quite as weird as they seem? An amusing, fast-paced adventure.

Mysterious Fairground

All the fun of the fair. Solve a mysterious mystery in the House of Horrors and the Ghost Train before you can find the five items of treasure hidden somewhere in the Fairground.

Pools Predictions

Score draws to score draws. Score away wins in this tennis-driven program to help you fill in that winning coupon. Double Scottish League and Scottish League for all your round success.

Racing Predictions

Covers the six racing seasons at the touch of the key board - all the race courses covered but on the user friendly prediction program. Pick the fast horses home with confidence - not a part!

Card Games

CRIBBAGE is the most fascinating of the series, produced in response to Crickhams article requests. Also on the same cassette are PATIENCE, BINGO and PATIENCE.

Loony Bin

Mad adventure requiring cool logic! Dashing to escape from the asylum and travel the world following the clues, like all but 2 copies of the Spectrum's side treasury.

All prices include VAT. Add 75p p&p or call in person at Buffer. Trade enquiries welcome. Visa, Access, American Express, Diners Club.

Please send me the following games:

☐ Athlete ☐ S. Bridge ☐ Music ☐ Adventure
☐ Myst. Fair ☐ Pools Pred. ☐ Racing Pred.
☐ Card Games ☐ Loony Bin

Met. Plot

An unusual and impressive way of using the ZX81 and printer from Henley on Thames inhabitant, David Lockyer.

Although this program will need a lot of care to enter it and get it working, it will be time well spent. I have never seen the ZX81/printer used to such an impressive degree. Without further adieu I'll hand you over to David:

Popular magazines for users of home computers often devote page after page to games programs and there is clearly a large market for such software and hardware. I believe that many a home-computer buff, having mastered the rudiments of his chosen machine, soon finds difficulty in making use of it; he ends up, not by computing at all, but by playing 'Space-Invaders' and the like.

One way to avoid this fate is to combine computing with some other hobby and so heighten the enjoyment gained from both interests. For instance, last year I attended a course of lectures on meteorology and found it very instructional to prepare weather forecast charts from the daily broadcasts to shipping made by the BBC. So, when I added a ZX-printer to my 16K ZX81 a few months ago, I set about writing a program that would print a simple weather chart, and plot on it barometric pressures, wind strength and wind directions to allow me to add isobars with a ball-point pen. The result is the program that follows.

You will need patience and perseverance to enter the program, and several cassettes of tape, for it is important to SAVE the program at frequent intervals in case of the dreaded ZX-81 crash, the unintentional use of RUN or CLEAR, or just the pressing need to do something else!

Figure 1a shows a print of the graphics that we are hoping to produce, with pressure data, wind strengths and direction arrows plotted. The names of the Coastal Stations and Sea Areas, together with the co-ordinates needed to plot digits and arrows in the relevant positions, are stored in a string array C\$(445). Similarly, the code that

describes each arrow is held in array D\$(72). These arrays have to be set up before entering the main program.

First of all, enter as a direct command,

POKE 16389,124

followed by,

NEW

to reserve space above RAM-TOP for use later by the main program. Now enter Program 1 and RUN it. (This should be your last use of RUN, unless you wish to start all over again!) It will dimension the arrays and let you enter the name of each Coastal Station or Sea Area followed by the three pairs of numbers exactly as listed in Table 1. Once this has been done the program will continue, displaying the data now stored in C\$(445). The next part of the program will enter data into D\$(72); you must enter all the 72 numbers shown in Table 2, reading from left to right. Again, the data entered will be displayed for checking.

When you are sure that the contents of both arrays are correct delete Program 1 except for line 1 which must always be there in its now changed form, line by line, and enter Program 2, which is based on the plotting program given in the ZX-printer manual, modified to allow you to 'draw' on the notional 256x256 grid held in array A\$(32,256). The plot position can be moved laterally, vertically or diagonally about the grid using keys '1' to '8'. With keys '1' to '4' movement is diagonally in the direction of the black square in the graphics symbol shown on the key; keys '5' to '8' move the plot in the direction of the arrow marked on each. I suggest that a little experimentation would be useful at this stage; again, do not use RUN but GOTO 100. Draw a few lines, preferably following a plan, to make sure that the program is plotting correctly in all directions. BREAK out of the program and examine your handiwork by using GOTO 9988. If

```

you experiment in this way, be careful to enter as a direct command,

DIM A\$(32,256)

to reset all elements of the array to zero.

Next, draw a large 256x256 grid of squares, or better, acquire some graph-

paper, and divide the top axis by 8 to produce a grid of 32x256 divisions, corresponding to the elements of the A\$(32,256) array. Label the large divisions 1 to 32 across the grid, from left to right, and the small divisions 1 to 256 from top to bottom. You must now mark on the grid the areas defined by the co-ordinates held in C\$(445) and listed for each station as DC,DR

in Table 1. For stations from Tiree to Jersey inclusive, mark out a rectangle, 3 large divisions across and 7 small divisions down, so that the area defined by DC,DR is in the top left-hand corner. For the remaining stations, 2 large divisions across and 7 small divisions down are required. In the same way, mark the positions of the wind direction arrows using co-ordinates NX,NY also given in Table 1, but this time produce a square, 1 large division across and 8 small divisions down.

Figure 2 shows how your grid should look for a small area around the Scilly Isles; ignore for the moment the graphics — they will be discussed later. The grid is shown marked for Scilly, Fastnet and Lundy, and partly for Channel Light Vessel and Jersey.

Landmasses

Once all the areas have been plotted on the grid, use your artistic talents to copy, as nearly as you can, the outlines of all the land masses shown in Figure 1b, avoiding completely these 'total exclusion zones'. Use a soft pencil and, when the outlines are to your satisfaction, go round them carefully, marking with ink a cross in the squares to be plotted. After that, you can rub out the pencil lines.

Now you must adjust your thinking and re-label the grid from 0 to 255 across the top (X-axis), and from 255 to 0 from top to bottom, down one side (Y-axis). For each land mass choose a convenient starting point and mark it with its X and Y co-ordinates. Use Program 2

Fig. 1b The outlines of the map (note the marking of some stations with a '+')

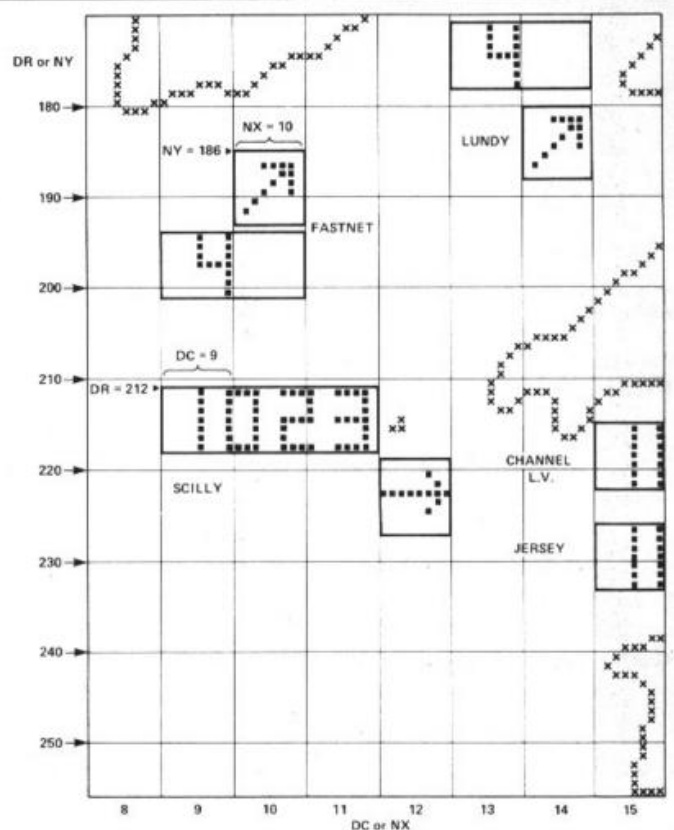

Fig. 2a How to mark out the areas of the grid to be avoided when drawing the map

(GOTO 100) to enter these co-ordinates and then work carefully around the outlines, from one cross to the next, using keys "1" to "8" as required to enter each point. I suggest that you SAVE (GOTO 2) and print (GOTO 9988) frequently from now on, and certainly after completing each major land mass. For the islands you should, of course, finish where you started, with the correct co-ordinates displayed on the screen. If you do not, don't panic! It is possible, with a little artistry, to finish at the right point without the error being obvious in the printed map. Also, the odd 'dot' in the wrong place can often be removed by the careful use of the direct command,

LET A\$(m,n)=CHR\$(O

where m and n are the relevant co-ordinates. If there are more than a few errors it is probably better to remove everything with NEW, reload with your most recent copy from tape, and start again from where that left off.

When all the outlines have been entered add Program 3 and run it using GOTO 8215 to produce a border around the map. Your print should now look like Figure 1b, with gaps in the French coastline as shown.

The rest is easy! Amend the program so far entered by deleting unwanted lines and adding new lines to produce Program 4. SAVE this definitive version using GOTO 2.

It may be of interest to readers to examine in a little more detail the routines used to plot the graphics. The numbers

are entered with the plotting routine at line 9970, taking X and Y co-ordinates from array C\$(445); these are listed in Table 1 as DX,DY. Each digit is printed as a particular combination of seven segments, in much the same way that digits are displayed on calculators and watches (see Figure 2). They are as small as legibility would allow. Because pressures need 3 or 4 digits, and wind strength 1 or 2 digits, a routine was necessary to remove previous entries. By making sure that all digits were confined to elements of the 32 x 256 grid, the simplest way of 'unplotting' was to assign CHR\$ 0 to the relevant elements. The sub-routine at line 6000 does this, using co-ordinates DC,DR retrieved from C\$(445) (Table 1).

The wind direction arrows are added in a way similar to this 'unplot' sub-routine except that, instead of entering CHR\$ 0, selected codes are retrieved from D\$(72) which, when A\$(32,256) is printed, will give the required symbol. You will see how this works from Figure 3. The arrow for Scilly in Figure 2 has been enlarged to show that the pattern of dots corresponds to the binary notation of the bytes contained in D\$(17-24) when assigned to A\$(12,220-227) respectively. There is no need for an 'unplot' routine because, when used again, the program will have the effect of over-writing the previous symbol.

When you are ready to use Program 4, Table 3 provides a list of representative data for all the Coastal Stations and Sea

Areas required. Later on, try recording a Shipping Forecast and extract from it some actual data. You will notice that I have had to omit a few Sea Areas altogether — there just was not enough room in the English Channel!

You should end up with a

weather chart like the one in Figure 1c and, if you feel up to it after all this effort, you could try adding the isobars as in Figure 1d. You may need a wet weekend or two to do all this, but what a challenge! GOOD LUCK!

Description

Machine-code from ZX-printer manual. Assigns numerical values to 'letter' variables to save space in memory. Variable FL is used as a flag, set in line 86. Modification of program given in ZX-printer manual. PRINTS instructions; requests INPUTS. Variable SUM is used to count the number of Coastal Stations/Sea Areas processed. Main processing loop. L\$ holds the name of Coastal Station/Sea Area retrieved from C\$(445).

The ZX81 soft selection

Nick Pearce looks at some new releases for the ZX81

Merchant of Venus Crystal Computing

This 'adventure with graphics' program was first on sale in 1982, and has recently been re-released 'due to popular demand' as Crystal put it.

Merchant of Venus is certainly an absorbing game. It combines real-time graphics simulation in which you control a leviathan space freighter (*whassat?*), with the challenge of building a strong economy on Venus.

The program auto-runs upon LOADING, and your first task is to select the class of freighter you desire. They vary in price, and of course, quality. A cheap ship will possess only limited cargo-carrying capacity, and could cost you a small fortune in repairs!

Once a freighter has been selected, trading can commence. As you gain experience as a merchant, you discover how prices for the various commodities — Plasteel, Technetium, Mylar etc. — vary between differing regions of the planet. It is a matter of judgement to buy and sell at the most advantageous prices.

Take off is not always uneventful. Insufficient thrust will result in the freighter falling back to the planet. The screen displays the readout from the on-board computer, relaying information such as the vertical and horizontal velocities, and the state of the reactor core and fuel.

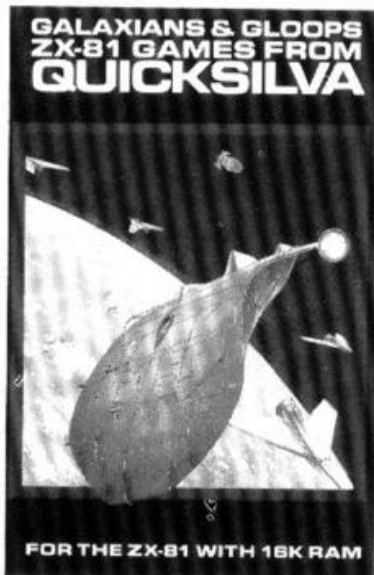

Once airborne and cruising, you are warned by the computer of any approaching landing base. As you descend the display changes and shows information from the ground tracking radar.

Piloting the freighter to a safe landing is not an easy task. If you are successful, a landing report details your touchdown velocity and the amount of damage sustained on landing. Trading can then continue.

Merchant of Venus is a complex and absorbing game, and

fun to play. However, it requires most of the 16K RAM and as a consequence, the load-time of the game is quite considerable.

Crystal Computing are at 2, Ashton Way, East Herrington, Sunderland SR3 3RX.

Galaxians and Gloops Quicksilva

Quicksilva have produced an excellent version of Galaxians for the ZX81. The action is fast and responsive, and it is a pleasure to play.

Two types of galaxians move, in formation, across the top of the screen, and swoop down attacking your base. You have three lives available, while the speed, firing-rate and the number of swooping Galaxians are adjustable by the player.

Points are scored, in the usual fashion, by blasting the Galaxians as they fly. However, more points can be scored if the Galaxians are hit as they swoop down from the top of the screen.

Scoring is displayed on the screen, and at the end of each game, your score is entered into a league table which can cater for up to 15 games/players.

The first batch of swooping Galaxians are particularly good at searching-out and destroying

your base, and some deft manoeuvring is required to avoid their attack. Thereafter the battle is fierce but a high score can be achieved by the experienced player. If it becomes too easy, the level of difficulty can be soon increased.

Gloops

This cassette also contains Gloops, a version of the arcade type maze game. You move your 'Gobbler' eating up food pills which are worth about 10 points each. The 'Ghosts' will eat you if they catch you. If you can reach one of the power pills in the maze, you take your revenge for a short while and add 100 points to your score if you can catch a ghost. There are 10 different mazes to choose from, and the speed is selectable in 10 discrete steps. Action is responsive, making Gloops a first-class version of this popular game.

Now for the bad points! Although the instructions state that both Galaxians and Gloop auto-run upon loading, the review copy I had did not. To execute the program, I had to enter in immediate-mode, GOTO 1. This being said, both are impressive machine code games, and overall the cassette is a very reasonable buy.

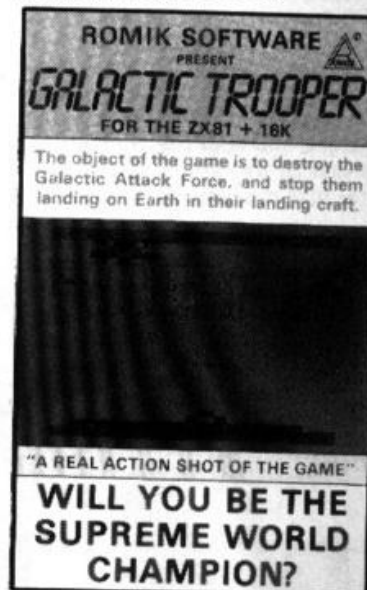

Galaxians costs £4.95, and Quicksilva Ltd. is at Palmerston Park House, 13 Palmerston Road, Southampton SO1 1LL.

Galactic Trooper Romik Software

Galactic Trooper is another fast moving arcade type game from Romik. The landing craft of the galactic attack force are in formation in columns at the top of the screen. You move your craft along the bottom of the screen, trying to destroy as much of the force as possible before the inevitable happens ie you are

obliterated. A mother ship services the galactic force; if you destroy it you gain 500 points.

There are three skill-levels available, but whatever skill level you select, the difficulty of the game continues to increase as the game goes along.

The action is good, but it is difficult to build up a high score. A fairly good game from Romik Software.

Romik Software Ltd is at 272 Argyll Avenue, Slough, Berks.

Frogger II The Software Farm

In this game, you have to help your frog to cross a very busy three lane road, a path, a river, and then into one of your 'frog-holes'. There are the usual hazards to make things difficult. Vehicles on the road must, of course, be avoided, and so must the ghosts which patrol the path, and the submerged turtles and ships in the river.

To cross the river, the frog must jump onto logs, floating or semi-submerged turtles, and the backs of crocodiles — but beware the heads and noses of these beasts!

There are three frogs per game, and a time limit. There is only one speed, which is perhaps a little slow. You do need to keep your wits about you, however, to build up a high score. The turtles have a nasty habit of quickly submerging just after your frog has landed on them.

A good scoring system is included, featuring a hall of fame. Instructions are given on screen at the start.

A fair game. The Software Farm is at Craigo Farm, Botany Bay, Tintern, Gwent.

The Computerised Diet Softchoice Ltd.

If you are a ZX81 owner, and would like to loose weight, The Computerised Diet might be of interest to you. It is a 'personalised' program, so after asking for your name, it goes on to ask your current weight and height, and your sex. Incidentally, it was at this stage that I made my first mistake, of the classic

'not reading the instructions' variety, and entered my weight in stones rather than pounds. Consequently, when I proceeded to select my 'ideal' weight — 150 lbs. — I was told that I needed a weight change of 140 lbs. which would require a calorie intake of 2100 calories! This program needs error trapping!!

Upon entering my correct weight in pounds, I was told that I needed a weight change of 10 lbs., and a calorie intake of 2100 calories daily. The next

step is to record the information onto a table in the booklet that accompanies the cassette.

The second part of the PSA (Present Status Assessment), asks 12 questions about current eating habits ie 'Do you eat quickly', 'Do you eat when bored' etc. Your bad habits are then listed on the screen and you are asked to enter them in the booklet.

Prior to using the program, the user must have kept a record of all food consumed over three to seven days. This is entered to build up your DEP (Daily Eating Pattern). For each meal you enter the calories consumed, and your mood at the time: anxious, bored, depressed etc. Tables in the booklet give calorie values of foods etc. Your daily eating habit pattern is summarised to give your average daily calorie intake, the calorie change required to give your desired weight, and predominant mood at snacks. Again, the data should be entered into the booklet.

The first side of the cassette ends with printouts in graphic and tabular format of your present, and ideal, calorie intake for each meal of the day. You can save your eating pattern to enable your progress to be monitored — a blank cassette is provided for this purpose.

The reverse side of the cassette contains a menu building program. Briefly, the computer assists the user in developing the food groups (there are eight) and the servings of each group for each meal. This results in a balanced diet containing the requisite number of calories.

The two programs work quite well. Screen displays and data-entry are generally clear and are well thought-out. The printouts are good and the booklet is helpful.

Doctors generally agree that dieting should be coupled with exercise if a lasting weight loss is to be achieved. Also that correct food balance is, if anything, more important than pure calorie counting. Perhaps a development of this program to include all these factors would be worthwhile aim. As it stands, I am sceptical that it would be of real benefit to the overweight.

Strangely, whilst the computer hobbyists spend many hours hunched over their machines and have pale complexions as a result, few in my experience, are overweight. Perhaps their preoccupation with computing leaves insufficient time for other indulgences.

Softchoice Ltd, are at 52 Platts Lane London NW3 7NT.

AXIS SOFTWARE

ZX 81 — for 1K

BUMPER 7

Bumper 7 Axis Software

Bumper 7 contains no less than — you've guessed it — seven games for the 1K ZX81. Considering the limitations of the 1K machine, and the price of a 16K RAM pack these days, there can be few ZX81 owners with just the 1K machine. For those that do possess unexpanded ZX81's, this cassette contains a selection of games which illustrate certain features such as scroll and cursor control which may help with your own programs.

Repeat 20 is a memory test in which progressively larger numbers have to be remembered. The Slalom is a downhill ski-run in which the player has to guide the skier through 25 gates.

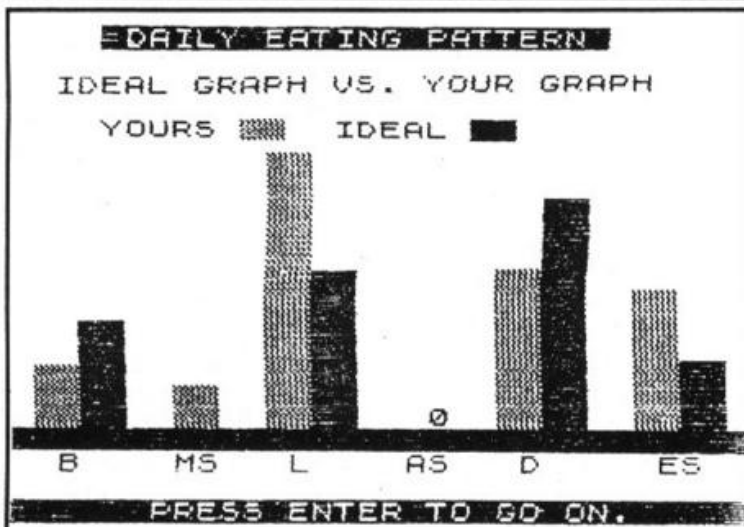

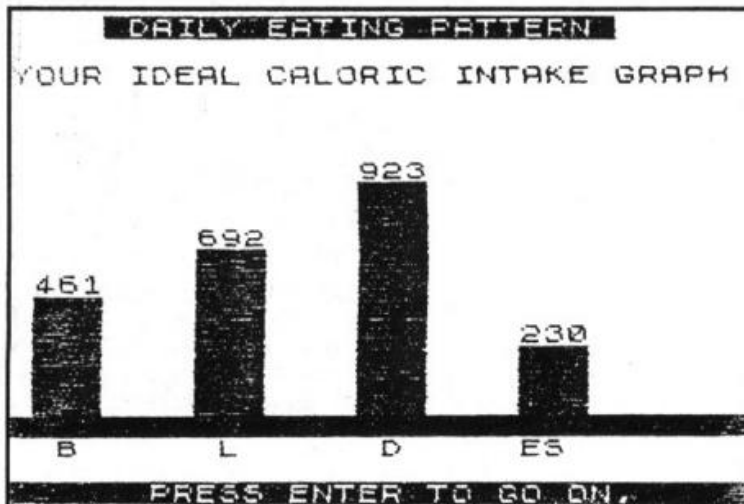

Also included within Bumper 7 are versions of Paper, Stone, Scissors (This used to be called *Ick, Ack, Ock. Don't ask me why* — Ed.); Snowflake, a game in which the aim is to catch a falling snowflake in a bucket; Patterns, an endlessly changing pattern-generation program; Banco, based on the card game *Chemin-de-fer*; and finally Sketch, which is a program to enable pictures to be drawn on the screen.

Bumper 7 is a good introductory cassette for the new-ish 1K ZX81 owner.

Axis (U.K.) Ltd is at 71 Brookfield Avenue Loughborough, Leics. LE11 3LN.

Correction!

In last month's issue I reviewed two games and gave the USA companies name and address. I would like to point out that the programs Signalman and Speedsnake are sold in England by Softchoice Ltd, 52 Platts Lane, London NW3 7NT.

P=PRINT OUT ENTER=CONTINUE

List Option

Stephen Bugg's makes the ZX81 LIST like a Spectrum.

this program which will scroll through the lines of a program from any starting line you desire to the end or to any specified line.

As it stands it is not par-

ticularly helpful, but all it needs is renumbering to a suitable high line number (say 9000), and to be loaded into your computer and left there before each programming session.

Comments

1000-1003 Input bounds of printouts of lines.
 1005-1008 Find bounds of memory allocated to program.
 1009 If first line is not wanted then goto find first line sub-routine.
 1010 Check for end of program.
 1020 Read line number (first two bytes of line).
 1022 Check if after last desired line number.
 1025-1030 Print line number in front of LIST command, bbbXb.
 1035 Increment address pointer by 2, number of bytes used for the line number.
 1040 Reads number of characters in line.
 1045 Increment address pointer by 2, number of bytes used for line length.
 1050-1085 Loop for each item in line except newline at end.
 1053 Check if pause is wanted. Pause routine at 1125.
 1055 Load A with value of address to which is being pointed. X is first text address in line, Z is position in line.
 1060-1065 Character 126 (NUMBER) follows a number in memory, and this is in turn followed by another 4 characters. These 5 characters do not want to be printed, and these 2 lines avoid this being done.
 1070 Print character held in A.
 1080 If Print line is 3 then move to SCROLL routine.
 1095 Increment address pointer by length of line.
 1010-1100 Loop for each line in program.
 1105-1120 SCROLL ROUTINE
 1105 Load B with Print column.
 1115 Set Print position to correct position, one line above previous position. After scroll the next character will be printed immediately after previous character.
 1125-1130 PAUSE ROUTINE
 1125 Return to main routine if pause is to end, if "Q" is pressed.
 1140 FIND FIRST DESIRED LINE
 1140 Read line number.
 1145 If reached starting position then goto main routine.
 1165 Read line length.
 1160&1170 Increment address pointer by line length.

Variables

A Value of address at pointer.
 B Print column.
 DFILE End of program address.
 ED Last line desired.
 ST First line desired.
 X Address pointer, starts at 16509, line 1005 and is incremented as byte is read, Lines 1035, 1045, 1095, 1160, 1170.
 Y Line number (1020 and 1140) and Line length (1040 and 1165).
 Y\$ String to print out line length.
 Z Counter for line length.

Operating Instructions

RUN 1000 and GOTO 1000 will call the routine.

START LIST asks for the first line that is to be printed.

END LIST asks for the last line that is wished to be printed.

The program will now list the lines between these two line numbers inclusive, it will not stop until the end, unless the Pause Routine is called, this is done by pressing the "S" key, the Pause is disabled by the

pressing of the "Q" key. By pressing the break key the user can stop the routine and the listing will remain on the screen. The line numbers used can be changed for something that is more acceptable such as 9800-9999, but the GOTO's will also need to be altered. Also the variable names may be changed if the same variable is used by the programs and cannot be changed. If the variables need to be retained then GOTO 1000 must be used as RUN 1000 will clear these variables.

```

1000 PRINT "START LIST "
1001 INPUT ST
1002 PRINT "END LIST "
1003 INPUT ED
1005 LET X=16509
1008 LET DFILE=PEEK 16396+256*PEEK 16397
1009 IF ST>1 THEN GOTO 1140

1145 IF Y>=ST THEN GOTO 1010
1160 LET X=X+2
1165 LET Y=PEEK X+PEEK (X+1)*256
1170 LET X=X+Y+2
1175 GOTO 1140
    
```

Unlike many maze/ghost-chase type programs this one is challenging and will be appreciated by the connoisseur of such games. The three independent ghosts have more than the average amount of intelligence, and in fact even with the *nine* extra lives allowed, experienced arcade players will need many plays before being able to clear all of the screens.

Most of the program functions, including man-movement, are in BASIC just the ghost movements and screen checks are in machine code, yet the speed is equal to the arcade versions. There are *twelve* carefully designed full-screen-size mazes (including 'tunnels'), all in a surprisingly compact listing.

In attaining this compactness only two things have been left out. One is 'power pills', the other is continuous (dot-counting) scoring. We think the quality of play and other features more than make up for these. The addictive quality of these types of games seems to lie in 'clearing screens' rather than scoring points.

Using the program, playing the game

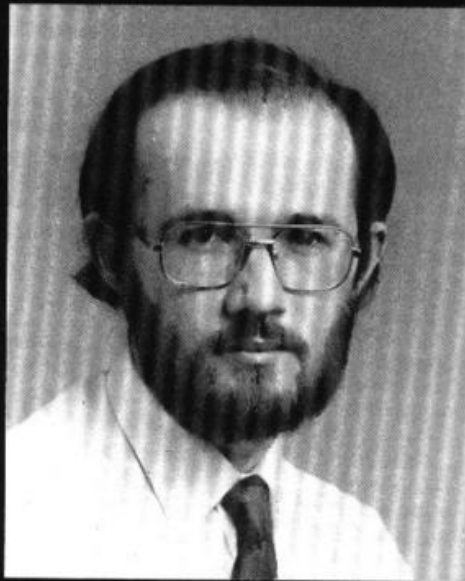

There are two sets of mazes, either of which can be chosen upon running. The second set are considerably harder to clear and are really intended for when you've become successful on the first set and are looking for a further challenge!

A fixed score is given for clearing each screen, and since they are graded in difficulty, successive screens are worth more points (see table 1). Also, the ghosts are programmed to be a bit less vicious on screens one and two, but reach their 'full-strength' from screen three onwards.

When killed you are rejuvenated, using up one life, and carry on from the point where you were hit. Clearing a screen also gives you an extra life, and there is an added bonus of four

Compac

Liverpudlians JD Rogers and C Hogg have produced yet another winner with this definitive Pacman type game.

J Dave Rogers

Colin Hogg

extra lives if you can get past screen three.

If you happen to break the program, don't press RUN or you will have to wait for maze decoding (see later). Always enter 'GOTO 400' to re-execute the program.

To save the program always use 'GOTO 500' as this includes a 'clear' to erase the large arrays that are used and so drastically reduce loading time.

The ghosts will not follow you through tunnels. Maze 'C', in addition to having normal tunnels, has two 'bolt holes' which can be used as resting places where the ghosts can't get at you.

Storing mazes in a five bit code

To store six, full-screen-size mazes in the usual way (as strings of characters) would require 132 such lines to be typed in — making a tedious and error-prone total of over four thousand black and white blocks to be entered. In this program the mazes are held in the form of a five-bit code (see figure 2), where each maze line (32 characters) is 'crunched' into just *three* coded elements, giving a compression ratio of almost eleven-to-one! An 8-bit code was first considered but was awkward to type in and ambiguous, involving back-spacing to enter the characters needed to represent certain numbers, and 'chr\$ N' to represent those not having a Sinclair code. Hexadecimal code was another possibility, but this only offered an 8-to-1 compression ratio.

The five bit code uses numerals 0 to 9 extended through characters A to V to represent binary numbers up to 31. Full stops can be used in-

stead of zeros and provide occasional visual landmarks for even easier typing in.

On first running the program it takes two minutes to decode the information to form the actual mazes. This, however, works out to be *less* than the extra time it would have taken to load the program had the mazes all been held in strings. So overall time is saved, and since the program itself is made much shorter you also have the advantage of more reliable loading. Even more economical is that six extra mazes ('second set') can be obtained more or less for free by decoding the information for the main mazes in a different order. Only three program lines are needed for this (772-774).

Concerning Bug movements

The programming of (what looks like) intelligence into the enemy 'pac's' is not as simple as it may seem, and many pages could be written on this interesting but sometimes frustrating subject. A particular

Screen	Points	Appearance	Tunnels	Title
A (G)	500	Grey	2 (4 + H)	Easy Street.
B (H)	2,000	Stripes	3 (4 + H)	Skid Row.
C (I)	4,500	Grey	4 (4 + H)	Mr. P. Acne.
D (J)	8,000	Quilted	2 + H (4 + H)	Roundabouts.
E (K)	12,500	Grey	None (4 + H)	Claustrophobia.
F (L)	18,000	Psychedelic	2 (4 + H)	Open-Field.

Table 1. Summary of screens (brackets indicate 'Second set' screens). H indicates Horizontal tunnel.

algorithm may work perfectly in a given shape of maze only to fail in a slightly different layout. It is also advisable never to rely on oneself to be 'test pilot' during development, since a system that consistently outwits one person may be useless against somebody else who naturally tends to take different route decisions during play.

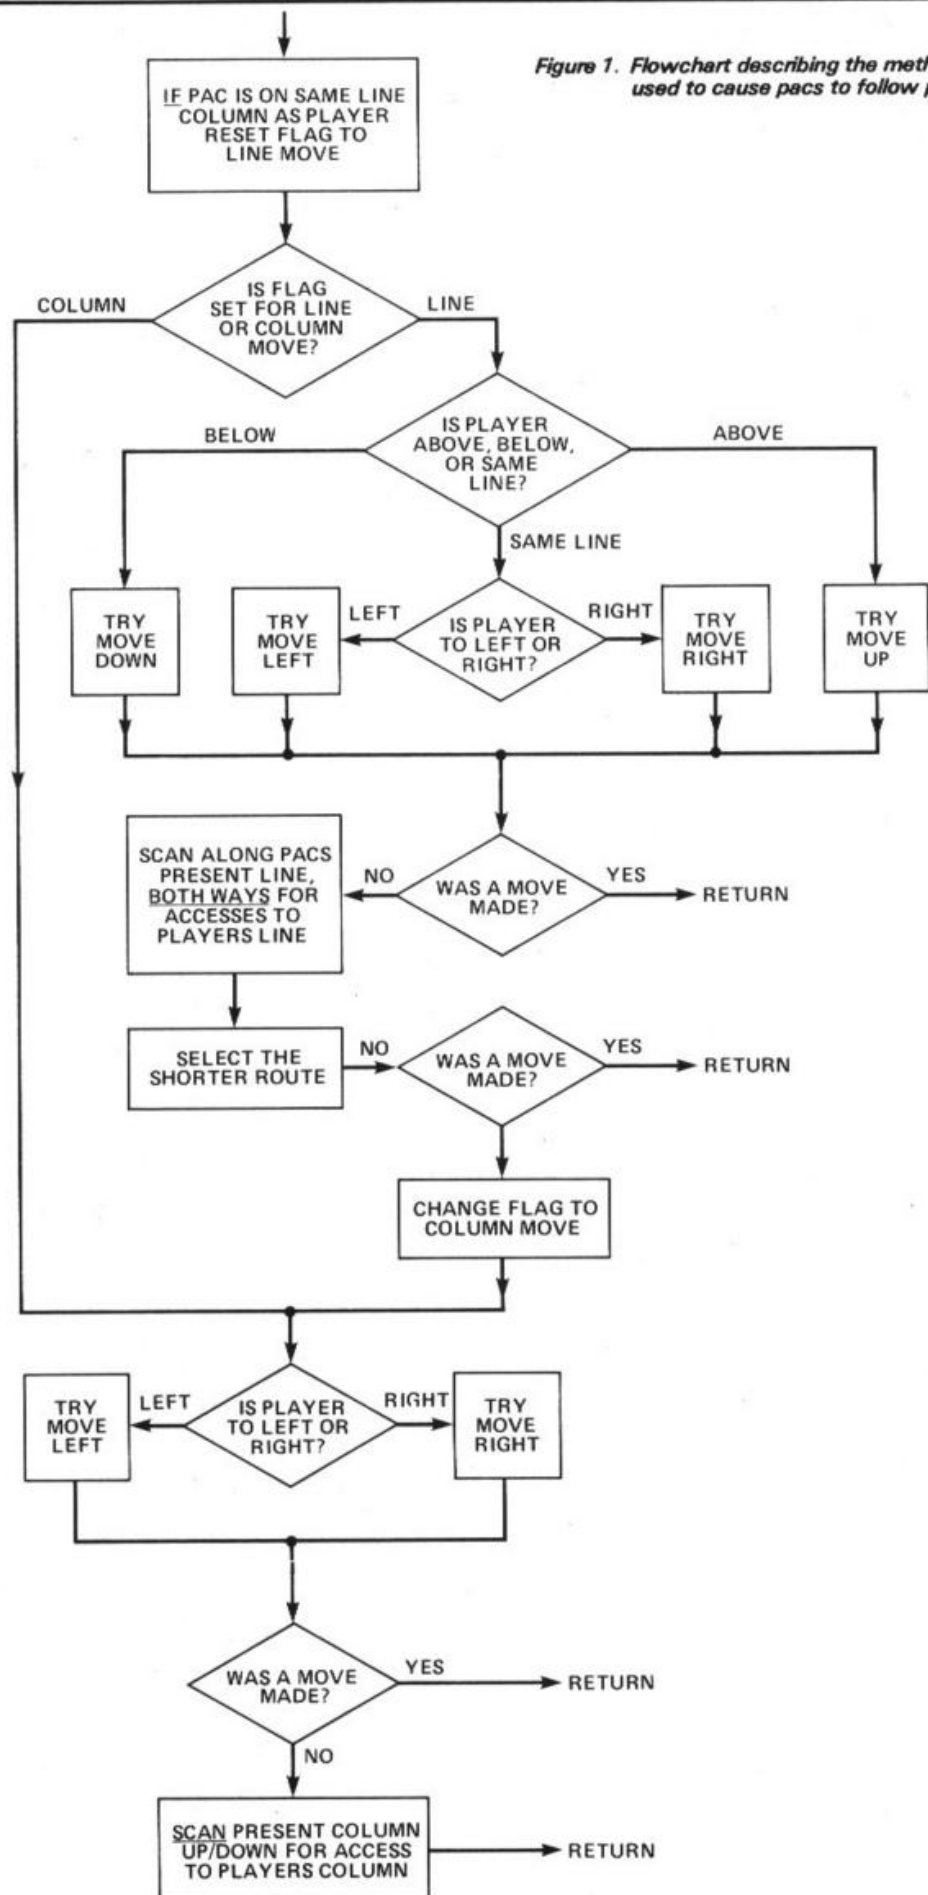

The common solutions, such as move towards player line then player column, produce 'stupid' enemy pac's that are forever getting stuck or will just jiggle up and down apparently unwilling to get past the slightest bend in the maze to catch you. Another typical behaviour is for all the pac's to follow the same path, in which case they are liable to stay in a 'train' behind the player, again offering no real challenge.

An interesting test for any pac move algorithm is a 'U' shape in the maze, or more accurately any construction that is topologically equivalent to a 'U'. Take a look at some commercial/arcade mazes — U shapes are avoided, except at the edges. Here it doesn't matter, because the situation 'player-under-the-U-with-pac-inside' can never arise, and it is this condition that can cause trouble.

The system used in this program is shown on the flowchart. It contains subroutines for moving in all four directions, but these are only called in response to a series of checks. The obvious moves directly towards player line and player column are tried first, and if none of these are valid, then scans are made for paths further afield. For compactness, the same central routine is used for all three pac's in turn, but information relevant to each pac is held in separate stores and flags (bytes are set aside for this at the end of the machine code rem line). The information on pack 'A' is first shifted into the pac move routine, the routine is executed, the pack is moved, then the new position and status of the pac are replaced into its store for use in its next move. This is then repeated for pac's 'B' and 'C'. Despite all three pac's using the same algorithm, they hardly ever follow the same paths as each other. This is because each pac is programmed to regard any other pac's as walls of the maze and so it will split off. In this way two pac's will often do a 'pincer' movement to trap you!

Use of RAND seed

The pac-move routine needs to

NOTE: "Line move" means a move towards the player's line, ie up or down. "Column move" is to players column.

know the players immediate line and column positions. So as not to slow down the program the 'RAND' function is used as an efficient means of transferring this information from the BASIC to the Machine Code. Changes in 'A' (across) only affect the low byte of the RAND seed, so this represents player column, while changes in 'D' (down) are multiplied by 256 and will therefore affect only the high byte, so this represents player line. The machine code can now go directly to the two fixed addresses of the RAND seed to obtain this information instead of messing about finding addresses in the Variables area, which is not fixed.

Typing In — IMPORTANT

- Type in, as line 1, a Rem statement containing *exactly* 101 of any character.
- Enter as a direct command 'PRINT PEEK 16511'. If the answer is *not* 103 then line 1's length is wrong and must be corrected.
- Duplicate line one, four times by editing its line number to 2, then 3, 4 and five.
- Type in the hex loader, then run 9000 and enter the hex data one line at a time *including* the check figures (but not the spaces). The loader will intercept errors of any kind and prompt you until you get it right! The commonest mistakes are confusing B's, 8's, 6's and 5's, therefore we have redesigned parts of the ZX81 character set to look less ambiguous on the ZX printer.
- Type in main program, erase the hex loader, *save* a few copies on tape, then run.
- Check the mazes, if you spot any 'dead ends' in mazes A to E then you have made a mistake in entering the code for that maze so check in lines 710 to 760.

Unlike normal Rem statements, line 9999 is *not* optional, since it forms one of the 'trigger lines' used for tunnel movements (see later). Also, please consider the following points:

- Line 650 must contain **twelve inverse spaces**.
- Lines 700-800 are best entered in 'fast' mode, and note that these contain letter O's, not zeros, and I's as well as 1's.
- Line 250 — inverse 'MAZE' then an inverse minus. Do not use an inverse space.
- Line 9070 (part of Hex loader) — inverse 'ERROR'.

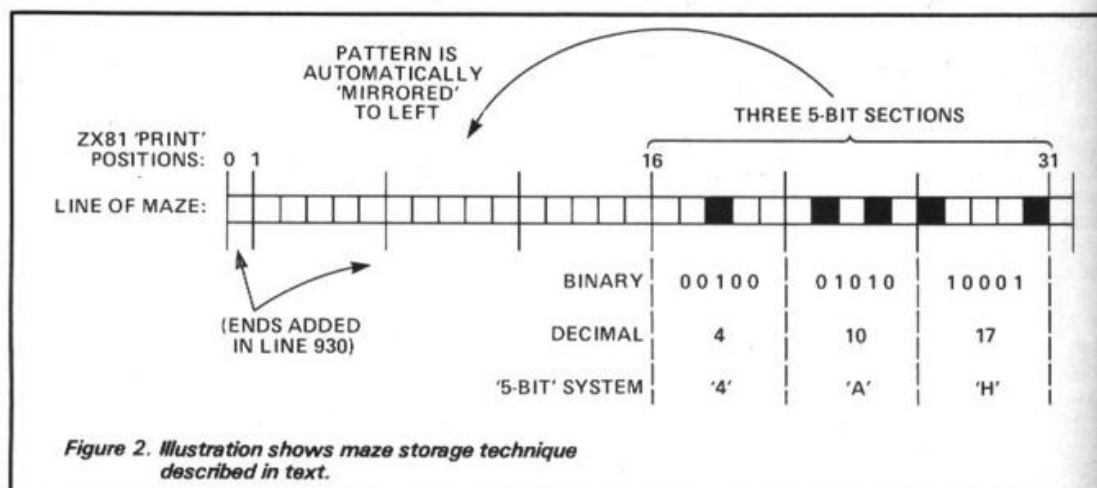

Figure 2. Illustration shows maze storage technique described in text.

Do not attempt to alter line numbers between zero and 400 since the machine code causes line 90 to 'GOTO' certain preset lines. Check lines 265 and 395, and lines 870 and 890.

Customising

If you find some of the mazes a strain on the eyes then you can have them all in 'restful grey' by changing line 840 to read 'LET A = 136'.

Some people prefer the arcade type of free-running control response, i.e. if no keys (or more than one key) are pressed then the player continues to move in the same direction. This can be obtained by adding: 5 IF CODE INKEYS + ABS (D + A) 4 THEN GOTO 20

You can alter the actual control keys to those you feel most comfortable with by changing lines seven and ten.

To slow down the game (and add an extra effect) add '+ RND' to line 50. Custom points 2 and 6 also slow down the game.

For desperately bad players the final figure in line 100 can be changed to 5. This gives the advantage when turning corners to you rather than the ghosts, and even lets you take a breather to compose your wits by purposely running against a wall for a while.

A proper pause facility (for when the phone goes or you suffer a sneezing fit at a crucial stage of play) can be obtained by adding: 15 IF INKEY\$ = "P" THEN PAUSE 4E4.

If you would prefer the player to restart at the top of the screen after being killed (as in arcade type) then relocate line 270 to 371 and line 280 to 372, erasing the originals of course.

To encode your patterns of mazes into the 5-bit format you should start at column sixteen of each line and work right, converting each group of five

characters into a five-bit binary number. ie dot = 0, Maze wall = 1. Mazes should be left-right-symmetrical.

The Basic

7-90
30

Players move routine. If character at Intended Position is anything other than a dot or a space then GOTO further checks at line 100, otherwise: Blank out previous position, POKE player onto screen at new position, update S. Update Line-Column variable (LC) then use this as seed for RAND (see text). Calls machine code to move the three 'ghosts' and do screen checks, then "goes to" one of the following lines:

Normally -----line 5

If player has been hit by ghost --- line 300

If screen has been cleared of dots --- line 200

110

If player hits one of the 'trigger lines' (consisting of CHR\$ 21) above and below the maze area then a "tunnel" move is performed by setting D to either 21 or minus 21 (depending whether player is at top or bottom of screen). Upon re-entering the main loop, D now alters the players position by means of line 20 (to re-emerge from the opposite tunnel) and also updates 'LC' to suit by means of line 70.

Note

Only the lower trigger line is actually visible on the screen, the other one is within the program (line 9999) which since it is the very last thing in the program area of memory is effectively one line above the screen (display file — Refer to memory map in ZX manual). This leaves more room on screen for the actual game.

200-290

When a screen is cleared updates score, adds another life (or bonus of four lives for reaching screen four), pauses, does 'rollover' effect then prints next mazes and resets players position. In the unlikely (!) event of a player clearing the sixth screen the sequence goes back to screen one. Resets Line-Column variable to coincide with players starting position.

270-280

Note

One is added on to LC during screens one and two, thus slightly disorientating the ghosts since they now 'see' the player as being one space to the side of his real position. This is done to make the first two screens slightly easier, then in screen 3 onwards the ghosts come up to 'Full strength'.

300-395

When player is hit takes away one life, flashes both the player and the life that is being used up. User call then returns ghosts to starting positions. If all lives used up ends game.

400-480

New game, resets various variables.

500 Selfsave and setting up.
630-640 Sets up arrays to hold mazes and maze data
700-770 Storage strings, holding the data for all six mazes in compact '5-bit' form. **Note:** for greater readability the extreme conditions of zero and thirty one are represented as full stops and X's respectively.

800-970 Routine that decodes the data into actual mazes. This consists of three nested for-next loops:
M loop — for mazes one to six.
X loop — for items of data one to 66
loop — extracted from each storage string.
N loop — for bits one to five of each item.

840 Alters the characters used to build certain mazes. Normal value of 136 gives a grey maze.
890 Builds up each maze line 'from the centre outwards' and thus mirrors the maze symmetrically to the left and right.
920 Continues X-loop until a line of 30 characters has been built up, line 940 then adds 'ends' to that line and places it into position within the appropriate maze array (M\$).
771 Repeatedly concatenates the string of inverse spaces B\$ into a whole screen full. Used to give 'rollover' effect between screen.
773-774 Shifts the data into the storage strings about so that when decoded different shaped mazes are produced ('second set').

Machine code

The machine code moves the three ghosts, checks for man-hit and for screen cleared. All addresses are in hexadecimal.

4082-40AE Set up pacs in starting positions using data from the fixed stores (see later).
40AF-40BC Scan whole screen for remaining dots, if none are found then return to Basic with value of 200, which is then used as the 'GOTO' value in line 90.
40BD-40E0 Call bug moves. Puts data from bug 1's store into workspace, calls pac move, then replaces data to store when move completed. Repeats this for pacs 2 and 3.
40E2-40F6 Player-hit check. The characters that are to be replaced behind each pac as it moves are held in stores, so by looking at these, if any contains the 'player' character then player must have been hit. If so, jumps to routine at 40F7 which wipes out all the pacs, replaces them at start positions and then returns to Basic with value of 300, so line 90 'goes to' player hit routine.
40F3-40F6 If player not hit, returns to Basic with value of 5, so line 90 continues movement loop to line 5.
4112-413F Set working flag. Sets various bits of working flag (4290) according to pac position **relative** to players position. i.e. above, below, same line, etc.
4141-4166 Move decisions (see flowchart).
4167-416F Try move towards player line.
4171-4175 Try move towards player column.
4177-41B9 Movement routines for all four directions. When called, checks if move is valid, if so does move, updates pac line/column and resets carry to zero, if not sets carry to 1.
41BA-41FD Column scan. Scans pac column up and down to find horizontal access to player column. Having found this, calls relevant movement routine. If no move possible, sets carry.
41FF-4259 Line scan. As for column scan but horizontally, *plus* a comparison is made between routines left/right and the shorter of the two is taken.
4268-end Various stores. Information for each pac is held in a standardised order: pac 1, pac 2, pac 3. For each bug; two positions, column, line, flag byte, chr\$ for replacing behind.
4268-4279 Fixed stores containing start values (read only)
428C-4291 Working store holding information on current bug being moved.

The variables

Players Variables

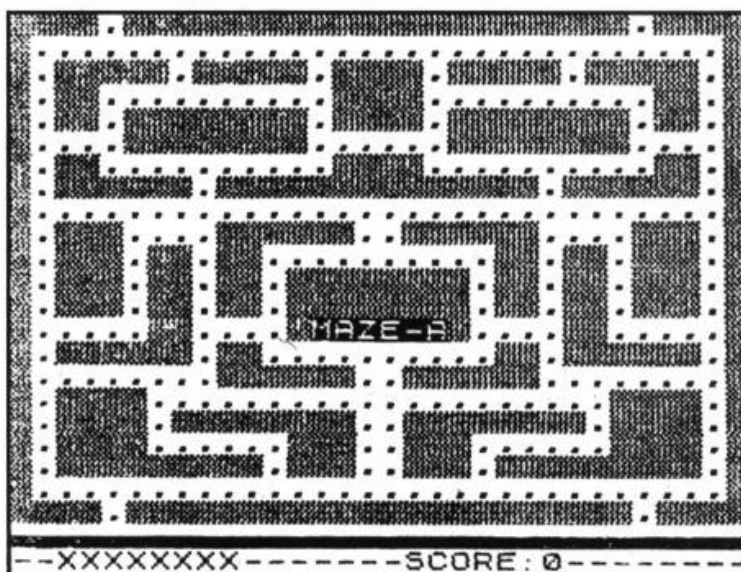

A Across movement.
D Down/up movement.
IP Intended position.
S Screen position.
LC Line/column. Represents both line and column position (one in high byte — * 256 — the other in low byte) for reference by machine code.

Other variables

SC Score.
LYF Life remaining.
MZ Maze number.
X Marks start of display File in memory.
SS The "Second set" of mazes are produced if this equals one, main set if zero.
S\$ (1 to 6) Storage strings, containing maze data in 5-bit code form.
M\$ (1 to 6) Maze strings, into which actual mazes are built up.
U\$ General-purpose, also used in decoder.

Decoder variables.

K Determines type of character used for walls of maze.
S Single value extracted from storage string for decoding.
D Divisor. Starts at 16 (bit-five) then reduced to 8 to decode bit 4, and so on down to bit 1.
U\$ String into which each line of maze is built up before being placed into a maze array.
A Code for character produced by decoding current bit.

University Software

LIBRARY OF ADVANCED MATH/STAT/ECON FOR SINCLAIR ZX81 AND SPECTRUM

TAPE 1: MATRIX OPERATIONS (*), (+) £9.95
SIDE A: Inversion, multiplication, addition, subtraction, scalar multiplication and determinants of matrices and vectors within one single program. Any output can in turn be used as the input of the next operation without re-typing. Capacities: 16K ZX81: 25x25, 16K Spectrum: 15x15, 48K Spectrum: 48x48.
SIDE B: Determinants of square matrices.

TAPE 2: POLYNOMIALS (+) £6.95
SIDE A: Includes quadratic equations (as degree 2 polynomials) and Newton-Raphson and half-interval search methods for higher degree polynomials. Computes the real roots with 8 digits of precision. SIDE B: Plot of polynomials in any interval, values of real roots, extremum points.

TAPE 3: INTEGRATION (+) £6.95
SIDE A: Simultaneous integration of two functions by Simpson's and trapezoidal rules. Also computes the area enclosed between the two functions. SIDE B: Plot of two functions in any interval. Integrated area shaded.

TAPE 4: SUPER-REGRESSION (*) £14.95
SIDE A: A highly developed multivariate regression program with log/ln option on each variable, allowing for exponential and geometric regressions. Displays estimated coefficients, standard errors, t-statistics, R^2 , corrected R^2 , F-statistic, degrees of freedom, Durbin-Watson statistic, variance-covariance matrix, matrix of correlation coefficients, INTERPOLATION and PLOT of residuals. Capacity examples (var.xobs.): 16K ZX81: 2x400, 5x200, 10x100, 16K Spectrum: 2x75, 5x30, 48K Spectrum: 2x1650, 5x900, 10x500. SIDE B: Plot of bivariate regressions, slope, intercept, R^2 , standard deviation.

TAPE 5: PROFESSIONAL LINEAR PROGRAMMING (*) £14.95
SIDE A: A user friendly optimisation program capable of handling all sorts of linear programming problems (any combination of $<=$, $>$ constraints and $X_i > 0$, $X_i < 0$, $-a < X_i < a$ sign constraints). Displays the canonical equivalent of the primal, values of slack variables, dual problem and its solution. Capacity examples (var.xcons.): 16K ZX81: 10x21, 15x18, 20x13, 16K Spectrum: 8x8, 48K Spectrum: 10x45, 25x35, 50x25. SIDE B: Solutions of simultaneous equations.

TAPE 6: STATISTICS (*), (+) £14.95
SIDE A: STATISTICAL TESTS AND DISTRIBUTIONS. Chi-square, Students t-, F-, Mann-Whitney U, Wilcoxon's Signed Rank tests and Chi-square, Students t-, F-, Binomial, Poisson and Normal distributions. Data on many samples can be entered at once, sorted and basic statistics displayed. Capacity examples (samp.xobs.): 16K ZX81: 1x230, 2x110, 5x45, 16K Spectrum: not available, 48K Spectrum: 2x1300, 10x250, 20x125.
SIDE B: DESCRIPTIVE STATISTICS. Analysis of ungrouped or grouped data. Ungrouped data sorted and grouped. Output includes mean, mean deviation, standard error, skewness, kurtosis, moments, Pearson's coefficient, etc. A comprehensive histogram with up to 30 class intervals, class frequencies, midpoint values. Capacities: ZX81: 450, 16K Spectrum: 200, 48K Spectrum: 2000.

TAPE 7: BIBLIOFILE £9.95
An academic indexing program to keep record of books and articles. Loading and saving of files, printing and listing of up to 150 records in a file, searching for an entry and sorting records into alphabetical order. It is possible to modify, delete and add a record.

EDUCATIONAL SERIES

INTRODUCTION TO ECONOMICS SET (48K Spectrum only): Basic concepts are introduced by extensive use of graphics, examples and exercises.

MICROECONOMICS I (+) £9.95
SIDE A: Demand and supply analysis, demand theory, cost-benefit analysis. SIDE B: Budget line analysis, indifference curves, decision making in a market economy.

MICROECONOMICS II (+) £9.95
SIDE A: Cobb-Douglas production function, linear programming and exercises on linear programming. SIDE B: Theory of the firm, elasticity of demand, CES production function.

MACROECONOMICS (+) £9.95
IS/LM curves, national income determination, aggregate demand and supply analysis, multipliers.

ECONOMIC GEOGRAPHY (+) £9.95
SIDE A: Von Thunen's model of agricultural land use. Locational rent and principle of diminishing returns. SIDE B: Models of agricultural and urban land use.

(*) Programs with INPUT, CHANGE, LPRINT and SAVE-DATA facilities. Spectrum versions of tapes 4 and 6 also embody MERGE/READ DATA facilities. A common data file can be used with these programs.

(+) Recommended for "A" Level, first year university and poly students.

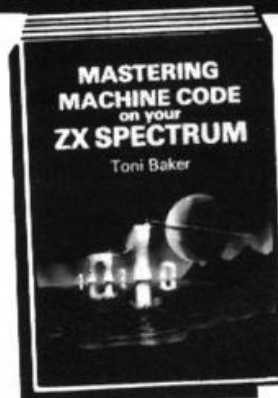

PLEASE SEND A5 SIZE S.A.E. FOR INFORMATION ON MICRODRIVE-BASED PACKAGES.

Tapes 1-6: £60. Introduction to economics set: £35.

All inclusive prices for the U.K. For overseas orders add 50p per cassette. Dealers enquiries welcome.

Cheques payable to: **UNIVERSITY SOFTWARE, 29 St. Peter's Street, London N1 8JP. Telephone: 01-359 0978**

Log Hop

Would be Lumberjack Christopher Gibbs sent us this challenging program from Reading Forest.

A program which is as addictive as this and yet written in BASIC is a rare thing indeed, Christopher has created a game which is not only fast but fits in to 16K with room for titles as

well! As can be inferred from the title, the game involves jumping over logs and up through gaps to reach the rings at the top of the screen.

You control a running man

with keys 5 and 8 for left and right movement and key 0 to jump. If you jump and miss the hole above you, you will be rendered unconscious for a short period of time and may fall through an approaching gap in the level you have reached.

Three levels of difficulty are included and a hall of fame chart for those who become adept

enough to reach a good score. Christopher says his highest score so far is 93%, I admit to not getting any score at all — mind you, I wasn't feeling too well. The score is worked out on the time you take to reach the rings. So for a real test of your ability type in this relatively short program — go on, hop to it!

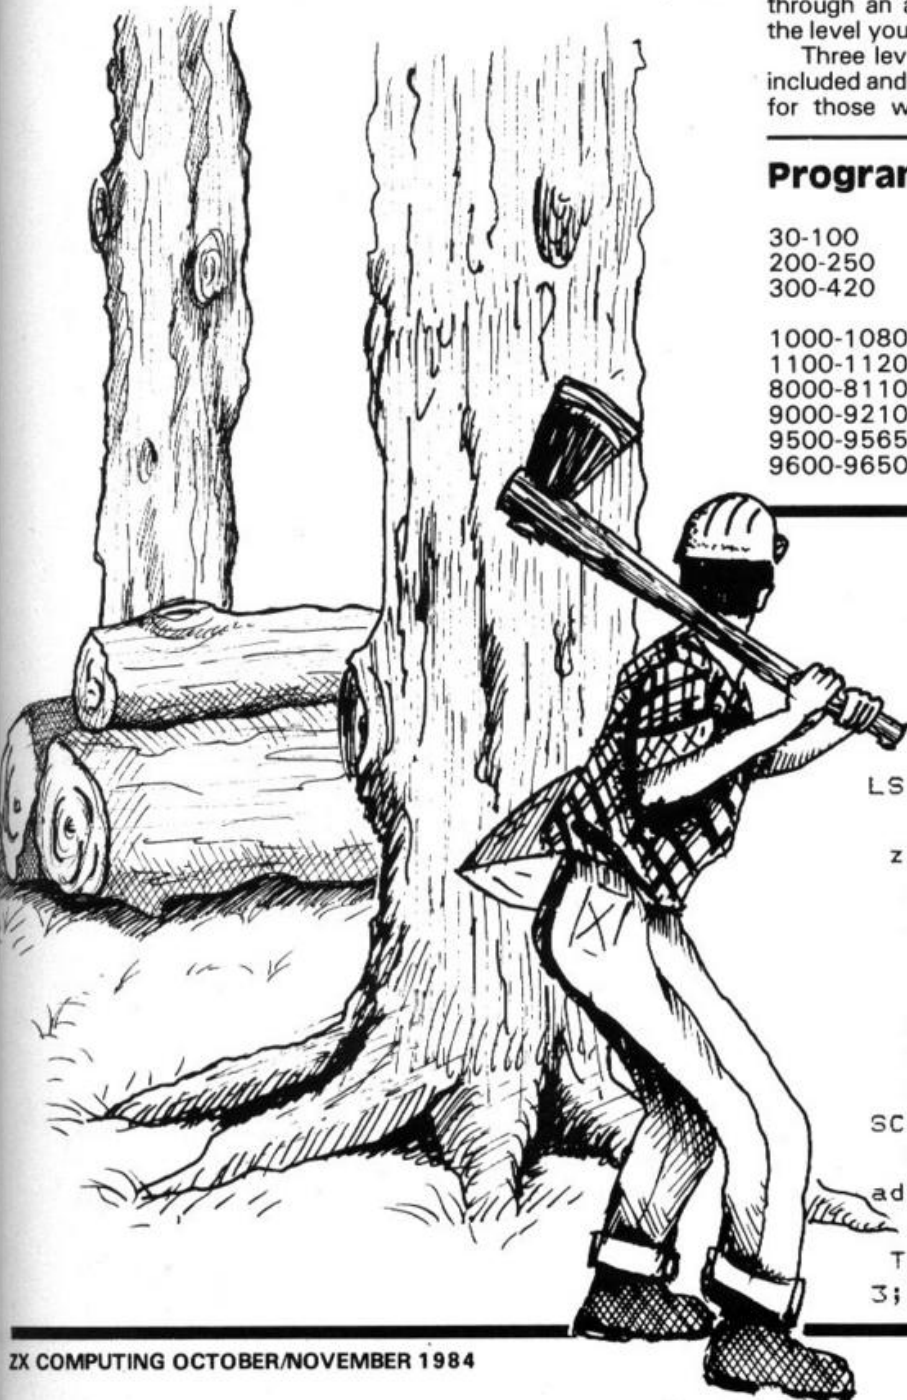

Program structure

30-100	Main loop
200-250	Fall down hole routine
300-420	Death routine, score assessment and hall of fame update
1000-1080	Jump routine
1100-1120	'Reached the rings' routine
8000-8110	Presentation and instructions
9000-9210	Graphics
9500-9565	Random set up of logs
9600-9650	Screen set up at start of game

The Sinclair

QL

and you

Exploring the Sinclair QL — An Introduction to SuperBASIC Andrew Nelson, £4.95

The QL has a rich, new programming vocabulary, and this great book gives you the chance to master the host of new words Sinclair has added. Sure, you can use the QL more or less just like a Spectrum, but if you do, you are missing the extraordinary power which lies behind the radical concepts of SuperBASIC. Command by command, statement by statement, Andrew Nelson takes you through the richness of QL SuperBASIC in *Exploring the Sinclair QL — An Introduction to SuperBASIC*. Just £4.95 and available from most book and computer shops. In case of difficulty, you can order it directly from Interface Publications, using the coupon below. (Trade only: Interface Publications are distributed exclusively in the UK and Eire by W H S Distributors. Export orders handled by Interface Publications.)

Interface Publications, Department QZX,
9-11 Kensington High Street, London W8 5NP.

PUBLICATIONS

— We're the experts! —

Budding Beethovens begin here with Lancastrian J W Casson's 16K computer composer program.

Although limited, this program will provide plenty of scope for creative musicians to write and play melodies of the kind usually played on flute, tin whistle etc.

The two biggest limitations are:

1. You can only play one note at a time and
2. You cannot play slurred notes (due to the first limitation)

Perhaps readers with sound boxes and 48K machines can adapt the program to overcome these problems. However, the main purpose of the program is to allow musical input into any Spectrum using standard musical notation.

Operation

• **KEY** — To tell the computer which note to play — sharp or flat. The computer will first ask

"Sharps?" and expect to enter, one by one, the letters of the notes to be played sharp or, if none, just press ENTER.

Next the computer will ask "Flats?" and expect the letters of the notes which it must play flat, again press ENTER if there are none.

• **TIME SIGNATURE** — To tell the computer how many beats there are in a bar.

When playing the tune the first note in each bar is played slightly longer than it's written value to emphasise the note. After the key inputs have been completed the computer will prompt "Time as a fraction". Enter the required time, 3/4 for a waltz, 3/8 for a jig, 4/4 for common time etc. The screen should now look like fig. 1.

• **CHARACTER SELECT** — The musical characters of the tune can now be entered, the options are:

REST	— a period of silence
FLAT NOTE	— a note 1 semitone below key note
NOTE	— a note played as written in the key
SHARP NOTE	— a note 1 semitone above key note

CHARACTER FLAGS

FLAT	NOTE	SHARP	REST	NOTE 1
------	------	-------	------	--------

1> SEMIBREVE
 2▲ MINIM
 3 CROTCHET
 4 QUAVER
 5 SEMIQUAVER

CHARACTER NUMBER:
0 < N < 101

PITCH CURSOR ONLY
 APPEARS IN 'SET PITCH'
 MODE FOR NOTES

DURATION CURSOR

DISPLAY ONCE DETAILS OF KEY
AND TIME SIGNATURE ENTERED

Normally the NOTE flag will flash.

All the options can only be selected from the NOTE mode, to select REST hold R until the indicator flashes, to get back to NOTE mode from REST hold key N.

To select SHARP or FLAT hold down S or F as required, to cancel these hold down the opposite key to the option in force, ie. if in sharp mode hold key F to cancel.

• **DURATION** is selected by moving the duration cursor by using the 6 and 7 keys to move it up and down the menu. When the correct duration has been chosen press enter. If the

character is a REST then it will be drawn and the computer returns to character select mode.

• **PITCH** selection — a cursor will now appear by the side of the staff and this can be moved up and down again by using the 6 and 7 keys until you reach the position you require. When you press ENTER the correct note will be drawn in position on the staff and the computer will return to character select mode.

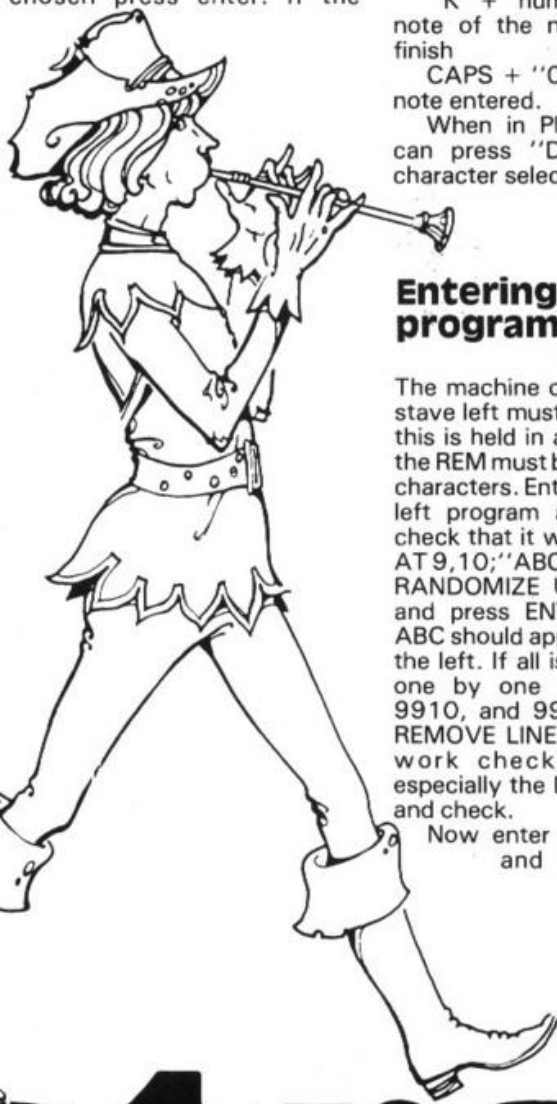

While in the character select mode you also have the following options:

"P" Play tune from start to finish.

"K + number" List from note of the number given to finish

CAPS + "O" Delete the last note entered.

When in PITCH select you can press "D" to return to character select mode.

Entering the program

The machine code to scroll the staff left must be entered first, this is held in a line 1 REM and the REM must be followed by 32 characters. Enter the short scroll left program and RUN it. To check that it works type PRINT AT 9,10;"ABC";FOR i=1 to 9:RANDOMIZE USR sc: NEXT i and press ENTER, the letters ABC should appear and move to the left. If all is OK then delete one by one lines 2, 9900, 9910, and 9920 — DO NOT REMOVE LINE 1! If it doesn't work check the program especially the DATA and re-run and check.

Now enter the main listing and let loose your musical talent.

Minstrel

Program notes

1	USR machine code routine to scroll the centre of the screen (lines 8u-15) left
2-160	Initialise variables, set Caps Lock on.
300-370	Character input loop
400-490	Pitch select input loop
500-550	Draw note, scroll screen left
1000-1230	Input sharps, flat and time sig.
1500-1509	Draw start of stave & treble clef
1510-1541	Draw lines of stave
2010-2500	Compile tune into beeps and pauses
2500-2530	Play tune
3000-3099	Coordinates for drawing rests, notes, bar lines etc.
4000-4060	Draw Rest, scroll left
8500-9000	Coordinates listing of tune
9000-9560	Draw note/rest subroutines

Variables

Tim	— No. of whole notes in a bar
BA	— No. of whole notes currently in the bar
T(4,100)	— Contains tune data as follows:
T(1,100)	— Note or rest type and
T(2,100)	— Pitch of note — both as entered by the operator
T(3,100)	— Actual note or rest length and
T(4,100)	— Actual pitch of note — both as compiled
N(1,19)	— Data to convert number to beep statement
S\$(100)	— Control characters — Sharps, flats and barlines
R	— Rest binary variable
S	— Sharp binary variable
F	— Flat binary variable
L	— Points to current character
C	— Cursor variable
FN1	— Converts INKEY\$ to var. C
FNB	— Converts note type to duration of beep
FNF	— Converts T(2,L) to screen coordinate

Across the Pond

Mark Fendrick is a respected American TS fanatic who will be keeping us informed of the latest USA developments.

Welcome to the first of my reports from the United States. As you may know, Sinclair research was distributed here under the Timex/Sinclair name. Unfortunately, in February 1984, Timex left the home computer market, leaving thousands of us high and dry, without support. Following Timex's pullout, the major source of information for Sinclair computerists in the USA, Sync magazine, ceased publication.

An American history of Sinclair computers is in order here.

The original Sinclair entry is familiar to you, the ZX-80. Sold only by mail-order through Sinclair Research Ltd., U.S.A., it did not make a big splash, but was truly a wonder for those who were handy with a soldering iron.

The introduction of the ZX-81 followed in 1982, and it was here that I became aware of Sinclair. For \$99.95, you could have a fully assembled computer! If you were the do-it-yourself type, you could get the kit for \$79.95. Playing on the safe side, I ordered the assembled version in July of 1982. From that point I was hooked.

In the fall, Sinclair announced that Timex, who had been manufacturing the ZX-81, had been licenced to distribute it in North America under the name Timex/Sinclair 1000. It was identical to its European counterpart in all ways but one. For the same \$99.95 list price, it would contain 2K RAM.

All Sinclair compatible software and peripherals would work with the T/S 1000. However, the ZX printer which Sinclair had developed could not pass the requirements of the Federal Communications Commission (it put off radio signals which caused radio and TV interference), so Timex contracted Alphacom to produce a printer which would be small, compatible, and the same price as the announced ZX printer. The result was a slightly larger, separately powered unit — the T/S 2040 printer. Most important however, is the fact that it prints black on white thermal paper, as opposed to the silver paper used on the ZX printer. Also, the T/S 2040 is much

faster, and quieter. (No longer do I have to hide in the other room if I need a print-out.) You can also get paper that produces blue writing, but that is harder to read, and does not reproduce well.

Inadequate Promotion

Unfortunately, Timex, so good at mass marketing its watches, went into hibernation, and the product fell victim to Timex's failure to promote it properly. While Commodore was touting its new C64, Timex placed very few printed advertisements and only two T.V. commercials. Nowhere was expandability mentioned, even though a number of 64K add-ons were available, as well as Timex's own T/S 1016 16K unit. Even Timex's T.V. spot said that you should get a Timex before you spend a great deal of money on a "real" computer!

About this time Sinclair in the U.K. announced the ZX-Spectrum. We could hardly wait for Timex to come out with the T/S 2000. It was finally shown, looking identical to your now familiar Spectrum. Timex decided, however, to improve upon the Spectrum, and delayed the format introduction. Now scheduled to be the T/S 2016 (16K), and T/S 2048 (48K), they had been updated, and redesigned. The case was now a silver rectangle with a hinged compartment, housing a slot in which to insert the solid state software (Command Cartridges) to be developed. The "chicklet" type of keyboard found on the Spectrum was replaced by the soft-touch, full-size keyboard similar to that of the Brother EP-20 personal printer. Yet, the introduction was further delayed as more improvements were made. Features such as four display modes, ON ERR statements, SOUND (in addition to BEEP) commands to utilize the four channel synthesizer, joystick capacity, bank switching, and an improved LOADING system were added. Now the newly dubbed T/S 2068 had a 16K ROM (differing somewhat from

the Spectrum's) an additional 8K (bank switched automatically) to handle the cassette interface, as well as 48K RAM. (The 16K RAM version had been scrapped). The suggested retail price for this was \$199.95.

Other Improvements

Also at the same time, Timex was updating the T/S 1000 into what became the T/S 1500. The 2K RAM was replaced with 16K built in. The membrane keyboard was replaced by the keyboard now found on the Spectrum. All this for \$79.95.

After lengthy delays, October 1984 saw these computers become available — barely. Although I live in New York City, I had to travel to Boston to attend the first, and only Timex show sponsored by the Boston Computer Society, to get my computer. At that time both Maggy Bruzelius, of Sinclair, USA, and Dan Ross, Vice President of Timex Computer Corporation, stated that Timex was to take an aggressive stance, and fully support consumers and third party suppliers. Also shown but not yet available, were the Timex modem, program recorder, joysticks, a Spectrum emulator, and the long anticipated micro-drive. A full size, letter quality printer was also in the works. However, the support was no better for the T/S 2068, or the T/S 1500, than it was for the 1000, so as the reviews were appearing in the U.S. computer magazines (all agreed that this was a superior computer), Timex was announcing its exit from the computer market.

Now all the peripherals that we looked forward to were not going to be marketed — at least not by Timex. Sinclair said that it had no intention of marketing any of the Timex line, although they were getting ready to introduce the QL here. The support you in the rest of the world get from Sinclair, we never received from Timex. However, in the months following the pull-out, many of the peripherals announced by Timex, have indeed become available.

T/S 2068 / Spectrum Compatibility

Much of the Spectrum software may be compatible with the T/S 2068, but there are a few problems. Due to the reorganization of the ROM, machine code software will rarely, if ever, work on the T/S 2068. All basic programs written for the Spectrum will work on the T/S 2068, but there are occasional problems LOADING them from Spectrum tapes. ZX-81 software is, however, compatible with both the T/S 1000, and T/S 1500. I will be investigating software, and will report to the U.S. owners on what is immediately compatible, so here is a chance for you U.K. suppliers to get a foothold into the U.S. If you could forward me a copy of your catalogue, indicating which programs are in BASIC, (along with instructions on how to order from North America), I will compile a list of products. (If you desire to send a test/review copy, I can report on those that I know for a fact work).

I have been informed that both Scrabble and Horace and the Spiders have been tested by Timex, and are known to be compatible. Horace and the Spiders is available in the U.S., but Scrabble is not. When I tried to order from Sinclair in the U.K. I was told that it could not be sent due to distribution agreements with Timex, and I should contact Timex for availability. Come now, Timex negated those agreements, and is importing no software. Please reconsider your position, and allow North American Sinclair owners to order those titles which are known to work on the TS/2068.

Right now ZX Computing is the best resource all Sinclair and Timex owners have, and I thank Ray Elder for thinking of us. I look forward to hearing from you from both sides of the Atlantic. Write to me at: Post Office Box 2392, Secaucus, NJ 07094-0992 U.S.A.

For those of you who are connected to THE SOURCE, my ID # is BCA632.

Mark Fendrick

Artificial Intelligence: ZX Spectrum Robin Jones & Mike Fairhurst £5.95

Heard about artificial intelligence but don't really know what it's all about? Well, now you can learn the basic theories and techniques and implement them on your Spectrum. With this book you can teach your micro to recognize patterns, generate conversational process images and represent knowledge. It's all scaled down of course, so all you need to know is BASIC, and off you go.

Other Titles

Easy Programming for the ZX Spectrum
Ian Stewart & Robin Jones £5.95
'I rate this book highly' - Educational Computing.
Games to Play on Your Spectrum Martin Wren-Hilton £1.95 A collection of games and utilities to amuse or amaze you.

Further Programming for the ZX Spectrum Ian Stewart & Robin Jones £5.95
'Again written with clarity and style' - Educational Computing.
Computer Puzzles for Spectrum & ZX81 Robin Jones £2.50 'What a gem of a book' - Education Equipment.

£5.95

Spectrum Machine Code
Ian Stewart & Robin Jones £5.95
'An excellent grounding in machine and assembly language' - Sinclair User.

DUCKWORTH HOME COMPUTING

THE ADVENTURER'S COMPANION Mike and Peter Gerrard

How do I survive the pale bulbous eyes? How do I get past the troll? Where is the Pirate's Chest? How do I escape the Goblin's Dungeon?

In response to these and hundreds of other questions sent in to magazines by frustrated adventurers, here is a complete guide to playing four of the most popular adventures on home micros today: *The Hobbit*, *Colossal Cave Adventure*, *Adventureland* and *Pirate Adventure*. The book provides a solution to every problem you will meet, and is designed to enable you to look up the answer without giving away anything of the rest of the adventure. It also includes complete maps for all four adventures. £3.95

THE ADVENTURER'S NOTEBOOK Mike Gerrard

This book is for both beginners and regular adventure players. It explains what an adventure game is, gives a history of adventure games, includes hints on how to play games more successfully and a list of recommended adventures. The main part of the book consists of a series of maps with space for your notes on verbs, nouns, locations, how to pass obstacles - everything the keen adventurer needs in order to keep all those scribbled sheets and notes together in one book. £3.95

Mike and Peter Gerrard are regular contributors to *Which Micro?* and *Personal Computer News*. Peter Gerrard is the author of many titles in the Duckworth Home Computing list, including the *Exploring Adventures* series, and contributes to *Popular Computing Weekly*, *Commodore Horizons* and *Micro Adventurer*.

DUCKWORTH

The Old Piano Factory, 43 Gloucester Crescent, London NW1 7DY
Tel: 01-485 3484

AVALON SOFTWARE LTD present, for 48K Spectrum

BOSSMAN A popular business/factory simulation game where you make all the decisions regarding production, employing and firing staff etc. The object of the game is to become a millionaire (and run off to a tax haven to enjoy your loot). The odds ARE stacked against you. You have to face union disputes, fire, flood, robberies, violent storms, power failures, machine breakdowns, rising bills etc. (And etc.) Five major disasters, and sorry, you end up a quivering wreck in Leafy Glade Retirement Home (or the Bankruptcy Court) £5.95

PIT-STOP Gives you the chance of becoming an expert racing driver, picking up dropped tools off the tracks to take back to the pits. But, two computer cars going in the opposite direction are homed in on you to foil your chances of winning. Another name for this game is frustration - a fast action game needing quick reflexes and even quicker fingers £4.95

OMADAN ATTACK Easily played by young children and equally enjoyed by older children (whoops, adults!). Planet Mardon needs defending from the maurauding Omadans. To destroy them you need to break down their force field with your lasers until you can bring out your final defence: Your Astro Cannon. Then, take aim, and annihilate the Omadan ship in one bang-on hit. Don't forget, the Omadans have a horrid habit of fighting back £4.95

For very young children Avalon introduces **AVALON'S STORY TIME**. An animated story about Zeena and Zebra who lost her stripes, together with education games and story colouring book £7.35

All games have hi-resolution graphics and full sound effects.

Readers' Reviews

Opinions from the people who play the games
and use the programs the most
— yourselves.

Defenda 48K Spectrum Interstella Software Mark Tynan

Here's a game for all you arcade game players that suffer from 10p-Nitus (lack of ten pence pieces for your favourite machines!). The game is of course — you guessed it — a take off of "Defender", and a pretty good take off at that. The game features most of the features of the arcade original, including humanoids to be rescued from the grip of the alien Landers, mutants, baiters and other little oddities to ensure sleepless nights. There is even a radar at the top of the screen (as in the original), showing how many little nasties are left to be dealt with as dots.

The action and screen scrolling is fast and smooth, enough to prove a real challenge. The graphics are good, very good in fact. When you rescue a falling humanoid, you see a small "500" whizzing past your ship showing the amount of bonus points you received. Very impressive! There is even **reverse!** All in all the game is quite like the "Real Thing", except for the fact that you can use interface II and Kempston joystick interfaces with the Spectrum version (something you can definitely not do with the arcade version!).

Another little advantage of the Spectrum version is the game produces special codes to verify your high-scores. Hyperspace is no-problem except for the fact that when you use the hyperspace button, you sometimes get materialised on to an alien, which results in an instant ship loss.

The instructions on the inlay card are quite good. There are graphic representations of what the aliens look like in the screen, with the scores for shooting the alien alongside. The only problem is the inlay card instructions assume you know how to play the game Defender already.

My only gripe about this game is that there is no sound during the course of the game, not even the low growl of the

engines, or even when you shoot an alien nastie. In fact, the only sound being when a lander takes a humanoid, there is a low series of clicks, and when you go into hyperspace or get killed, there is a sound like something you could make using a FOR-NEXT loop, with a BEEP statement in the middle.

Verdict:

- Graphics — 75%
- Instructions — 65%
- Playability — 85%
- Use of Machine — 65%
- Value for Money — 80%

The Train Game Microsphere £5.95 John Bourne

Last Christmas the Computer was the in thing for dads to buy their children so they could use it as an excuse to get something they wanted for themselves. Twenty years ago Fathers bought train sets for their sons for the same reason. Now, courtesy of Microsphere you can have the best of both worlds. No longer need one sit with ones legs around the neck as a miniature train weaves its way through make believe tunnels under the lounge chair. Your entire layout appears on the TV screen and, indeed, is far more ambitious than the average model railway enthusiast could afford. This excellent simulation gives one the possible choice of two distinctly different layouts. There are 25 switchable points on track A and 19 on track B. Each layout boasts 3 stations and many other novel additions appear as the game progresses.

There are seven levels, so the instructions inform us, but I have yet to reach them all by progression although one can designate which level at the start of the game. The first six levels have five sub-levels and level 7 offers nine sub-levels.

Now if you think the running of a railway is simple then forget it, for it takes considerable skill and practice even to control the running of a single train. One has to avoid wrongly set points and de-railments due to changing points with the train on them. The disasters are graphically

represented on the screen.

There is also the problem of passengers. You have to pick up 25 passengers before progressing to the next sub-level and each passenger scores points providing they are picked up in time. If, However, you keep them waiting they will turn white with anger and score nothing when picked up. Indeed, if there are angry passengers there when the train arrives then only they are allowed on board and all the others must wait. They may well be white with anger by the time you get to that station again. There is another problem that could well arris. You may allow the station to fill up and then you will find yourself in further trouble.

You are allowed three disasters before the railway looks for another General Manager. A high score column keeps a record of your efforts.

You can stop the whole system while you reflect on what to do next but beware, while nothing is happening your score will begin to decrease. Then there is the odd goods train or express that appears on the system and the only way to get rid of these is to send them from whence they came. Care is needed here for if you inadvertently direct one of your suburban trains along that line it will disappear for ever.

Every so often a turntable bonus appears but whether you consider this is a bonus is a matter for conjecture.

Realistic train noises accompany the screen image but I found them too repetitive to be enjoyable. Fortunately there is a facility for switching them off.

There are many other problems and eventualities built into the program and these are fully explained in the adequate instructions printed on the cassette inset.

All in all, this is an excellent example of what can be done on even the 16K Spectrum and the program is very addictive. It would be interesting to hear of high scores achieved by others.

There are, of course, drawbacks in even the best programs. The letters that designate the points are difficult to see and it would have been very much better if a simple introductory track had been included, with say eight points, to enable the user to get in some practice. I have made copies of both the tracks on a piece of card and lettered the points clearly. This card is left near the computer for reference.

I would thoroughly recommend this game to all Spectrum owners and suggest that at £5.95 it is very good value for money.

Fighter Pilot Digital Integration & Flight Simulation Psion Mark Stoneham & David Wright

Of the many uses the Spectrum can be put to, flight simulators seem to have the most lasting appeal and probably utilise its

considerable facilities for memory, colour and graphics more than any other type of commercial software. Two of the best currently available have been produced by two very different software houses: Psion and Digital Integration. The former has many good quality games to its credit whereas the latter has only appeared on the Spectrum scene recently.

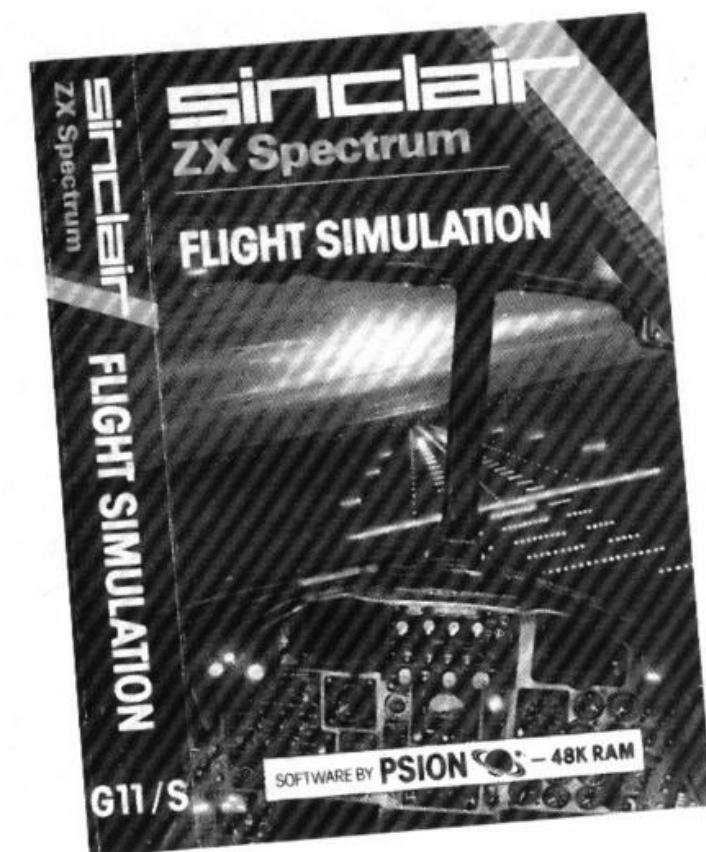

Seen on the shelf Psion's Flight Simulator has a considerable and unmistakable head start on Integrations Fighter Pilot as its cover design is a much more eye-catching and tempting piece of printing. The next aspect of the products which is always taken into account is the price; in this case they are both a reasonable £7.95 which should not deter the would-be flying ace.

Documentation is both thorough and precise for the two packages although Fighter Pilot's is slightly superior in that it contains pilot's notes and technical data as well as the usual instructions. The notes give advice on your approach, flaps and undercarriage and informs you of your take-off and stall speed. The aircraft's performance and specifications are dealt with in the Technical Data.

Flight Simulation does not have provision for a joystick although it is possible to use the Kempston device with the aid of a conversion tape. On the other hand, Fighter Pilot can incorporate one of three: Kempston, AGF and Sinclair Interface 2 (as well as the keyboard).

Both programs load in just under four minutes and result in a list of options. In Flight Simulation there are three: In-flight final approach and take off. Having made your choice, you are asked whether you require wind effects or not (the novice should decline as it makes the game considerably harder). Fighter Pilot boasts a more extensive menu containing five options: landing practice, flying training, air-to-air combat practice, air-to-air combat and blind landing. As well as this, you have the choice of cross winds and turbulence, your pilot rating and controls.

The Fighter Pilot instruments, from left to right, are as follows: radar and compass which includes your compass bearing and distance in relation to either one of eight beacons or an enemy bomber, depending on whether or not you are in combat mode. Next comes a digital speedometer beneath which sits the flap extension indicator. In the middle of the panel is the artificial horizon

which shows the roll and pitch angle of your aircraft with respect to the ground. Below this is a linear thrust scale followed by digital altitude and vertical speed indicators. Adjacent to these is the Instrument Landing System (ILS) which doubles as a flight computer. On the far right of your console is the fuel gauge, below which is the undercarriage status indicator (i.e. up or down). Finally comes the ammunition indicator and "kills" so far.

The Flight Simulation instrument panel is somewhat similar but consists almost entirely of dials, which can be confusing when the hands rotate more than once. The controls are from left to right: an ILS below which is a radio altimeter which displays your altitude digitally when it is less than 1,000 ft. Beneath this is an undercarriage status indicator adjacent to which is a flaps indicator. Above this is the airspeed indicator which displays your speed in knots. Next comes the RDF clock. This is the principal instrument in your panel and shows your current bearing and your position in relation to your present beacon. Below this there are three digital locks showing your present beacon, your distance from that beacon and its bearing in relation to your aircraft. The altimeter comes next and this is a dial with two hands; the longer giving the height in

hundreds of feet and the shorter in thousands. Finally there are the fuel and power indicators.

The maps in both programs are very impressive although the Fighter Pilot one is bigger in order to accommodate the much more powerful aircraft. Both maps are wraparound affairs which can be very confusing when crossing from one side to another. The Flight Simulation map covers 12,288 sq. miles and has two runways: club and main. It has seven beacons, one range of hills (1,000 ft high) and three lakes: Orb, Long and Tri. The Fighter Pilot map covers 20,000 sq miles, has two ranges of hills (3,500 & 2,000 ft high), eight beacons and four runways: Delta, Base, Zulu and Tango. Unfortunately, when one displays the map in Flight Simulation, one loses the instrument panel thus making prolonged periods of air borne navigation impossible.

There is no sound in Fighter Pilot and hardly any in Flight Simulation (only when you crash) although I am sure most users would rather sacrifice audial effects for the excellent graphics in both programs.

The object of Fighter Pilot (that is when air-to-air combat has been selected) is to defend the four airfields from destruction by simultaneous enemy bombers which, although of an inferior performance, are capable of devastating effects on both the airfields and your

plane. The only aim we could see in Flight Simulation was to educate the user in the art of flying (which it does admirably). However, we would advise the would-be pilot to consult a flying manual if he is seriously considering flying!

Although we have not dealt with Flight Simulation and Fighter Pilot to their full extent we have tried to cover most of the important points. On the whole Fighter gives more satisfaction, even though its landscape graphics are inferior. Its controls seem more responsive and we would like to conclude in saying that although both programs are good, Fighter Pilot is more exciting and thus slightly better than its counterpart.

Wheelie Microsphere David Wright Price: £5.95

As the well-printed documentation will tell you "in the 48K game 'Wheelie' you have just taken delivery of the fastest thing on two wheels"; namely the Zedexaki 500. During a quick spin on the road you happen to see a sign saying 'PRIVATE ROAD - no speed limit to brave riders.' Being the hero you undoubtedly are, you enter the sinister driveway only to discover that the gates have shut behind you and that you are imprisoned in a labyrinth of horrifying alleys infested with hedgehogs, kangaroos and terrifying birds (all trained in karate of course). As well as the undesirable fauna there are other dangers in store, such as spectacular jumps (over buses or cars) and bricks which you must 'wheelie' over; not to mention perilous slopes, patches of dangerous ice and unexpected dead-ends. There are only a few petrol stations so you have to watch the revs' a bit while you speed about.

On the screen there is a cross-sectional view of four roads at the most, and these are connected by steep slopes which can be used by pressing the 'up' or 'down' key, according to whether you wish to travel uphill or downhill. To attain the next level you must first find the 'ghost rider', who will be a few miles of your original starting point, and then race him back to the start. If you succeed in beating him he will tell you a code which allows you to jump to the next level, of which there are five. Although the game is

hard, it provides an excellent challenge to the budding Hell's Angel!

The graphics are fantastic especially if you crash. For example, if you go too fast down a slope the bike will cartwheel and crush you under its fuel-injected engine; and if you go too slowly over a car-jump you will be thrown over the handlebars. At the beginning I found myself crashing on purpose just to see the amazing effects! As well as this there is a good use of colour and a constant engine revving sounds which is very authentic, and adds to the brilliance of this game from Microsphere.

Kempston, Protek or AGF joysticks can be used and if you possess none of these, there is a routine for defining your own keys which is very helpful indeed.

On the whole 'Wheelie' has all the properties of a bestseller and is great value for money. It combines excellent graphics with stunning sound to create one of the best and most addictive games I have ever seen for the Spectrum.

the information that the course is 6444 yards and your set of clubs consists of 4 woods, 8 irons, a pitchwedge, a sandwedge and a putter.

Next is seen the course of 18 holes, their par and the distance of each hole. The overall par for the course is 70. The clubs are then shown and the expected distance for each one. There is a wind factor (or slope of green when you get there). This affects the distance and accuracy of your shot. It is displayed by a number between 0 and 9 for the strength of wind and an arrow showing the direction of the wind.

The capacity of the game is for one or two players. You are asked if you want a preview of the course or to start the game. If you ask for a preview the computer will take you through all the holes and their different views. This is not worth seeing as you can see a preview of each hole as you come to it.

When starting a hole, the view is displayed, the amount of

indicator up or down taking into account the wind factor. The animated golfer hits the ball, hands the club to the caddie and walks to the ball during which the process of club choosing is repeated until you reach the green.

On the green, a close up is observed and your ball is seen along with the hole. A direction indicator runs round the screen and you have to stop it in line with the hole and your ball. The power is then asked and you move the indicator as high or low as you wish depending on the distance to the hole. This repeats until the ball has been holed. You are then told your score for that hole. You then go to the next hole and repeat the process. At the end of the round the player runs into the clubhouse for a drink but the poor caddie has to go back home! You can then see your card for the course and you are asked if you wish to play again.

This is very good game and the graphics are exceedingly good. The main rules of golf are followed and at £5.95 it is well worth the money. I highly recommend it.

Starfire Virgin Games Nigel Stutt Price: £5.50

I must admit that I would not have gone all out to find and pay £5.50 on it, its front cover not being too eye-catching. But when I received Starfire as a present, I was pleasantly surprised. Its clear, extensive instructions and excellent colour photograph of one of the screen dumps in the game, do a great deal for the user. There is even a condensed list of all control keys used for easy access when playing the game (and I must say, you certainly need it for at least your first ten games). There is also information on the author of the game which is a very good idea as it gives an indication of how long the program took to write, etc.

Once the program has spent four minutes loading (my copy loaded every time) your name is entered and the skill level chosen, of which there are 10. Number one (ZX80 Brain) is supposed to be easy, but I haven't found it easy to complete yet, and level ten is the hardest (impossible is a better word). I am just about up to level two (ZX81 Brain) and I have had the game for two months now!

After this interaction, a data sheet appears, informing the

Starship Captain (you) for the number of aliens to kill, starbases to refuel at, and time available to do all of this in.

Eventually, the game starts and the controls provided can be called up from the shipboard computer. Briefly these are:-

- Abort — abort attempt at alien or starbase
- Battlestations — to attack the aliens using keys B,H,F,T and 4 to fire
- Computer Call — calls up a list of controls for the forgetful, damage to ship, or energy distribution
- Dock — to dock with starbase (if you're lucky) for refuelling and repair
- Long Range Scan — to see which are the lucky aliens to be blasted this time or to locate starbases
- Navigate — to move from one subsector to another
- Galactic War Report — shows how many aliens, starbases and stardates (time) remain
- Smart Bombs — the ultimate in weapons, destroys all aliens and starbases in adjacent sectors and usually yourself if you haven't enough power left

The graphics when used are relatively slow with a slow reaction time on the keyboard but this, however, does not make the game any worse as the alien stops moving and firing when the button is pressed. This makes the game easier on level one while still being difficult on level ten as the alien is moving so often that it is usually impossible to get him (it) into your sights.

The game is mostly in 3D but there are a few screens when two dimensional graphics are used. These are when the ship needs to navigate an asteroid field, time portal or dock with a starbase. In these, the ship is seen in 2D as the precision and skill needed would be lost in a third dimension.

The whole program is written in BASIC and is easily listed. The REM statements make the listing easy to understand and I have seen a couple of areas that I have not come across in the game yet, such as a black hole and a self destruct mode. The game runs for over an hour and one disappointment at the end is that no score is employed thus, skill needs to be determined by the amount of aliens destroyed, my total being twenty-one.

In a summary, then, I found the game exciting, strategic and enjoyable though it could be vastly improved with better graphics.

Starfire runs on the 48K Spectrum.

Handicap Golf Computer Rentals Ltd Owen Brooker Price: £5.95

The title is misleading as no handicap is used in this game. The inlay card gives a brief description of the game but the instructions on the program are sufficient in order to play it. The program takes about 5½ minutes to load and you are greeted with

yards in the hole, the score taken so far to this hole and the par for the hole. The graphics are good and well laid out showing trees, bunkers and water hazards. Also, if you go off the edge of the screen at either side you are told that you are out of bounds and must take the shot again.

Before each shot you are asked which club you wish to use. This is a simple matter of moving an arrow to the desired club and pressing 'ENTER'. After this, the view is displayed again and you are asked to move the direction

campbell systems

The 80 in 84

Mike Hyams is one of many who still use the ZX80 and here he presents some valuable tips to all it's fans.

Hi there. My name is Zeddy. (What do you mean you've never heard of me? I bet you've never heard of Tim Hartnell either.) Anyway, there I was, waiting for a number 84 databus to come along when all of a sudden this geezer shoves a ZX-printer into my I/O port. Well, I know I've only got a 4K ROM, and there ain't no way that I'm going to get that printer running, when all of a sudden.....

I think it would be wise to stick a "But seriously folks" in at this point. Because this article isn't just about interfacing ZX-printers with ZX-80's. It's about the wealth of hardware available, or nearly available, for the 4K ROM ZX-80.

In most peoples eyes the ZX-80 died when the '81 was announced in 1981. At that point there were about 50,000 '80's in Britain alone. Add to that the 65,000 in the USA and the rest of the world and you have a force to be reckoned with. Except, of course, not many people bothered. The ZX-81 and the Spectrum each had an "essential" hardware extra announced at launch. These were the printer and, after a while, the microdrive. The hardware add-ons offered by the independent companies have reflected the quality of Sinclair's own. For example speech, sound, joysticks, and son on. The ZX-80, however, only had a 16K RAM pack as its' extra. Revolutionary as it was then, it hardly compensates the '80 owner of today, who sees so much zap-pow-boom going on around him/her, that a dash to the nearest computer retailer is imminent; if it hasn't happened already.

But do not despair; for help, and hardware, is at hand. I will now make a bold and sweeping statement. At least 50% of ZX-81 hardware will work on a ZX-80. There, I said it. And it didn't even hurt. I'm going to get a bit technical for a couple of paragraphs, so those of you who shudder at the sight of strange words with lines over them can go and amuse

themselves with figure 1. By the time you've finished playing with that, us hardware buffs should be finished.

Now then. The words I just referred to above are ROM CS and RAM CS. These are very important to all Z80 based computers, (and more than likely all other computers, but that

All except for track 23B, which is on the extreme right underside of the port, looking at it from the front. On the '80 this track is not connected; on the 81 it is the RCM CS line. So what? Well, as you will see, it has an effect on what hardware can be used.

Having established the differences between the two com-

locations and the other is by using Input/Output ports. An I/O port is a sort of lateral-thinking version of the memory. If I were to compare a computer to a human being (and who doesn't these days) the computers memory would be like the brain, whereas the I/O would be things like hands, eyes and mouth. As its name suggests, the I/O port is the computers link with the outside world. On the Z80 chip there are 256 of these ports, but some are unavailable for use on the '80. They are used for the keyboard, cassette, and TV, but, fortunately for us, the same ports are used on the '81. Fortunately because this means that any hardware designed for the I/O port on the 81 should work on the '80.

"Aha", I hear you cry. And those of you still playing with figure one should come back for Revelation number two. The ZX printer is purely I/O driven. The port it uses, FBh, is well documented in the manual supplied with it. So we turn to figure two. This is a relocatable machine code routine for using the 4K ROM ZX-80 and the ZX printer together, using the equivalent of the COPY command.

As a brief aside, while some of you are rushing out to buy ZX printers, you might consider 16K of RAM. When extra RAM first appeared for the '80 the cost was over £60 for just 3K. 16K packs can now be bought for less than £20. I know that they are made for the 81, but I think you'll find that they work on the '80 as well. I use Sinclairs' '81 rampack and it works perfectly.

To get back to the printer listing; you will notice that the machine code part is in hex. This is more convenient than decimal when a large amount of data is being entered. The second byte of the code, which is the third and fourth characters in string A\$, tells the computer how many lines to copy. For a normal screen copy this is set to 23, or 17 in hex. If you would rather use the routine as an LPRINT command, this number can be

```

doesn't concern us). First of all, let us consider the port at the back where you would plug in a RAM pack. If you compare the circuit diagrams of the '80 and the '81, you will find that all but one of the tracks on the port match. Address line one is in the same place on both machines; so is the 0 volts line; and so on.

puters we can now move on to Technical Bit number two. (Those of you who are getting a bit bored with all this talk of ports and tracks, try ordering a QL and find out what REAL boredom is all about.) There are two methods of making your Sinclair talk to a hardware add on. One is by using memory

reduced. For example to dump just one line to the printer, change the second byte to a 1. This is done by either changing th "17" to "01", or by poking the relevant memory location with a 1: i.e. if the code is stored from 32,000 onwards then poke 32001 with a 1. This will then COPY the first line on the screen to the printer. To activate the routine just use a USR function. The way figure two is set at the moment, RANDOMISE USR (30000) will produce a screen copy. If you put the code lower down the memory to say, 18000, then a call to that address will activate it.

thesizers, but unfortunately Timedata has withdrawn them from sale, probably due to lack of demand, although the official reason is... "No reason". It might be worth giving them a call just in case they still have a few in stock, as they were fine products. Alternatively, there are others still on sale. The Chat-box from William Stuart Systems is also I/O mapped (or it was last time I looked) as is the ZONX-81 from Bi-pak. These units, speech and sound respectively are still available, and could well extend your ZX-80 beyond what you thought possible. There are others, such as

Maplins I/O port. For those of you who want to control your central heating or perhaps run Fulham Power Station, this could be what you've been looking for.

My next few notes are, I'm afraid, rather hazy. I know the technique, I have read that it works, but I just haven't got the nerve to do it. What I refer to is the ROM CS connection. For those who wish to throw caution to the wind (you fools) here is the theory.

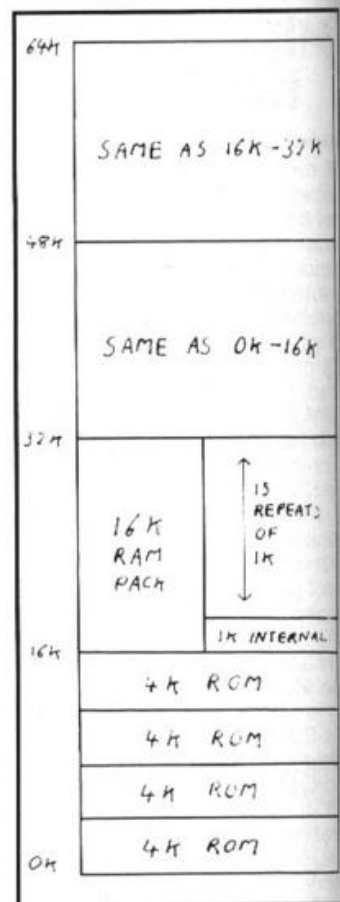

The ROM CS pin must be connected to track 23B. To do this break the track leading to pin 20 of the ROM chip, and put a 680 ohm resistor across the break. Then take a wire from this pin to track 23B on the edge connector. This track should be labelled on the circuit board. This now gives a ROM CS for all add ons. The amount of hardware that can now be used increases significantly with this change. I have not made this connection, but I would be interested to hear from anybody who has, and what they use that takes advantage of it.

If you look at figure 3 you can see how the '80 memory is arranged. It appears that there is more than one ROM, although there is obviously only one. The problem is that the '80 has been built in such a way that chunks of memory keep repeating throughout the memory map. If you want to use an add on that uses part of the memory with a ROM copy in it, then your stuck. Unless you have connected the ROM CS track. This hardware will try to turn off part of the memory, usually the 8K - 16K bank. If the connection is made, the unit should work.

One of the most interesting add ons that utilises the ROM CS line is an EPROM programmer. These are available from, amongst others, Eprom Services and Camel Products. Even if you have moved onto another computer, the possibility of using an old '80 to make your own ROMs must interest a few of you.

Other peripherals that use the ROM CS track are the range from Memotech. These unit will need some careful inspection before use, as some of them may use ROM calls in the firmware supplied. One Memotech unit that should work is the keyboard. As it uses the I/O method it should be alright, but the legends on the keys will need changing. The DK'ronics keyboard would be just as good, but the wires would need to be soldered in as there are no sockets, the keyboard being part of the circuit board.

On the memory pack side, 32K and 64K RAM packs should work with the aforementioned connection. Quite how you can poke a location greater than 32767 from BASIC I'm not sure, but I expect someone has done it.

Well that just about wraps it up. I hope I have shown you that the ZX-80 is not dead, but merely resting. If you have any problems then call the manufacturer; most are only too pleased to help, and there's usually someone near the phone who knows the technical ins and outs (no pun intended). Or write to me at the Golden Square address and I'll do my best to help.

The program in figure one, by the way, is a little routine that some friends and I nearly used to study the effects of alcohol on reaction speeds. However, we never got round to using it because we were too busy trying out alcohol supplies. Try running the program before and after 10 press-ups. You may be surprised by the results.

If I can convince Ray to give me some space in a future issue I'll go into the mathematical aspect of using your '80. With a little bit of software, and a little bit more understanding, I'll show you some repetitive floating point maths. Now where did I put my Log tables?

For machine code freaks, I can tell you that this routine can be adapted to produce hi-res graphics on the printer. I won't tell you how, but I'll give you a clue. The ZX-80 character set starts at 3584 (or 7×512) and the pointer is stored in register H, so if you can find the instruction LD H, 7 then you're halfway there. The rest is up to you (unless Ray gets lots of letters, in which case I may explain further. Never let it be said that ZX Computing doesn't make you think.).

We now know enough about the I/O port to say that ALL I/O mapped products should work on the '80. After the printer and RAM pack, the most popular extras would appear to be speech and sound. A quick flick through the pages of this mag should produce two or three adverts for these on the '81. If you are interested in purchasing one of these for your '80 then check with the manufacturer first, to see if it is I/O or memory mapped. Remember, if it is memory mapped it will probably have a connection to the ROM CS line which isn't connected, so it more than likely won't work.

Two units for the '81, ZXM and ZXS, made by Timedata, ARE I/O mapped and DO work on the '80. These are sound (music) and speech syn-

thesizers, but unfortunately Timedata has withdrawn them from sale, probably due to lack of demand, although the official reason is... "No reason". It might be worth giving them a call just in case they still have a few in stock, as they were fine products. Alternatively, there are others still on sale. The Chat-box from William Stuart Systems is also I/O mapped (or it was last time I looked) as is the ZONX-81 from Bi-pak. These units, speech and sound respectively are still available, and could well extend your ZX-80 beyond what you thought possible. There are others, such as

the Cheetah Sweet Talker, but I'm afraid I haven't had time to check what type of mapping is used. One point to bear in mind when using these I/O units is how you are actually going to program them. Because they are I/O, you have to use the instructions IN and OUT. After a series of finger stretching exercises you can get to these in Spectrum Basic, but on the '80 and '81 they are only available via machine code. Most, if not all, the above products come supplied with instructions on how to do this, but it will require some effort to implement these if you haven't used m/c before. You could always ask a friend.

While browsing through the ads, looking for things to hand on the end of an '80, I came across two items that could be placed inside the case. The first is from P.V. Tubes and appears to be a 8K ROM chip. Those of you hankering after string-slicing and real numbers (but not SLOW) might like to give them a call. The other chip is a Forth ROM from David Husbands' Skywave Software. This may or may not work on the '80 because of the lack of SLOW hardware. Again, a phone call should clear things up.

Before we leave the subject of I/O, a quick mention of

The Key to Spectrum Machine Code Success.

Picturesque's MACHINE CODE SYSTEM is used and recommended by professional software writers, yet the excellent documentation and the friendly, easy-to-use programs have been highly recommended for beginners.

You will only buy one Machine Code System, so buy the best, the one the professionals use.

NEW IMPROVED PROGRAMS — MICRODRIVE COMPATIBLE

ASSEMBLER

Completely self-contained with its own line editor, giving an easy-to-read 40 column tabulated listing. Auto line numbering, line renumbering and auto tabulation make this one of the fastest and easiest Assemblers to use. 5-character label names. Decimal, Hex or ASCII constants. SAVE/LOAD/VERIFY both the listing and Machine Code to cassette/MICRODRIVE/NETWORK. Assemble from cassette or Microdrive into memory for very large programs. Customise to most Centronics printer Interfaces, or RS232 (with Interface 1) for 80 column printout. FAST ASSEMBLY — 1k of code in 7 seconds. Assembler Directives:— ORG, END, DEFB, DEFW, DEFB, EQU, DEFL. (Microdrive and Centronics facilities only operate with 48K machines.)

£8.50

INCL. VAT & P&P.

Programs supplied on cassette with option to Save onto Microdrive (cartridge not supplied.)

Existing owners can obtain the new programs by returning the cassette only to Picturesque, along with a cheque/PO for £1.50 per program (inc. VAT & P&P). New cassettes will be supplied by return of post.

Available from the "SPECTRUM" chain of stores, branches of John Menzies and all good computer shops, or by mail order by sending cheque / PO to:
PICTURESQUE, 6 Corkscrew Hill, West Wickham, Kent, BR4 9BB. Send SAE for details.

MONITOR

The ideal tool to help the beginner get started, yet it contains all the commands for the experienced programmer to run and de-bug machine code programs. Inspect and alter memory contents in Hex or ASCII. Breakpoints and full Register display. NOW WITH SINGLE STEPPING through RAM or ROM. Disassemble any part of memory, RAM or ROM. Dec-Hex-Dec number converter. Printer output to ZX printer or via RS232 (with Interface 1) or customise to most Centronics printer Interfaces. General memory management commands include Hex dump, Insert, Delete, Fill and Move. Can reside in memory with the Assembler (48K machines only) to give a complete Machine Code programming system.

£7.50

INCL. VAT & P&P.

NEW

ZX Spectrum and QL Microdrive Storage Box

£5.95

- * HOLDS 20 CARTRIDGES
- * FULLY INTERLOCKING
- * CENTRE SECTION FOR INDEX CARDS

- * DESIGNED TO MATCH SPECTRUM AND QL

Transform Ltd has now produced a smart new Storage Box for the ZX Spectrum and QL

The Transform Microdrive Storage Box is attractively designed to match both the Spectrum and QL

It will hold 20 Microdrive cartridges (enough to store 1.6 megabytes of data!)

The Microdrive Storage Box is fully interlocking and will allow you to expand your system with all the new programmes on microdrive as well as enhance the 'smart' efficient look of your office/study.

Simply write or telephone:

Mid Cornwall ZX Club

Dear ZX Computing,
Please give our 'ZX Computer Club' a plug:

Mid Cornwall ZX Club,
CO-OP Rooms,
8, Victoria Road,
Roche,
Cornwall PL26 8JF.
Tel: 0726 890473

We meet Mondays and Friday, 7 to 9pm.

Yours sincerely,
Mike Richards.

Blackburn Computer Club

Dear ZX Computing,
I am handling the publicity for the Blackburn Computer Club, which is non-machine-specific Club.

The Club is open to everyone, regardless of age. It doesn't matter if you haven't got a computer of your own. If you are still reading this, then you must be interested at that is all the matters.

You don't need to own a particular brand of computer to join in — at present our members have machines which range through BBC, Atari, Dragon, Spectrum, ZX81 and so on. If you have a computer of any make — or are thinking of buying one — then we'd like to hear from you. We can offer the chance to meet other people with the same or similar interests. The atmosphere at our meetings is friendly and informal, with the accent on enjoyment. If you don't want to talk then there's usually the opportunity to play a game or two. Bring along our own machine to show us if you want — that's what the Club is all about. If you want anything else out of the Club then all we ask is that you tell us.

When you first come along to a meeting, we will ask you for 50p as a cover charge. If you join during the meeting then your 50p will be refunded in exchange for your subscription. At present the subscriptions are: Juniors — £3 per annum; Adults — £5 per annum; Family — £10 per annum. Once your subscription is paid then there is nothing further to pay to attend normal meetings for the next year. Membership at present stands at about 20, but this is steadily increasing.

The best way to join is to come to a meeting. These are held every other Monday night, at 7.20 pm. at The Fernhurst Hotel, Bolton Road, Ewood. At the bottom of this sheet are the dates of the next three meetings (as at the date of preparing this leaflet).

If you have any queries then please contact any of the following:

Bob Hillyard,
34 Palatine Road,
Blackburn.
or
John Schofield,
1 Sutton Street,
Feniscoules
Tel: 60033 or 28127

FLUSIB

Dear ZX Computing,
In the centre of Belgium a new and already flourishing club is born: the FLEMISH Users of Sinclair In Brussels (FLUSIB). Already about 25 members meet each other at least twice a month in order to exchange experiences, literature, programs etc. And even guests are welcome!

From October on, every first and third Thursday of each month a new series of free lessons will be given, with the view to give a solid base to all members for their own designing and developing of well structured and correctly running programs. And above all: the club is

a non-lucrative one, run in the most efficient possible way by the members itself.

Join it, and write for more details of chairman Erick van Dyck, Trefcentrum, Dapperheidsplein, 1070 Anderlecht, or phone him (after 19 h.) on (02) 76 76 22 3, or simply try it out by attending a meeting on the first or the third Thursday of the month.

Yours sincerely,

Erick Van dyck
(chairman)

P.S.: thanks for your support by publishing this letter in your ever-interesting magazine's club corner.

Canada ZX

Dear ZX Computing,
Talk about a long distance users club!

First to introduce myself, Roelof Mulder (Bob). In essence I am the Administrative officer and Editor in Chief of the Timex/Sinclair Users Group Ottawa/Hull Chapter. We hold regular monthly meetings and discuss hardware and software, swap programs, hardware projects and program development. Our group of approximately 50 members cover a range of doctors, lawyers, engineers, public servants and housewives and labourers.

Our interests encompass all aspects of hardware development from small modifications to robotics; software development from business and education to game programs and programming from the all pervasive Basic to Forth, Logo, Pascal, Cobol, and the ever mysterious machine language.

In other words, if it has anything to do with Timex/Sinclair, Sinclair computers and products, then we are most interested.

Membership in our group is entirely free and we would be pleased to include your group

name as a member of our group. In doing so, you would receive a newsletter whenever they are published, as well as have a forum where in which you may wish to submit comments/reviews/programs for sale etc.

The only thing we ask is to be members (collectively) of our group. I would appreciate your response, even heaven forbid, to the negative.

Yours sincerely,
R. Mulder.

Turkish delight!

Dear ZX Computing,
We would like to inform you that since one year we have a ZX Users Club in operation in Turkey with 740 members. We are publishing a monthly bulletin in Turkish. We are also receiving special discounts for club members from Computer shops for equipment, publications and software.

It would be appreciated very much if you would kindly publish this letter in *news and ideas* with other user groups.

Yours sincerely,
Tuncay Turkeli

Kempsey contact

Dear ZX Computing,
My name is Jason Ellem. I would like to start or join a club in Australia. If there is no club I would like people to write to me at the below address. If there is a club I would like to know about it. So please write to the same address.

Yours sincerely,
Jason Ellem,
148 North Street,
Kempsey, N.S.W. 2440
Australia.

Bookshelf

Read all about it with Patrick Cain.

An Expert Guide to the Spectrum — Mike James

If your bookshelves are already almost full of "Instructions to...", "Beginners Courses in..." and other elementary texts for better Spectrum use, then I suggest that you may well find an "Expert Guide to the Spectrum"

by Mike James a worthwhile addition to make. Of course books for Spectrum users at all levels proliferate and there is nothing new in books for more advanced reading, but maybe its because this one says what the best part of most of them do that I found it such a good read.

Mike James is the author of several very successful books on programming and many more

to come I'm sure. Why am I being quite so generous with the praise? My temperature feels all right. I don't think I need a holiday I must confess I would be getting worried if it wasn't for the blatant fact that Mr. James is a very good writer and deserves any praise — at least for this book, let's not get carried away — that I might lavish.

He doesn't mess around prat-

ling on about this, that and the other before finally making a stab at the topic in question. I get the feeling that he now knows his subject so well that he didn't need to use any notes. His familiarity with the subject shows. As a result the text doesn't labour; moving quickly from point to point while at the same time being aware of the reader and possible areas of difficulty. The text is concise; but accurate and clear and a stimulating read.

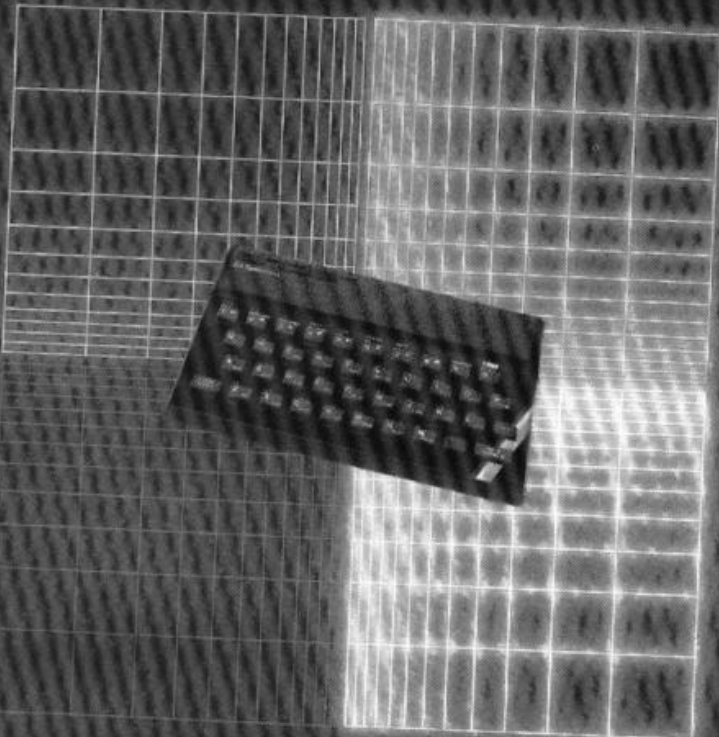

1.8 million Spectrum users can't be wrong (figures approx. correct at time of writing i.e. 6.45pm), the Spectrum is a remarkable machine and as such enables programmers to do remarkable things with it. Logically an investigation of these remarkable features will enable programmers to put them to good use. The reader is required to have no more than a working knowledge of basic to undertake this investigation.

Chapter one, an overview of computer hardware in general, examines busses, addresses, data and bit patterns and effectively establishes the fundamental relationship that exists between them — Ah! so that's why the highest address is 65535. Chapter two is more specific to the Spectrum, the intention being that a knowledge of the hardware will influence the readers approach to software, and to this end the memory, the video display, input and output devices and the U.L.A. are discussed. Much of the material of the first two chapters is used and developed further in later chapters dealing with more specific topics.

As important as the hardware, the software: the ZX Basic is looked at in chapters 3, 4, and 5. In all there are twelve chapters covering the above, the video display, video applications, tape, sound and printer, interface and microdrives, communications and advanced programming applications.

Readers may well have to turn back a few pages sometimes, indeed the author recommends that the reader should read from front to back

AN EXPERT GUIDE TO THE SPECTRUM

MIKE JAMES

and then from back to front. That can only be because of the complexity of the subject and not its treatment on the pages. And even if subsequent readings and necessary then that should require little effort for this is one of the most valuable books I have read this year.

"An Expert Guide to the Spectrum" is written by Mike James, published by Granada and costs £6.95.

ISBN 0-246-12278-1.

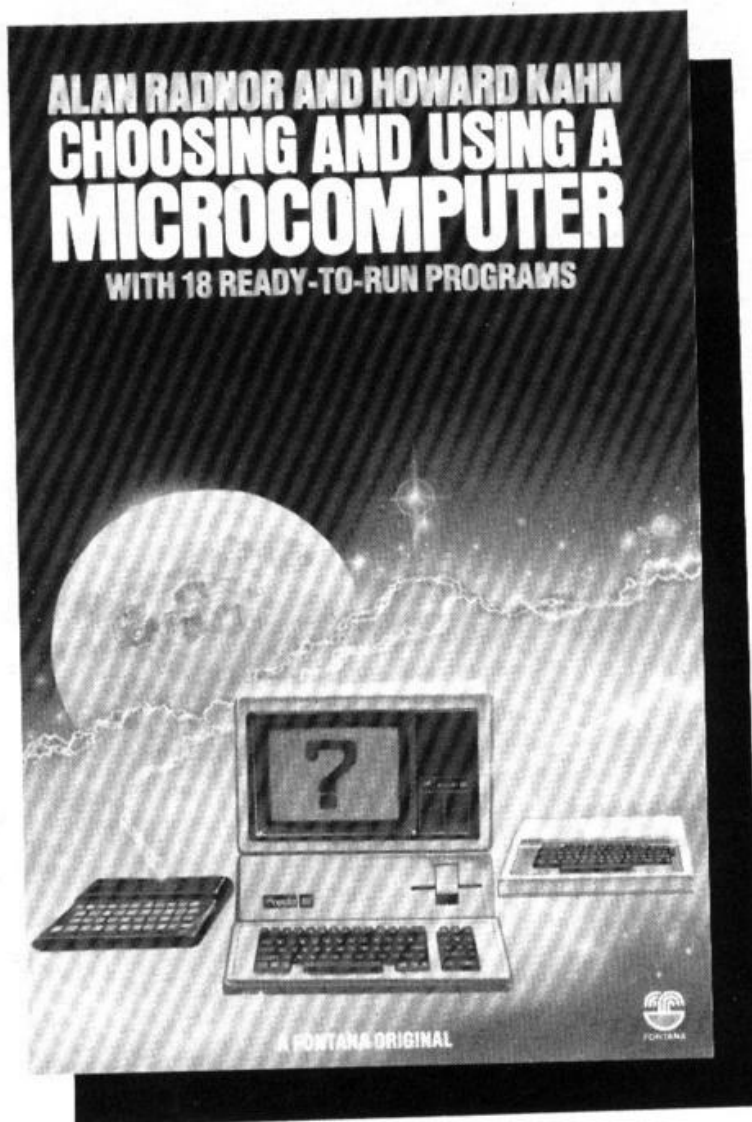

Choosing and Using a Micro Computer — Alan Radnor, Howard Kahn

"Choosing and Using a Micro Computer" and not only that but also 18 original programs. Original programs like "Radius", "Patterns", "Compound Interest" and all for £2.50. No I didn't think it was likely either; but what the heck it was a raining Saturday afternoon the type that made you wish it was Monday morning; Oh! and I had a cold as well and apart from darning some socks there was little else to do so I took a browse through the 140 page Fontana Paperback.

The credits were certainly impressive; Alan Radnor is a journalist and producer of TV computer programmes, Howard Kahn lectures in computing at Manchester Polytechnic. The intentions are valid — "written for everyone who is thinking of buying a computer for the first time and wants to know what it can do, which one to choose, the rudiments of how it works, now to set it up and how much it will all cost" and 18 original programs as well.

Special features includes: a questionnaire which tells you at a glance which micro is best suited to your needs, a sample text program to use in the shop, a micro comparison chart showing the capabilities of each make, an explanation of computer jargon and 18 original programs.

There is, I am convinced a need for such a book. Difficult as it is to believe there are still people around who are looking for some basic, commonsense advice on computing and computer buying. The cover notes suggest that "choosing and Using a Micro Computer" might be

it. Even on a rainy Saturday, cold and all I was not convinced that the text matched those intentions.

Seventy pages cover who needs a computer, what one is what one can do, setting up the computer and information on software. Seven pages would have done. The text is vague and mostly irrelevant rambling, dated and largely useless.

Am I being too critical, what of the 18 original programs. Any program for someone who doesn't already have a computer must be original. Those of us who do will recognise those listed above and the rest of the 18 O.P.s. to be the same as the ones that would fill these pages and excite us when we were still playing with ZX80's. Why they take up almost half of the book I do not know.

The nicest thing that happened on the rainy Saturday afternoon, and this is original, was having the cold.

"Choosing and Using a Micro computer" is written by Alan Radnor and Howard Kahn published by Fontana and costs £2.50.

ISBN 0-00-036624-4.

The Art of Micro Design — A.A. Berk

"The Art of Micro Design" is one of those 'Text book' books that manages to successfully cross over into the general interest category. Its ability to do that is due to the author's awareness of the difficulty that people have in putting together a sufficient understanding of the workings of a microprocessor.

Maybe I should clarify what I mean by general interest. The book is aimed at engineers and enthusiasts who wish to gain a practical working knowledge of

microprocessor system design. Naturally being of general interest it restricts itself to 8 bit microprocessor systems. As you might imagine it amounts to fairly demanding reading; but it is of general interest as it assumes minimum previous knowledge of electronics, while it covers the topics in sufficient detail to allow the reader to design around microprocessor circuits.

I met this fellow recently who lists being a fisherman and a defence systems designer on his C.V. He pointed to the fact that it now wasn't possible for the hobbyist to compete with technology from the kitchen table or anywhere else for that matter. Enthusiasts who have taken technology to where it is today are being forced from their pastimes because of it. I had to agree.

Three hundred consuming pages later I'm not so sure. Using three actual MPU's — the Z80, 6800 and the 1802 — as examples Mr. Berk offers actual data and principles of reading data sheets which could be applied to any MPU. Subsequent discussions on bus structures, memory, input/output devices and interfacing are detailed and supported by examples.

Later chapters develop this new knowledge to consider the use of the micro in computer systems from control and data collection machines to local area networks.

No more is required of the reader than an understanding of logic gates and some general electronic theory. Four appendices offer any further background required and the text provides rather than assumes any more advanced knowledge.

The author manages throughout to convey concepts and principles which are highly theoretical by reference to practical situations and standard hardware. His intention was to enable the reader to have a sufficiently complete understanding of microprocessor design to be practical; in this he has been highly successful.

"The Art of Micro Design" may plant the seed for a whole new crop of micro controlled systems. I shall certainly recommend it to my hobbyist friend, his hitherto frustrated fellow enthusiasts and daunted and bewildered engineers.

"The Art of Micro Design" is written by A.A. Berk and published by Newnes Technical Books.

MAIL ORDER PROTECTION SCHEME

If you order goods from Mail Order Advertisers in this magazine and pay by post in advance of delivery, this publication will consider you for compensation if the advertiser should become insolvent or bankrupt, provided:

1. You have not received the goods or had your money returned; and
2. You write to the publisher of this publication explaining the position not earlier than 28 days from the day you sent your order and not later than 2 months from that day.

Please do not wait until the last moment to inform us. When you write, we will tell you how to make your claim and what evidence of payment is required.

We guarantee to meet claims from readers made in accordance with the above procedure as soon as possible after the advertiser has been declared bankrupt or insolvent to a limit of £1,800 per annum for any one advertiser, so affected, and up to £5,400 p.a. in respect of all insolvent advertisers. Claims may be paid for higher amounts, or when the above procedures have not been complied with, at the discretion of this publication, but we do not guarantee to do so in view of the need to set some limit to this commitment and to learn quickly of reader's difficulties.

This guarantee covers only advance payment sent in direct response to an advertisement in this magazine (not, for example, payments made in response to catalogues, etc. received as a result of answering such advertisements:

OMNICALC HAS BEEN EXTENDED!

The thousands of satisfied owners of the original OMNICALC spreadsheet program for the Spectrum will already know how powerful and versatile it is. The extended version (which goes under the highly original title of OMNICALC2) retains all the good features of the original and adds many more such as

- Full support for the microdrive/net/RS232 facilities within Interface 1
- Inbuilt graphics to draw histograms from your data
- Insert/Delete column and row functions
- A separate work area to enable transfer of data between spreadsheets (for consolidation etc).

It can be used with or without microdrives; with a full size printer; includes a conversion program to let you run models set up on the original OMNICALC and comes complete with a comprehensive manual.

OMNICALC2 is priced at £14.95

For existing owners of OMNICALC we are offering a special trade-in deal. Simply send your existing tape and manual and a remittance for £8.00 (£9 Europe £10 elsewhere) to the address below and we will despatch OMNICALC2 by return. Please note that this trade-in deal is only available directly through MICROSPHERE.

Keyboard masks

**A simple idea that takes a genius to invent.
Enter J L Phillips of Dorset.**

Many Spectrum owners have interfaced a joystick with their computer to enjoy playing those games which are suited to such control. Indeed, there is a welcome practice among software houses to produce cassettes which are compatible with available joysticks. However, more and more games are becoming available which are not so obviously suited to joystick control and, as their complexity increases, so does the number of keys which are required to be operated during the course of the game.

A certain amount of manual dexterity is called for, which adds to the interest and entertainment but the need to remember which keys are to be used, and for what purposes, can be tedious, and the con-

tinued accessibility of all the unused keys is an unnecessary and sometimes irritating complication.

There are keyboard overlays available, of course, which help in readily identifying the keys in use for a particular game, but these suffer from two disadvantages: first, the remaining keys are still obviously accessible and second, these overlays are designed for use with the standard Spectrum keyboard and not with the typewriter style keyboards in which many Spectrum computers are eventually housed. Moreover, the distances between the rows of keys on these "add-on" keyboards are so small that a simple keyboard overlay would be so flimsy as to be impracticable.

In fact, it is quite feasible to make very functional and effective masks which not only provide quick reference to the control keys but also deny access to the unused keys, removing them from sight and any possibility of confusion.

In the description below, the dimensions are those which I have found suitable for the DK Tronics keyboard but the principle is applicable to any similar unit, the only variation being in readily measureable dimensions. The mask is made up of four basically similar pieces of folded card of postcard thickness. Each piece is formed into the shape of an inverted U section, as shown in Fig 1.

It will be found that these dimensions are such that the card will surround and cover one

of the four rows of keys, locating itself at the ends of the keyboard cut-out, resting upon the upper surface of the printed circuit board and with the top face just clearing the tops of the keys. To permit access to particular keys in the row, remove appropriate sections of the card, as shown in the example. When the four pieces, one for each row, have been cut as necessary, they are stapled (or glued) together through the long sides, eg at positions A, B and C. The top surfaces are then labelled to indicate the control functions of the adjacent exposed keys. I found a combination of Dymolabel on black card to be particularly effective.)

Fig 2 shows a plan view of a mask constructed in this way for use with the game '3D Ant Attack' (Quicksilver).

For games requiring the use of but a few keys, it would be possible to make up the mask from fewer, broader pieces but I favour the user of four pieces nonetheless because of the consequent support given to the mask by its five 'legs' down to the printed circuit board. Although only thin card is used, I have found a mask constructed as described to be quite rigid and serviceable. Use of the device has been most successful, permitting more concentration upon the game itself, thus adding considerably to the enjoyment.

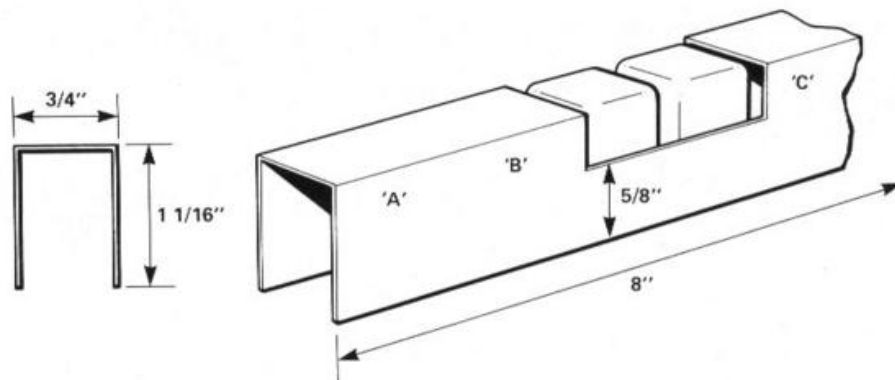

Fig 1. Details of key row cover.

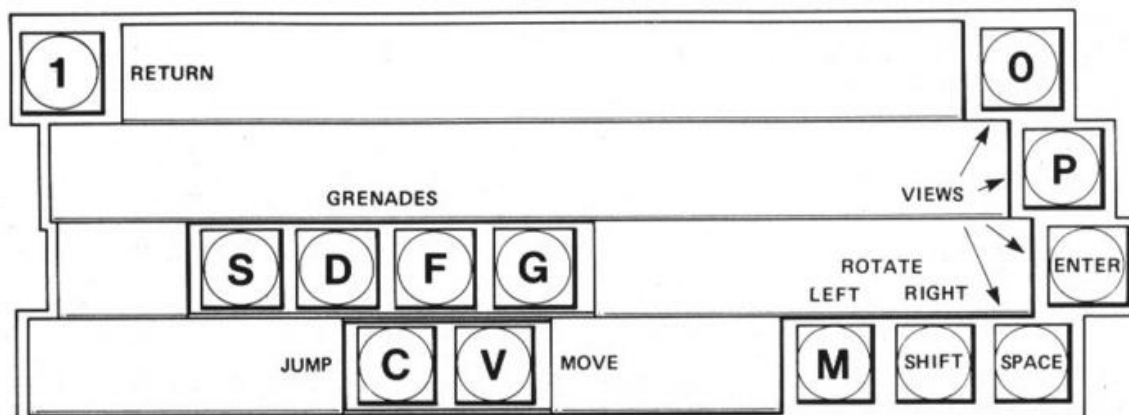

Fig 2. Mask layout for 3D Ant Attack.

The 1K Corral

Getting a quart into a pint pot is easy compared to getting a program in 1K! A selection of the impossible

Adding machine Mervin J Cagle

A useful little program to turn your computer into an adding machine, but what is special is the routine to align the decimals.

This can be utilised for any program which requires figure work involving decimals.

Another tip from Mervin is that you can economise when using this program by turning the printer paper around and re-using it.

Slalom Andrew Norton

This down-hill skier program works on the ZX81 in 1K and is quite rapid even in slow mode. The object is to move the skier, using the keys "5" and "8", through 20 randomly positioned gates which scroll up from the bottom, without hitting the

posts. Your score is given at the end — over 15 is fairly good. To make the game easier the gates can be widened (by altering line 50 slightly) and then changing line 120 to read: IF X=Y+1 OR X=Y+2 OR X=Y+3 etc. etc. depending on how much wider the gate is made.

S is the score, T the number of gates, X the skier's position and Y the position of the gate.

```

David Webber

This program can solve equations of the type

$$A(x * b) + C(x * d) + E(x * f) = S$$

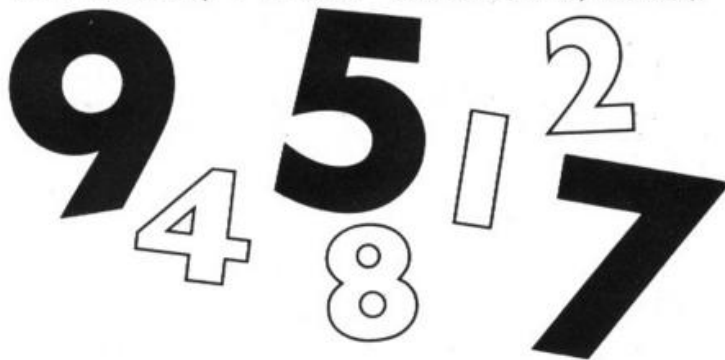

providing A,b,C,d,E,f and S are known, by a system of trial and error.

The program starts x at 0 and increases by 1 for each

check, once the equation is greater than S then the trial value of x is reduced by one and the trials are started again this time with a increase value of 0.1.

This system is repeated with ever decreasing increments but line 112 limits the accuracy to six decimal places.

If you are dealing in large values then it is possible to alter the value of M in line 2 to accommodate (ie. 10, 100 etc.).

```

1 PRINT "(A*(X**B))+(C*(X**D))
+(E*(X**F))=S"

Jailbreak

Jens Philipp

I have deliberately avoided the scrolling type of game as there are many around which, although clever, seem to be all that people do when writing a 1 K game.

The aim of this game is to free as many prisoners as possible. The prisoners — X — are moved from right to left by pressing 1. Patrolling the top of the prison walls are the guards who will catch you if they are above you. However, if you are standing beneath a pillar then the guard cannot see you.

When your man has reached the left hand side of the screen then another starts from the right. The number of prisoners that have escaped is shown in the left corner of the screen.

If you are caught then press newline to restart the game.

TAIL

Quicksoft

Clive Smith lurks among some more unusual programs

Rainy Day Cases Computer Simulations

Ray the Ed. has just dropped off a load of cassettes for me to review. sorry wife, I shall have to stop the decorating and press on with these (he he!).

First of these is Rainy Day, nothing to do with rain but a compendium of games to play when it's raining. If you're rich you can use your Currah speech unit and the program is compatible with a number of joystick interfaces.

There are three games which you can play. Game 1 is called 'puzzle unit', where you can choose one of ten pictures which are jumbled up. Then, with the aid of the cursor, you have to put them back into their original form.

Game 2, called 'Code-breaker', is based on the Mastermind game. Instead of colours though, they use numbers which makes it more difficult. You have to break the code within 15 attempts and if you are successful a safe door will open.

Game 3 on the tape is not really a game at all but a reaction test. A ball is dropped from the top of the screen into a glass at the bottom of the screen and you have to hit a key before it reaches there. Comments are made on your ability.

Not a bad tape for £2.99 which I think has been aimed at

the 10 to 16 age group. (To tell you the truth I couldn't do the pictures). Spectrum 48K only.

Double Dealer M F M Software

As you might guess from the title, it's a card game. There are two games, one on either side.

Game 1 is 'Black Jack' or for the less informed, 'Pontoon'. A fairly simple game where you are dealt two cards and, with the cards you have or more if you require, hope they add up to 21. Go over 21 and you have 'bust and lost. If your cards are less than 21 you have the option of either 'sticking' with what have got and hope the computer cannot beat you, or 'twisting' and have another card to try and reach 21.

On the other side the game is a little more complex, but nothing as complicated as bridge. It's 'Stud Poker', one of the best gambling card games there is. I won't go into the rules now, but basically each player has a 'hand' which carries a value. You have to try and assess the value of your opponent's cards and if you think your cards are worth more than his, then you bet money which he has to equal to stay in the game. If he has a low value he can 'fold' and drop out.

However he might have a low value and try and bluff you. The computer will play the most experienced player and has all the abilities of bluffing and clever betting.

A very good game and well written, but I thought the layout of the cards could have been better. For the 'Mavericks' amongst you it's played with a French deck with 2's as a wild option.

Double Dealer is for the 48K mavericks only £6.50.

Athlete Buffer Micro Ltd.

To keep the Olympic spirit go out and buy this tape. There are five events which you can take part, 2 sprints, 2 hurdles (110 & 400 metres) and the hammer throw.

In the track events you compete against two other athletes. To win each race you have to press a key which increases your effort as you run. Too much effort and you will fall flat on your face with exhaustion, too little effort and you come in last. A scale at the bottom of the screen shows you how much effort you are using and also a scale of what distance is left to run.

In the hurdles you have another key to press to make your man jump.

There are facilities for training and a choice of event. Graphically it's not bad but there is an awful lot of time wasted with menu's between each event.

Overall 'Good fun' and your money is not wasted. 'Athlete' is for the 48K owners only. £5.95

Blockbuster Compusound

Based on the TV series of the same name, Blockbuster is a quiz game. You get two cassettes in a presentation box and hundred of questions to answer. It's a game of speed and skill. The question is flashed across the screen and the first person to hit a key can answer it.

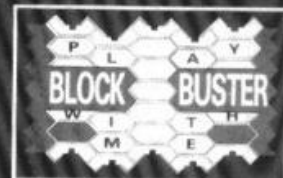

The screen shows a 'honey-combed' grid and for each correct answer one space is filled in with your colour. The idea is to get from one side of the screen to the other and block your opponents route.

You can either play the computer or a friend. There are also different skill levels to choose from.

A very well thought out game and clever use of questions, if you like quizzes I'd recommend it to you.

Blockbuster is written for the 48K Spectrum and will cost you £5.95.

For the 48K RAM ZX SPECTRUM

XOR Xorsoft Spectune

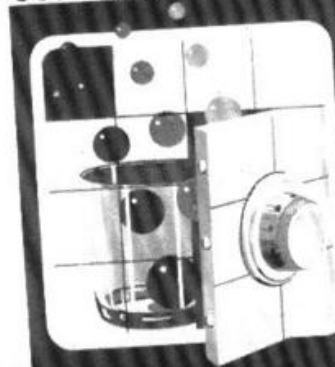

There are many 'make music' tapes about and this is one of the better ones.

Without the use of external hardware you are limited to what the spectrum can offer and this program makes use of everything the spectrum has. It turns the Spectrum into a piano keyboard with 34 notes. You can adjust the bar length and the crotchet length, (sounds painful). It gives you a good range of all the sharps and flats etc. and it can also memorise your tune and play it back to you. You can also edit and change your tune and it can hold up to 2500 notes.

Written for the 48K it will set you back £5.95.

Oh Well, back to the decorating.

De-bugger

Getting a program typed in is often only the start of your problems. Ed to the rescue.

Typing in a program is a useful exercise. Apart from the patience required, techniques learned and the end program to be used, probably the most educational part of it is tracking down the bugs introduced by yourself or occasionally by our publication system.

In debugging you gain a much deeper insight and understanding on how the program actually works than by merely typing it in, but tracking down these errors is an art in itself and needs some skill. So here are some tips to help you in your efforts when faced with that cryptic error report!

1 NEXT without FOR

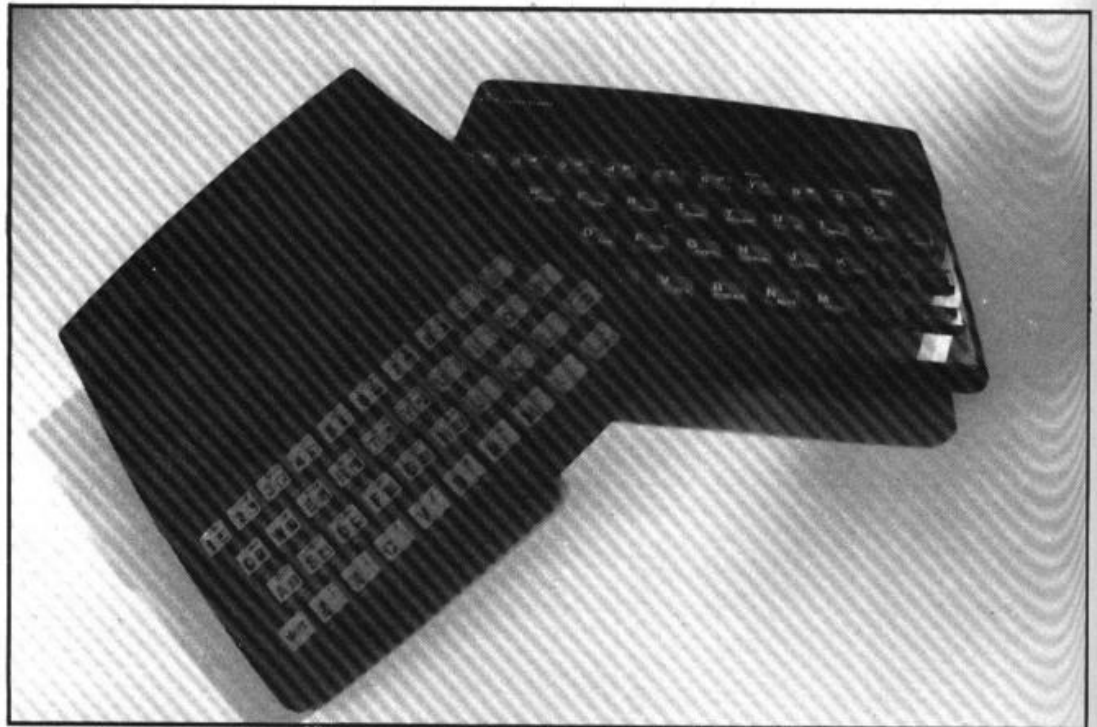

Look back through the program, either the loop has not been set up — no related FOR 'letter' = No1 TO No2 line, or the letter has been re-used as an ordinary variable within the loop with a LET 'letter' = No.

2 Variable not found

This is one of the most common errors. Again, the problem may not lie in the line where the error was detected and reported. If there is only one variable, which may be one or more letters or a string (\$) variable, then that is the problem. There may be more than one variable in the line section reported and you will have to identify the offending one. In a line PRINT AT Y,X;A\$ the culprit could be Y or X or A\$. To find out which of them is causing the problem (it may be more than one) type in turn as a direct command:

```
PRINT Y Enter/Newline
PRINT X Enter/Newline
PRINT A$ Enter/Newline
```

Note which produces the error report. Now look back through the program printout for the line which sets it up — usually a LET or FOR command. Did you leave it out? Does the program get there or has a GOTO/GOSUB been wrongly addressed?

3 Subscript wrong

Connected with DIM A(No) or DIM A\$(No). If the number in the brackets on the line where the error is reported is greater than the one in the original DIM statement, is not an integer or is less than 1, then this report is generated. If the subscript — number in brackets — is a number then check and change, however, if it is a variable then follow the procedure for tracing variables. It has probably exceeded the limits, look for lines with the variable being altered with + - * / : if necessary add limiting code. For example:

```
IF X > 10 THEN LET X = 10
```

4 Out of memory

As well as for programs which are too big, it may happen if the previous program set RAMtop. Before despairing, enter CLEARUSR "a"-1 on the Spectrum: on the ZX81 SAVE the program, turn the machine off and on, then reload the program.

7 RETURN without GOSUB

Somewhat the computer has reached a RETURN command other than via a GOSUB instruction. Check a GOTO hasn't been entered in place of a GOSUB. Check for a missing GOSUB.

B Integer out of range

An integer (whole number) either as a number of variable is too big or small and you are attempting to do something like PRINT AT 0,33 — not allowed! Check any variables involved as per report 2 and trace it back through the program looking for adjustments to it by + - * / : Add limiting code if needed — see report 3

E Out of DATA

A Spectrum problem. Check the number of DATA items match the number of READs; usually one (or more) has been missed out. Attempting to reread a DATA list without first using a RESTORE command will cause

this and it can happen on an auto start program (saved with a LINE number). Good programming usually RESTORES to the correct line number before using READ.

I FOR without NEXT

See report 1 but this time the NEXT is missing!

Note that the letters I have used for examples could be ANY letters not just A\$, X, Y etc and depend on the particular choice of the programmer.

This is by no means a comprehensive list but I have tried to cover many of the most common error reports. Personally, I get almost as much satisfaction from debugging as I do from programming. I do assure you, however, that there is absolutely no truth in the rumour that we deliberately inject bugs into our listings in order to introduce you to the dubious delights of debugging!

Apocalypse Expansion Kit Vol.1 Nova Maps. Red Shift £4.95

For a review of the base program, see page 49 of the Apr/May issue. This tape is for wargamers who have grown accustomed to the maps of the main program. The new scenarios use the same rules, but give you a chance to try out different tactics. They include:

• U.S.A.

Mostly land-based warfare; high city densities for troop conflict. Nukes would be very destructive. For revenue play, the winning target is 240 points.

• S. AFRICA

Another land battle; could support many player power zones. Rapid and devastating troop attacks are possible.

• SE. ASIA

A marvellous map; similar to that of 'Europe'. Large sea areas for aquatic conflict. The troop distances are large, making Nukes ineffective. Many coastal bases are available. This is definitely my favourite my favourite of the new maps.

• ARTIC

Interesting picture of the North pole. Only 201 revenue points needed to win in points-play.

• GALACTIC

The last two maps take the play out of the usual terrestrial-based warfare. This adds new interest to the game. Wide-spread centres allows for space ship dominance of this map.

• NETHER EARTH

Unusual city names here; many appear to be based on a well-known Tolkien book!

Overall this tape is a useful addition to the Apocalypse range. It prevents you from getting bored with the earlier situations.

Apocalypse historical scenarios. Vol.2 Chapters 1 & 2. £4.95 each.

These are four new expansion programs, with data files. They MERGE with the main game. Unfortunately this takes a long time; and to play a different game you have to reload the whole lot! The advantage is that you essentially have five different games totalling some 400K. The rules are slightly altered, as are start conditions, which helps to keep you interested in playing out the situa-

Mind Play

Greg Turnbull looks at games of strategy and skill.

tions again and again. This feature significantly extends the useful life of the program. Red Shift say it is selling as well now, as when it was first produced last year.

In all four programs the centres are already distributed, and troops deployed for you. The players merely decided which empire or force they wish to assume then straight on with the play. Specifically the programs are:

• DECLINE AND FALL (OF ROME)

Disease is the main change here. Although random its local effects are very significant on your troops.

The combat phase is slightly changed. However it is still based on an input number of divisions used. This can be set by the player, and is perhaps not the most satisfactory method of deciding who wins a battle.

• NAPOLEON'S CAMPAIGNS

Generals are introduced here, their symbols can be viewed on the main map. A time limit for play is introduced. As in real life the generals when defeated, may be either captured or escape. No Nukes are allowed in these early period wargames.

• WAR IN THE PACIFIC

An airstrike option replaces the Nukes phase of the main program. Otherwise the rules are essentially the same.

• 1984

This is the most interesting of the new situations; and the most graphically effective. A world tension bar reflects changes in Europe. Wars and the use of Nukes increases the indicator; disarmament decreases it. If the bar turns red total global thermonuclear war ensues! This appears to be almost unavoidable in extended games; hopefully not representative of real life. The graphics of the world destruction are well done, and fun to watch.

Overall some very useful additions to the Apocalypse range,

and moderately priced too. Sadly no further expansions are planned as yet. However, future tapes should have M.code maps for increased speed during loading.

The quest for the Holy Grail. 48K Spectrum, Dream Software

This is a new graphic adventure game from an up-and-coming company; Dream Software. The current trend for flashy presentation packaging is continued. The instruction pamphlet (like the program itself) contains witty notes and very few clues.

As usual the tape takes forever to load; although the screen display is claimed as 'Cert. XX'. Once loaded you are straight into the adventure, with very little to help you.

The screen display is horizontally split Hobbit-style, with scrolling pictures and text. From the name you might expect this to be purely a medieval adventure, like 'Knight's Quest'. You would be wrong; it's right up to date including: CND pickets, nuclear powered lamps, motorways etc.

When a picture of a modern road with street-lights appears, the text says: "This picture is 500 years before its time, but who cares!" There are also various references to other programs, for example: Eugene from Inagime, and if you ask 'who' you get "This isn't 'Valhalla' you know."

The usual adventure facilities save/load/quit are provided. Plus graphics on/off, for when you get sick of seeing them time after time. However no help or score routines are available, nor is character interaction allowed.

Don't be tempted to use bad language if you get frustrated; the program doesn't like it. It can even get insulting and will call you a nerd, or a berk on some incorrect entries. The response

are quick, as is the screen drawing. Unfortunately the pictures don't help the action much, and are really just padding.

It is incredibly easy to get killed; this is where the program lets itself down. You can be battered to death with a VIC20, or suffer one of numerous other equally nasty fates. For example: If you try to enter the cesspit, it says: "You're not God, and haven't learnt to walk on water yet." The program abounds with such humorous touches; one aspect which is good fun.

Eventually you may manage to reach Camelot castle; just as you were thinking you had loaded the wrong tape by mistake. Once inside I was immediately killed by the French guard. He unclogs his nose in your direction, and you die a horrible green death!

The film buffs among you will recognise this as a reference from the hilarious "Monty Python and the Holy Grail." This appears to have been the inspiration for the program; those who have seen the film will therefore be at an advantage. For instance: You can die at the hands of the knights who say 'NIC'; and get frizzled into a pile of bile salts! (Your fate can be quite gruesome at times.)

Ultimately you get frustrated with going through the early stages so often. The terminal boredom sets in; as dying is so easy, and happens very quickly. You merely get transported back to the start to try again. So for all its comic touches this program is already out of date by today's high standard of games.

The copying of a Hobbit-style screen and the addition of Monty Python ideas doesn't manage to hold your interest. The text and scenarios soon become tiresome, causing you to lose any incentive to try and progress further. Sorry Dream, better luck with the next attempt.

CURRAH μ SPEECH

Speech Synthesiser for ZX Spectrum

The **CURRAH μ SPEECH** is ready to talk immediately on power-up, has an infinite vocabulary and outputs speech and ZX Spectrum sound through your TV speaker. There is no software to load with **μ SPEECH** — sophisticated Gate Array technology means you can just plug in and start constructing words and sentences like this:

LET SS = "sp[ee]k (nn)[oo] (ee)vil" will say "speak no evil"! Further commands control the "voicing" of keys as they are pressed, and an intonation facility allows you to add expression to the speech.

μ SPEECH is fully compatible with ZX Interface 1 and may be used with the **CURRAH μ SLOT** Expandable Motherboard, allowing easy expansion of your ZX system. **μ SPEECH** and **μ SLOT** will also be compatible with the **CURRAH μ SOURCE** unit when it arrives later this year, allowing you to write **Assembler** and **FORTH** statements directly into your **BASIC** programs!

Top selling games like **ULTIMATE'S Lunar Jetman** feature **μ SPEECH** voice output — watch out for other titles from Bug-Byte, CDS, Ocean, Quicksilver and PSS.

μ SPEECH is available from COMET, W.H. SMITH, WOOLWORTHS, GREENS, BOOTS, JOHN MENZIES, SPECTRUM STORES and good dealers nationwide — or use the form to order the **CURRAH μ SPEECH** — winner of the CTA 'Product of the Year' award 1984.

ZX, ZX Spectrum and ZX Interface 1 are trademarks of Sinclair Research Ltd.

How much would you expect to pay for a dual 128K fast access storage system for your Spectrum that included Centronics and RS232 interfaces and free word processing software as standard?

Chances are it's a lot more than £129.95. But this is what will buy you the incredible Rotronics Wafadrive unit. There are no extras - this price includes VAT and postage.

A fast reliable dual-drive storage system

Integrated System

The Wafadrive is a complete system which contains the micro interface, two 128K drives, RS232 and Centronics ports, all in one attractively-styled, compact unit. There is a minimum of connecting leads and no extra boxes to clutter the desk top. Like the majority of professional systems, the units are dual drive. This offers the optimum balance between system flexibility and cost. Built-in serial and parallel interfaces allow the direct connection of just about any popular printer.

Fast and Reliable

The Wafadrive achieves very fast loading and saving, but not at the expense of reliability. Extensive research and the use of high grade materials ensure that the Wafadrive will give years of dependable operation. Data

integrity is on a par with floppy disk. The fully interchangeable wafers are available in three sizes - 128K, 64K and 16K. Low capacity wafers give faster access. They are therefore most suitable for program development applications. The high capacity wafers are suitable for more general data storage. Loading rate is well over ten

times as fast as cassette!

Software

Armed with the comprehensive user manual, blank wafer and word processor supplied, you can use your Wafadrive straight away. There is also a rapidly growing range of software to enable the programmer and

games player to exploit the Wafadrive system to the full. Wafadrive for the 16/48K Spectrum is available now. Versions for other popular home computers are under development.

Send a 16p stamp for a full colour brochure and information on software and accessories.
